The use of a circle to mark the boundary of an area which is sacred, set apart from everyday life and to be protected against worldly or evil influences, is very ancient. The stone circles of Stonehenge, Avebury and many other prehistoric sites are examples. The Babylonians drew a circle of flour round the bed of a sick man to keep demons away from him. A Roman ambassador to a foreign potentate would draw a circle round himself with his staff, to show that he should be safe from attack. Medieval German Jews drew a circle round the bed of a woman in childbirth to ward off demonic attack, and the words 'Sanvi, Sansanvi, Semangelaf, Adam and Eve, barring Lilith' were chalked on the door or the walls for additional protection.

In medieval and modern European textbooks of ritual magic the circle is of great importance. The magician and his assistants stand inside a circle to protect themselves from the spirits, demons or forces they intend to conjure up. But the circle is not only intended to keep something out

Mansell Collection

Magic circle from *Le Veritable Dragon Rouge*, a 16th century magical textbook: the magician and his assistants stand in the triangle, with wax candles on either side and a brazier of charcoal in front; the inscription JHS stands for Jesus

but also to keep something in – the magical energy which the magicians will summon up from within themselves in the course of the ceremony. It is this energy which will force the spirit to appear and if it were not for the circle the energy would flow off in all directions and be dissipated. The circle keeps it inside a small area and so concentrates it. The same motive lies behind the circle of people who link their hands at a seance.

The magic circle should be nine feet in diameter, drawn on the floor or the ground with a sword or a knife, or with charcoal or chalk. Inside this circle is drawn a slightly smaller one, eight feet in diameter. In the narrow rim between the two circles are bowls of water, crosses, names of power (see NAMES) and plants like vervain, which demons are said to dislike, to reinforce the barrier against hostile forces. There must be no gap or break in the circle, through which an evil influence could get into it and take possession of the magician, and when the magician has entered the circle he must close it carefully behind him.

The 18th century French *Grand Grimoire*, introducing a grislier note, says that the circle should be made of the skin of a young goat, cut into strips and fastened down with four nails from a dead baby's coffin. The magician stands in a triangle, drawn inside the circle, with a wax candle placed in a circlet of vervain on either side.

A modern formula for drawing the magic circle is given in Dion Fortune's book *Psychic Self-Defence*. The magician begins by facing east and making the sign of the cross, touching his forehead, shoulders and solar plexus. This is not the Christian cross but the equal-armed cross, standing for the four elements and the four cardinal points, and so for mastery of all things (see CROSS). Next, he imagines that he is holding a great cross-handled sword in his right hand, point upwards. He says, 'In the Name of God I take in hand the Sword of Power for defence against evil and aggression.' He imagines himself as a 'tremendous armed and mailed figure, vibrating with the force of the Power of God.' He draws the circle on the floor with the point of the imaginary sword, in a line of imagined golden flame. Facing east and clasping his hands above his head, he says, 'May the mighty archangel Raphael protect me from all evil approaching from the east.' He repeats the same formula facing south, west and north in turn, naming Michael, Gabriel and Uriel respectively.

This circle has been drawn 'deosil' or clockwise, moving to the right, which is the side of good. In black magic the circle would be drawn the opposite way, moving to the left or 'widdershins', a word derived from an Anglo-Saxon phrase meaning 'to walk against', and which means moving against the direction of the sun and therefore in an unnatural and evil manner.

Circumambulation, moving round something in a circle, is a very old magical and religious rite, and circular dances are known from all over the world (see CAROLE: DANCE). In eastern Europe, at least until recently, at a Jewish wedding it was the custom for the bride to walk round her husband three or seven times under the wedding canopy. The original purpose was probably to keep the pair and their marriage safe from evil by drawing a protective circle round them.

E. E. Evans-Pritchard

Circumcision

Removal of all or part of the foreskin: the underlying motives for its use in a religious context are uncertain but it is usually a form of initiation; occurring at puberty, as among many African peoples, it is part of the initiation into adulthood; sometimes, as in Jewish practice, it is connected with the naming of a child, which makes him a real person and so initiates him into human life.

See AFRICA: INITIATION.

Clairvoyance

Mysterious ability to see what is not present to ordinary sight, including objects or happenings at a great distance, and things in the future; clairaudience refers to hearing instead of seeing; distinguished from telepathy, which is the ability to sense other people's thoughts and mental states, or to convey your own to other people, without the use of speech, gesture or the other normal methods of communication.

See DIVINATION; EXTRA-SENSORY PERCEPTION.

The churchyard of a ruined church was the sinister setting for a series of events at Clophill in Bedfordshire. Tombs were discovered broken open and the skeleton of a young woman who died two centuries ago was disinterred

CLOPHILL

A DERELICT CHURCH on the slopes of Dead Man's Hill at Clophill in Bedfordshire, has twice been the scene of incidents apparently connected with the practice of ritual magic.

On the first occasion, in March 1963, seven tombs in the churchyard were seriously damaged and the coffin of a girl who had been dead for 200 years was removed from one of them. Her bones were found inside the church. In 1969, on Midsummer Night, a tomb was smashed to pieces and attempts were made to dig the body from beneath it.

The first desecration is thought to have taken place at full moon. It was discovered, according to a newspaper report, when a visitor to the churchyard saw a child carrying a human skull. Arranged in a circle inside the church were the thigh, shin and arm bones, and part of the pelvis; an earlier visitor claimed to have seen the skull impaled upon a spike in the centre. The feathers of a cockerel were scattered nearby. The bones were those of Jenny Humberstone, the young wife of an apothecary, who had died in 1770 at the age of 22.

At first the affair was regarded as a hoax, possibly carried out by students. This was not unlikely considering the large number of graveyard desecrations that had taken place in the previous year. At Knutsford, Cheshire, the grave of a man buried in 1682 had been opened, while many of the stone crosses in Eltham churchyard, near London, had been damaged by vandals. Nevertheless there was a strong suggestion that other, more sinister, agencies had been at work. Westham church in Sussex had been invaded by black magicians who spat upon the crucifix in broad daylight. In Haydale Wood, Derbyshire, a girl had been found tied to a tree after being scourged with whips by Satanists. Only a few miles from Clophill itself the mutilated heads of a number of cattle were found in a bluebell wood, outside Luton.

Commonplace as these incidents were becoming, the Clophill affair seemed to suggest that some kind of organization might be involved. For one thing it was evident from the damage inflicted upon the tombs that a great deal of effort had been put into the attempt to break them open, which seemed to discount a mere students' frolic. They were table-top tombs and each was surmounted by an extremely heavy slab of stone. Prising this masonry from its base must have involved intensive effort with crowbars, and the attendant risks of detection and imprisonment were considerable. The entrances to six of the tombs had been securely sealed with layers of bricks, and only Jenny Humberstone's grave permitted entry. The raiders had smashed open the coffin and removed the skeleton. It seemed unlikely that this was merely a sick practical joke. Certainly the police believed that the evidence suggested that a Black Mass had been celebrated.

The incident was widely publicized and the suspicion that one of the modern English witch covens might be involved soon arose. This was strenuously denied by the then spokesman for British witchcraft, the late Dr Gerald Gardner, who insisted, 'It is nothing to do with us. We are as puzzled as everybody else. English witches don't do things like this.' He was undoubtedly right. The Clophill affair had nothing in common with modern witchcraft which is concerned with white or good magic. A more pertinent theory was that Satanism or necromancy was involved.

One national newspaper claimed to have interviewed a prominent Satanist who was reported as saying that a Black Mass had indeed taken place in the church. 'The ideal arrangement,' he had said, 'is to use a naked woman as an altar for the ceremony but it was too cold that night. So it was decided to use a woman's bones. This was part of the cult's worship of the mother figure as represented by the goddess Diana.'

Shreds of a Shroud

It is far more likely, however, that the ceremony performed that night involved necromancy, the art of making the spirits of the dead return and speak. It was a common practice among black magicians during the Middle Ages and even today is well known

Tombs in the graveyard of the church on the slopes of Dead Man's Hill at Clophill have twice been desecrated in what seem to have been preliminaries to necromantic rites: on one occasion the bones of a 200-year-old corpse were arranged in a circle inside the church ***Facing page*** **Clophill church: a notice on its walls reads 'Keep awey. This church is dangerous'** ***Right*** **The remains of one of the tombs**

in Africa and in Haiti, the land of Voodoo. A corpse is essential for necromancy, but is not necessary for Satanic rites.

Another incident, not generally reported, added to the mystery of the Clophill affair. The Rector had told the press that he intended to re-inter the skeleton and fill in the grave as soon as possible. Meanwhile, he locked the bones away for safety in another building. The tomb robbers returned to search for the skull and other objects that had played such a prominent role in their sinsiter rites. On discovering the grave to be empty, they vented their rage upon what was left of the coffin, smashing it into fragments which were left scattered about the church and churchyard.

Jenny Humberstone was finally laid to rest in her old grave by the church porch, with eight tons of earth over her coffin.

Six years later, yet another tomb was smashed and attempts made to disinter the corpse. The Rector was horrified, and spent the following two nights in a lonely vigil by the gutted church. On the third night he went home to bed, thinking that the danger was over. The following morning, two more graves were found destroyed and opened.

Understandably, the villagers of Clophill are reluctant to discuss the strange happenings; they refer to them as 'the troubles up in the church'. Meanwhile no one knows when more 'troubles' may occur. On the red tiled floor of the ruined church lie shattered pieces of Jenny Humberstone's coffin, with ragged pieces of her shroud still attached. Everyone in Clophill hopes the remaining coffins on Dead Man's Hill will continue to stay underground.

FURTHER READING: *Ghosts*, edited by W. Mayne (Elsevier-Nelson, 1971).

Little is known of one of the greatest mystical writers, the author of the Cloud of Unknowing, *yet thousands of Christians have gained help and solace from this 14th century work, which argues that the dark cloud which shuts us off from God, can be penetrated with God's aid, not by the intellect but only by a sharp dart of love*

CLOUD OF UNKNOWING

THE AUTHOR of the *Cloud of Unknowing*, one of the most famous of all mystical works, is himself unknown. Even the date when it was written is still uncertain, although its style and other evidence place it in the late 14th century. The author belonged to a group of mystical writers which included Richard Rolle of Hampole, Walter Hilton and Julian of Norwich, and which arose at the same time as the Rhineland and Flemish mystical school, among whose members were Eckhart, Tauler, Suso and Ruysbroek.

The two groups, however, appear to have developed independently, although along parallel lines. They were both products of a similar intellectual climate which seems to have fostered the search for an experimental form of religion. Both groups drew their inspiration from a writer known to us as Pseudo-Dionysius, whose works were first heard of in Constantinople in the 6th century AD (see DIONYSIUS THE AREOPAGITE).

The teaching of the *Cloud*, insists throughout on the impossibility of knowing God by human reason. Right at the beginning occurs the passage:

> For of all other creatures and their works – yea, and of the works of God himself – may a man through grace have fullness of knowing, and well can he think of them; but of God himself can no man think.

And towards the end, appealing to Dionysius, the author says, 'The most godly knowing of God is that which is known by unknowing.' The 'cloud of unknowing', in fact, which lies between God and man, is pierced not by the intellect but only by a sharp dart of love.

A Beam of Ghostly Light

The people for whom he is writing, the author says, are those who aim at being perfect followers of Christ, not merely by the practice of good works but through contemplation. Like Hilton and the other English mystics mentioned above, he uses what was then a new approach to religion, the cult of contemplation. The word contemplation, in this its technical, mystical sense, means a mental prayer based on intuition rather than on reason, and is distinct from meditation. In the *Cloud* contemplation is seen, according to the principles laid down by Dionysius, as being beyond the intellect. The working of the intellect can only hinder it, and so it must consist in concentrating the mind on the

Illustration from the ***Cloud of Unknowing*** **showing the twelve sons and one daughter born to Jacob, later called Israel, by his two wives and their handmaidens: the sons' descendants became the twelve tribes of Israel, the chosen people of God, and each of them is here linked with one of the qualities of the faithful worshipper of God**

simplest idea of God, with all created things rigidly excluded.

> This darkness and this cloud . . . is betwixt thee and thy God, and hindereth thee, so that thou mayest neither see him clearly by light of understanding in thy reason, nor feel him in sweetness of love in thine affection. And therefore shape thee to bide in this darkness as long as thou mayest, evermore crying after him whom thou lovest. For if ever thou shalt see him or feel him, as it may be here, it must always be in this cloud and in this darkness. And if thou wilt busily travail as I bid thee, I trust in his mercy that thou shalt thereto come

But this initial effort is not contemplation, though the writer believes that to one in the proper frame of mind God will bestow this formless knowledge. He makes it very clear that it is God who must be sought, not an experience, but he does say that it is possible that of his goodness God will sometimes grant a mystical experience:

> Then will he (God) sometimes peradventure send out a beam of ghostly light, piercing this *cloud of unknowing* that is betwixt thee and him, and show thee some of his secrets, the which man may not and cannot speak . . .

Much research and speculation has gone into the attempt to identify the author of the *Cloud*. At one time it was suggested that Walter Hilton (see HILTON) may have been responsible, but this theory has now been abandoned. It seems likely, however, that Walter Hilton knew the author, who was himself acquainted with the work of Richard Rolle. The language of the *Cloud* suggests that the author lived in the north-east Midlands. Some scholars have suggested that he was a Carthusian monk, others that he was a secular priest, but his identity remains an unsolved mystery.

Clover

A three-leafed clover is a symbol of the Trinity and a protection against evil and witchcraft; the four-leafed variety is also lucky, provided it is not given away, and is supposed to give its owner clairvoyant powers; five-leafed clovers are unlucky unless given away.

Coal

A rock which burns, a paradoxical quality which suggests that it contains powerful magic: it is lucky to find a piece in the street; coal brings good luck if carried in the pocket and there are cases of burglars using it in this way, of schoolchildren carrying it with them to examinations, and of prisoners taking it with them to their trials; in Scotland and the north of England coal should be the first thing to be brought into the house on New Year's Day.

Timekeeper, scarer of demons and giver of health, the cock is connected with dawn and the sun. Its pugnacious nature has caused it to be one of the oldest symbols of the fighting spirit

COCK

THE PROUD STRUTTING, aggressiveness and sexual ardour of the cock, together with its striking appearance and loud crowing, are the reasons for this bird's particularly widespread involvement in folk customs and traditions. It has retained its association with ancient lore, and has also tended to accumulate new beliefs and practices wherever it has been introduced.

The cock appeared in southern Europe in post-Homeric times, probably about the 5th or 6th century BC. Early in the 5th century a cock was depicted on a Sicilian coin. The Persian wars were fought during this period and there can be little doubt that the bird's introduction was due to this Asian incursion. The cock was sacred in Persia and to kill one of these birds was regarded as a serious sin. Its Persian name indicates that it was considered oracular. Aristophanes, in *The Birds*, called it 'the Persian bird' and compared its crest to the head-dress of the Persian king.

The Persians, in their turn, called the Carians, who came from a region in Asia Minor, 'cocks' because they wore crested helmets. A Greek writer compared the cock's adornments to the magnificent robes of Croesus, the proverbially wealthy king of Lydia. Pliny, too, commented on the remarkable comb. Because of the bird's pugnacity and courage, a cock was placed on the head of the statue of Athene on the Acropolis, as symbol of battle.

The crowing of the cock attracted special attention among the Greeks because it occurred about dawn, although the bird does, of course, crow at other times. There was a Greek story that when Mars chose to spend a night with Venus in the absence of her husband, Vulcan, he commissioned Alektraon (the Greek for 'cock') to watch at the door. He fell asleep and Mars, surprised by the returning husband, punished Alektraon by transforming him into a cock. He has been vigilant at dawn ever since.

The cock is part of folklore and tradition in many parts of the world; in both Asia and Europe the crowing of a cock was believed to drive away ghosts and demons: mosaic at Misis, Turkey

Sonia Halliday

Because evil spirits, 'the powers of darkness' have always been believed to be particularly active at night, the dawn crowing of the cock was usually a welcome sign, and the belief arose that the bird itself was effective in exorcizing evil. In the Persian sacred books it was stated that the cock's crow awakens the dawn, arouses mankind to praise the perfect Holiness and drives away spectres and demons. This tradition persisted in Europe.

The belief arose that a bird that could frighten devils must be able to scare wild animals, and travellers in Libya carried a cock with them to frighten lions and basilisks. The basilisk was a fabulous monster, hatched by a serpent from a cock's egg, and alleged to be able to kill with a glance. The Greek writer Aelian, who died in about 222AD, remarked that the basilisk dies in convulsions on hearing the crowing of a cock. It is widely believed that a crowing hen is a sinister omen.

The Healing Bird

Another Greek author, Heliodorus, writing in the 3rd to 4th centuries AD, stated that the cock crows because of its affinity with the sun. The bird's solar connection dates from ancient times in Europe as well as in

Asia, and we may assume that this association was introduced at the same time as the bird itself. The Greeks believed that the cock was sacred to Apollo, god of the sun, and it became associated with Asclepius, the god of healing, Apollo's son by the nymph Coronis. This association with Asclepius and healing is an outcome of the bird's connection with the sun and the life-giving powers, and its opposition to the powers of darkness. In the *Phaedo* Plato records Socrates's request before drinking the hemlock that a cock should be offered to Asclepius on his behalf, although this request was not connected with any desire to escape the effects of the poison.

The practice of sacrificing cocks has been widespread. Cocks were sacrificed to the sun in Mexico, and elsewhere served as ritual sacrifices after the erection of a building or bridge (probably instead of human victims). In the East a cock may be killed over an invalid's bed and the blood sprinkled on the sufferer. It is, or was, a custom in Ceylon for a red cock to be dedicated to a sick person and sacrificed if he recovered. In Scotland, the blood of a red cock was administered in a flour cake to the invalid. There were places in Germany where it was believed that illness and bad luck could be warded off by hiding the head, heart and right foot of a cock in the house. In both Germany and Ireland a cock was sacrificed on 11 November, St Martin's Day (or Eve, in Ireland). In Athlone in Ireland the blood was sprinkled on the threshold and the four corners of the house. D'Arcy Thompson in *A Glossary of Greek Birds* (1936) states that he himself remembers a cock being sacrificed to St Nicholas to cure a sick cow. Cocks are sacrificed among the Arabs and in North Africa, although in some African regions it is considered wrong to kill these birds.

Below left **The cock is renowned for its courage and pugnacity, and cock-fighting is an ancient entertainment that still survives in some parts of the world: cock-fight in Haiti** ***Below right*** **'Saviour of the World': the cock was a sacred bird in Persia and India, and this figure with a man's body and the head of the bird which daily saves the world from darkness, by crowing to bring the dawn, was often found on amulets used by members of the Gnostic sects which flourished in western Asia and the eastern Mediterranean area. Late 18th century gilt statuette, in the Gerald Yorke collection**

Denial before Cock-Crow

The cock's symbolism is important in Christian traditions. Its crowing gained additional significance because of its role in St Peter's repudiation of Christ (Matthew, chapter 26) and it naturally became symbolic of the Christian's duty to remain alert against temptation and 'the wiles of the devil'. As such it became customary to place a weathercock on church towers and steeples.

A tradition dating from the 4th century tells how the cock announced Christ's birth by calling out *Christus natus est*, 'Christ is born'. Shakespeare embroidered tradition when he made Marcellus comment on the disappearance of the ghost in *Hamlet:*

> It faded on the crowing of the cock.
> Some say, that ever 'gainst that season comes
> Wherein our Saviour's birth is celebrated,
> The bird of dawning singeth all night long;
> And then, they say, no spirit dare stir abroad;
> The nights are wholesome; then no planets strike,
> No fairy takes, nor witch hath power to charm;
> So hallowed and so gracious is the time.

Many ideas concerning good and bad luck involve the cock. American lore says if a cock crows on a porch, visitors will come; if in the rain, the rain will stop. A cock crowing facing a house, at the front door, on a banister, or inside the house, is an omen of death. In Germany it was an ill omen if a wedding procession met cocks fighting while on its way to church.

Cock-fighting is an ancient amusement, popular in some eastern countries and all over Central and South America, also still carried on illegally in certain regions of Europe and the United States. As early as the 3rd century AD the Christian writer Lactantius had declared cock-fighting an unsuitable spectacle for Christian people, but the compassion for animals shown by many saints had little effect in encouraging humane treatment.

Cockle-Shell

Or scallop-shell, the heart-shaped shell worn in the hats of pilgrims to the shrine of St James of Compostela in Spain; the polished side of the shell was engraved with a drawing of the Virgin Mary or the Crucifixion, and the shell was blessed by a priest to protect the pilgrim from spiritual harm; hence Sir Walter Raleigh's famous lines, 'Give me my scallop-shell of quiet, my staff of peace to walk upon. . .'

Kress Collection, Seattle Art Museum

Cockroach

Large beetle-like insect infesting many old houses, dark-coloured and nocturnal, so acquiring supernatural attributions: in the Old American South, it was believed that a witch could be caught by leaving a jar in the hearth ashes overnight; a cockroach found in the jar was the trapped witch: folk medicine used cockroaches to treat urinary ailments, epilepsy and worms in children: United States lore suggests ridding your house of roaches forever by sweeping them out on Good Friday.

Giving up all entertainment was demanded of anyone who joined the Cokelers, a small 19th century Nonconformist sect which survives today

COKELERS

THE STRICT PURITANICAL sect of the Society of Dependants, or Cokelers as they were known popularly, was founded in 1850 and still has a small following today. It is exclusive to the West Sussex area and parts of south-west Surrey. The origin of the strange name Cokelers is not certain, although it has been suggested that it refers to the members' custom of drinking cocoa at their meetings, as part of the simple refreshments which were provided on these occasions. Another possible explanation is that it derived from a place called Cokkeg, in the village of Loxwood in Sussex, where the sect was formed.

The Cokelers were founded by a London shoemaker named John Sirgood, who was born at Avening, Gloucestershire, in 1820. As a young man, living in the Clapham area of South London, Sirgood became a member of a small sect named the Plumstead Peculiars, which had been founded by the evangelist William Bridges in 1838 (see PECULIAR PEOPLE).

At first Sirgood preached in Clapham, but he soon discovered that the further he journeyed from London the more genuine the response became. Closing his shop, he and his wife set out, with their belongings packed into a hand-cart, and walked into Surrey and West Sussex. They decided to settle in Loxwood, a small village about eight miles from Horsham. Here John Sirgood started to preach in the fields and behind the cottages. Informal prayer-meetings were held, and his fame as a preacher soon spread around the countryside. He was reputed to possess remarkable powers as a faith healer and even to have raised someone from the dead.

Forbidden Flowers

In 1850 Sirgood decided that the time had come to form his own sect. The principles which he prescribed for his followers were that they should lead a life of simple Puritan austerity. 'We believe that man must have a second birth,' he preached, 'he must realise Christ in his own life.' Those who joined him were expected to renounce the world. They must accept that they had become possessed of part of the body of Christ and therefore free from sin; the sect was first known, in fact, as the 'Body'.

The demands which he made on his followers were rigid in the extreme. Villagers and labourers who had once enjoyed their ale in the local inn found that, once they had joined the Society of Dependants they were expected to scorn all intoxicants and other pleasures. The Bible was their only literature, and whole passages had to be learned by heart and quoted in conversation. No flowers were allowed in the cottages, which had to be austerely furnished, with the minimum of decoration. Entertainment and music were forbidden, and pictures and photographs were destroyed. Sport, literature, drama and most of the relaxations of the average man and woman were denied to the Dependants. Furthermore, the Society did not advocate marriage. Anyone wishing to marry was at liberty to do so, but no marriage service could be solemnized by the followers of John Sirgood. They believed that marriage interfered with one's relationship with God, and that it was impossible for God to permit a marriage service in one of their chapels. This severe mortification of the flesh attracted many sincere, but often simple, followers and half the farm labourers in the district were soon Dependants.

As Sirgood's doctrine spread further afield, many new Dependant communities sprang up in neighbouring towns and villages, and the Cokelers still use their chapels today. Large provision shops were opened by the Society wherever a colony was formed, and were owned by the members on co-operative lines. At Loxwood there still is a large store with a meeting-house, steam bakery and laundry, and with every kind of article for sale, from provisions to bicycles, haberdashery, kitchen utensils, gardening equipment and furniture. These shops have paid big dividends over the years, and only the ale houses have been the poorer for the coming of John Sirgood. For generations the Cokeler farmers have sold their produce to the Dependant dairies, and families in the various districts have invested their savings in the shops, with whom they have dealt exclusively. John Sirgood's system meant that labourers in this part of the country have always been comparatively well-off and better dressed than those in other parts of Surrey and Sussex.

Joyful Funerals

But although the Cokelers prospered, they have not multiplied. Their doctrines were sterile and their membership dwindled, out of touch with the world beyond their little kingdom. In 1885, the year of Sirgood's death, membership in the district totalled 1,500. At the beginning of this century the members formed almost a third of the population of Wisborough and Northchapel, and there were many other villages under their influence. By 1904 there were only about 900 members regularly attending their chapels, dressed in black. Today a few of the meeting-houses remain open, but only a few Cokelers attend the services. Many of the stores and communal farms have been sold. It is not a religion likely to attract young people, in a world where the internal combustion engine, television, pop music, the cinema and alcohol are worshipped.

Visitors nevertheless are welcomed tu the Loxwood meeting-house and are warmly received by this friendly sect. They will observe that members of the congregation spend the interval between the morning and afternoon services in a small back room where refreshments are served free of charge. At their gatherings, when prayers have been said and hymns sung without music, the meeting is thrown open. Any member can stand up and give testimony to God's goodness.

When John Sirgood was buried in the field behind the Loxwood chapel which he had built, the interment was attended by many hundreds of followers, farm hands and labourers. A Cokeler funeral is impressive and lasts for several hours. Death is not considered fearful, but is regarded as a happy release from a world where there is much sin and misery.

The whole of a Cokeler's life is devoted to attempting to reduce sin and unhappiness to a minimum. The funeral, with its feasting and singing, is therefore more a celebration than an occasion for mourning. Instead of the usual gravestone, the Cokeler's grave is marked simply with a number on a metal plate.

Radio Times Hulton Picture Library

COLERIDGE

THE MIND OF COLERIDGE (1772–1834) has been described as an ocean. This image is apt for many reasons – for its all-embracing scope, its profundity, unity, movement, and mystery. As the supreme literary critic not only of the Romantic movement and of his friend Wordsworth, but of English poetry in its entirety, Coleridge stands alone; his lectures on Shakespeare are unsurpassed in their kind. His *Aids to Reflection* remains a living contribution to Anglican and Protestant theology. Coleridge has been seen as an early Existentialist philosopher. He was a declared Platonist, and the names of two of his sons, Hartley and Berkeley, declare his affinities in English philosophic thought. 'Every man', he wrote, 'is born an Aristotelian or a Platonist. I do not think it possible that anyone born an Aristotelian can become a Platonist; and I am sure no born Platonist can ever change into an Aristotelian. They are the two classes of man, beside which it is next to impossible to conceive a third. The one considers reason a quality, or attribute; the other considers it a power. I believe that Aristotle could never get to understand what Plato meant by an idea.'

As a young man Coleridge visited Germany in order to study the language and philosophy of Kant and Schelling, with whom he has many affinities. He was among the last minds to attempt that universality of knowledge which characterizes Renaissance thinkers, but which has scarcely been possible since. 'I am, and ever have been, a great reader, and have read almost everything – a library cormorant. I am *deep* in all out-of-the-way books, whether of the monkish times, or of the puritanical era. I have read and digested most of the historical writers; but I do not *like* history. Metaphysics and poetry and "facts of mind", that is, accounts of all the strange phantoms that ever possessed "your

Illustration by J. Noel Paton to Coleridge's *Ancient Mariner*: the belief that it is unlucky to shoot an albatross was largely invented by Coleridge

philosophy"; dreamers, from Thoth the Egyptian to Taylor the English pagan, are my darling studies.' From childhood, when his father first showed him the starry sky, his mind had been 'habituated *to the vast*'. His favourite reading as a child was *The Arabian Nights*, for its marvels. A fine classical scholar, he read the Greek philosophers in the original.

In its immense scope, Coleridge's mind embraced all that European civilization had to offer. He corresponded with Humphry Davy on scientific subjects. At the same time he was one of the first to attempt that kind of introspective observation which has since laid the foundation of modern psychology. He held a very low opinion of Locke and the materialists; his own thought was given its unity and coherence by his unwavering view of man as a spiritual being. For Coleridge, both as Christian and Platonist and as transcendentalist, mind is primary. As against Locke's view that nothing is in the mind that was not first in the senses, he considered Imagination to be 'the living Power and prime Agent of all human Perception, and as a repetition in the finite mind of the eternal act of creation in the infinite I AM. The secondary Imagination I consider as an echo of the former, co-existing with the conscious will, yet still as identical with the primary in the *kind* of its agency, and differing only in *degree*, and in the *mode* of its operation. It dissolves, diffuses, dissipates, in order to re-create; or where this process is rendered impossible, yet still at all events it struggles to idealize and to unify. It is essentially *vital*, even as objects (*as* objects) are essentially fixed and dead.' This view of imagination differs in its dynamic character from Plato's more static presentation of the world of ideas.

Pleasure-Dome in Xanadu

It is well known that Coleridge wrote the poem *Kubla Khan* from the vivid recollection of an opium-dream. He was perhaps the first poet to draw upon the unconscious images of dream, uncensored by rational understanding and without reference to any theological or mythological system. 'Dreams with me are no Shadows, but the very Existences and foot-thick Calamities of my Life.' His immense learning, his knowledge of traditional mythology and its symbolism, is interwoven with archetypal dream-figures luminous with the aura of mystery which belongs to our dreams.

Coleridge insisted upon the distinction between Reason and Understanding; the former being an immediate perception, the latter the discursive faculty of the mind. 'Understanding is the Faculty of *Reflection*. Reason of Contemplation. Reason indeed is much nearer to SENSE than to Understanding; for Reason . . . is a direct aspect of Truth, an inward Beholding, having a similar relation to the Intelligible or Spiritual as SENSE has to the Material or Phenomenal.' He writes elsewhere, 'For to us, self-consciousness is not a kind of *being*, but a kind of *knowing*, and that too the highest that exists in us.' In the *sum*, or I AM, 'object and subject, being and knowing are identical, each involving and supposing the other.'

Coleridge never completed the great work for which he felt, to the end of his life, that all his writings and studies had been only a preparation. His thought is to be discovered throughout his letters, note-books, lecture-notes and table-talk recorded by his friends and the hearers of his inimitable extempore lectures on literature; and in the political and literary journalism to which he devoted so much time and energy; to the detriment, it may be, of his incomparable poetic genius. It is impossible to dip into Coleridge anywhere without discovering some rich treasure; and yet the whole is greater than the parts, for perhaps no other man has ever left such a record of all that passed through his mind and senses.

His profound intellect notwithstanding, Coleridge was a man of deep feeling, capable of great love and great suffering. If knowledge be a fourfold experience, as Jung has explained, embracing intellection, feeling, sensation and intuition, Coleridge was, in this respect also, a complete man to a degree seldom achieved. 'My opinion is this,' he wrote, 'that deep thinking is attainable only by a man of deep feeling, and that all truth is a species of revelation. The more I understand Sir Isaac Newton's works, the more boldly I dare utter to my own mind . . . that I believe the souls of five hundred Sir Isaac Newtons would go to the making up of a Shakespeare or a Milton.'

COLOURS

THE RUSSIAN PAINTER Vasily Kandinsky, one of the founders of the modern movement in art, believed that colours have 'a corresponding spiritual vibration' and that 'colour harmony must rest only on a corresponding vibration in the human soul'. The experiments conducted by B. J. Kouwer and reported in his book *Colours and Their Character* (1949) suggest that people react to colours in ways which match their traditional significance, whether because each colour has some innate quality of its own or because of the association of similar ideas with them for centuries.

The traditions are embedded deep in myth. The Aztecs spoke of four main colours – red, yellow, white and black – which were the four main types of corn, the four cardinal directions, and the gods associated with them. The Pueblo Indians, Cherokee and other American tribes also assign special colours and myth qualities to the four directions.

A colour's meaning may vary considerably in different parts of the world. Black is generally the colour of mourning in Europe but in China mourners wear white. Even in Europe, the ideas associated with

a colour vary. Black is the hue of death but the typical flower of death is the white lily, and white birds are usually considered ominous, because of their rarity. But broadly speaking, there is a rough general agreement in the European tradition on the significance of the principal colours.

Black is naturally linked with night and darkness, and by extension with death, the night that ends a man's days, with mourning and sorrow, and with evil, the Devil and the 'powers of darkness'. Black magic is evil magic, a black day is one of disaster, a black sheep is the one that goes astray, the black flag marks the pirate, the lawless rebel, and the arch-rebel himself, the Devil, frequently appeared to witches as a black animal, or as a 'black' (dark-complexioned) man, often in black clothes.

Black is also the colour of the earth, in which the dead lie buried. In Greece and Rome black animals were connected with the earth goddess, the powers below and the ghosts of the dead in the underworld.

Standing for both death and earth, in alchemy black means death and putrefaction but also germination, new life burgeoning in the depths. Renewed life comes to the surface in the 'white' stage of the alchemical work (see ALCHEMY).

The contrast of black and white is fundamental to European colour symbolism. In churches the black trappings of Good Friday are replaced on Easter Sunday by white for Christ's resurrection. Black and white knights do battle in legends and also on chessboards. Where the Devil and his legions are black, the angels and the righteous wear white in heaven.

White means cleanliness, and therefore purity and innocence. A bride wears white for purity. White magic is good magic. The sacred horses of the Greek, Roman, Celtic and Germanic peoples were white. White is the moonlight that shines in the blackness of night, and so it may stand for inspiration and insight, light in the darkness of the mind. Black is ruthless, as in the black shirts of Fascists, white is meek, or sometimes even cowardly, the white feather and the white flag.

Red For Danger

Red is pre-eminently the colour of blood, and the words for 'red' in English, French, German and Latin all stem from a root which probably meant 'blood'. As a result red means physical life and energy, and in prehistoric burials the body was often sprinkled with red ochre, apparently to give the corpse life in the underworld. In American superstition, red occurs in many folk cures: a red silk handkerchief for neuralgia, red yarn around the thumb to stop a nosebleed. But red also means bloodshed, and is the colour of the planet and war god Mars. When a victorious general rode in triumph through the streets of Rome, his

face was painted red. In Irish legend, the fiercest of all warriors were the Red Branch, the guards of Conchobar mac Nessa, King of Ulster in the 1st century AD. In a wider sense, red means violence in general, danger (as in traffic lights) and all fierce and passionate emotions, including revolutionary enthusiasm and lust, the red flag of Communism and the red light that marks the brothel. Kouwer found that the ideas people principally associate with red are passion, emotion, temperament, action, mutinousness, force, sexuality.

Green is the colour of vegetation, and our words 'green', 'grass' and 'grow' all come from the same root. Green is the peaceful bounty of Nature and most people find it a soothing and restful colour. Its connection with fertility appears in The Green George of Slav countries, a young man covered from head to foot in branches and flowers, the centre of a joyful procession in April, or the Jack o' the Green in England, wearing green boughs and ivy on May Day.

The symbolism of blue is less clear. It is the colour of the unclouded sky, and so the blue in the United States flag means vigilance (the white is for purity and the red for courage). It is linked with supreme gods, ruling from the sky, and perhaps as a result with aristocracy and conservatism, blue blood and true-blue: though in France and Russia white has been the symbol of the old order. The Virgin Mary's robe is usually blue, perhaps because of her role as the queen of heaven. On the other hand, blue is sometimes connected with the sea and water, with tears and sadness, 'the blues', and with the murky depths of pornography, as in blue films.

Yellow is also ambivalent. As the colour of the sun and gold, it means perfection, wealth, glory, power. But in early times saffron-yellow vestments were worn in churches on Good Friday, as a reminder of the Jews' vindictiveness in crucifying Christ, and Judas was given reddish-yellow hair in medieval paintings, because yellow meant jealousy and hate.

Comets

The appearance of a comet was long believed to mean that some cataclysmic disaster was likely to occur – war, famine, plague, the downfall of kings or even the end of the world: presumably because the comet's swift and unexpected passage through the sky was seen as a disruption of the orderly regularity of the heavens, heralding a parallel disruption on earth: a comet was seen before the Norman invasion of England in 1066, and comets accompanied both the birth and the death of Julius Caesar.

Common beliefs and interests have led members of the Amish sect, an offshoot of the Mennonites, to set up segregated communities in the United States, where they pool their resources for the welfare of the group

'They did not seek profits but they did what they had to do with pleasure and creativity.' Same religious Utopias in which all property is held in common have been extremely successful, not only finoncially but in giving their members a happy and constructive life: in some cases, even with what to most people would be an impossible ban on all sexual relations

COMMUNISTIC RELIGIOUS MOVEMENTS

HOLDING ALL PROPERTY IN COMMON has never been a widespread practice among religious movements. It is an interesting variant of the much more frequently found monastic arrangement, in which the monk abandons all his goods on entering the order. Orders of monks, nuns and friars, as they are found in Christianity and Buddhism, differ from communistic religious movements principally in being constituted of members of only one sex; in accepting a hierarchic system of authority; and in emphasizing personal poverty rather than communism of possessions. Most important of all, these orders are part of a wider religious organization and tradition. By contrast, communistic movements are total social systems, which usually do not admit those outside the commune to any place in their religious scheme of things.

Communistic movements are necessarily communitarian, that is, they establish communities, in which the principles of communism are applied. Without the total control of the activities of everyday life possible in a separate community, communistic principles would be difficult, if not impossible, to implement. The initial aim of many of these sects has been to create a community, rather than to establish communism, and the principle of common ownership has often been adopted only after the life of a separated community has been established.

Although many Christian communities have existed which have not been communistic, when sects set up separated communities, their basic principles of brotherhood, equality in the love of God, and the shared prospect of salvation, predispose them to communistic arrangements. When a group has drawn together as a fellowship, any disparities of wealth among them are irrelevant to their new hopes, a hindrance to their common purpose, and a symbol of the vain and corrupt values of the world.

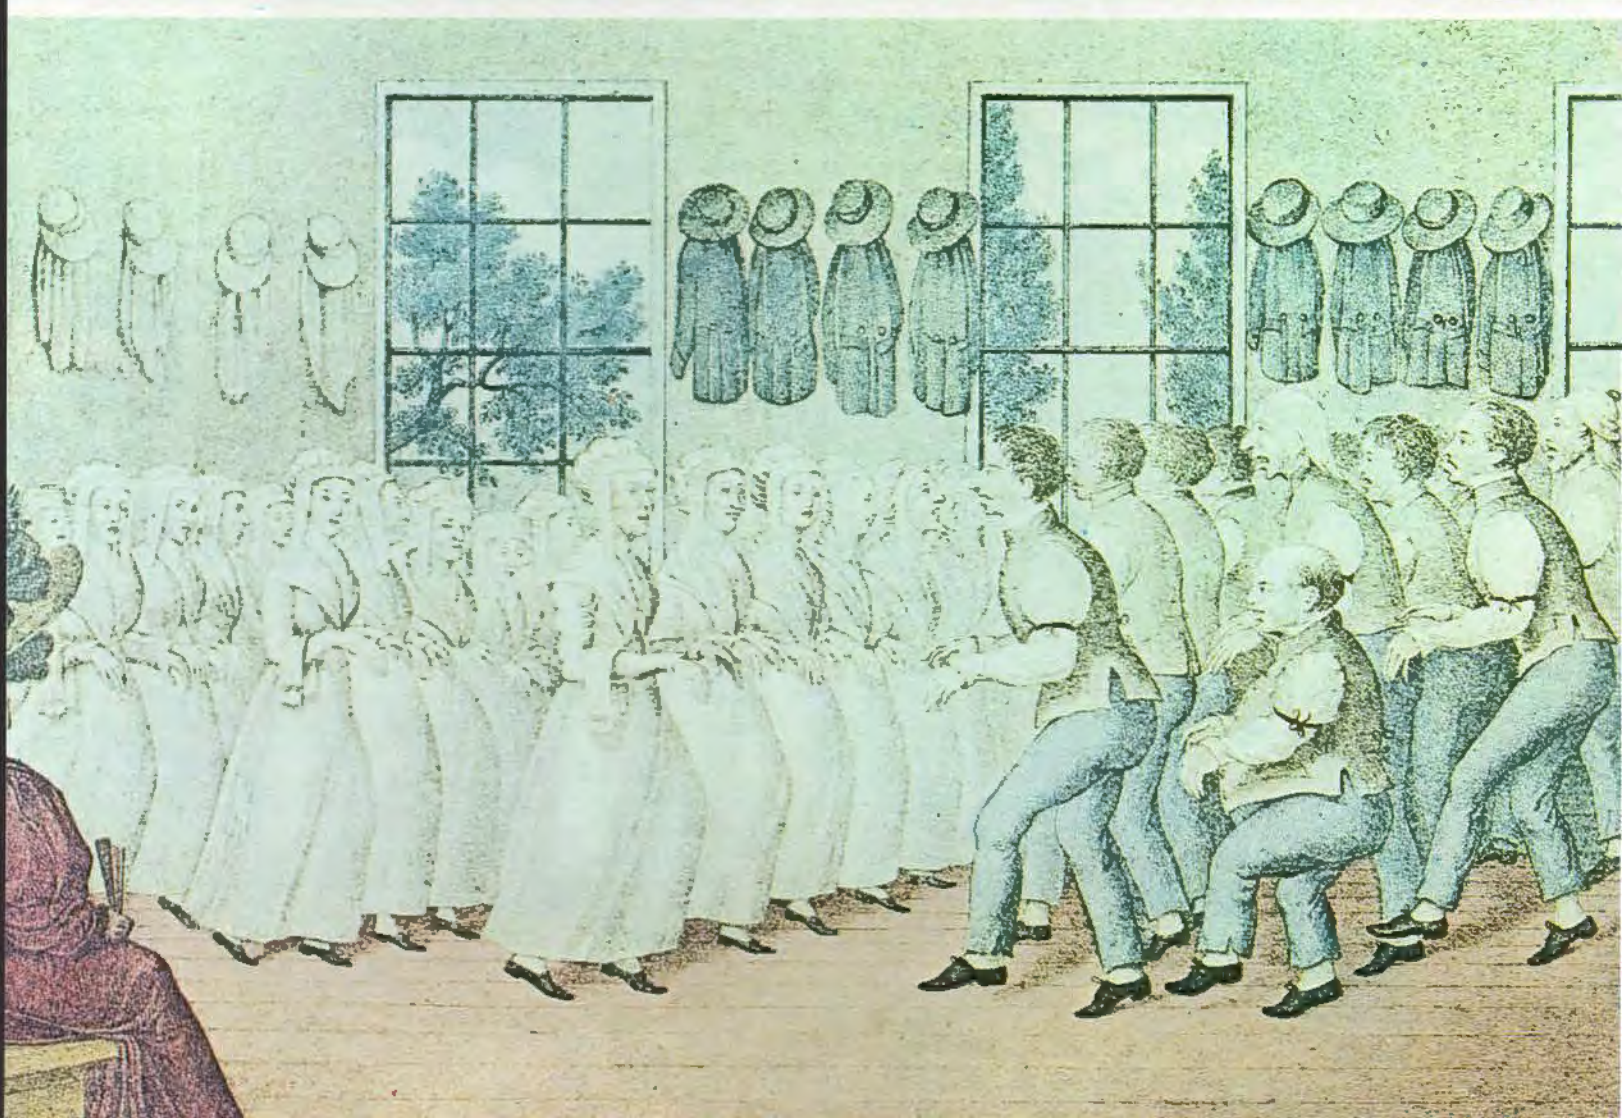
So communism may be adopted as a matter of expediency, as an outgrowth of the movement's new circumstances once it has established a separated colony. In this case, the new system may he justified by inspiration or revelation, as among the Community of the Truly Inspired (the Amana Society), who adopted communism of goods after they had emigrated to America and whose new practice was made legitimate, after some members had challenged it, by revelation of the Holy Spirit to their leader.

In other cases, as among the Oneida Community, or the Tolstoyans, communism is prescribed as part of the way of life of the saints and is a basic principle, to be realized by the establishment of a colony. Sometimes there is explicit reference to the early Church at Jerusalem, as described in the Acts of the Apostles, which provides scriptural justification for communism.

Politics and Persecution

Religious communism differs from the communism of political Utopians, such as the followers of Robert Owen at New Harmony or the disciples of Fourier, who set up many colonies in the United States during the 19th century. Religious groups are not necessarily, and not usually, attempting to provide a model of social organization for other men to imitate – at least not until other men learn the spiritual truths which they know. In the event, political communities have always failed, usually very soon after being founded. Religious communistic colonies have had more varied fortunes and some have flourished for decades.

One of the necessary conditions for the establishment of sectarian communism is the possibility of finding a place in which the sect can be sufficiently isolated from the



Mary Evans Picture Library

Communistic sects have sought isolation from the rest of society to enable them to safeguard their beliefs *Left* In Paraguay Mennonite communities often recruit new members from the local Indians; communal baptism of Lengua Indians *Below* The Shakers, who got their name from the ecstatic trembling which took place at their religious meetings, fled to America in the 18th century to escape persecution; there they organized themselves into strictly disciplined celibate communities *Right* In the 16th century, Protestant revolutionaries known as Anabaptists established a 'kingdom of the saints' at Münster in Germany; they were accused of all manner of atrocities

rest of the world. This is essential, to prevent the contamination of the group by outside influences and to provide a stable context in which children can be brought up in the values of the sect. Since such groups come out of the wider society, the colony is both a place of refuge and a heavenly community.

It is not every society that allows men to congregate in this way. The Levellers and Diggers of 17th century England were seen as a threat to the social order, and when this is the response of the political authorities such groups are not permitted to establish themselves. Only where royal or aristocratic patronage was gained, as the Hutterian Brethren gained it successfully in Moravia, Hungary and Russia (see HUTTERIAN BRETHREN), were European sects able to practise communism, at least until late in the 18th century. More often, the sects fled from persecution, usually to North America where land was abundant and diligent settlers were welcomed.

The principal religious communistic sects have come from central Europe and have usually been German-speaking. Some semi-communistic sects have arisen in England but the groups like the Girlingites in the New Forest met with opposition.

An important factor aiding the success of communistic sects has been their isolation from the wider society, and one of the most important insulating mechanisms has been the use of a language differing from that of the surrounding people. The Mennonites in Brazil, who were not always communists though they always lived in segregated communities, were well aware of the importance of retaining their native German as a defence against assimilation to the society outside. In those communistic groups which have permitted sexual relations and have raised children, difference of language has been of great importance in preventing young people from learning too quickly about the attractions of the world outside.

Shaking with Joy

The Shakers are perhaps the most celebrated of all the communistic sects. This sect owes its origin to the preaching of refugee French Camisards (see CAMISARDS) in 18th century England. They converted some Quakers in Lancashire to belief in the imminent return of Christ, with the unusual feature that the returning Christ was expected to appear as a woman. The Shakers got their name from the ecstatic shaking that occurred in their noisy religious meetings.

In 1770 a woman named Ann Lee became their leader, after she had experienced a vision in which she clearly saw that sexual intercourse was the source of all the evil in the world. Her preoccupation with this subject may no doubt be explained by the fact that she had had several stillborn children. She now saw that redemption was to be gained by renouncing sex and reproduction. Although scarcely literate and given to shaking and speaking in tongues, Ann Lee was undoubtedly an impressive leader of considerable intelligence. She declared that to escape persecution the sect should go to the New World, where they expected to make converts in what they thought of as the last days of the existing order of things. Eight Shakers made the journey to America in 1774.

In the following years Shakers came into being in various places, scattered over several states. Perhaps as a defensive measure, and as a way of establishing the appropriate control of the godly life, the leading Shakers, after Ann Lee's death in 1782, decided to organize themselves in segregated communities. From 1787 Shaker communities were set up. Within them were organized large groups known as 'families', each with its male and female head. Celibacy was the absolute rule and each man was provided with a 'sister' who undertook a variety of household tasks for him. Care was taken never to leave individuals of opposite sex alone with each other, and there is no record of scandal in any of the 18 Shaker communities that were eventually established.

To become a Shaker was no light undertaking. New members, on entering a community, gave up all their possessions for the good of the fellowship. Thereafter they received a share of what was termed 'just and equal rights and privileges, according to their needs.' Should anyone leave the community – and inevitably some did – he received an agreed sum on discharge.

Practicality was a much prized Shaker virtue, their organization was a model of efficiency, and although agricultural work was the basis of their economy they were from the outset interested in a wide range of craft and industrial activities. Since no wages were paid, and each received simply what he needed according to the modest assessments that their religious dispositions dictated, the Shakers could devote all their energy and ingenuity to the work that they saw as the testimony to their faith. Among the many useful devices that they produced were a new type of circular saw, a much improved washing machine (this in the early 19th century), a tilting chair, and new designs in sewing machines and brooms.

Industry and inventiveness were principal outlets for Shaker enterprise, facilitated by the fact that they were a celibate community, in which no one had family problems or sexual distractions. Visitors were generally impressed by the spirit of harmony that prevailed among the Shakers. This harmony, and their successful economy, have been attributed to the simple principles of faith on which they based their way of life, and the intensity with which these were inculcated. Order, neatness, cleanliness, frugality and sobriety were the pervasive demands.

The discipline of the daily lives of the Shakers was informed by the joy that they expressed most fully in their worship, particularly in their ecstatic dancing, which in time was organized along a wide variety of set patterns. They believed in communications from spirits (though they found nothing in common with Spiritualism when that movement arose), in direct revelation from God, in faith healing and in speaking in tongues. They gave a good deal of time to religious exercises and, like other communistic sects, they did not have to give too much time to labour, because their needs were very limited.

Despite celibacy, the Shakers recruited sufficiently from the outside world to continue through the 19th century and into the 20th. They can rarely have numbered more than 3000 at any one time and there probably cannot have been more than about 16,500 of them altogether during the movement's entire life. By the mid-1960s only a few old ladies remained, still living together in the last surviving Shaker community. Shaking as such had ceased to be practised and so had the dancing, which had been so fully developed in the 19th century. (See also SHAKERS.)

Living in Harmony

A strong injunction to celibacy and community of goods were the distinguishing features of another sect that flourished in 19th century America, the Harmonists, or Rappites. This sect built successively, at ten-year intervals, three substantial villages in the states of Pennsylvania and Indiana. Initially the sect was composed of the personal following of its remarkable, autocratic and impressive leader George Rapp, a weaver, who in the 1780s began to conduct his own religious meetings in his native village in Württemberg, Germany, expressing severe disapproval of the outward show and ritual of the Lutheran Church. Württemberg was a strong centre of sectarianism at this time, and Rapp soon acquired a significant following from his own and neighbouring villages. His separatism and the emptying of the Lutheran churches caused the Lutheran authorities to seek the intervention of the state to discourage Rapp, and periodically he was called to account for his teachings and activities.

Of One Heart and Soul

Many religious communists have cited the book of Acts in the New Testament as their scriptural justification:

Now the company of those who believed were of one heart and soul, and no one said that any of the things which he possessed was his own, but they had everything in common. And with great power the apostles gave their testimony to the resurrection of the Lord Jesus, and great grace was upon them all. There was not a needy person among them, for as many as were possessors of lands or houses sold them, and brought the proceeds of what was sold and laid it at the apostles' feet; and distribution was made to each as any had need . . .

But a man named Ananias with his wife Sapphira sold a piece of property, and with his wife's knowledge he kept back some of the proceeds, and brought only a part and laid it at the apostles' feet. But Peter said, 'Ananias, why has Satan filled your heart to lie to the Holy Spirit and to keep back part of the proceeds of the land? While it remained unsold, did it not remain your own? And after it was sold, was it not at your disposal? How is it that you have contrived this deed in your heart? You have not lied to men but to God.' When Ananias heard these words, he fell down and died. And great fear came upon all who heard of it. The young men rose and wrapped him up and carried him out and buried him.

After an interval of about three hours his wife came in, not knowing what had happened. And Peter said to her, 'Tell me whether you sold the land for so much.' And she said, 'Yes, for so much.' But Peter said to her, 'How is it that you have agreed together to tempt the Spirit of the Lord? Hark, the feet of those that have buried your husband are at the door, and they will carry you out.' Immediately she fell down at his feet and died. When the young men came in they found her dead, and they carried her out and buried her beside her husband. And great fear came upon the whole church, and upon all who heard of these things.

Acts, chapters 4 and 5

In the earliest known formulations of Rapp's beliefs there was no explicit demand for celibacy among his followers, although he himself – in spite of being married – was known to be leading a celibate life. Nor, in the first two decades of his movement, was there any direct assertion that there should be community of goods among the faithful. Perhaps, however, in those circumstances, such a demand would have been scarcely practicable for the farmers and artisans who were among his following. They believed that withdrawal from the world was necessary, in preparation for Christ's reappearance, which they believed to be imminent – as indeed did many quite orthodox Protestants in Europe and America at the time of the Napoleonic wars.

It was after the keenest members of the sect had emigrated to America, in 1804, that communism proper was adopted by them. Migration itself tested the faith of the Rappites, since they all gave what they had to support the costs of the journey for themselves and others, and for their initial expenses in America. The Harmony Society, as the sect called itself, bought land and, after considerable hardship in the early days built a model village on the Connoquenessing Creek, near Pittsburg in Pennsylvania. The community regarded itself as a Church, in which all members surrendered their property to the society and pledged themselves to its laws. In return, they were ensured all the necessities of life, education and religious instruction, and insurance for their dependants.

The Harmonists soon achieved a reputation for industry and good husbandry, despite financial difficulties, dissensions, disappointments about the land they had purchased, and, above all, despite their intense expectation of the early second coming of Christ. Celibacy was instituted in the very early days, but some marriages took place. Rapp held that the imitation of Christ, which was the aim of the community, was incomplete without celibacy. He permitted marriages only for those who were insufficiently spiritually advanced to accept the full rigours of the wholly dedicated life, although he did so less readily and with more impatience over the years. Since the Harmonists, like the Shakers, were sure that they lived in the last days their failure to reproduce did not trouble them.

Visitors from outside were eager to see the way of life of the Harmonists and were impressed by their simple dedication, their complete security, their indifference to profits and to entertainments, and their certainty about their heavenly reward. Yet within ten years of first settling in Pennsylvania, the Harmonists, disturbed by the close encroachments of the world around their land, seeking water power and a milder climate better suited to the vine, and despite all the labour involved in beginning again the work of creating a settlement, put up the town of Harmony for sale, and moved to the banks of the River Wabash in Indiana Territory.

Wonder of the West

In the new location, the Harmonists were less surrounded by German-speaking immigrants, but they were more immediately involved in political affairs, being a sizeable community with opportunity to influence political decisions in their county. As a frontier society, their achievement in Indiana was all the more remarkable, and New Harmony was regarded as 'a wonder of the West'. Robert Owen, the English socialist manufacturer heard of it: he visited the community, and eventually bought the settlement, when the Harmonists again moved on. But Robert Owen's secular communists, who permitted freedom of religious belief, preached emancipation of women, and who lacked the community discipline that characterized the religious society of George Rapp, failed within a year or two to make the ready-made colony function. The Harmonists, meanwhile, set up a third prosperous colony, named Economy, on the Ohio River in Pennsylvania. Again, they established a town that was a model of neatness and order.

Celibacy was, however, a severe test. The community ceased to recruit by new immigration from Württemberg, and indeed came increasingly to regard itself as the completely gathered remnant of the faithful, enjoying wisdom quite different from that available to men in the world whom it now had no interest in recruiting. As a result the average age of its members rose and its numbers began to decline. A schism occurred in 1831, when an impressive imposter arrived at Economy, presenting himself as His Royal Highness Maximilian of Este, Ambassador of Christ. The Harmonists were undergoing an internal crisis at the time and were anxious for the coming of Christ. Expectant and gullible as they were, a number seceded with Count Leon, as he was also known, and continued to practise communism in other parts of America; this reduced the community even further.

Throughout the 1830s and 40s the Society continued to prosper but, having completely closed its ranks, ensured its own decline. Its reserves of wealth were considerable, and became the subject of prolonged litigation in the 20th century. That they had accumulated so impressively, was largely due to the competence of Frederick Rapp, adopted son of George, who died in 1834, and to the spiritual control of George Rapp himself, who died at the age of 90 in 1847. In its day, the Harmony Society had been a pioneer of the oil industry and had built the first oil pipelines.

The Truly Inspired Ones

The productivity, inventiveness and social usefulness of the communistic religious societies is again illustrated in the history of the Amana Society, the Society of the Truly Inspired, which eventually settled in Iowa. The Amana Society which numbered some 1500 people at the height of its success also came from south Germany. It had originally arisen early in the 18th century, at the instigation of two inspired preachers, Rock and Gruber, who had travelled to various places at the bidding of the Spirit, preaching the word. The sect which they founded was pacifist and committed to the view that God still inspired men through the Holy Spirit, whose instruments some men were called to be.

After Rock's death, no new 'instrument' appeared for some time, but a number of prophets arose in the sect at the beginning of the 19th century in various parts of Germany. In 1842, under the leadership of Christian Metz, it was revealed that they should emigrate to America. Initially, the sect settled near the city of Buffalo and called their community Ebenezer. They were not, at this stage, communists: their intention had been to find a place where they could live the life of faith in peace.

Trouble with the Seneca Indians and fear of encroachments on their withdrawn way of life from the growing city of Buffalo.

induced them in the late 1850s to sell their land and move to Iowa, where they settled in seven villages. They took the name Amana from the Song of Solomon (chapter 4, verse 8). Force of circumstances caused them to become communists, and this was an understandable development for a group that had already committed itself to a common destiny in this world and the next. Their adoption of the communistic principle was conveniently reinforced and made legitimate by the inspiration of the Holy Spirit, speaking through Metz, the leader of the community. The regulations concerning the entitlements of individuals and the responsibility of the community were similar to those of the Harmonists. They ate as a community, in common dining halls, the two sexes being separated.

Low Status of Marriage

The Amana Society did not impose celibacy. It was approved, but was not so strongly enjoined as among the Harmonists and the Shakers. Even as children, the sexes were kept apart, and marriage was permitted only when a man reached the age of 24: ideally, however, the faithful should not marry. This had been an early injunction, long before the sect became communistic but, of course, the virtual elimination of the family unit predisposes a sect to communism of goods and mutual help.

The sect had three orders of piety, and those who married revealed by so doing that they were of the lowest order. Only by leading a conscientious life could a couple who married rise again in spiritual status. Families did, however, dwell in individual homes in Amana, which suggests that marriage continued to be a common, if disapproved arrangement. In contrast with the Shakers, whose way of life allowed for considerable elements of recreation, the Amana Society frowned on entertainments and all levity.

The Amana Society was governed by trustees under the inspired instruments of the Holy Spirit. After Metz died, Barbara Landmann was the leader of the community, but she was the last of the 'instruments' and long before the end of the 19th century the Society ceased to have a spiritual head with inspired power. The villages were organized by elders, who were not necessarily old, but who were recognized as spiritually advanced. They were in charge of industrial and agricultural activities. In their dealings with the outside world, the Amana Society gained a reputation for honesty and shrewdness, neither cheating others nor letting themselves be cheated.

The religious beliefs of the sect were simple. They accepted the Bible in a literal

Above **The pacifist Russian Doukhobors, who emigrated to Canada at the beginning of the century, practised communism for a time; they caused embarrassment by parading in the nude as a protest against government interference** ***Below*** **Drop-Out City in America is a haven of refuge for hippies, and others who feel themselves at odds with the highly organized world around them; they share their goods in common and practise free love**

way, believed in the Trinity and in the resurrection of the dead, but not in eternal punishment, since hell would purify even the most wicked in time. They sought to avoid the world in every way, and to lead retired, withdrawn lives in humility and simplicity, eschewing anger, impatience, criticism, levity and idleness. They were exhorted neither to desire nor to grieve. The men were to 'fly from the society of womenkind'.

Without an inspired leader, the Amana Society continued, although in decline, until in 1932 they decided to abandon their communistic organization. They reconstituted themselves, abandoning the old restrictions on dress and in other matters. In time their settlements became tourist attractions.

Promiscuous but Perfect

Perhaps the most thorough-going of all communistic religious societies was that founded by John Humphrey Noyes, which was eventually established at Oneida, in the state of New York. Its thoroughness consisted in its adoption not of celibacy, or preferred celibacy, but of communism of sexual relations.

The Oneida Community were known as Perfectionists, because they taught the possibility of perfection in this world. This was an extreme version of the Holiness teachings that had developed among some Methodists, Presbyterians and Congregationalists in the eastern United States in the second quarter of the 19th century. The principal idea of Holiness teachings was that men might, after their conversion, experience a second blessing of sanctification; the more extreme advocates held that sanctification might be instantaneous. Although the majority of Holiness believers took the doctrine to mean that the converted person who was 'born again' should lead an exemplary life, others believed that, being sanctified, they could no longer sin, no matter what they did. In consequence, promiscuity occurred among some as a 'proof' of perfection, and theories of 'spiritual wivery' opened the way to considerable sexual licence (see SPIRITUAL WIVES). The Oneida Community were frequently condemned on this score and their intentions misunderstood.

After a false start in 1846 at Putney, Vermont, where local hostility drove them out, the Perfectionists who had gathered around Noyes set up a community at Oneida. The farmers who joined Noyes sold their property and settled for life in common. They engaged in agriculture, trapping, silk-manufacture, satchel-making and the production of a variety of other consumer-goods. They justified their experiment by a distinctive theology. Noyes believed that the second coming of Christ, which so many Americans were then awaiting, had in fact occurred in 70 AD. Catholics had perverted the consequence of the advent, but now his own community were to restore the perfection of the 1st century Christians.

The early Church at Jerusalem, with its communistic organization, was the obvious model. To avoid the sexual excesses current among Holiness extremists, many of whom he knew, Noyes taught that it was evident that when God's will was done on earth there would be no more marriage, just as there was none in heaven. But abolition was possible only when men were perfected. Thereafter, two individuals would not be bound, either in marriage or outside it. Possessiveness and its accompanying selfishness would be put aside. At Oneida, a man was not permitted to claim a woman as his wife, and neither could a woman claim a child as 'hers'. Sexual relations were a matter for the community, not just for the individuals involved. Cohabitation had to be planned. Noyes enjoined a high degree of continence, in favour of intelligent, well-ordered procreation. Children were detached from their mothers as soon as possible, and put under the care of others.

Defeat by Public Opinion

Noyes was both the theological architect and the administrator of Oneida. In some ways he was undoubtedly a genius, as the remarkable success of his experiment in religious communism indicates. The community was seen as the social state of heaven governed by God – a community in which personal sanctification preceded social reconstruction. While the Bible was the foundation of their faith, they were, as a sanctified community, people who had passed beyond the literal interpretation of the scriptures. What they sought was absolute love among men: they were still growing in spiritual grace, even though they regarded themselves as already sinless. One of the ways in which this grace was developed was through the practice of mutual criticism within the community. The community assembled to hear the self-criticism of one of its members, and then to engage in comments on his shortcomings; finally Noyes himself would offer an exhortation to the member concerned, usually with some words of commendation included. Such a process may have done much to sustain allegiance to the community. Members, as William James put it, 'externalized their rotteuness', and publicly re-dedicated themselves to the life of the community.

Oneida flourished, and was still flourishing, when in the 1870s the propagation of its views led to considerable misrepresentation and brought public pressure to bear against it. Eventually, in 1879, the community was constrained to abandon its way of life in deference to public opinion, and its substantial property was converted into a joint stock company for the 280 members. The industrial activities were continued.

A number of other communistic religious sects have flourished, some of them, such as the Russian Doukhobors, who settled in Canada at the turn of this century, espoused communism in part and for a period, but without particular success. An outstanding case from Africa is the Aiyetoro Community in Nigeria. This sect was constituted by seceders from the revivalist movement known as Cherubim and Seraphim. They established themselves on the coast, and organized a communist system of production. Within a few years, their fishing enterprise had produced considerable profit, and the plain uniforms of the early days were abandoned for dress of individual choice. The community is essentially religious, and although it has a living standard far higher than the Nigerian average, it has maintained its collective services and its community structure.

CONGO

Macabre stories of idol-worship, witchcraft, human sacrifice and ritual cannibalism which have at one time or another been told about the tribes of the Congo, reflect their deep abiding fear of the supernatural

ITS RELIGION, MYTH AND MAGIC make the Congo the most striking region of Africa, for here black men lived for thousands of years completely out of touch with outside civilizations. The Congo has always been the heart of Africa both geographically and, to some extent, culturally. Most of the aboriginal population of 15 million people are pure Negroes, racially different from the Semites of North Africa and the Bushmen and Hottentots of South Africa.

It was not until the 15th century that Portuguese explorers, looking for a new route to India, landed on the west coast and penetrated into the interior of Equatorial Africa. They found a country of immense rivers and impenetrable forests, peopled by black men who lived in a state of semi-barbarism. Portuguese missionaries made strenuous efforts to Christianize these pagans, and we read of 1500 of them being baptized with a hose by a Jesuit priest on his rounds of the villages. The conversion of the Congolese, however, was short-lived; it is estimated that there was not a single Christian in Central Africa by the end of the 18th century.

When the European merchants and missionaries returned to the Congo a century later, they found the natives living very much as they had done when the Portuguese first saw them 400 years before. They lived by hunting and primitive agriculture and, as far as their religious life was concerned, were accounted 'heathen who bowed down to wood and stone'.

In fact, some observers maintained that these Negroes had no concept of God whatsoever and only worshipped idols called ju-jus and fetishes. They were said to be under the domination of witch-doctors, depicted as masked wizards who performed unmentionable rites, including the sacrifice

God is depicted as something of a tyrant who drove both men and animals from a pleasant land to a harsh life here below

of living infants. In addition, the Congolese were described as having such a low view of the value of human life that they strangled several of a dead chief's wives and buried them with their feet pointing towards their deceased husband. Cannibalism, too, was rife among certain tribes. Idols, witchcraft, human sacrifice and ritual cannibalism – these were thought to be the sum of Congolese religious beliefs and practices.

It is now known that this picture is only half-true, and is partly due to the difficulties encountered by white men in trying to discover the truth about African myths and magic. It is inevitable that a subject people should be wary of revealing their secrets to their alien masters. This is especially the case where ritual murder,

With so many ghosts and spirits to contend with it is natural that the pagan Negro should turn for help to experts in the supernatural. Two witch-doctors from Stanleyville: Congolese witch-doctors, called *Mganga* or *Mfumu* are a combination of soothsayer, herbalist philosopher and psychiatrist

trial by ordeal and similar savage practices are involved, since the European authorities immediately made such customs illegal. Whether the colonial governments were ever able to eradicate such ancient tribal rites in remote areas of the Congo is doubtful.

It is, however, generally agreed that the Congolese have some idea of what civilized people call God, though the principal difference is that whereas Christians, Jews and Moslems believe in a *personal* deity, the African regards God as a vague figure with no particular interest in him as an individual. Yet most natives would readily admit that there must have been a Creator, or Lord of the Universe, a sort of super-king who rules the whole world. They have various proper names for this mysterious and remote deity – Maweja, Mulopo, Nzambi, Kalunga, Akongo and so forth; and various honorific titles such as 'Elephant in Strength', 'Tortoise in Patience' and even 'Tomato in Sweetness'.

More specific is a god-chief called Lyangombe, a combination of a folk-hero and a supernatural being of great power. In general, Lyangombe is a beneficent god who is prepared to help his devotees,

Federico and Aldo Patellani

Armed with weapons and dressed to kill, the Watusi of the former Ruanda province dance themselves to a frenzied pitch of excitement before going to war

provided he is well treated. As he can protect his worshippers against sickness and calamities, he has a special cult and priests. Lyangombe enters into his chosen people and controls their actions, even deigning to allow his women followers to bear his children. In consequence, missionaries have found him an obstacle to Christian teaching, for his cult is said to lead to considerable licence and promiscuity.

But whatever the Congolese call God, their attitude towards him is inclined to be unceremonious for they neither love nor fear him as Christians are supposed to love and fear their God. This indifference is reflected in the lack of any kind of temple or even of a representation of the Almighty. Congolese folktales which embody a great deal of their religious and social history emphasize the distant, almost hostile attitude towards the Supreme Creator.

At the same time, there is a close, almost personal relationship between men and animals. The legend of why the dog has no hands, for instance, is typical of the animal myths. God denied the dog hands, but told him he could always live close to man, who would be his hands. Thus the dog is the servant of man, and vice-versa. God, however, is depicted as something of a tyrant who drove both men and animals from a pleasant land to a harsh life here below. No particular reason is given for man's expulsion from paradise, except that God was angry over some small misdemeanour. Alternatively, woman is blamed as the prime cause of men's troubles, as in Hebrew and Greek myths (see WOMAN).

The Drumming of the Dead

Despite the impersonal attitude towards the deity, the Congolese are conscious of the supernatural at every turn: 'every breath that the native draws is tempered and controlled by his awareness of the supernatural.' This means that the black man in the forests of Central Africa believes the world around him to be peopled with a multitude of spirits and ghosts, some

Federico and Aldo Patellani

The Burning of Shakespeare

The famous explorer H. M. Stanley set out to cross the largely unknown territory of Central Africa in 1874. During this expedition, while encamped on the banks of the River Congo, his party was surrounded by hostile native warriors

'What is the matter, my friends?' I asked. 'Why do you come with guns in your hands in such numbers, as though you were coming to fight? Fight! Fight us, your friends! Tut! this is some great mistake, surely.'

'Mundele,' replied one of them . . . 'our people saw you yesterday make marks on some tara-tara' (paper). 'This is very bad. Our country will waste, our goats will die, our bananas will rot, and our women will dry up. What have we done to you that you should wish to kill us? We have sold you food, and we have brought you wine, each day. Your people are allowed to wander where they please, without trouble. Why is the Mundele so wicked? We have gathered together to fight you if you do not burn that tara-tara now before our eyes. If you burn it we go away, and shall be friends as heretofore . . .'

My note-book contained a vast number of valuable notes, plans of falls, creeks, villages, sketches of localities, ethnological and philological details, sufficient to fill two octavo volumes – everything was of general interest to the public. I could not sacrifice it to the childish caprice of savages. As I was rummaging my book box, I came across a volume of Shakespeare (Chandos edition), much worn and well thumbed, and which was of the same size as my field-book; its cover was similar also, and it might be passed for the note-book provided that no one remembered its appearance too well. I took it to them.

'Is this the tara-tara, friends, that you wish burnt?'

'Yes, yes, that is it!' . . .

We walked to the nearest fire. I breathed a regretful farewell to my genial companion, which during many weary hours of night had assisted to relieve my mind when oppressed by almost intolerable woes, and then gravely assigned the innocent Shakespeare to the flames, heaping the brush-fuel over it with ceremonious care.

H. M. Stanley *Through the Dark Continent*

benevolent, but many more malevolent. Further, he is concerned more with the spirits than he is with gods, because the former affect his life more obviously and are much closer to his own material world. Thus, even the members of his family, once they are dead, are still not far away; they retain the power to harm as well as to help him.

The African spends a great deal of time and energy in placating these *mizumu*, or spirits of the departed. In a sense, he believes in an afterlife much more fervently than many Christians, since no one 'dies' in the course of Nature. He is spirited away. And when the departed leaves his village, he continues to exist very much as he did on earth, needing to be fed, talked to, and even housed. Of course, life is more pleasant in this afterworld, because there is more time to drink beer and to dance.

Proof of the existence of the mizumu is easy enough to obtain, say the Congolese. Put your ear to the ground and you will hear their drums. And since they obviously exist, they must be treated with respect. It may even be necessary to offer them a human sacrifice in order to placate them; otherwise they will harm the living. One can see their handiwork all around – in the suicide of this person, or the death in childbirth of another.

This obsession with the ghosts of the dead should not be compared with ancestor worship. The Congolese do not properly worship anybody or anything. Their religion is based on a fear of the unknown. Their chants, dances, drum-beating, sacrifices, food offerings, and the wearing of all manner of ju-jus are nearly always intended to ward off evil. When the Congolese address their ancestors, they assume a tone half-wheedling, half-hectoring. A typical 'prayer' would go, 'O Father! O Mother! Can you hear me, old ones? Why don't you come and drink this good beer? And isn't it time you brought us good hunting?'

Casting the Bones

With so many ghosts and spirits to contend with it is natural that the pagan Negro should turn for help to experts in the supernatural. For the black man believes just as firmly in magic as we believe in science, his whole attitude to life is based on the mystery of Nature, as ours is based on a rational explanation. Two men are swimming a river. One man is devoured by a crocodile, another escapes. Why, the Congolese ask, is one spared, the other taken? The answer is that malevolent spirits are responsible, where we attribute it to chance.

The experts in magic and the supernatural are the witch-doctors whose religious and social functions have been greatly misunderstood by Western observers. The genuine witch-doctor called *Mganga* or *Mufumu* in the Congo – is a combination of soothsayer, herbalist, philosopher, and psychologist. He undertakes to predict the future, cure the sick, administer the tribal laws, and cast out evil spirits. He must not be confused with the sorcerers, or *Mlozi*, who work in the dark against their fellowmen and are hated by all.

One of his primary functions, as tribal medicine-man, is to treat the sick. Like all African pagans, he starts with the premise that sickness is caused by magic – in some cases by a sorcerer who has to be rooted out; in others by a malign spirit in the form of some animal hostile to man, such as a snake or a lion. The witch-doctor's job is to compound an even stronger 'medicine' than the magic spell under which his patient is suffering. Perhaps he will try to transfer the disease to the sick man's enemy. Or he will impregnate his potions and salves with secret incantations. To this extent, the witch-doctor relies more on psychology than physiology, and most of his cures would fall in the category of faith healing.

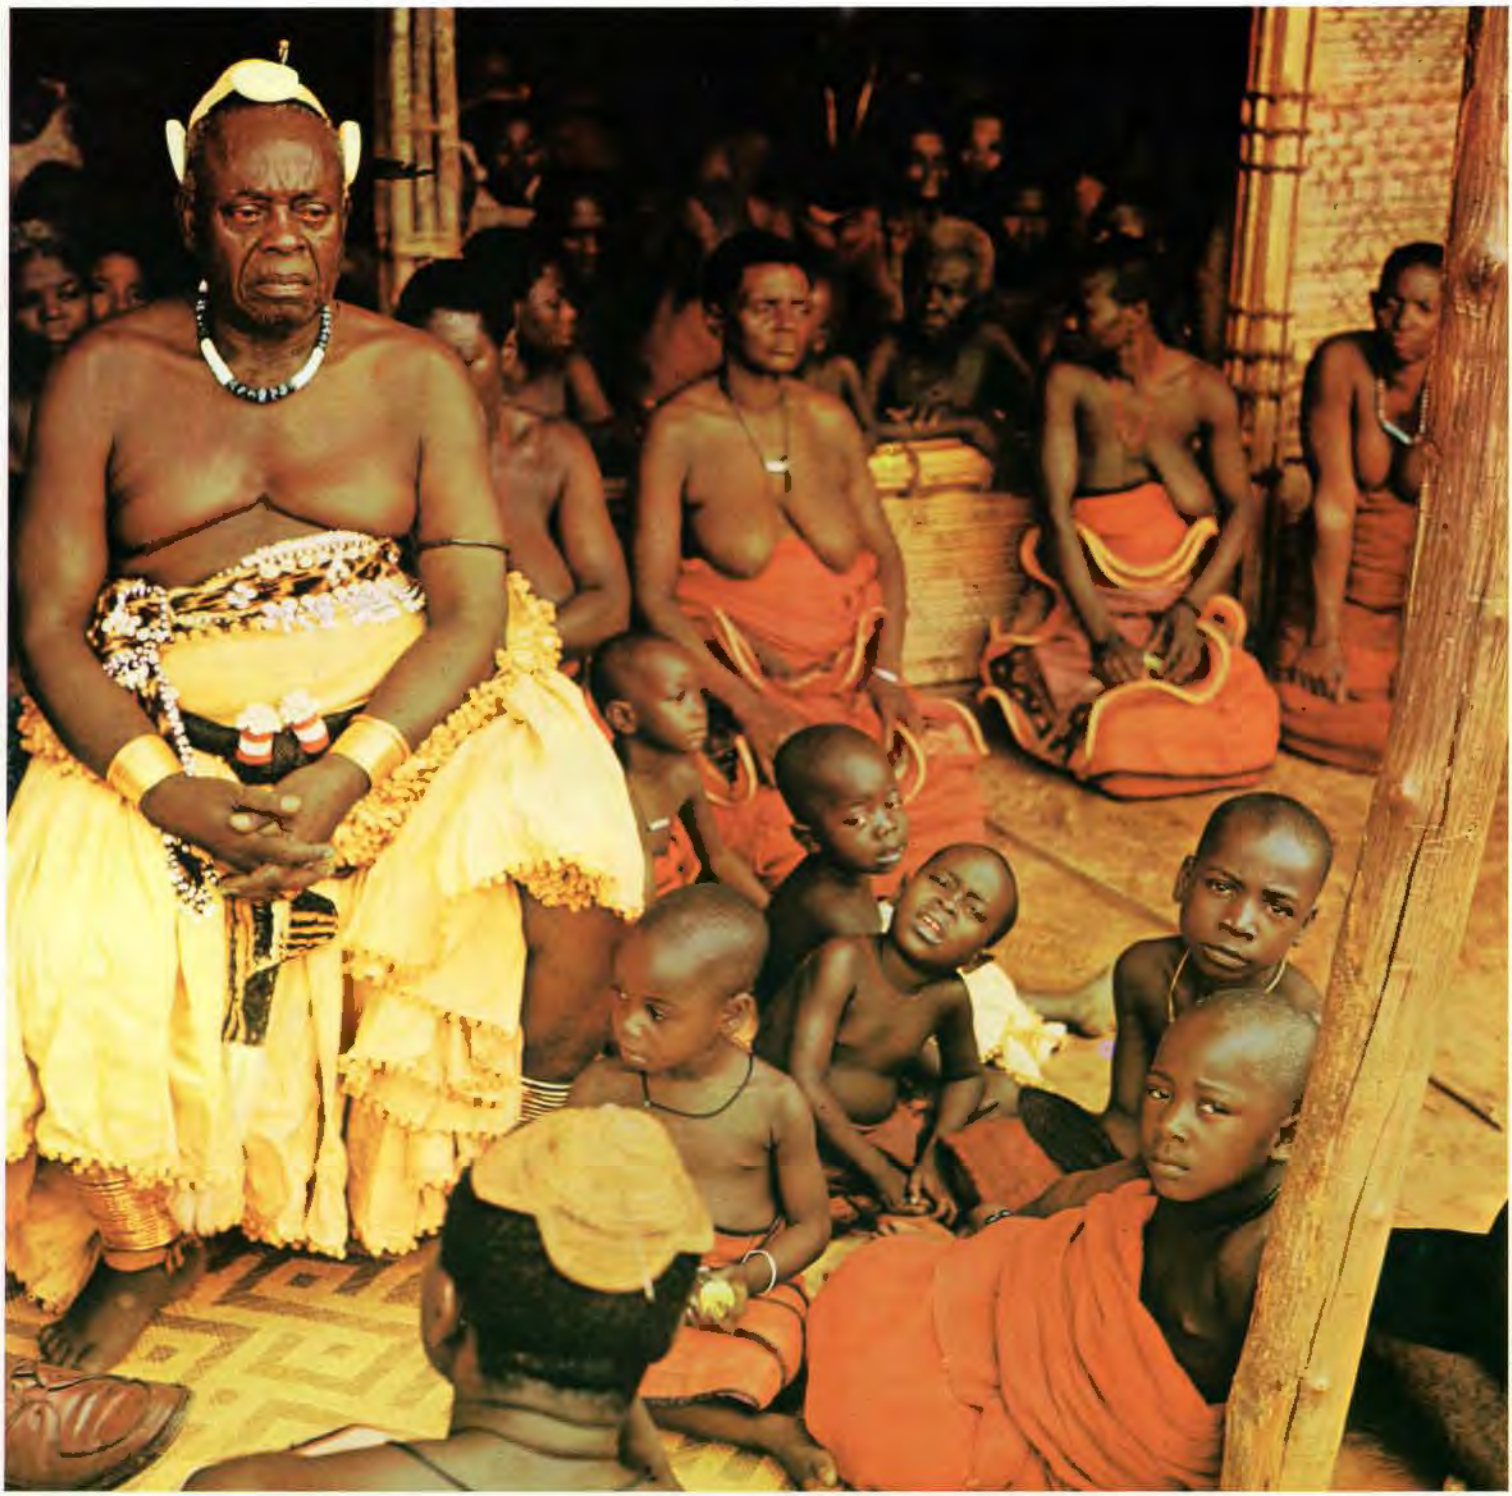
Another important function of the witch-doctor is to predict the future, and no Congulese would undertake an enterprise of any significance without first consulting him in his role of soothsayer. Divination is usually effected with the aid of 'the bones' – traditionally the leg bones of goats, highly polished and shaped to resemble the heads of various animals. The witch-doctor, after falling into a self-induced trance, casts his bones. There are reports from reliable witnesses that certain of these objects actually stand up and remain standing on end, while others lie flat on the ground. The soothsayer interprets them accordingly. If the bones signifying a crocodile or lion stand erect, he predicts danger, while if those representing a friendly animal remain standing, he forecasts a successful journey.

The witch-doctor is also responsible for the general welfare of the community and is called upon in times of drought to make rain. For this ceremony he organizes an impressive spectacle, decking himself out in a mask, feathers and animal skins, and leading a ritual dance to the accompaniment of drums. If he is a good weather forecaster, he will time the ceremony to coincide with the gathering of the storm-clouds; and if he fails to make rain, he can always fall back on the excuse that some evil spirit or some undiscovered wizard is opposing him. It follows, then, that his most important function is to 'smell out' sorcerers.

He has numerous ways of achieving this object, the most common being 'trial by ordeal'. The method most used is the poison test, based on the belief that the innocent will not be affected by the medicine while the guilty will succumb to it. Accordingly, all those members of the community who are under suspicion will be required to drink a poisoned brew. The witch-doctor will then interpret their degree of guilt from their reaction. Some Western observers maintain that the potion the witch-doctor administers is not poisoned at all, but the guilty assume that it is and thus reveal their guilt. In any case, the idea is not to kill the witch outright, since first a confession must be extorted, by torture if necessary.

The Secret Societies

And so it is that despite the complete irrationality of these Central African methods of 'smelling out' witches and despite the cruelty of the punishments – poisoning, drowning, feeding the victims to crocodiles, and even burning alive – the natives of the vast forests of the Congo accept without



Federico and Aldo Patellani

The wise and serene chief of a tribe may, after his death, attain the status of a god-chief, with the power to help and protect his people

question the necessity of eliminating sorcerers by any means. They are absolutely convinced that at night, crouched in their hovels, wizards make wax images of their enemies and slowly destroy them by tearing off their limbs one by one. In order to identify himself with the powers of evil, the sorcerer sacrifices infants and drinks their blood. Among his paraphernalia will be found human teeth, bones, cocks' feathers, and magic pebbles. And, to distinguish him even further, the sorcerer is said to have a special sullen appearance and to be noticeably antisocial in his behaviour. Hence, anthropologists trace the origin of the pagan Negro's obsession with sorcery to the primitive fear of the 'outsider', of the member of the tribe who in some way or other does not conform to the conventions of the group.

This obsession with witches and sorcerers often leads to the formation of secret societies whose professed aim is the smelling out of the Mlozi, but who, in the natural course of events, turn into gangs who terrorize the weak and innocent. Members of these societies, like the Bamucapi and the Atinga, who have been known to operate in the Congo, disguise themselves in animal masks and skins and travel from village to village intimidating and robbing the inhabitants. Such organizations were never wholly controlled by the white colonists. With the departure of the Europeans, it is probable that they have strengthened their hold on a helpless and superstitious population.

The general impression the European is bound to get from a study of the Congo is that the natives are self-condemned to a life of considerable wretchedness, caused on the one hand by their obsessive fear of the unknown and on the other by the severity of their tribal law. These factors account for their outbursts of violence as well as their indifference to cruelty, their love of dancing, feasting, and drinking, as well as their acceptance of drudgery and boredom.

CONJURE MAGIC

ONE NAME for the magical beliefs and practice among Negroes in America's Old South; also called 'hoodoo' or 'voodoo' though only vaguely resembling the complex Voodoo religion. Elements of religious worship were perhaps more evident in some areas, as in New Orleans in the last century, but now the idea of 'conjure' means simply magic-working. In this it seems to have retained much of the African way of magic.

Practitioners – called many names, including 'hoodoo doctors' – were employed to cast spells on clients' enemies, or to take off spells cast on clients. Thousands of charms designed to kill or afflict illness have been recorded, using ingredients like graveyard dirt, bat's blood, chicken bones and feathers, salt and ashes, usually tied up in red flannel. Every conjure man had his own recipes.

The charms were not always harmful, but were used to cure ailments like barrenness, impotence, ill temper, anything (as the saying goes) from a bald head to a broken heart. The powerful New Orleans 'gris-gris' went into action for gamblers' luck and lovers' success. And these magics can still be found in parts of the South, even in northern ghettoes, wherever the credulity remains.

Barnaby's Picture Library

In the Old South a black cat's whiskers were often used in 'conjure' magic

This holy man, who predicted that the world would end in 1900, aroused the hostility of both the government and the Church in Brazil but his followers regarded him with reverence and fought to the last man for his beliefs

ANTONIO CONSELHEIRO

THE MOST SPECTACULAR of the various leaders of millennial movements that have arisen in Brazil, Antonio Vicente Mendes Maciel, called Conselheiro, 'the Counsellor', was born in 1835. He was the child of a family of impoverished landowners in northeast Brazil.

Millennial movements expect a cataclysmic end of the world and the coming of a better one. The migrations of some Brazilian Indians, sometimes extending across the whole continent, are explained in terms of a search for a 'land without evil' before the present earth is destroyed. A similar influence came to Brazil from Portugal, centring around the young King Sebastian who disappeared mysteriously at the battle of Kassr-el-Kebir, fought by the Portuguese in North Africa in 1578. Stories of the imminent return of Sebastian periodically agitated Portuguese and, later, Brazilian society, just as myths of the return of Arthur or of Frederick Barbarossa circulated in England and Germany.

The many wandering monks, friars, holy men and vagabonds who roamed about Brazil in the 19th century often speculated about the returning hero who would save the people from their distress. These penitents were often herbalists and prophets, and in regions without very many priests they catered for the religious needs of the illiterate peasantry. Some were held in much greater respect than the priesthood.

As a young man, Maciel worked as a clerk in various places. His marriage was unsuccessful and after his wife had left him he drifted into the life of a wandering preacher. He quickly gained the respect of the superstitious peasants, and acquired his name of 'Counsellor' because of a reputation he gained for wisdom and as an arbitrator in local disputes.

Maciel's appearance was striking, and his strange way of speaking in short, unconnected phrases won him the reputation of being a prophet and a holy man. He lived on alms, but very sparingly, and his fasts, ascetic habits and mysterious manner, made him an object of superstitious awe. Unsolicited by him, mendicants and others began to follow him from place to place, reciting beads and litanies.

In time, his fame had spread through all the great cities of the country, although he kept himself to the backwoods areas. In 1876 he was arrested on a false charge, and to his asceticism was now added a note of martyrdom. His followers, and the ignorant peasantry, were even more devoted to him on his release, and he moved about the country as before.

The End of the World

Conselheiro's influence was generally beneficial, and he was able to command local people to a variety of good works – repairing buildings, mending walls, building chapels – which otherwise would have been neglected. As a result, local priests were prepared to tolerate the descent into their parishes of the prophet and his rabble of followers. Such was his influence that just as he could persuade the poor to work, he could also persuade the rich to supply the materials for various undertakings. Civic authorities could not interfere, and the ordinary life of the villages and small towns of the backlands ceased when Antonio arrived to preach and prophesy. Healings and miracles were claimed.

After the establishment of the Republic of Brazil in 1889, Conselheiro's prophetic utterances came to have a clear anti-republican character. As long as he had been only the object of clerical censure, on the grounds that he over-excited the consciences of men and preached an 'over-rigorous morality', the civil authorities had done nothing to stop the prophet and his entourage of several hundreds. The accusation that he sought to convince men that he was the Holy Ghost, whether true or not, had not induced the government to confine him to an asylum. His preaching against the new and highly insecure Republic, however, led to a skirmish with the police but his followers, who were often vagabonds of dubious character, were too numerous and too ferocious to be routed, and inflicted severe casualties on the police.

Conselheiro's preaching began to take up the millennial strain that had reappeared at various times in Brazilian history. He prophesied the return of Sebastian, who would arise with an army from the sea to free men from the yoke of the Republic. He promised the end of the world in 1900, and saw his own movement as the gathering of the flock under the one shepherd. Many of his sayings appear meaningless, but they had that dark mystery well calculated to impress the simple people who listened to him.

Now in open conflict with the authorities, Conselheiro led his following north into the arid backlands and settled in the village of Canudos, remote from civilization. There he was joined by people from villages around, and then from farther afield, until a sizeable community grew up around the old village and in the hills round about. Bandits joined the new settlement and from there foraged the surrounding countryside.

Conselheiro preached austerity and privation, and set aside normal marriage, as the community prepared for a siege. He was hostile to the Republic, and his own society was run as an independent state at war with the outside world. But in 1895 he permitted a Capuchin friar to undertake a mission, to marry a number of couples, and to baptize over 100 children, even though many members of the settlement were opposed to the friar's being allowed to stay. The community remained a religious society, however, and in its own way was very devout, engaging in a great deal of prayer and the kissing of images.

The Siege of Canudos

Endemic banditry and the general inefficiency of the civic authorities in dealing with these numerous local manifestations of disorder perhaps accounted for the long lapse of time before any attempt was made to disperse the rebellious settlement at Canudos. Trouble arose after Conselheiro's followers came into conflict with the authorities of Joazeiro, a town some 125 miles from Canudos. Troops were called to deal with the millennialists, who lost many killed and wounded in the ensuing action, but managed to stop the offensive.

In 1896 a new force of over 500 men was sent against the settlement. This body was also repelled, and as a result of this victory many new recruits set out for Canudos, which now became an effective

The exhumed body of Antonio Conselheiro. This holy man prophesied that a saviour would arise with an army from the sea to free the Republic of Brazil

military camp. A third military campaign, with 1300 troops involved, was no more successful and the military were again put to flight. Eventually, a force of over 5000 was dispatched by an alarmed government which feared a major insurrection. A long campaign ensued, in which the troops suffered more than 2000 casualties in dead and wounded, and which required more recruits for the final assault on the stronghold. The difficulties of the terrain, the inexperience of the army officers and the guerilla tactics of the rebels were all factors which lengthened the struggle.

The millennialists were prepared for just such a siege; they viewed it as part of the events leading to the end of the world, when salvation would be vouchsafed only to those at Canudos, whereas the Republic would everywhere be damned. Only at Canudos would there be a promised land, in which men would enjoy the earth's abundance. A church with walls as thick as a fort had been built at Conselheiro's direction, where the long services of the community were conducted, and the ceremonies performed in which images were kissed.

Fortified with elaborate rituals such as these, which often ended in hysteria, the followers of the Counsellor fought with extraordinary tenacity. Time and again, they cut off the troops' supplies, and only when a regular supply line was established, and larger cannon brought into the difficult positions around Canudos, was there a prospect of victory for the government. The cannon destroyed the towers of the new church and soon afterwards, in 1897, Conselheiro fell ill, apparently of dysentery, and died.

The situation in the encampment was now desperate, with the military closing in around the centre. Conselheiro's followers continued to hold out, believing that their leader had gone to heaven to summon the assistance of angels. Two weeks later, the troops succeeded in forcing the millennialists to raise a white flag, but only the elderly and the children came out. The grown men remained, and fought for a few more days to the very last man.

Antonio Maciel himself was undoubtedly a deluded fanatic, of whom the principal commentator has written: 'The multitude created him, refashioning him in its own image . . . The people needed someone to translate for them their own vague idealizations, someone to guide them in the mysterious paths of heaven . . . He drew the people of the backlands after him not because he dominated them, but because their aberrations dominated him.' This is to see Conselheiro as the personification of the aspirations of a disoriented and disorganized people, whose way of life had never been provided with stability and settled customs, and whose grasp of religious ideas was tenuous and permeated with superstition.

Personification of a Dream

Maciel was a curious and magnetic figure, whose contribution to events, in providing the dreams in which his followers sought their salvation, became significant only after the end of monarchy in Brazil. He did not envisage himself as outside the Christian tradition, but rather as a special emissary of God, holier and more inspired than priests, but deprived of the priest's right to officiate at Mass. He had been infuriated when, on occasion, he had sought the right to preach in churches and had been refused by priests. These experiences may have hardened his teaching, and led him to make some dire predictions about the fate of the Church. Despite these prophecies, he had remained essentially in the Roman tradition of liturgy, and had encouraged its more superstitious and fetishistic aspects.

The overthrow of the Empire may have fitted into his hazy conceptions of the time of the end. Equally his change of attitude may simply have reflected a more serious turn in the mental derangement from which he was evidently suffering. There is nothing to suggest that his militancy stemmed directly from the aspirations of his followers, although, since many were vagabonds, his willingness to lead them as a hostile religious movement admirably fitted their aspirations and their pent-up and otherwise frustrated hostility to the authorities.

BRYAN WILSON

FURTHER READING: E. Da Cunha, *Rebellion in the Backlands* (Chicago Univ. Press, 1944).

Conversion, whether of an individual or a crowd, involves a fundamentol change of belief. The methods by which people can be induced to change their beliefs are strikingly similar, whether employed by the preacher, the psycho-analyst or the political indoctrinator

CONVERSION

THE CHANGING OF BELIEF to an extent that substantially affects an individual's outlook and personality is the sense in which the word 'conversion' is used in this article. This change brings with it, at least temporarily, a change from 'a self hitherto divided, and consciously wrong, inferior and unhappy,' to a self 'unified and consciously right, superior and happy', in the words of William James (in *The Varieties of Religious Experience*).

The restriction of the term to those changes in belief that *substantially* affect the individual's outlook and personality means that changes on this scale are likely to relate to religious outlook; indeed, in the past, when conversion in this sense was spoken of, it was always religious conversion that was intended. But conversion may be not only *to* religion but equally *from* religion, and in so far as the change in belief relates to those needs which religion exists to satisfy, such a change may fairly be called a religious conversion. Moreover, nowadays the conversion process may as readily be seen in changes of political belief, and in those major changes in an individual's outlook that may be brought about by psycho-analysis or other psychiatric treatment; and Walter de la Mare has spoken of falling in love as 'a conversion of the heart'. The processes of conversion are similar, whatever the change in belief effected.

Such changes can be divided into two basic categories: the conversion of people in groups; and the conversion of individuals. The classic example of the conversion of

The conversion of a person to a new religious belief is often confirmed by a ceremony after which the convert feels cleansed, purified and regenerated. Communal baptism, by Canadian Baptist missionaries, in a stream near Lake Titicaca in Bolivia

Kress Collection/Seattle Art Museum

Most scholars agree that conversion is a gradual process, often culminating in a sudden and dramatic climax. The climax may come at the traditional revival meeting with a spell-binding preacher like the Rev Billy Graham *(left)* and an outburst of group emotion, or at a mass political rally like those held by Adolf Hitler *(above)*, or in solitude like the conversion of St Paul *(below)*, who saw a blinding flash of light and a vision of Jesus saying, 'Saul, Saul, why do you persecute me?'

people in groups is the revival meeting in its traditional form. With a spell-binding preacher, making full use of such aids to arousing feeling as lights or fire, and music – often of a strongly percussive kind – and expounding graphically the terrible alternatives to acceptance of belief, members of the congregation will lose their individualities in group emotion. They may sing and shout, groan and wail. Some may 'speak in tongues', usually in an uncontrollable and incoherent babble. Others may be stricken by convulsions and roll on the ground in apparent agony. The revival reaches its climax with complete breakdown of rationality in all or most of the congregation. On recovering their calm, they will announce that they have undergone conversion. Accepting the new belief, they feel cleansed and purified, remade and newly regenerated.

Famous examples of religious conversions by this process are those effected by John Wesley in the 18th century, by Billy Sunday in the early years of the 20th century and by Dr Billy Graham today. There are also the early Salvationist meetings, and the many camp meetings, so called, of revivalists of one creed, or another in the rural districts of the United States. In the political field, such mass rallies as those held by Adolf Hitler in the 1930s clearly fall into the same pattern.

In the religious field it is not only the Holy Spirit who is believed to move the congregation. The notorious convulsionists of Loudun in France in the 17th century (see GRANDIER) were believed to be possessed by the Devil; and John Wesley, who had originally believed that the peculiar manifestations at his own meetings were the work of God, came to believe that they were sent by the Devil to bring discredit to his work.

The mental processes that result in the dramatic if short-lived conversions of this kind are believed to be understood and have

been extensively discussed, notably by Dr William Sargant (in *Battle for the Mind*). What apparently happens, briefly and figuratively, is that the individual is brought to a point of emotional stress whose only relief is breakdown, at which point acceptance of the new belief proffered is felt to be remedial and therapeutic. In the revival meeting, the stress is applied to people who may have been in a state of comparative equilibrium shortly before; their need for breakdown, release, new belief, is artificially induced. As the need is not long or deeply felt, the remedy is not long-lasting.

The Discovery of Unease

It is rather in the conversion of individuals that the process can be studied in greater detail. To start with, the often dramatic instances of instantaneous or lightning conversions sometimes adduced as proof of the miraculous workings of Grace can be dismissed. As the Catholic writer, R. C. De Sanctis has shown (in *Religious Conversion*), no conversions are in fact sudden and unprepared, although many converts like to believe them so. Conversion is the end of a long process of 'mutation', although much of this process may take place at an unconscious level of the mind; as it obviously did in the most famous convert of all, St Paul.

Its beginning may perhaps be defined as 'the discovery of unease'. The individual finds himself, as William James put it, divided and wrong, inferior and unhappy, in what concerns a major part of his outlook. Consciously or unconsciously he begins to seek an outlook that offers greater prospects of harmony and happiness. He may even decide what outlook it is that will suit him, and then seek to believe it. This was the case, for instance, with St Augustine of Hippo; originally a Manichean, he had made an intellectual decision for Christianity some time before he was able emotionally to accept it. But it is equally usual for potential converts not to know what it is they are seeking. If, however, they are eventually to emerge from the disturbed self through conversion, they will gradually become more inclined to one possible answer than another. Evidence that suggests that *this* is the right answer will be consciously or unconsciously accepted, and other evidence rejected.

During this period of seeking an answer whether it is consciously known early on or not, the subject is likely to become increasingly disturbed and unhappy. He will probably show, to a greater or lesser degree, many symptoms of the depressive stage of manic depression. He may feel himself to be lonely, isolated, unwanted; guilty and soiled; incapable of creative thinking; devoid of any capacity for happiness. He may reach that extreme state known to Catholics as 'aridity' or the dark night of the soul.

Sometimes the conversion – we might almost call it a cure, and such it is felt to be by the subject – is gradual. Gradually the loneliness, unhappiness, guilt, pass away and are replaced by more positive attitudes. Gradually the subject realizes that he is possessed of new and (for the time being, at least) satisfying beliefs. But sometimes the actual moment of conversion is sudden and dramatic, and these, not surprisingly, are the conversions we hear most about.

It seems clear that such a moment occurs when the subject is ready for it, but what constitutes readiness we do not know. Certainly the pattern of the new belief has been more or less established and is awaiting emergence. Almost certainly, in some sense stress has been increased to the point of breakdown. What seems usually to happen is that breakdown is triggered by encounter with some potent object, event or idea, a breakdown often accompanied by ecstatic happiness and followed by almost immediate acceptance of the new belief.

The 'triggers' themselves are various. For St Augustine it was the reading of a verse in the Bible that suddenly took on powerful significance. Often it is encounter with Nature. St Ignatius Loyola, the founder of the Jesuits, was by a river at the moment of his conversion; the American missionary, David Brainerd, in a wood at night. It may be a meeting with another person of inspiring ideas, though this is more often an early point in the mutation process than the actual moment of conversion. The trigger may be a religious service or edifice or image: Paul Claudel, the French writer, had his moment of conversion in Nôtre Dame. But the trigger may be comparatively trivial and only the sudden change perceived.

Calculated Stress

In psycho-analysis the moment of breakdown known as 'abreaction' is clearly similar to that of conventional conversion. It follows a long period of usually painful self-examination and probing. It is followed by the characteristically joyful release, the feeling of being 'made new'; in this state such hypotheses as the Freudian ones are accepted as true because they *feel* true. Political conversions, forceful or willed, can be brought about by similar means, as Dr Sargant has shown. For most individuals to be, as it is now called, *brainwashed*, all that is needed is a sufficiently long period of enforced stress, during which the subject is reduced to a state of confusion, guilt, isolation and misery; while he is presented, as an alternative, with the political ideas to which it is desired to convert him. The point of breakdown is reached, often expedited by a sudden show of kindness, a promise that guilt, isolation and misery will be replaced by happy purged 'belonging' once the change of heart is achieved. The breakdown occurs: the promised change is effected, though how long it will last again depends, in most cases, on continuous follow-up and indoctrination. Nearly all the American soldiers brainwashed in Korea reverted to their former beliefs soon after they had returned to their former environment.

Many of these were, however, processed in small groups. This is an increasing tendency, whether used openly for religious or political conversion or indoctrination, or for psychiatric therapy. The method is both more economical than individual treatment and more likely to be effective with people of higher intelligence than would respond to the revival or mass meeting.

It is believed that some kinds of people are more susceptible to conversion techniques than others, though there is disagreement as to what types are most likely to resist or succumb; and there may well be differences according to whether individual or group techniques are in question. Hysterics, for instance, may respond to the more dramatic manifestations of group conversion, but are unlikely to hold any beliefs stoutly or lengthily. Psychopaths do not in general respond. It is variously said that people already holding strong beliefs are likely to resist conversion techniques or to accept them. It is generally agreed that the apparently normal healthy extrovert is the most vulnerable.

Renewal Through Exhaustion

The general physical process of conversion has obvious similarities to various others where change of belief may be less in question than mere release from tension. Native dancing is often adduced as an example, where a strong state of tension can be built up to the point of exhaustion and collapse, with subsequent feelings of release and renewal. The dancing manias of the European Middle Ages have clear likenesses to this pattern (see DANCING MANIA).

Since the important outward manifestation of conversion is the adoption of new belief, felt, at least for the time being, to be satisfactory, the possible worth of the new belief must come into question. For the person concerned, this is not in doubt: the new belief is validated by the satisfaction it gives and its ultimate truth is certain. A dispassionate judgement, however, must accept that *feeling* a belief to be true is no proof that it *is* true. As we have seen, all kinds of beliefs may be acquired through conversion processes, but some at least outsiders will judge to be of doubtful truth and dubious moral value, whatever immediate benefit they may confer on the person concerned.

As to the scope and durability of conversions, it would appear that the conversion of an individual by his own efforts and as the result of a personally-directed search is likely to be the longest lasting and most deeply held. This holds good whether it is brought about by gradual processes or by a final 'lightning flash' experience – except in the cases of those few people who apparently need more or less frequent changes of beliefs. The kind of conversions effected by group pressures are likely to be only temporary unless reinforced by constant indoctrination. Conversion may, as we have seen, be to any kind of belief substantially affecting the individual's outlook, and, whether belief it may be, to be properly called *conversion*, its adoption will change the individual, temporarily or permanently, from 'a self hitherto divided, and consciously wrong, inferior and unhappy,' to a self 'unified and consciously right, superior and happy.'

The extravagant manifestations of the Convulsionaries included violent agitation of the body and cataleptic trances, during which they were insensitive even to the pain of crucifixion

CONVULSIONARIES

THE TOMB of an obscure deacon, François de Pâris, in the little Parisian cemetery of St Médard, was the scene of a series of extraordinary events in the early 18th century. Not only were miraculous cures of the afflicted reported to have taken place after touching the tomb, but some of the visitors began to be seized with convulsions similar to those of epilepsy. These events attracted considerable notoriety; they were events which had their roots far back in the past and which were to have far-reaching religious and political consequences.

François de Pâris was born in 1690, the son of a wealthy member of the Parlement. A man of heroic humility, he declined to be ordained priest, although conscious of the call to serve God. His ascetic and charitable practices were legendary; so much so that in self-mortification he went without communion for almost two years. Worn out by his asceticism and his labours for the poor, he died in 1727, at the early age of 37.

On the day of the funeral, an old woman whose arm had been paralysed for 25 years was cured on touching the bier. Other miraculous cures were reported from time to time during the next four years. But it was in the early months of 1731 that a new and disturbing element began to manifest itself. Visitors to the tomb at St Médard began to be seized with convulsions and in extreme cases to pass into cataleptic trances, evidently as a result of contagious hysteria.

The Church of St Médard had Jansenist connections, situated as it was near Port-Royal which was a renowned centre of Jansenist scholars. When the cult of François de Pâris grew, the adherents who became known as Convulsionaries were a group of Jansenists, a sect named after a heretical Flemish bishop Cornelius Jansenius (1585–1638). The Vatican had issued a series of Bulls condemning Jansenius's teachings, the latest of which was the Bull *Unigenitus* of 1713. A Jansenist heretic was therefore anyone who refused to accept this Bull.

Strange Things at St Médard

Jansenism had already been associated with spiritual healing before the events at St Médard. The first link was forged in March 1656, at Port-Royal, when a young girl named Marguerite Périer was cured of a terrible ulcer. She was the niece of the theologian Pascal, who had written in defence of the Jansenists. The second link came much later, in 1725, when a certain Anne Charlier was cured of a haemorrhage. This took place in the course of a religious procession, but the priest who had celebrated Mass and was carrying the host, was against *Unigenitus*, and therefore a heretic. The third and fourth links followed in 1727, with the deaths of Gerard Rousse, a priest of Avenay, and François de Pâris. Cures were effected on both tombs, but the greatest wonders took place on the tomb of Deacon de Pâris.

In violently ecstatic trance states, the Convulsionaries were completely insensitive to pain: from Collin de Plancy's *Dictionnaire Infernal*

The fame of St Médard spread and the number of visitors multiplied. However, not all those who came did so for worthy reasons; on 7 August 1731 a certain widow Delorme came to the cemetery to scoff, and was paralysed for her impudence. Insult was added to injury when she was thrown into jail. Public opinion was still further roused, for political issues were involved; near-riots ensued, and in January 1732 the cemetery was closed by royal decree. This action provoked some unknown wit to write:

De par le roi, défense à Dieu
De faire miracle en ce lieu

which we might paraphrase as: 'God is forbidden to work miracles here by order of the King.'

But although the focus of the convulsionary movement was thus removed, neither the healings nor the convulsions were thereby brought to an end. Evidently the connection with the tomb of François de Pâris was incidental, rather than essential. The movement spread into the provinces. Significantly, it found support among the aristocracy, and even Voltaire's brother, Armand Arouet, counted himself among its adherents.

The most celebrated of the Convulsionaries was a member of the Parlement, Louis-Baptiste Carré de Montgeron (1686–1754). Montgeron, whose early life had been far from exemplary, went out of sheer curiosity to St Médard in September 1731, and addressed to Deacon de Pâris a typical sceptic's prayer, beginning, 'If it is true that you exist and that you can hear me . . .' After four hours at the tomb, he emerged from the cemetery a believer, and the rest of his life was devoted to working out the implications of what must be reckoned as a classical conversion experience. He at once began the work of attempting to persuade the world that the events at St Médard were both true and significant. Although for political reasons he was in exile from Paris, he returned in 1737 to present to Louis XV in person the first volume of his massive book *La Vérité des Miracles*, in which he defended the authenticity of the cures of St Médard. Predictably, he was arrested and thrown into the Bastille.

Montgeron's book (the first volume of which had been ordered to be burned on his arrest) was not only a defence of the Convulsionaries; it was equally an attack on the French Church, the Pope and the Bull *Unigenitus*. He paid the price; the last 17 years of his life were spent in captivity, and when he died in 1754 Montgeron was buried in a pauper's grave. But he gave the world a disciple's picture of a movement which even the doctors of the Sorbonne who were against *Unigenitus* felt to imply 'reprehensible things', and urged should be 'rejected in its entirety as an object of horror and mistrust.'

Crucified in a Trance

If we ask what the Convulsionaries actually did to provoke these extreme judgements, the account of an interview which took place in 1758 between Lieutenant Bertin of the French Police and a certain Dr Dubourg of Paris is illuminating. Dubourg's testimony was restrained and factual. He was privately convinced that although the practices of the Convulsionaries were odd and indeed repugnant, there was no question of imposture or trickery; nor was there anything in them to offend against public decency. He reported that the convulsions led to five classes of apparent maltreatment, varying from kicks and blows to the dropping of weights on the abdomen, the driving of nails into the flesh and, in extreme cases, actual crucifixion – all in a state of trance. Women were particularly desirous of undergoing such tortures, which in their own private jargon they called *secours* (aids); those responsible for providing them, usually young men, were known as *secouristes*. The sexual implications are obvious. Other contemporary accounts tell of similar manifestations: for instance, the case of one Marie Sonnet, who was said to have remained suspended over a fire for 36 minutes, supported only by the head and feet.

Clearly what was involved was spontaneous or induced catalepsy, more common in primitive and Oriental religions than in Christianity but not unknown, either before or since, in the West. The body's rigidity and insensitivity to pain when in such a state are well-known symptoms, attested from many religions and many parts of the world. The ultimate object is usually to demonstrate the relative worthlessness of the body, and the triumph of the spirit over the flesh. In this respect the Convulsionaries have their place in the history of religious asceticism. But in this case the Jansenist origins of the movement introduced a political element into the picture, and as a result the authorities adopted repressive measures. Thousands of Convulsionaries were imprisoned. This had the effect of driving the movement underground, where it later gave rise to competing sects before disappearing completely.

Since the prosperity of a community and indeed its very life hung on the success or failure of the corn crop, our ancestors wove many superstitions around the harvest

CORN

WHEAT WAS GROWN in the Middle East some 7000 years ago and was known in Northern Europe as early as 1000 BC. With its cultivation grew up the concept of a spirit or goddess living within the corn plant who must be kept alive from harvest time until next year's sowing to guarantee the renewal of the crop.

In ancient Greece the goddess was called Demeter, the 'Giver of Wheat', and her Roman equivalent was Ceres, the goddess of grain crops and the harvest (see DEMETER). Not even the advent of Christianity substantially affected the essentials of this pagan belief, except to effect a transformation in the nature of the object venerated. Thus in France, the Virgin became known as 'Our Lady the Bread Giver', while in Ireland St Vulgan was appointed the patron saint of sowing and the harvest.

Any intrusion into the domain of the Earth Mother by the plough was surrounded by taboos and superstitions. In the ancient world a new plough could not be manufactured from the wood of an old one that had been struck by lightning, while hair was plucked from the hides of the oxen that pulled the plough as a protection against the assaults of the sky gods.

The Plough of Death

The plough alone became the focal point of many superstitions. If a man omitted a furrow while ploughing it was taken as an omen that one of his household would die, while even to dream of a plough, with its undertones of newly-turned earth for a grave, could be a portent of death. As a means of protecting the community from the assaults of malignant spirits a ploughshare was ritually drawn in a circle around the village by naked women at dead of night.

To ensure an auspicious sowing a hen's egg or a loaf from the previous year's harvest was sometimes placed under the plough before the first furrow was cut, and in Prussia the ploughman and sowers were doused with water in the hope that there would be a plentiful supply of rain. Some American farmers invariably sowed their corn in the dark of the moon, believing that this prevented the growth of over-tall, spindly stalks. (But South Carolinians preferred the light of the moon.) American superstition also tells farmers to plant corn when the leaves on hardwood trees are as large as squirrels' ears; and never finish cutting your corn before sunset. A corn stalk hung over a mirror brings good luck.

The Irish farmer tries to encourage the growth of his corn by placing a sickle in its midst, to remind the crop of its destiny. In Europe it was a favourable omen if poppies grew in cornfields, since this flower was originally associated with the Roman corn goddess Ceres.

For American Indians who grew corn, the ceremonies and festivals associated with the crop took a paramount place in their worship. Most Indian mythology personifies the corn as a corn mother, or perhaps two corn maidens (though the corn deity of the Hopi was the male god of the underworld – rather as if Hades supplanted Persephone). Many origin myths among Indians depict the disappearance and return, or resurrection, of the corn deity; and the corn plant is important in charms and prayer sticks used in ceremonies.

But the corn's dominant role is a central feature of the year's biggest ritual, the spring Corn Dance. The Pueblos have a secret and gorgeous Green Corn Dance in spring, really a series of complex rites, addressed to the corn maidens, the rain and the clouds. The Shawnee, Cherokee and some eastern tribes like the Iroquois have similar corn ceremonies: the Iroquois Corn Festival is a harvest rite, in September, with many circle dances and other fertility motifs, and women taking the major parts.

Corn was supposed to be particularly vulnerable to adverse psychic influences, and had to be carefully protected from contamination by the presence of the sick or by death. Those who were seriously ill were kept well away from the cornfield, and under no circumstances was a funeral procession

Michael Holford/Horniman Museum

Plaited corn dolly from Montenegro, Yugoslavia, made from the last ears of the harvest; throughout Europe corn dollies were kept in the farm to ensure the success of future harvests

permitted to pass through it. A vindictive extension of this theme was the custom among jealous Irish peasants of magically transferring their own misfortunes to a neighbour by secretly burying a dead animal or a piece of meat in his field.

Rain, one of the primary essentials for growth, could be secured by the farmer in a number of ways. Primitive communities usually employed for this purpose a rain-maker whose rites varied from scattering water from a hut roof as an intimation to the rain spirits to follow suit, to those of the Omaha Indians who spurted water into the air to make a fine mist. Among the Macedonian Greeks, it was customary for a procession of children to visit every spring and well in times of drought, led by a girl adorned with flowers, singing:

> Send Thou us a still small rain
> That the fields may fruitful be
> And vines in blossom we may see
> That the grain be full and sound
> And wealthy grow the folks around.

In the United States farmers of the old school in the Ozark hills tried to ensure plentiful rain by soaking cobs from the seed corn in water. Only when the new crop was thought secure would the cobs be buried or cast into a running stream.

The Last Sheaf

When the corn was ripe for harvesting the first sheaves were sometimes gathered and taken into the church. The people of Lillers in France celebrated a Mass for the crop and blessed the wheat and fruit. At Valenciennes, following the feast of St Veronica, dancers were led by a girl dressed in white who presented grain to the onlookers in return for money which was spent on wine. In a similar custom taking place annually at Richmond, Yorkshire, the first farmer to offer the Mayor a substantial specimen of the new crop is ceremonially given a bottle of wine at the Market Cross.

In the British Isles the gathering of the harvest was generally supervised in the old days by a workman called 'The Lord of the Harvest', assisted by another known as 'The Lady'. During the reaping the farmer generally remained well in the background. In Ireland it was the custom to attach a small box containing insects to the scythe handle in the belief that it would intensify its cutting

Andy Weir

Italian bread baked to represent the local goddess of crops and fertility

power. The most significant of the former rituals enacted by the reapers were associated with the last sheaf, once believed to contain the spirit of the corn. Sometimes a few ears of corn were left standing in the field but more often these were plaited as they stood into a 'corn dolly' and then severed by the sharp blades of sickles hurled by the reapers. The 'dolly' was kept in the farm until the beginning of the new season's ploughing, thus ensuring continuity.

The last sheaf of the harvest might symbolize either a human being or an animal. In parts of Germany the sheaf was referred to as a pig, he-goat, wolf, straw cock or rye sow, and in the Kiel district as the corn cat. In Scotland it was called the maiden, the old wife, or the clyack chief, while in England it was variously known as the mare, the maiden, kern baby, or kern doll.

Trespassers Will Be Sacrificed

In Cornwall the last handful of corn, called 'the neck', was always ceremoniously cut by the oldest reaper who cried out at the same time: 'I havet! I havet! I havet!' When asked what he had, he replied, 'A neck! A neck! A neck!' The sheaf was cut and carried to the farm with much merriment, decked with ribbons and then left until the following year. Sometimes it might be set up near the gate of the cornfield as a magical charm against unfavourable weather.

In Central Europe the 'corn mother' wandered the fields in spirit at night, dressed in a linen robe with cornstalks for hair. During summer when the wind blew through the corn, sending great waves from one end of the field to the other, German peasants would mutter 'the corn mother is going through the corn' and children were warned to keep well away lest the corn mother should catch them. Behind this mysterious belief lie certain dark traditions of human and animal sacrifice, as suggested by the saying in parts of Bavaria that he who gives the last stroke at threshing has 'killed the corn man'. In ancient times any stranger passing through the cornfield might be sacrificed as the ritual representative of the corn spirit, and it was long accepted that a forfeit might be demanded from any stranger venturing among the harvesters.

Among the other rites which have gone the way of sickle and scythe has been a ritual associated with gleaning, in which there was a garlanded Queen of Gleaners: this was once as important a rite of the corn harvest as the dolly. Yet although mechanization has gradually displaced the age-old rites, man stubbornly refuses to abandon ideas that are as old as the cultivation of corn itself. But the ceremonial side is today mainly confined to the revived agricultural festivals of the Church and in particular the Harvest Festival.

Most interesting, however, is the survival of a tradition that originated with ancient rites of the cornfield and which forms part of the wedding ceremony. It is not generally realized that the wedding cake is a relic of the symbolic corn ears worn by the bride in the pagan past to ensure fertility. These, in the course of time, were replaced by cakes and were scattered over the newly-married couple as they left the church. The pleasing custom of sending pieces of cake to guests and friends is a modern expression of an ancient desire to share with one's friends the magic of the corn spirit.

Cornucopia

Literally in Latin, 'horn of plenty': generally a twisted horn overflowing with fruit and flowers, a symbol of abundance and prosperity; often shown in the hands of Plutus, god of wealth, Fortuna, goddess of fortune, and other deities: in Greek mythology it was originally the horn of Amaltheia, the goat which suckled the infant Zeus; he rewarded her by putting her in the sky as the constellation Capricorn.

Slide Centre

Fairies of one sort or another were once commonly seen in Cornwall — and not only by imaginative children. Grown men and women had a healthy respect for the 'little people' and preferred to keep on the right side of these touchy and capricious spirits

CORNWALL

A CENTURY AGO the Cornish 'piskey', now surviving merely as a banal motif on innumerable brass toasting forks and other souvenirs for tourists, was alive in the imagination of thousands of Cornishmen. He was only one of a number of supernatural beings which were believed to people the countryside, both above and below ground.

Because of its isolation, geographical and linguistic, Cornwall has a strongly individual tradition of legend. Folk tales, or 'drolls' as they are called, are of giants, of saints not known in England, and of holy wells. Superstitions sometimes centre around the great standing stones, the cromlechs, the *men scryfa* left in Cornwall by the contemporaries of the men who put up Stonehenge. There are also the stories and beliefs of those who follow the traditional occupations of the Cornishman: mining tin and catching fish.

The Little People

In the 19th century, belief in the 'little people' was widespread, as illustrated in two stories quoted in A. K. Hamilton Jenkin's book *Cornwall and its People*. Mrs Rebecca Noall of St Ives, who died in 1927, told the author how she had seen the little people in her youth. One evening after working late at her trade as a dressmaker, she was walking home escorted by her father when an extraordinary sight appeared: on each side of them they saw a procession of the little people, walking in orderly fashion, arm-in-arm, with the greatest decorum and dignity. The old lady used to describe them as being the neatest little creatures imaginable, and beautifully dressed in scarlet cloaks and black steeple-crowned hats. Her father had evidently seen them as clearly as herself for, in a whisper, he bade her keep strict silence and avoid attracting attention by any exclamation of surprise. Thus they reached home in safety, none the worse for their strange encounter.

The fairies were mischief-makers and took a naughty delight in 'mazing' walkers in the country, so that they lost their way on familiar paths. The only way to break the spell was to turn some garment inside out. Jenkin had such an incident described to him by a man whose wife had recently suffered from the fairies' attentions. The small people could be aggressive: William Bottrell, in a 19th century collection of Cornish folklore, tells how a smuggler who planned to land some goods on Penzance's Eastern Green, went to spy out the land. Climbing a hillock, he came across hundreds of the piskeys dancing. 'Tom noted that the little men were all rigged in green,' says Bottrell, 'except for their scarlet caps (small people are so fond of that coloured headgear,

John Webb

The mischievous and sometimes malevolent piskeys, reputed to have caused so much havoc in 19th century Cornwall, have now become familiar figures in the Cornish tourist trade

that they used to be nick-named "redcaps"). But what struck his fancy and tickled him most was to see the little, old, grave-looking pipers with their long beards wagging. For the life of him, Tom could not forbear shouting "Will 'e be shaved . . . will 'e be shaved old redcaps?"' At once hundreds of the dancers lined up, armed in an instant with bows, spears and slings. 'Tom made off to the boat, and his comrades followed close on his heels; but on the way, a shower of pebbles fell on them, and burned like coals of fire wherever they hit them.'

Miniature Miners

The 'knackers' or 'knockers' are mine fairies. They haunt only the richest lodes, so to hear them at work was a good sign; many a lode of good ore has been discovered by hearing them singing and knocking. The miners would leave a small piece of their dinner on the floor for the knackers; if they did not, then the little creatures would find some way of punishing this meanness. This was called leaving a 'didjan' (a small piece) for 'bucca'. Originally a bucca was a spirit that must be propitiated and fishermen would leave a fish on the sands for him; at harvest time they left bread and beer. There were two buccas, 'Bucca Gwidden', the good or white one, and 'Bucca Dhu', the bad or black one. Many miners have recounted suddenly breaking through into a lode and finding the knackers all at work in a cavity, with miniature picks and other equipment.

Other small inhabitants of the West Cornwall peninsula were the spriggans, spiteful creatures forever carrying off babies from their cradles, and popping their own ugly brats inside instead. One way of getting rid of the changeling was for the robbed mother to take the creature and dip it in a holy well on the first three Wednesdays in May. Another was to make a smoky fire with green ferns in the hearth; when the house was full of smoke, the unfortunate changeling would be thrown down on the hearthstone, and the injured mother would rush out of doors and run three times around the house. When she returned, her own child should have been put in the changeling's place.

Spriggans, like the buccas, were watchful of old pieties. They guarded the vast treasures that were buried by the old kings. Anyone digging for treasure was likely to find himself surrounded by hundreds of spriggans, who would so scare him that he would be forced to rush off; after this experience he would be so ill that he must spend several days in bed. If he dared to return to the place he had tried to desecrate, he would find the hole filled in, so that no trace of it could be found.

Cornwall is famous for its logans or rocking stones, the best known example being at Treryn Dinas on the western peninsula. Logan Rock was most delicately balanced, though enormous. Like all others of its

kind, it had magical associations, and for thousands of years the Cornish had regarded the stone respectfully. Early in the 19th century a lieutenant in the Royal Navy for a wager sent the great stone crashing to the bottom of the cliff with a single push. Local opinion was outraged and the Admiralty ordered the officer to replace the stone at his own expense. The operation was duly carried out with block and tackle, but the logan never rocked as well again.

All the great rocks have some association. In connection with Merlin's Chair, a square formation of rock, situated opposite Mousehole, there was a saying:

> There are those who shall land on the
> rock of Merlyn
> Who shall burn Penzance, Paul and Newlyn

This prophecy was fulfilled in 1595, when a force of Spaniards landed and did just that.

Logans and 'chairs' are natural formations, but the prehistoric standing stones were put there by the hand of man. The most potent magically was the *Men-an-Tol*, the holed or 'crick stone'. The most famous of them is at Madron, near Penzance. Here there are three standing stones, the middle larger one pierced with a hole in its centre. Until this century, the country people used to crawl through this hole for the cure of lumbago, sciatica and cricks in the back. It also possessed curative powers for rickets. Children afflicted with this defect were passed nine times through the hole. A man stood on one side of the stone, a woman on the other; the child was passed with the sun from east to west, and from right to left, a boy from the woman to the man, and a girl from the man to the woman. The order had to be very strictly observed.

There are many other holed stones too in this neighbourhood, called 'Quoits'. According to local legend the giants who inhabited the district used these stones to play quoits. One of these was the giant who lived on Carn Galva, who used them to play with a human friend and also with neighbouring giants. The rocks scattered all over West Cornwall are the result of the giants bombarding each other when vexed.

Cursing and Ill-Wishing

There are many Cornish ghost stories associated with the sea. A seaman's apparition will appear to his wife or sweetheart at the moment of his drowning; sometimes a great ghost ship in full sail appears off the coast. The most gripping story concerns the wreck of Sir Cloudesley Shovel's flagship, the *Association*, on the Gilstone in the Scillies. This has recently been discovered by underwater divers, who have recovered considerable amounts of treasure from the bottom. It is said that a local man in the crew warned Sir Cloudesley that he was steering too close for safety. Incensed, the Admiral ordered him to be hanged. Before he was launched off the yardarm, the condemned man requested that a psalm be read, and chose the 109th, known as the 'cursing psalm'. The execution was duly carried out but not before he had sworn that the ship would sink. No sooner had the sailor's body been heaved overboard than the sky grew dark, and a tempest blew. The ghost of the hanged man appeared in the water, and followed the ship till she struck.

The cursing psalm was often used by witches. Powers of sorcery ran in certain of the oldest families, in the seventh son of a seventh son, or daughter of daughter. Touching a logan stone nine times at midnight also turned a person into a witch; another method involved the feeding of a toad with consecrated bread. Witches often transformed themselves into hares and would ride about in the night on ragwort stems, usually to a meeting at a logan stone.

Witches could cure complaints, and they could also 'ill-wish'. It is still believed by quite a few people throughout the county that power to bring ill-luck by cursing does in fact reside with certain persons, and that they use it. The idea is very much alive: anyone looking pale and wan is likely to hear the comment 'Es, me'andsome, yor lookin' brer ill-wished. Was the matter?' ('Yes, my handsome, you are looking very ill-wished. What's the matter?') This common expression does not in fact mean that the speaker believes that ill-wishing has taken place, but it does show the survival of the idiom.

As well as verbal charms, there were actual objects. The most interesting was the 'milpreve' (from the Cornish *myl pref*, 'a thousand snakes'). This was a type of prehistoric bead, blue with sometimes a yellow wriggly line (a 'snake'). Boiling water with this bead, which is also known as an 'adder stone', makes an effective draught for those stung by adders. This is a living link between Cornwall and the Druids, for Pliny describes how among the Druids a bead known as the *ovum anguinum*, the 'snake's egg' was worn as a badge of office, and how it was formed from the breath of a mass of snakes.

These milpreves were often worn in rings by white witches or 'pellars', who used to provide written charms for placing under pillows to work against ill-wishing. They often charged a handsome fee for this service. Numerous omens predicted death: the sudden appearance of rats or mice in a house, the perching of a bird on the window-sill of a sick person's room, a blackbird seen through glass or the appearance of a robin. The hand of a dead man used to be passed over sore eyes or facial disfigurements. A wedding ring taken from the hand of a dead woman was supposed to be effective in curing a stye on the eye, if the eye is stroked with it.

Although many of the superstitions recorded by folklorists at the end of the 19th century have disappeared, there are still many curious survivals in the county, among fishermen and in children's talk. There are still families which get up at dawn on May Day and go for a long country walk – a tame survival of the elaborate 'Maying' ceremony of former times, but a real one nevertheless.

CORRESPONDENCES

CORRESPONDENCES

THE LION, THE SPARROWHAWK and the phoenix, the colour yellow and the number six, the heliotrope and the sunflower, gold, the god Apollo, a child, the zodiac sign of Leo, cloves, cinnamon and myrrh, a cock, a sceptre: the link which connects the items on this list together is the fact that they are all associated with the sun in ritual magic. These chains of association are part of what is called a 'system of correspondences'.

The most familiar correspondences are those between the days of the week and the planetary gods: Sunday is the day of the sun, Monday of the moon, and so on. European magicians use this set of links as a guide to the best time for performing different types of magical operation. For example, the *Key of Solomon*, the most famous of European magical textbooks, says that Sunday, the day of the sun (or one of the traditional hours of the sun – see DAYS) is the right time for a ritual intended to gain money or attract the support of influential people. A magician performing a ceremony for this purpose will use as many of the things which correspond to the sun as he can. He will light six candles on his altar, he will wear a gold ring on his finger, he may drape the room in which he is working with yellow hangings, he may wear a yellow robe adorned with hexagrams, six-pointed stars. He will burn cloves, cinnamon or myrrh in a brazier, and he may perhaps sacrifice a cockerel. He uses these things because he believes that they are secretly linked with a powerful force or current of energy operating in the universe, and that by using them he attracts this force and brings it to bear on the object of his ceremony.

This idea is part of one of the basic beliefs underlying European magic, the conviction that the universe is not a disorderly collection of stray bits and pieces but an ordered whole, a design or a pattern. The main strands in the pattern are the correspondences. They are the magical equivalent of a scientist's classification of the phenomena he studies into orderly groups, and they go back to men's attempts to make sense of the world by classifying things in terms of the gods who controlled them. The modern magician has substituted for the gods the mysterious currents or forces, at work both in himself and in the universe outside him (see FORCES), but many of the correspondences are drawn from the ancient world and are based, not on any principles known to science but on a symbolic or poetic logic which links together things that outwardly and rationally do not appear to be connected.

The dove and the sparrow, for instance, are still said to correspond to Venus, the force of love, just as they were sacred to Aphrudite in Greece, because they are noticeably amorous birds.

Planets, Metals, Colours

Similarly, the traditional connections between planets, metals and colours have a certain logic behind them.

Planets	Metals	Colours
Sun	Gold	Yellow
Moon	Silver	White
Mercury	Quicksilver	Grey
Venus	Copper	Green
Mars	Iron	Red
Jupiter	Tin	Blue
Saturn	Lead	Black

Gold and silver belong to sun and moon respectively, partly because of their colour and partly because it was natural to connect the two most valuable metals with the most valuable planets, the ones which gave light. The sun's link with gold explains the *Key of Solomon's* recommendation of Sunday as the right day for a magical operation to make money.

Quicksilver belongs to Mercury because it is the most mobile of the metals and Mercury is the fastest-moving planet. Green is the colour of Venus or Aphrodite as ruler of Nature, the force behind the green growth of vegetation, and copper is probably her metal because Cyprus was both the place of Aphrodite's birth and also the classical world's principal source of copper.

Iron is the metal of Mars because of its use in weapons of war and red is the colour of blood and bloodshed: also the planet Mars sometimes has a reddish look. Blue belongs to Jupiter as lord of the sky but his connection with tin is obscure though very old, for the Sumerian term for tin was 'metal of heaven'. Lead, the darkest and heaviest of the metals, and black as the colour of death were naturally associated with Saturn as the dimmest and slowest-moving of the planets known in antiquity (see also COLOURS).

The same type of thinking lies behind the other sun correspondences listed earlier. The cock, for example, is here because it greets the sun at dawn, and the sparrowhawk because it soars towards the sun. Cloves and cinnamon correspond to the sun, as the preserver and sustainer of all life on earth, because they were used as preservatives, and do in fact have powerful bacteria-killing properties. Myrrh is also a preservative, used by the Egyptians in embalming corpses and offered at midday to the Egyptian sun god.

Magicians influenced by the Cabala relate their correspondences not only to the planets but to the ten *sefiroth*, the aspects of God or parts of the divine being in the cabalistic Tree of Life, and also to the 22 Paths which link the sefiroth together on the Tree, and to the 22 letters of the Hebrew alphabet and the 22 major trumps of the Tarot pack (see CABALA: TAROT). A detailed system of cabalistic correspondences was published by Aleister Crowley in his book *Magick in Theory and Practice*. It was based on the work of Crowley's one-time master and later bitter enemy Macgregor Mathers, head of the Order of the Golden Dawn (see GOLDEN DAWN).

One of the uses of this system is to provide the aspiring occultist with a set of signposts on the 22 Paths, along which he tries to 'rise through the spheres' or climb towards God, a hazardous undertaking in which he may easily stray from the true way (see CABALA). For example, the path from Malkhuth up to Yesod, the first path which he must follow, belongs to Saturn and emblems of death are assigned to it, including the colour black and the yew and the cypress, which are graveyard trees. If he sees a figure in red on the path, or a horse, which is a beast of Mars, or an almond tree, which belongs to the moon, he knows he has strayed from the true path. Similarly, if he believes he is in the region of Netsah, the sphere of Venus, he would expect to see doves or sparrows, or a swan, or a spotted beast like a leopard or a lynx, which are creatures of Venus.

CORYBANTES

THE WHIRLPOOL of Greek mythology not only mingled together a myriad of conflicting tales but sucked into itself many elements of foreign belief, especially from Asia Minor. The result, more often than not, is confused. The Corybantes provide a good example of this confusion. Their very name probably means 'whirlers', although even this is uncertain. In their various guises they usually appear as supernatural beings devoted to noisy, orgiastic dancing. But who they danced for and why is disputed – not only by modern scholars but also in the Greek stories themselves, where the Corybantes are frequently confused with another band of loud leapers, the Curetes (youths) of Crete.

The reason for this confusion is the interaction between Greek and Asiatic myths. Apart from their similar behaviour, both Corybantes and Curetes are presented as attendants on the Great Mother of the gods: Rhea in the Greek stories, Cybele in the Asiatic. As the cultures intermingled between the two sides of the Aegean Sea, Rhea and Cybele became identified with each other and so did their attendants.

Some authorities, attempting to make the matter clearer, tell us that the Corybantes are not Greek at all but purely Asiatic. They are ecstatic dancers in the train of the 'mountain mother' Cybele, playing the piercing instruments of the uplands. These were cymbals, rattles and 'bull-roarers' or stones with a hole in them which, when whirled round on a thong, made a noise like a rushing wind; they were believed to invoke rain. As well as being dancers, the Corybantes are associated with magical cures, especially of mental disorders. They seem, in fact, to be an example of the ancient and still surviving concept of the medicine-man, whipping his followers into a trance-like dance, purging them of evil and controlling the elements.

Such a precise attribution cannot get rid of the fact that the Greeks themselves muddled up the Corybantes and the Curetes

and when they were describing the Cretan Curetes quite often called them Corybantes.

Yet another element arises in that the Corybantes, or Curetes, appear to be connected with the Dactyls, who also served Rhea, the Great Mother. Rhea's husband, Cronus, had the habit of devouring their children. After she had given birth to three daughters (Hera, Demeter and Hestia), Rhea found that she was again with child. In order to cheat her husband, she decided to bear the infant secretly and went into hiding in a mountain cave in Crete. In which mountain the cave lay is, again, disputed: some say Aegeon, others Dicte, yet others Ida. It is interesting incidentally that Cybele was connected with another Mount Ida, in Phrygian Asia Minor. When her labour began, Rhea pressed on the ground with her hands. From each of her fingerprints, spirits or divinities sprang up to assist at the birth and protect the infant Zeus. These beings are generally called the 'Idaean Dactyls', *dactyl* being the Greek for 'finger'. There are various accounts of their nature and characteristics but they are all, in a sense, children of the Great Mother.

The Corybantes (or Curetes) are sometimes identified with the Dactyls and sometimes said to be the latter's offspring.

The Corybantes were frenzied armed dancers who guarded the infant Zeus. These strange nurses, who frightened away enemies by the clanging of metal, were believed to have magical powers of healing

Alinari

Whatever their name and parentage, they were armed with sword and shield which they clashed together as they danced round Zeus's cradle to prevent his father hearing his cries. (No scholar has yet suggested that the great god's later predilection for thunder dates from his earliest aural experiences.) The number of Corybantes or Curetes varies from account to account but they are often said to be three and it is thus that they are usually represented in art.

In other versions of the birth of Zeus, Hera persuaded her mother Rhea to allow her to take the new-born infant to the Cretan fastnesses, where she cared for her baby brother until he was old enough to marry her. In these accounts the Curetes are local youths assembled by Hera to dance and clash their weapons when the child cried. From a hymn discovered in Crete, it is evident that the Curetes were the object of a cult and were revered as attendants of 'Zeus Curos', the adolescent Zeus. The hymn is of the Hellenistic period but it has been plausibly suggested that the rite itself has far more ancient origins and that historical Curetes existed. These were Cretan youths who, in Minoan times, worshipped Zeus as a god of their own age.

In all these stories, whether they be of Greek or Asiatic origin, the same elements occur. In each there is a connection with the Mother of the gods, wild dancing, the warding-off of harm and the clashing of metal on metal. The last point leads to further ramifications. Many of the ancient tales present the Dactyls as the earliest workers in metal and also as magicians, weavers of spells both good and bad. The same qualities are also attributed to the other beings associated with the Dactyls, including the Corybantes, the Telchines, semi-divine beings of Rhodes, and the Cabiri, Phrygian deities associated with Samothrace and also with Asia Minor. In many versions there are dark stories of male fertility and mutilation, of three brothers, one of whom is murdered or revoltingly maimed by the other two.

This strand of fratricidal strife runs through all the accounts of the sons of the Great Mother. These artisan beings seem often to be thought of as dwarfs, echoing quite foreign myths such as that of the Niebelungen, the Teutonic smith-dwarfs who dwelt in caves beneath the earth.

Cosmetics

Preparations designed to beautify the skin: body painting, cicatrizing or tattooing are common in many parts of the world, for ornamental and also for magical and religious reasons: the Old Testament writers generally disapproved of cosmetics and the elaborate beauty aids of ancient Egypt, Greece and Rome were condemned as pagan and immoral by the early Christians.

See COSTUME; TATTOOING.

Axel Poignant

Cosmogony

Theory of how the universe was created: 'cosmos' means the universe as an ordered whole: the great variety of creation myths can be divided into two groups; aetiological myths were speculative accounts of how things came to be; ritual creation myths were an essential element of ceremonies meant to ensure that human society, prosperity, order and the universe itself would continue.

See CREATION MYTHS.

COSTUME

Clothes can be the distinguishing mark of the specialist, whether he is a medicine-man, a monarch or a monk. Their purpose is less to protect the wearer from the bitter winds and burning sun than from hostile magical attack

WHY HUMAN BEINGS took to wearing clothes is still not agreed upon by anthropologists. A hundred years ago such a question would have produced the inevitable response that the answer was to be found in the Bible, in the first chapter of the Book of Genesis. When Adam and Eve had eaten of the fruit of the Forbidden Tree they 'knew that they were naked' and hastily sewed fig leaves together to cover their bodies. In more secular language, human beings were alleged to have an innate sense of modesty.

This theory has fared badly as anthropological knowledge has increased. It has been pointed out that notions of modesty vary widely at different times and in different places. An Arab woman caught with her veil off will raise her skirts over her head, thereby causing what Europeans would regard as a much more indecent exposure. Chinese women used to think it improper to expose the foot, and Japanese women the nape of the neck. Even among Europeans the parts of the body – especially the female body – which could be exposed without impropriety have varied from age to age.

Another reason which is often given for the wearing of clothes, that human beings clothed themselves as a protection against the cold, does not bear examination either. The early civilizations arose in comparatively hot climates, in the valleys of great rivers such as the Nile and the Euphrates. But while the Egyptians wore little or even, in the case of the lower classes, no clothing, the Assyrians and Babylonians were enveloped in layers of fringed shawls. Even today the Arabs in some of the hottest

Above **The costume of medicine-men and shamans reflects the belief that wearing ornaments or clothes made from feathers or skins will transfer the qualities attributed to the bird or animal to the wearer: a North American Indian, wearing wings made from eagle feathers, performs the Eagle Dance to bring prosperity to his tribe**

Even in Europe, the parts of the body, especially the female body, which could be exposed without impropriety have varied from age to age

regions on earth wear voluminous clothing, while the inhabitants of Tierra del Fuego, in South America, where the climate is bitterly cold, wear no clothes in the proper sense of the word. They merely hang from their necks a kind of leather shield which they turn around in accordance with the direction of the wind.

According to yet another theory, clothes were invented as a protection against the bites of insects: this would explain the concentration of clothing around the middle of the body to protect the vulnerable sexual organs. The modern view, however, is that primitive man was not trying to protect his sexual parts from insect bites – although such a subsidiary motive may have existed – but from hostile magic.

Primitive man had a horror of sterility, for a tribe which did not breed doomed itself to extinction. This horror was reinforced by his belief in magic. The 'evil eye' of an enemy could, he believed, rob him of the power of begetting offspring. He therefore sought to to protect his sexual organs either by concealing them or by the more primitive method of hanging near them some kind of fertility amulet. From the earliest times the most potent of such amulets was thought to be the cowrie shell; specimens have been found all over the world in burial mounds, even many hundred of miles from the sea. This shell was chosen on the magical principle of 'like to like'. To those who believe in it, everything that *resembles* something else *is* that something else, by a kind of mystical affinity. Therefore since the cowrie shell bears a certain resemblance to the female sexual organs, it is believed to have the power of promoting fertility.

In the same way, if a powerful animal such as a bear can be killed and its teeth made into a necklace, then the wearer's own vigour will be reinforced. There were other motives, of course, in wearing such a necklace for, in addition to being an amulet, it was a trophy and a decoration. The history

Priestly clothes in both primitive and advanced societies often show strong feminine elements

Modern body-painting *(above)* is a striking throwback to the tattooing or painting of patterns with special magical or social meanings, common in many primitive societies *Right* Brazilian Indian: the pattern painted on his body represents a jaguar, an animal that figures largely in South American mythology

of clothes, apart from their utilitarian and protective qualities, is largely a matter of interaction of these three motives. They are still exemplified in a modern woman wearing a valuable necklace. It is at once a decoration and a proof of her husband's wealth and social status; men having transferred such proofs to their womenfolk.

In any developing civilization the secular and the sacred gradually become separated. Protective magic is more and more left to a specialist: the shaman or medicine-man. Cave paintings of the Ice Age show that such persons were already distinguished from what we would call the laity by their costume. As Lawrence Langner puts it (in *The Importance of Wearing Clothes*), 'The ornaments and clothes of the medicine-man, sorcerer or magician of present-day primitive religions are intended to indicate his special relationship to the spirits or gods and his control or power over them. Thus feathers, horns or antlers, amulets in the form of shells, claws and teeth of animals, and complex systems of painting or tattooing having special magical meanings, and symbols of the totems, form part of the medicine-man's or shaman's stock-in-trade.'

We do not nowadays regard tattooing as 'costume' but to the primitive mind there was not much distinction between them, especially if both shared the same magical purpose. The earliest tattoos of which we have any record are those on the skins of Egyptian mummies, some of which date back to 2000 BC (see TATTOOING).

Why Priests Wear Skirts

Anthropologists have long noted the curious fact that the costume of the shaman or his equivalent in primitive societies has strong feminine elements. Some scholars have suggested that the wizard wears women's clothes because 'he stole them from a witch'. In other words, the first channels of communication with gods or spirits were ecstatic women whose functions were gradually taken over by men. It is remarkable that priestly

clothes are still 'women's clothes' even in the most advanced of world religions.

A curious paradox in early representations of gods and goddesses is that sometimes they are shown elaborately clothed and sometimes completely naked. The reason would seem to be that sometimes it is desired to protect the *mana* or mysterious spiritual power of the deity in question from too rapid an evaporation. Sometimes, on the other hand, it is desired that the *mana* should flow out freely, as in the case of fertility goddesses. Hence the exposed breasts of the snake goddesses of Crete, or even complete nudity and the exposure of the sexual parts.

In classical Greece participants in sacred rites wore, in general, a longer version of ordinary dress. The Romans did the same

For Glory and Beauty

Part of God's instructions to Moses for making the garment of the high priest:

'And you shall make a plate of pure gold, and engrave on it, like the engraving of a signet, "Holy to the Lord." And you shall fasten it on the turban by a lace of blue; it shall be on the front of the turban. It shall be upon Aaron's forehead, and Aaron shall take upon himself any guilt incurred in the holy offering which the people of Israel hallow as their holy gifts; it shall always be upon his forehead, that they may be accepted before the Lord.

'And you shall weave the coat in chequer work of fine linen, and you shall make a turban of fine linen, and shall make a girdle embroidered with needlework.

'And for Aaron's sons you shall make coats and girdles and caps; you shall make them for glory and beauty. And you shall put them upon Aaron your brother, and upon his sons with him, and shall anoint them and ordain them and consecrate them, that they may serve me as priests. And you shall make for them linen breeches to cover their naked flesh; from the loins to the thighs they shall reach; and they shall be upon Aaron and upon his sons, when they go into the tent of meeting, or when they come near the altar to minister in the holy place . . .'

Exodus, chapter 28

with the difference that while the Greeks sacrificed bare-headed, the Romans always covered the head with a fold of the toga. The vestal virgins wore a white robe with a border which could be drawn over the head and fastened under the chin. The priests of some cults wore the high conical bonnet called a *tutulus*.

We have no pictorial representations of the religious garb of the Jews, owing to their horror of 'graven images', but there is an elaborate description of the high priest's vestments which Moses was instructed to make for Aaron (Exodus, chapter 28).

There is some difficulty in distinguishing between priestly vestments and royal robes. In the early days of monarchy, the king was a priest-king. Even when the two functions separated, the priestly character of the king's office persisted, even if only vestigially, in his ceremonial robes. Certain ecclesiastical garments are assumed to this day by the English monarch at a coronation, and in earlier times the resemblances were much more obvious.

When Constantine, the first Christian emperor, moved his capital from Rome to Constantinople he abandoned the austerity of his predecessors and clothed himself in oriental splendour, wearing a robe of gold tissue embroidered with flowers. Byzantine costume reached the height of its splendour in the 6th century, as can be seen in the splendid mosaics in the Church of San Vitale in Ravenna. In these it is impossible not to be struck by the ecclesiastical look of the imperial costume. The emperor was indeed a priest-king, the Viceroy of Christ on Earth, and if he did not actually say Mass he scattered incense on the altar and presided over Councils.

The vestments of the Roman Catholic Church followed a somewhat different line of evolution, their starting-point being sometimes purely utilitarian. The maniple, for instance, was a simple strip of linen worn over the arm and used, in the hot climate of Italy, to wipe the brow of the officiant. It later became more elaborate and was invested with all kinds of symbolic meanings. The same might be said of the cope, the chasuble, the stole, the cincture, and the dalmatic, a wide-sleeved, long loose robe slit at the sides. All these garments were originally worn by all persons above a certain social level but, from the 5th century onward, clerical garments became more and more different from the costume of the laity.

Frock-Coat and Top Hat

Liturgical costume – as opposed to the everyday dress of priests and monks – had become almost entirely stereotyped by the end of the 12th century. The only important modification was in the form of the mitre which began to be worn with the two peaks back and front instead of sideways and gradually increased in size. During the last two centuries of the medieval period, the Church grew richer and richer, and even the ordinary dress of the higher clergy reflected this affluence. For religious ceremonies, elaborate vestments, glittering with gold, jewels and embroidery were worn. Then, in the 16th century came the Reformation, one aspect of which was a deliberate attempt to return to the simplicity of the primitive Church.

With most of the Reformers this meant an abandonment of vestments altogether. The Mass was abolished or reduced to a communion service requiring no special garments. Preaching became the most important part of worship, and the Calvinist preachers wore for the purpose what was known as the 'Geneva gown'. This was simply the professional dress of the day, such as worn by doctors, lawyers and academic persons, and, like their costume, was black. In the pulpit ministers continued to wear a gown, usually of academic origin. For ordinary wear the cassock persisted until the 18th century, one of the last Anglican clergymen to wear it being John Wesley. By the end of this century the costume of a clergyman was no different from that of any gentleman, except, of course, that it was invariably black.

The Anglo-Catholic movement of the mid-19th century brought back the use of vestments for the service of the altar, but in ordinary life most clergymen wore the frock-coat and top hat of their lay contemporaries. Their neckwear, however, was white, but varied in form from the 'Pusey collar' of the High Churchman to the white tie of the Evangelical. Up to the early years of the 20th century it was often possible to tell a clergyman's religious convictions at a glance by this exterior sign.

It is only within recent years that psychologists and anthropologists have begun to give serious attention to the basic meaning and derivation of religious dress. Some of its elements undoubtedly go back to very primitive times, and have a significance which would horrify their pious wearers today. It has been suggested, for example, that the mitre is ultimately derived from the open-mouthed fish's head worn by the priests of Dagon. The form of the chasuble with the hole in the middle has been thought to have had, originally, a phallic significance, since all primitive religions were heavily concerned with fertility.

This may be speculation, but what seems certain is that religions which have retained a magical element have also retained their gorgeous and symbolic vestments. Those that have become, or are in process of becoming, ethical societies and social service organizations, have shed their splendour and conduct their services in ordinary dress. Some clergymen even decline to wear the clerical collar or any kind of distinctive dress on the grounds that it imposes a barrier between themselves and the laity. The magical apparatus of the medicine-man has thus been completely laid aside. (See also HEAD-DRESS.)

Counter-Charm
A spell intended to counteract hostile magic: examples are the gesture of defence against the Evil Eye, making the sign of the cross for protection against evil, or the hex signs, still seen on farmers' barns in the United States, which traditionally keep witches at bay.

The gentle cow plays an important part in mythology and nowhere more than in India, where in recent times she has become the symbol of the Indian nation

COW

THE COW FOR CENTURIES has been looked upon as a tangible symbol of life and fertility by nomadic and pastoral peoples, who depend on this uncomplaining beast for nourishment and prosperity. In mythology the cow has come to be associated in particular with the divine givers of life, the mother goddesses, either of the sky or of the earth.

In ancient Egypt the goddess Hathor, mother of the sun god, was frequently represented either as a cow, or as having a human face, with cow's horns and ears. It was believed that every night she engulfed the sun god, only to give birth to him afresh every morning. Similarly Nut, another Egyptian sky goddess, was depicted as a cow, supported by the other gods, and with the stars on her underbelly.

In many ancient religions, however, the cow as a source of fecundity took second place as an object of worship to the bull as a source of generative power. The male symbol thus took precedence over the female. This is true of ancient Near Eastern religion generally. In Greece and Crete, too, the bull-cult of Minoan-Mycenean religion was far more important than any corresponding veneration of the cow, though in some traditions the sky god Zeus was said to have been nursed by a cow. His consort, Hera, is described by Homer as *boopis*, 'cow-eyed'.

This idea of divine nourishment is also to be found in ancient Scandinavian mythology. Snorri's *Edda* tells of the primeval giant, Ymir, who was nourished by four rivers of milk from a cow. The beast, Audumulla, was herself created out of condensing frost. Being thirsty, she licked the blocks of salty ice around her and as the ice melted under her warm tongue, the head and then the body of a man appeared. This was Buri, grandfather of Odin, greatest of the gods.

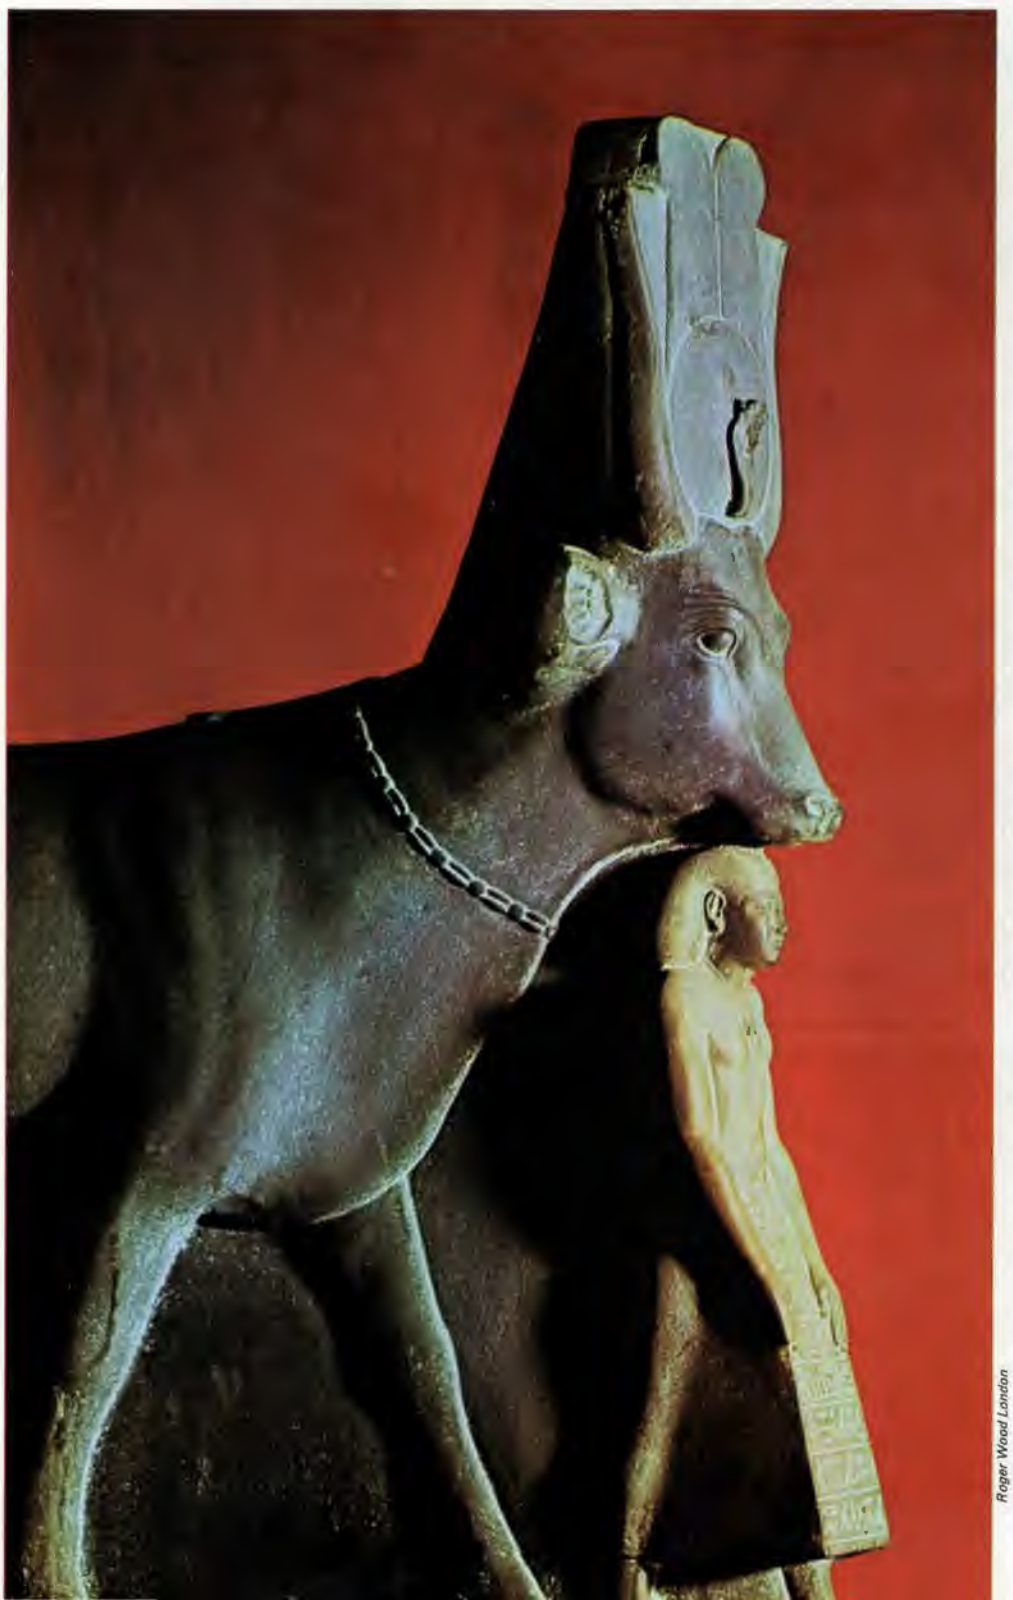
Accept the Cow

It is in India and in Hinduism that the cow plays the most striking role, both in mythology and in the day-to-day practice of religion. In practice, Indian cow-worship is restricted to one species of the animal, the East Indian humped zebu. The roots of this worship are certainly Indo-European, and have much in common with features already mentioned. The cow is thought of as a symbol of the divine bounty of the earth, and as the 'mother' of gods and men. The high god Varuna is called 'son of Aditi' in the oldest of the four chief Hindu collections of prayers and hymns, the *Rig Veda*, while the goddess Aditi is called 'the Cow, the sinless'.

The myth of the earth taking the form of a cow receives its first detailed expression in the *Vishnu Purana*, an ancient Sanskrit collection of legendary lore. In this, Prithu, the monarch of all, approached the earth in order to make her yield plants. The earth assumed the form of a cow and ran away, but was finally caught and persuaded to nourish the earth with her milk. Then Prithu milked the earth into his own hand, and there grew up all manner of corn and vegetables for man's food.

Although there was no express prohibition of cow-killing or the eating of beef in early Indian history, by the time of the great epic, the *Mahabharata*, of the 3rd century BC, it was stated categorically that the killing of a cow was the greatest of all crimes: 'All that kill, eat, and permit the slaughter of cows, rot in hell for as many years as there are hairs on the body of a cow so slain.' The *Laws of Manu*, the greatest of the Hindu codes of law, are less extreme. They lay down that slaying cows is a 'minor offence'. Provided the killer lives in a cow-house, bathes in urine, and follows the cows all day, standing when they stand and sitting when they lie down, he may expiate his crime in three months. It may also be noted that Zoroastrianism knew of similar prohibitions: Ahura Mazdah is the lord of all cattle, and therefore 'all robbery and violence against the (sacred) Kine' is forbidden.

The cow, by reason of her sacredness, is also a practical means towards the expiation of other sins. Again according to *Manu*: 'He who unhesitatingly abandons life for the



Roger Wood London

The Egyptian goddess Hathor, mother of the sun god and guardian of the dead, was often represented as a cow: statue of Hathor protecting the Pharaoh Psammetichus II

Brahmanas (the priestly caste) or cows, is freed from the guilt of the murder of a Brahmana, and so is he who saves the life of a cow, or of a Brahmana.' Similarly, he who has committed a mortal sin can be purified by attending cows for over a year. On a somewhat different level, a birth at an inauspicious time can be remedied by passing the infant beneath the body of a cow – thus bringing about a symbolic rebirth from the source of holiness.

Death Clutching a Cow's Tail

Not only the cow itself, but also its products, are powerful sacred instruments in Hinduism. They are especially effective in purifying a person from the stain of sin. There are five of these products: milk, curds, clarified butter, dung and urine; none must be wasted. All were important in the sacrificial rituals of early Hinduism, and have increased in significance down the ages.

Of the many reasons for the tenacity of the cow-cult within Hinduism, special mention must be made of the association of Krishna, the most popular of Hindu gods, with the cow. A legend told of Krishna's youth depicts him as a cowherd, devoted to their care, and yet dallying with the maidens who shared his responsibilities. Their devotion to him is a pattern of human devotion to God; but the setting, amid the cows, is also significant. Cow-worship was further strengthened in opposition to the Moslem invaders who had no compunction about the slaughtering of cattle. Again, it received fresh impetus with the development of the doctrine of *ahimsa* (harmlessness), with its implicit reverence for all forms of life, animal as well as human. A more modern development has been the symbolical identification of the cow with India as a nation – a localization of the original identification of the cow with the earth.

At present, the cow plays a variety of roles in the religious life of Hindu India. In some Hindu temples, a cow is brought in every morning, placed with her back to the image of deity and solemnly milked. In Hindu rituals generally, every part of the cow – as well as the five products mentioned earlier – has significance.

At an annual festival, the Gopastami (cow holiday), women attend an adorned cow, placed in the temple courtyard. They move round it four times, each time pouring water on the tail from a jug, and then lifting the tail to their eyes and head. Finally each woman kisses the cow, whispering, 'Truth belongs to you, and it is our duty to keep our promises.'

It is widely believed among Hindus that the cow is able to act as a pathfinder in the world beyond the grave, and that it is highly auspicious to be able to die clutching a cow's tail. For the lower castes, often forbidden direct access to temples, a cow-shed has come to fill the function of a temple in their daily lives.

The protection of cows in India because of their sacredness has led, ironically, to the neglect of their welfare, partly because controlled breeding and the exercise of ownership and restraint is virtually impossible. The traditional Hindu attitude, however, is summed up in Gandhi's well-known words: '"Cow Protection" to me is one of the most wonderful phenomena in all human evolution; for it takes the human being beyond his species . . . Man through the cow is enjoined to realize his identity with all that lives . . . "Cow Protection" is the gift of Hinduism to the world; and Hinduism will live as long as there are Hindus to protect the cow.'

Richard & Sally Greenhill

'All that kill, eat, and permit the slaughter of, cows, rot in hell for as many years as there are hairs on the body of a cow so slain', according to the *Mahabharata*, written in the 3rd century BC: even today in India the cow is a sacred animal, and its protection was described by Gandhi as being Hinduism's gift to the world

Coyote

Major Trickster figure in myths of Plains Indians and other tribes, including Californian; sometimes described as taking human form in a mythic past when animals lived like men; a creator and a central culture hero, he appears in many origin myths, teaching basic skills, bringing fire and so on, but his dual nature also places him in tales of entertainment where he appears mischievous, violent, erotic or merely foolish.

See TRICKSTER.

Michael Holford

Crab

Sometimes a symbol of the union of opposites, because it is at home both on land and in the water: in the Tarot card called the Moon a crab crawls up onto land from a pool, a symbol of the depths of the mind revealing themselves: in some of the Pacific islands crabs are gods, or the shadows or messengers of gods: the fourth sign of the zodiac is Cancer, the Crab.

See CANCER.

CRANE

CRANES FLYING IN LARGE, clamorous flocks attracted much attention in ancient times. The Greeks noted that the cranes travel in a wedge formation, which reminded them of the triangular shape of their letter D (Δ); and so a connection arose between cranes and the alphabet.

There was also a mythological or symbolic association between cranes and trees. On a Celtic altar of the 1st century AD, found in Paris, the god Tarvos Trigaranus is shown felling a willow tree in company with three cranes and a bull. In Eastern symbolism the crane and the pine tree, signifying long life, are often depicted together. In Irish legends there are indications that the crane was once regarded as having supernatural qualities. St Columba, who was called 'crane cleric' was said to have turned some women into cranes. In the West the lofty 'alphabetical' flight of the birds connected them with Apollo, the god of sun and poetry, and with Hermes, the patron of communications. But the association between long-necked birds and the sun is very ancient. Such birds appear frequently as a design on early pottery in the Middle East and it seems that not only cranes but other long-necked birds such as geese, egrets and even flamingoes were associated with the sun.

The migrations of cranes and geese have been connected with the coming of spring, and with increasing warmth and fertility, since time out of mind. Even today, when the numbers of cranes breeding in Europe are much reduced, the migrating flocks arouse excitement as they pass noisily overhead.

As happened not infrequently in the bird lore of antiquity, accurate observation merged into myth. Aristotle noted that cranes when sleeping stand first on one leg, then on the other. Aelian, the Roman writer of the 3rd century AD, improved on this; he stated that they posted sentinels and that these birds held a stone in the raised foot to help themselves to stay awake. Horapollo, a Greek grammarian living in the 4th century AD, referred to the crane as a symbol of vigilance. Thus the stone-grasping belief is probably an addition to much earlier tradition, based on the fact that the crane is indeed a wary bird.

Dancers Entombed Alive

During the mating season, cranes perform an elaborate and impressive type of dance, and this was interpreted by some ancient peoples as a form of magical ceremonial. The crane's curious movements during its 'dance' were imitated in human dances in Crete, China and elsewhere. Describing the courtship display of the American whooping crane, now a rare species, Margaret Rawlings wrote (in *The Yearling*): 'The cranes were dancing a cotillion . . . two stood apart, erect and white, making a strange music that was part cry and part singing. The rhythm was irregular like the dance. The other birds were in a circle. In the heart of the circle, several moved counter-clockwise . . . The outer circle shuffled around and around. The group in the centre attained a slow frenzy . . .' A crane dance was performed by human dancers in ancient Crete in connection with the labyrinth, the home of the Minotaur. The lay-out was circular and apparently the performance was enacted on an arena of swastika pattern. The circle and the swastika are both symbols of the sun so we may assume that the dance was a solar ritual, which is in agreement with evidence that the crane was a bird of the sun.

In ancient times crane dances were also performed in China. According to historical records Ho-lu, king of the ancient kingdom of Wu in the Yangtze Valley, offered his daughter a fish of which he had already eaten a portion, thereby breaking a taboo. She committed suicide, whereupon the king in order to propitiate her spirit and avert evil, sacrificed dancers by burying them alive. He constructed a magnificent tomb, furnished with objects of priceless value, for her remains. An underground passage led to the sepulchral chamber. The dance of the white cranes was enacted in the market-place of the capital. The crowd was ordered to follow the funeral cortege and boys and girls were instructed to enter the passage following the crane dancers. Then a machine was set in motion to close the passage and bury the dancers alive.

In the Far East crane dancers were associated with a group of ideas – thunder, rain, fertility and reincarnation. In Chinese records it is stated that black cranes and demons danced during times of drought. A picture of a crane is placed on the catafalque when coffins are carried to the grave in parts of China; a crane fashioned from paper is sometimes harnessed to the sedan chair containing an image of the deceased. Such a paper crane may be suspended from the window of the dead man's house during Taoist funeral ceremonies. The patriarch of Taoism, Lao-tze, is shown wearing a red robe embroidered with white cranes and riding a one-horned monster, not unlike a water buffalo. Thus in China, as in Crete and Gaul, there is an association between a supernatural being, a horned beast and the crane.

The crane figures in a number of fables. The story of a war between cranes and pygmies goes back to Homer's reference in the *Iliad* and is mentioned, among others, by Aristotle and, in English literature, by Milton. It was constantly repeated by Greek and Latin writers. It even travelled to India, where a tradition became current that dwarfs fought the monstrous mythical eagle of Hindu mythology, Garuda.

CREATION MYTHS

The phenomenon of birth, and artistic creativity, lie behind many of the world's myths of how the world began; this article deals with the creation myths of the ancient world, including the stories in the early chapters of Genesis

THE CREATION OF THE WORLD and the origin of mankind are the themes of many myths. They are found among the primitive peoples of most lands and they can be traced back into remote antiquity. Creation myths are of two kinds: aetiological myths which concern the beginnings of things, and stem from primitive speculation about their origins; and ritual myths, which were essentially connected with various periodic ceremonies, particularly at the New Year, designed to ensure the continuation and well-being of the state or even of the world.

It is interesting to consider how the idea that the world had a beginning or had been created arose in the first place. Although the idea is a familiar one to us, it is not self-evident. The earliest members of our race obviously could not have witnessed the creation of the world – indeed, to them in their brief lives, their physical environment must have seemed eternal, supposing that their minds were sufficiently developed to have reflected on the fact. However, two factors in the experience of the Paleolithic peoples doubtless gave them some idea both of the beginning of life and of creativity. The remains of Paleolithic culture reveal a great concern with the phenomenon of birth, both of humans and animals. The emergence of the child from the womb of its mother must surely have been a most impressive demonstration of the beginning of a new creature, whether human or animal. The earliest creation myths, indeed, instinctively used the imagery of biological birth.

The idea of creativity can also be traced back to the Paleolithic era. As the evidence of their art shows, the Paleolithic peoples must have been aware of the mysterious power of creation when they drew the image of an animal on the blank wall of a cave, or fashioned a piece of stone into the figure of a woman. When pottery was invented in Neolithic times, further stimulus was given to the conception of creativity. In several myths the creator-god is imagined as a divine potter who fashions men out of clay.

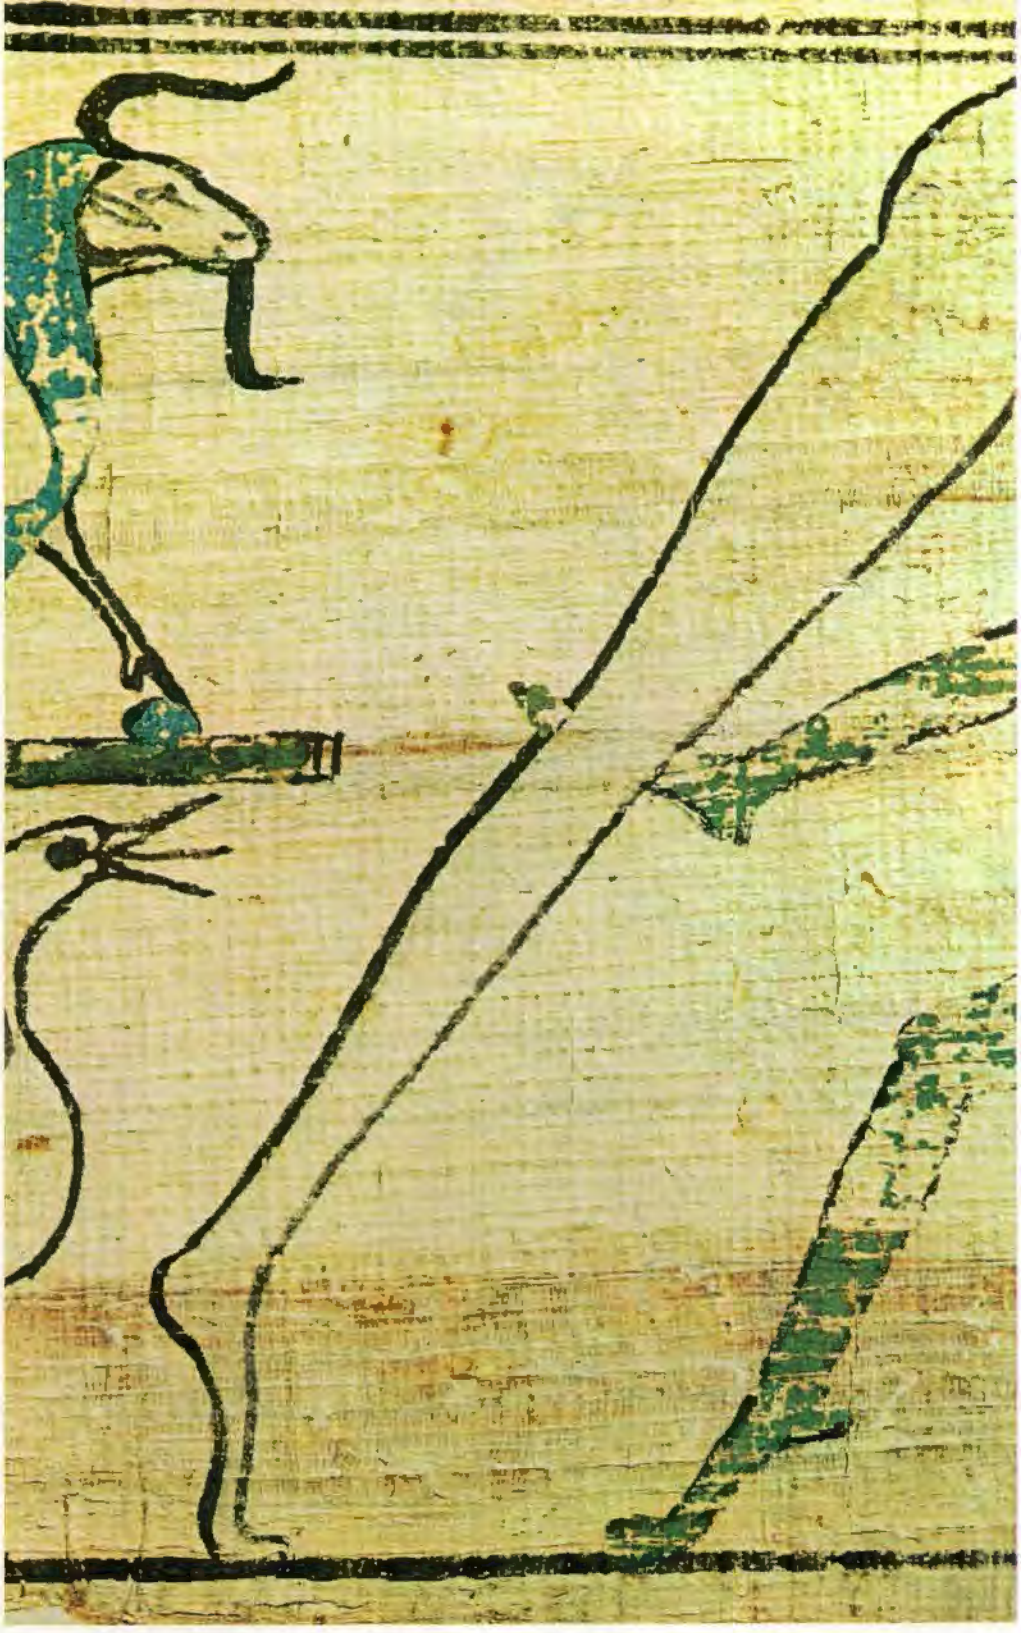
It is accordingly not surprising that in the earliest written cosmogonies, or creation myths, we find a mixture of thought and imagery about the beginnings of things which derives both from the new needs of civilized society, and from the cruder concepts of the pre-literary past. Egypt and Sumer provide our earliest examples of creation myths, the texts concerned dating in each instance from about the middle of the 3rd millennium BC.

Birth of the Earth and Sky

The earliest evidence of ancient Egyptian thought about the beginnings of things occurs incidentally in the Pyramid Texts. The fact is significant, because these texts are not concerned with the creation of the world but with the destiny after death of the kings of Egypt (see BOOK OF THE DEAD). The priests of Heliopolis, who composed the texts about 2480–2137 BC, drew upon traditions about their god Atum, whose temple at Heliopolis was one of the oldest cult-centres in the land. Atum was a mysterious deity, whose name could mean 'the not-yet-Completed One, who will attain (completion)'. He was identified with the sun god Re, under the composite title of Atum-Re. Various passages in the Pyramid Texts reveal that the priests of Heliopolis believed that originally there had been only a primordial waste of water, without shape or order, called Nun. The 'first time' started when Atum emerged from this primeval deep and began the work of creation. In order to begin this work, Atum needed a firm place on which to stand, and reference is made in the texts to a primeval hill which also emerged with Atum out of Nun. This primeval hill was identified with the site of Atum's temple at Heliopolis, thus making it the most ancient and sacred place in Egypt, since it was there that the creation of the world began.

God created the world in six days, according to the book of Genesis, and rested on the seventh day. Section of an initial letter in a 13th century illuminated manuscript in the British Museum, showing, from top to bottom, the acts of God on the seven days of Creation: the separation of light from darkness; the creation of Heaven; and of the Earth, the seas and vegetation; the stars, moon and sun; birds and creatures of the sea; animals and 'everything that creeps upon the ground', man and woman. On the seventh day God rested

British Museum



The sky goddess Nut and her brother Geb, the earth god, were originally locked in a close embrace according to Egyptian belief; their separation, by Shu the personification of air, gave the universe its shape: scene from the papyrus of Tamenill (c 1000 BC) in the British Museum, showing Nut, her body forming the vault of heaven, arched over her brother the earth

The idea of a waste of waters existing from the beginning, called Nun, from which the first land emerged, doubtless reflects the conditions of the Nile Valley. Each year the Egyptians witnessed the inundation of their land by the mysterious rising of the river Nile; then, as the flood subsided, the higher points of land began to emerge from the water. Beyond the delta of the Nile lay the Mediterranean Sea, the 'Great Green', which seemed a limitless expanse of water. Hence came the imagery of Nun and of the primeval hill.

Having conceived of the emergence of their god Atum, the priests of Heliopolis had next to imagine how he could have created the universe. Since they instinctively thought in terms of biological generation, they were, consequently, faced with the problem of accounting for the process of creation from a sole male deity. Their solution was crudely primitive. According to one passage in the Pyramid Texts, Atum produced two deities, Shu and Tefnut, by masturbation; in another passage, by spitting. These deities were, respectively, personifications of air and moisture.

Since Shu and Tefnut were male and female, the next stage in cosmic creation could be described as an action of procreation. From the union of Shu and Tefnut were born Geb, 'earth', and Nut, 'sky'. In later Egyptian art, Shu, as the personification of air, is represented as lifting up the sky goddess Nut from the recumbent body of the earth god Geb. Evidently the earth and sky were imagined as being at first in close embrace, and thus had to be separated in order to give the universe its shape. In art Nut is generally depicted as a gigantic woman, whose body over-arches the earth. The sun, moon and stars are shown as passing over her body, which forms the vault of heaven. It is interesting to note that Egyptian cosmogony differs from most other cosmogonies in making the earth male and the sky female.

The Heliopolitan priests, having thus accounted for the four chief constituents of the cosmic universe, namely air and moisture, earth and sky, did not go on to describe the origin of vegetation, animals or mankind. Instead, they told how from the union of Geb and Nut were born two pairs of deities: Osiris and Isis, Set and Nephthys. This fact significantly reveals the real motive behind their myth of creation. The four deities mentioned were ancient and important deities who originated from other parts of Egypt. By making these deities the great-grandchildren of Atum, the Heliopolitan priests asserted the precedence of their own god. In other words, this earliest example of a creation myth was designed to exalt Atum as the supreme creator, to whom other gods owed their existence, and his temple at Heliopolis as the most ancient and holy place in the Egyptian world.

The Cosmic Egg

This Heliopolitan cosmogony seems to have provided a stimulus to the priesthoods of other great temples in Egypt. At Memphis, as we learn from the famous Shabaka Stone, now in the British Museum, the priests of the local god Ptah neatly rebutted the claims of Heliopolis by claiming that Ptah was the original creator and that he used Atum as his agent. This Memphite cosmogony is more sophisticated in its imagery, and Ptah is represented as creating by the power of his magical word.

Hermopolis in Upper Egypt was distinguished by the peculiar form of its creation story. There, it was related, eight original beings, represented as frogs or serpents, deposited on an island an egg, out of which the sun god emerged to begin the work of creation. According to the tomb-inscription of a priest of Hermopolis in the 3rd century BC, pilgrims were still being shown the shell of this cosmic egg.

Michael Holford

When Thebes became the political capital, about 1580 BC, and its god Amun the chief state god of Egypt, the priests composed a cosmogony which represented Amun as a life-giving wind moving over the inert waters of Nun; this initiated the process of cosmic creation. Thebes, too, claimed to be the first of cities – 'the water and the land were in her at the First Time'. Other temples each had its creation myth, notable examples being those of Esna and Edfu.

One remarkable feature of the ancient Egyptian creation myths is that they show no concern to explain the origin of mankind. They are literally 'cosmogonies', in that they deal with the beginning of the 'cosmos' or world and the relations of the gods. There are passing references to the creation of men in various other texts; but the Egyptians were not so much concerned with the origin and purpose of the human race as were the Mesopotamians and Hebrews. There is evidence, however, of the manner in which the Egyptians believed that human beings were created, as for example in a bas-relief commemorating the birth of the pharaoh Amenhotep III (1405–1370 BC) at Luxor. In this the ram-headed fertility god Khnum is depicted as fashioning the infant king and his *ka* or double on a potter's wheel, while the goddess Hathor endows them with life. According to a text of the 7th century BC, 'man is clay and straw'.

In the creation myths of ancient Sumer attention was focused more upon the beginnings of civilization and mankind than on the origin of the world. The goddess Nammu, the personification of the sea, is called 'the mother, the ancestress, who gave birth to all the gods'. But it is Enki, the god associated with the fresh waters, who figures most as the creator in the early Sumerian texts. He is depicted as arriving by sea in Sumer, in a kind of golden age at the dawn of time, and impregnating Ninhursag, 'the mother of the land'. Enki's fertilizing activity produces the plants necessary for food. He also invents the pickaxe and brick mould, the two essential implements of Mesopotamian economy.

In one notable Sumerian myth the creation of mankind is described. To relieve the

gods from the toil of providing their own food, Enki causes human beings to be fashioned out of clay to act as servants of the gods. At a feast given by the gods to celebrate the creation of their new servants, the goddess Ninmah challenges Enki to deal with two freaks which she has made. These freaks are a eunuch and a barren woman. Enki adroitly finds a place for them in the Mesopotamian social system. He then challenges Ninmah to find a purpose for the two freaks which he himself has made, a diseased and an aged man. Ninmah can do nothing with them, and she curses Enki because what he has made cannot be unmade. This addition to the myth of the creation of mankind is significant; for it reveals that the Sumerians were concerned with the problems of disease and old age, and that they attributed these ills to the sport of the gods.

The most famous of the Mesopotamian creation myths is the Babylonian *Enuma elish*. This cosmogony is similar in motive to the Egyptian cosmogonies, in that it was designed to exalt the god of Babylon, Marduk. This deity was not reckoned among the most ancient of the gods of Mesopotamia; in fact, he was regarded as the son of Enki. But when Babylon rose to political supremacy, it was evidently felt by the Babylonian priests that the status of their god had to be raised.

This was done in the *Enuma elish* by telling how Marduk became the leader of the gods and the creator of the world. A primordial chaos is described, when there existed only Tiamat, the personification of the sea, and Apsu, who personified the fresh waters. From the mingling of these two entities the first generation of the gods was born, among whom was Enki, who slew Apsu. Tiamat, imagined as a great monster, sought to avenge Apsu by destroying the gods. Her horrific appearance, and the monsters she creates to aid her, so terrify the older gods that they readily accept the offer of the younger god Marduk to save them on condition that his supremacy is recognized. Marduk meets Tiamat in battle and kills her. He then slices up her body and fashions the universe from it. From the blood of Kingu, leader of Tiamat's monstrous host, Marduk makes mankind to serve the gods. The poem ends with an account of how the gods, in gratitude, build

The Babylonian god Marduk killed Tiamat, personification of the sea . . . he fashioned the universe from her body; and from the blood of the leader of her monstrous host he made mankind to serve the gods

Ole Woldbye

for Marduk his great temple at Babylon.

The Hebrew creation myths, though later in date than the Egyptian and Mesopotamian, are better known and have exercised a profound influence upon Western thought and culture. They are contained in the first three chapters of the Book of Genesis. Although these chapters in their present form have the appearance of a continuous narrative, careful analysis of the text reveals two distinctive cosmogonies.

Be Fruitful and Multiply

The first (Genesis, 1. 1 to 2. 4a) contains an account of the creation of the world in six days, the creation of mankind being the last episode. Scholars generally agree that this cosmogony dates from the 5th century BC, and represents what is known as the Priestly tradition. This account of creation reveals traces of Mesopotamian influence, particularly in the picture of the original watery chaos: 'And the earth was waste and void; and darkness was upon the face of the deep.' The Hebrew word *tehom* 'deep' is akin to the Babylonian Tiamat. What is especially notable about this Priestly cosmogony is that God does not create the world out of nothing, as later theologians maintained; a watery chaos existed before God's acts of creation. Mankind is represented as being created 'in the image of God' and commanded to 'be fruitful, and multiply, and replenish the earth, and subdue it'. God finishes his work of creation in six days and rests on the seventh, thus providing, according to the Priestly writer, the divine example and authority for the Sabbath.

The other Hebrew creation myth (which starts at Genesis 2. 4b) is recognized by scholars as an older tradition. They designate it the 'Yahwist' tradition, dating it about 900–750 BC. This version does not deal with the creation of the world but concentrates on the creation of mankind, which precedes the creation of the animals, contrary to the Priestly account. God (who is here given his characteristic Hebrew name of Yahweh) fashions Adam out of the earth (*adamah*) as the Egyptian god Khnum and the Mesopotamian deities made men out of clay. Having animated Adam with the 'breath of life', Yahweh places him in the

British Museum

garden of Eden, imagined as a kind of oasis. In the narrative that follows, the Yahwist writer was primarily concerned to show how mankind became subject to death through Adam's original act of disobedience to his divine creator. This episode involves the mysterious 'Tree of the Knowledge of Good and Evil' and the 'Tree of Life'. The writer's second motive, to account for the beginning of things, also finds expression in these chapters. He explains the origin of the names of animals, the creation of woman, the wearing of clothes, why the serpent 'goes upon his belly', the origin of the pain of childbirth and the toil of agriculture.

Egypt, Mesopotamia and Israel provide the earliest and most striking creation myths of the ancient world. Fragments of such myths have been found among Hittite records, and they seem to have exercised some influence on Greek mythology. In ancient Greece, however, there was no established tradition of creation myths. Certain vague references in Homer suggest some belief that Oceanus was the source of life. The Greek writer Hesiod devoted a whole work, the *Theogony*, to explaining the beginnings of things; but the composition is a strange mixture of mythical imagery and primitive rationalization. Traces of creation myths are found in other Greek writings. But the naturalistic explanations of the origin of the world advanced by the early Greek philosophers are, doubtless, more characteristic of the Greek mind here; and it is significant that Zeus was not regarded as the creator of the world.

Axel Poignant

The earliest forms of Iranian cosmogony are difficult to determine. Under the influence of Zoroastrianism a cosmogony recognizing two independent principles was later formulated, in which Ahura Mazdah was responsible for the good aspects of creation, and Ahriman for the evil (see AHRIMAN). Ancient Indian literature contains brief references to speculation about creation but no mythological tradition concerning the origin of the world. China also produced no established creation myth; the alternating cosmic forces of *yin* and *yang* characterize Chinese cosmogony (see CHINA).

In the myths of more primitive peoples, tales of the origin of life on earth often seem to take precedence over cosmogonies. Among American Indians, only tribes of the south-west, and some in California, have true creation myths – on the lines of the Zuni myth of the god-being Awonawilona, who existed before 'the Beginning', and who created Sky and Earth from whom all life came. Otherwise, Indian accounts of the origin of things concern, for instance, some culture hero like the Earth Diver bringing up sand from some primal sea, and making the earth out of that sand – not as a creation from chaos or nothingness. (See also FIRST MAN.)

Creed
A system of belief: in Christianity, a statement of the principal Christian doctrines; the creed recited during Mattins and Evensong in Anglican and Roman Catholic churches is the Apostles' Creed, dating from the 3rd century or earlier; the creed recited during the Communion service is the Nicene Creed, dating from the 4th century and containing formulae directed against the Arian heresy.

A notable 19th century advocate of cremation was an eccentric doctor who cremated his own son, at the risk of being arrested. The rapid increase in cremation over the last century is largely due to the efforts of a few individuals

CREMATION

IN MODERN BRITAIN, more people are cremated than are buried. In America, high pressure funeral salesmanship combines with organized religion to keep the figures down; still, cremation is growing more popular every year, so that now in California and other Pacific states one out of five dead bodies is cremated. Yet it is less than a century ago that cremation became legal. A long and heated battle for the right to dispose of the dead by burning was waged from early in the 19th century until the practice gained official sanction when England's Cremation Act was passed in 1902.

The earliest way of disposing of the dead was by burial. Cremation was very rare until the appearance of agricultural peasant-village communities from about 8,000 years ago. These communities spread through Europe from the 4th millennium BC, and while they mainly disposed of their dead by burial, cremation occurred as a variant rite. Thus in the long barrows of England and the chambered megalithic passage graves of Ireland and Brittany cremation took place, though not as the principal burial custom.

In the 2nd millennium BC in Europe cremation became more and more common, and from the 15th century BC was the main method of disposing of the dead. In Britain, cremation had completely displaced burial by the Middle Bronze Age and the dead throughout much of Europe were interred cremated in Urnfields, or cremation cemeteries, by the Late Bronze Age. Previously, cremated remains in bags or urns had been put in barrows. The prehistoric Iron Age saw mixed rites of burial and cremation. It seems clear that the change from burial to cremation in the 2nd millennium was one which took place within society and did not involve the incursion of new people.

Burning on the funeral pyre was the custom in Rome from the end of the Republic in the 1st century BC to the end of the 4th century AD. In Hindu India, cremation has always been widely practised and the burning ghats are a feature of many Indian cities today. Here the dead, not in coffins, are burned in public on funeral pyres. In the past, it was the custom for a widow to jump on to her husband's funeral pyre and be consumed by the same flames that burnt his body. This custom was made illegal in India in the 19th century under British administration but one still hears of isolated cases of such suicides by widows on the funeral pyre (see SUTTEE).

In some societies there have been objections to cremation because burning the dead was thought to be polluting the sacred principle of fire. This was not the objection of Christianity. The Christian religion objected to burning the dead because it seemed to violate and invalidate the doctrine of the resurrection of the body. In Christian countries cremation was forbidden for centuries although in the 19th century even clergymen advocated it.

Support from Science

The main defence of cremation in Europe came from people horrified by the insanitary conditions caused in towns by the custom of burial. The problems caused by drainage from churchyards and cemeteries and the waste of land in and around towns and villages were set out in a book by Edwin Chadwick, *A Special Inquiry into the Practice of Interment in Towns*, published in 1843. In the second half of the 19th century many physicians and chemists, especially in Italy and Switzerland, recommended the adoption of cremation. A congress at Milan in 1874 petitioned the Chamber of Deputies for a clause permitting cremation. In the same year the Cremation Society of England was founded to promote the practice of cremation. 'We disapprove

In many cultures burning the body of a dead hero or warrior was thought to be a fitting and spectacular way of speeding him on his journey to the otherworld, a romantic belief that retained its appeal even when cremation was rejected by the Christian church: illustration from a 16th century manuscript

British Museum

Golders Green Crematorium

of the present custom of burying the dead,' it declared, 'and desire to substitute some mode which shall rapidly resolve the body into its component elements by a process which cannot offend the living, and shall render the remains absolutely innocuous. Until some better method is devised, we desire to adopt that usually known as cremation.'

Four Pounds of Lime Dust

The founder of the society was Sir Henry Thompson who had for years brought the question of cremation to the attention of the English public. He used to say that the problem was a simple one: 'Given a dead body, to resolve it into carbonic acid, water and ammonia, rapidly, safely and not unpleasantly.' He himself experimented with a furnace in which a body weighing 144 pounds was reduced in 50 minutes to about four pounds of lime dust.

Great difficulties were placed in the way of all who wanted to bring back the ancient rite of burning the dead. The Council of the Cremation Society of England was unable to purchase a freehold until 1878, when an acre of land was obtained at Woking not far from the cemetery there. In 1882 the Council received an application to undertake the cremation of two deceased persons who had left express instructions that their bodies were to be burnt. The Home Secretary was approached but refused permission. The bodies were therefore preserved. A member of the Society thereupon erected a crematorium on his estate in Dorset, and the cremation of these two persons took place. A year later he himself died and was also cremated: the cremations were supervised by an official of the Cremation Society.

Police Protection

No comment, for or against, was made by the Home Office, who seemed nonplussed by the situation. In 1884, however, they took action when a Dr William Price of Llantrisant in Glamorgan, announced publicly that he intended to cremate the body of his infant son and proceeded to do so. William Price is justly described in *The Dictionary of Welsh Biography* as 'eccentric'. A practising doctor, he claimed to be an arch-druid, practised free love and opposed vivisection and vaccination. He carried out rites dressed in a white tunic with a huge fox skin on his head, and constantly advocated cremation. The dead boy had been born to him at the age of 83 and christened Jesus Christ.

At first the police did not know what to do but eventually Price was arrested. His trial took place at Cardiff Assizes, where Mr Justice Stephen ruled that no offence had taken place and that cremation was legal, provided that it was carried out without nuisance to others. A year later, in 1885, the first publicly organized and controlled cremation in Britain took place, at Woking. Price himself was cremated when he died in 1893.

There was still much opposition and prejudice in the early days and police protection was required at some cremations. Now all this has changed. Today 51% of those who die in Britain are cremated, and there are already more than 200 crematoria in the country. The ban on Roman Catholic cremations was lifted in 1964. Orthodox Jews, however, still continue to object to cremation.

The ashes from cremated bodies are disposed of in various ways. The remains of a Hindu funeral pyre are put in the river – usually the sacred river Ganges. The Digger Indians smear the ashes with gum onto the heads of the mourners. In Europe and America the ashes are stored in urns, buried in the earth or in graves inside a church, thrown to the winds, or scattered in a garden of remembrance. Cremation has dealt with the sanitary problem that worried the 19th century reformers; the scattering of ashes deals with the problem of storage and grave-space, but its widespread adoption brings to an end the tombs and monuments for the dead which were a feature of western European Christian civilization for so many hundreds of years.

Crescent
The shape of the waxing moon, and, so a symbol of increasing power, hence its adoption as the badge of the Ottoman Turks: it became an emblem of Islam: often an attribute of deities connected with the moon: a horned moon stands for growth and fertility, both because it is waxing and because horns are symbols of fertility (see HORNS): a crescent and star together stand for paradise.

Giraudon

'For the Cretans the supreme embodiment of the divine power in the world was feminine.' In her many roles the Great Goddess dominated the Minoan civilization, so named from the title of the Cretan king, Minos

CRETE

AN EXTRAORDINARY CIVILIZATION flowered in Crete after 2000 BC. Its geographical position made Crete a natural meeting-point for many of the cultural currents of the Mediterranean. It belonged to the Aegean world, making a link between Asia Minor and Greece, yet at the same time commanded sea routes southward to Egypt and eastward to the rich trading ports of the Levant. The influence of such widespread contacts is particularly evident in the religious ideas by which Minoan civilization was so largely inspired.

Crete seems to have remained uninhabited until early Neolithic times when the beautiful and fertile island attracted settlers, presumably from the adjacent region of Asia Minor. The Anatolian peninsula is now recognized as one of the earliest centres of the development of the new farming economy and then of urban life. Already by 6000 BC a large settlement such as Catal Hüyük had many shrines devoted to fertility cults. A supreme goddess, a lesser male divinity, birds, lions and bulls were represented in art. Actual bulls' horns were mounted as cult objects, while much later, in the Bronze Age of Beycesultan, in south-west Anatolia, these were architecturally formalized into horned altars – in one instance associated with a sacred wooden pillar.

These forms are strikingly similar to what was to emerge in Crete. Whether an important element of Cretan religion was directly derived from Anatolia, or whether it was only that both shared in a common inheritance is open to question. In spite of chronological and cultural difficulties, it is likely that there was a direct relationship. The initial settlement of Crete was followed by further immigration from the peninsula, and during Minoan times the two territories remained linked by ties of trade, and probably of language and of social custom as well.

Fashionably Dressed Goddess

For the Cretans the supreme embodiment of the divine power in the world was feminine. The Great Goddess or Mother Goddess, whose worship was common to the early agricultural peoples of the Mediterranean and south-west Asia, was probably immediately introduced into Crete by the Anatolian settlers. She kept her supremacy, although in appropriately changing forms, with the rise of high civilization. She was at once the one and the many. In the words that Apuleius put into the mouth of Isis herself in *The Golden Ass*, she was one 'whose godhead, single in essence but of many forms, with varied rites and under many names, the whole earth reveres'. In Minoan times the emphasis on pregnancy, maternal amplitude and nakedness found in the prehistoric idols was left behind and the goddess was usually portrayed in the same elegant fashion as the ladies of the court.

Among the 'many forms' of the Great Goddess some, indeed, were domestic. One was as guardian of the house, and particularly of the royal palace, where the prince may have ruled as her servitor and consort. At the same time her wilder aspects, more directly related to the old fertility cults, were no less important. She was the divinity of vegetation, mistress of animals, at home in forest, cave and mountain peak. In rites concerned with the death and rebirth of vegetation and seed, the goddess was associated with a young male divinity, probably both son and consort. She represented the continuity of the vegetation cycle, he its discontinuity. He died and was born again.

The various aspects of the goddess can be seen emerging in the divinities of historic times. As guardian she is best represented by Athene – already worshipped at Cnossus in late Minoan times. Demeter, with her other-self Persephone, was recognized as Cretan, as also was Hera. An association with doves seems to evoke Aphrodite, while Artemis best expresses her role as mistress of animals and virgin goddess of the wild places. Artemis was identified with Britomartis (the name means 'sweet virgin') who was worshipped in eastern and central Crete, and with Diktynna (Lady of Dikte), who was her western counterpart.

As for the young god, he too has local Cretan manifestations in Hyacinthus and probably also in the leader, or single embodiment, of the Curetes. Under the influence of the Achaean Greeks, the Indo-European Zeus was identified with the Cretan god, and the story of his concealment (or birth) in a Cretan cave, of the Curetes dancing and beating their shields to save the infant from his devouring father, was an accepted part of Greek mythology (see CORYBANTES). While the Greeks thus allowed their supreme god to have been born in Crete, they denied the inevitable Cretan heresy that he also died there.

Frenzied Dancing

The rites centred on the household goddess of the palaces and involving the princely families must have been formally ceremonious. Those enacted out of doors in the fertility and vegetation cults were ecstatic and mystic. The Greeks came to associate the island with mystical religion, and the Cretans themselves claimed, probably with justification, that they had enacted in public those Mysteries which at Eleusis were veiled in utter secrecy (see ELEUSIS).

Scenes engraved on gold signet rings and seal stones may represent rites celebrating the cycle of the seasons. The goddess is shown sitting below a tree, dancing in flowery meadows or occasionally perhaps lamenting at a shrine or over ritual jars. In these scenes the goddess is attended by female votaries, including young girls. In others, especially where boughs and trees are being plucked, she is accompanied by the young god. In these vegetation rites the dancing, especially of the god, is often ecstatic or frenzied.

Ritual meaning was expressed in positions of the arms. The goddess is often shown with arms bent and raised above the head, or extended before her. A common position of worship was with the right hand clenched and pressed against the forehead. Conch shells were blown, perhaps in order to summon the goddess.

The supreme deity of Crete was feminine, 'single in essence, but of many forms', one of which was guardian of the royal palace: the prince may have ruled as her consort. 'Prince of the Lilies', wall painting from the Palace of Minos at Cnossus; the lily was the most sacred flower in Crete

Hirmer Verlag

'Snake Goddess', her hands raised in a ritual gesture: the snake was generally attributed to the Great Goddess of Crete in her role as guardian of the household, although this symbol may also have been associated with fertility. Faience statuette in the Heraklion Museum, Crete

Funerary rites were related to the general conception of rebirth through the goddess. The elite were buried in unpretentious chamber tombs, dressed, ornamented and accompanied by pots, bronze vessels or other grave goods. It can be supposed that a happy Cretan view of the afterworld survived in the Elysian Fields of Greek mythology, associated as they were with the Cretan Prince Rhadamanthus, who was renowned as a just ruler. Frescoes on a sarcophagus from Hagia Triada in southern Crete illustrate funerary rites of the late Minoan period, c 14th century BC. They include the pouring of a libation, to the accompaniment of a lyre; the dedication of what look like fruits and wine at an altar; the blood sacrifice of a bull, to the accompaniment of a double flute, and apparently the carrying of offerings to the dead noble's tomb. The principal officiants are women wearing skirts of fur or fleece that may be priestly garments. Others, however, wear ordinary courtly dress and may have been royal ladies who were also priestesses. It seems to have been a princess of this kind who had been buried at Arkhanes near Cnossus. Among her rich grave furniture were gold amulets and a gold ring engraved with a ritual scene. She had been buried in a dress similar to that worn by the goddess on her ring.

The number and richness of ritual vessels are proof of the important place of libations and perhaps of ceremonial purificatory sprinkling in Minoan ritual. These vessels were often in the shape of the heads of sacred animals, particularly of the bull and lion. In one of the Hagia Triada funerary scenes libations are being poured from a large two-handled vase into another vessel that may have carried them into the earth. On a seal stone strange composite figures referred to as 'demons' are represented bearing elegant beakers, the contents of which are to be poured into a conical vessel held by the enthroned goddess. Little narrow-necked jars of exquisite workmanship may have served to sprinkle holy water.

Serious Play

Minoan society had reached a stage of sophistication at which activities which were originally religious had become partly secularized. For the peaceful, conservative island society this led to a kind of serious playing characteristic of Minoan culture. Crete was later said to be the home of the dance, and dancing – sometimes graceful, sometimes frenzied – was among the rites of the goddess. Less purely religious dancing formed an important part of both court and country life, probably often associated with seasonal festivals. The sacred nature of some ring dances appears in a model where naked dancers, arms clasped, are circling within an area enclosed by horns of consecration (formalized horns, indicating sacredness). Dancing in line in an altogether more stately fashion was practised by court ladies (see DANCE).

The most remarkable manifestation of serious play was in the famous Cretan bull games. Young men and girls, both wearing men's dress of tight-fitting belt and loincloth, performed athletic feats with the beasts, including vaults and somersaults between the horns (see BULL). The bull, symbol of male potency in relation to the goddess, was here encountered in actuality, possibly to celebrate life's renewal, or as an initiatory test of skill and courage. These games were, however, watched by lighthearted audiences. The palaces were provided with sacred ways and theatres that must have made a setting for processions and other performances.

Snakes in the Palace

The goddess of many names was also identified by a variety of symbols and manifestations. The most used were the horns, the pillar, the double axe, the tree, the dove and other birds, the snake and the shield. Horns of consecration were placed on palace buildings, on shrines, on the head of the goddess and in many other settings. Freestanding or sculptured pillars were part of the sacred furnishings of palaces, villas, shrines and tombs. They were anointed and offerings were made on, or to, them. Their primary meaning was probably phallic, but some authorities believe that they stood

for the Great Goddess herself. In 'pillar crypts' such as the one in the palace of Cnossus, functional pillars seem also to have been anointed and held sacred.

The double axe, perhaps originally a sacrificial symbol like the cross, came to represent the goddess. It may often, as in the scenes on the Hagia Triada sarcophagus, have been set on the apex of the sacred pillar; it was represented between the horns of a sculptured motif representing an ox's skull or within horns of consecration. For votive use, double axes were made in gold or bronze and in a variety of sizes (see also AXE). Trees appear in many ritual scenes, often growing in shrines or small enclosures. They were not formalized in the usual manner of symbols, but shown naturalistically, usually in leaf but occasionally bare.

The snake was principally an attribute of the goddess in her role as guardian of the household, although it may also have had chthonic and sexual meanings. The two 'snake goddesses' of Cnossus are well known. In the town shrine at Gournia nearby, a crude goddess figure was twined with a snake, and there were snake tubes among the utensils; these were terra cotta cylinders with snakes represented twining round them, the purpose of which is not known. Real snakes were probably kept in the palaces, and rooms were set aside for them in private houses.

The goddess was sometimes portrayed between a pair of lions (as long before in Anatolia) or between birds and fabulous griffins, of oriental origin. The god was similarly shown as a master of beasts. Among the least understood figures of Minoan art are those known as demons – strange hybrid creatures, which often have the head of a lion or an ass. They attended upon the goddess, sometimes in procession and bearing libation ewers; demons appear to have been particularly concerned with the growth of crops.

A figure-of-eight oxhide shield, a recurring motif, gave rise to a religious symbol. It was occasionally personified in male or female form, presumably god and goddess. Its siguificance may partly have derived from the shields of the Curetes, but it must also have stood for the protective power of the goddess. Not only the shield but also the snake, the bird and the tree all survived as attributes of the Athene of the classical world.

Spirals, including linked and running forms, were among the most popular motifs in Minoan art. They were often used decoratively, but possessed symbolic meaning, perhaps of eternal continuance. They appear on altars, shrines and ritual vessels. Among minor symbols were a sacred knot and a human ear and eye. The lily was the most sacred flower of Crete, and three poppy seeds might be worn or carried by the goddess.

Ecstasy in the Open Air

Unlike most of their contemporaries in the Bronze Age world, the Cretans had no large temples or temple figures. There were shrines of modest size in the palaces. At Cnossus there was a pillar shrine in the main court, and nearby the low, dimly lit throne room with stone basins and a sunken tank, suggesting use for purification ceremonies. The throne, with its flanking griffins, may have seated a divine prince, a high priestess or even a queen. Houses had their small shrines for private worship, and probably most towns and villages, like Gournia, had public shrines where little images and symbols of the goddess were ranged on a shelf in an inner sanctum.

More characteristic of Minoan Nature worship were sanctuaries in the countryside. Caves, probably often associated with the birthplace of the god, were among the most ancient and most popular. Some were walled and provided with chapels, altars and offering-tables. Very many generations of islanders visited them to worship and leave their offerings. The counterpart of the caves were the peak sanctuaries, of which there were about a dozen in the island.

The more ecstatic rites of the goddess were celebrated out of doors, in localities where there might be shrines for a sacred tree, or an enclosure with a sacred grove.

Minoan influence on the Mycenean culture of the Achaeans in the late Bronze Age is nowhere more dominant than in its religious forms. The goddess appeared on the mainland with all her familiar attributes. The pillar between lions stood above the great gate of Mycene itself. Yet even by this time nearly all of the gods of the Olympian pantheon were already being worshipped. Dionysus also had his place, and at Cnossus there was a shrine to the legendary craftsman Daedalus. The goddess still held a high place but the male divinities, and particularly Poseidon, were now perhaps held in at least equal honour.

Directly, and through Mycenean civilization, Minoan religion gave much to that of Hellenic Greece. In addition to the relationship between the Cretan goddess and her classical descendants, there was the powerful Cretan element in the Eleusinian Mysteries, and a traditional Cretan founder at Delphi, later to be presided over by Apollo. All the main centres of Greek mythology were of Mycenean origin. The connection between the cult of Dionysus and the ecstatic rituals of the goddess is evident. In their stories of Theseus and the Minotaur, the Greeks embodied their sense of the strangeness of ancient Crete and memories of its former power.

The Bull-King

Theseus and the Athenians at Cnossus:

Picture to yourself all the kings' palaces you ever saw, set side by side and piled on one another. That will be a little house beside the House of the Axe. It was a palace within whose bounds you could have set a town. It crowned the ridge and clung to its downward slopes, terrace after terrace, tier after tier of painted columns, deep glowing red, tapering in toward the base, and ringed at head and foot with that dark brilliant blue the Cretans love. Behind them in the noonday shadow were porticoes and balconies gay with pictured walls, which glowed in the shade like beds of flowers. The tops of tall cypresses hardly showed above the roofs of the courts they grew in. Over the highest roof-edge, sharp-cut against the deep-blue Cretan sky, a mighty pair of horns reared toward heaven . . .

We entered the Palace precinct by the great West Gate. On either side there were staring people. Before us was the great red lintel-column, the painted shadows beyond . . . Once more we waited, but this time in deep decorum. The people peeped discreetly, and murmured together. To pass the time, I raised my eyes to the walls; and then I forgot my resolve to stare at nothing new. For pictured there was the bull-dance, from the taking of the bull to the very end: beauty and pain, skill and glory, fleetness and fear and grace and blood, all that fierce music . . .

The guards' spears rattled. King Minos entered, and went up the side of the dais, and sat upon his carved white throne, resting hands on knees like the gods of Egypt. He wore a long red belted robe, and he looked tall; but that might have been his horns. The light from the portico gleamed dimly back from his gold face and crystal eyes.

In the quiet, I heard from the Cranes' soft indrawn breaths. But that was all. Old Cretans say we were the first band of victims, seeing Minos in his bull-mask, of whom not one cried aloud for fear.

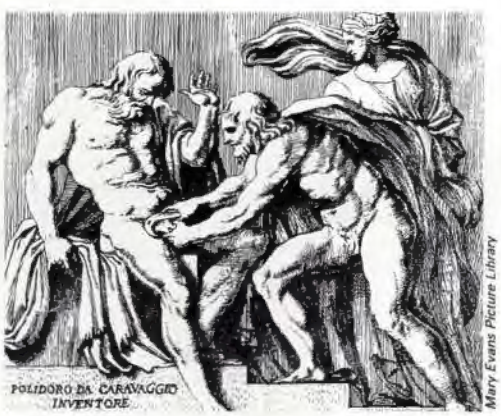
CRONUS

MORE IMPORTANT in myth than in cult, Cronus was chief among the Titans, the 12 'former gods', according to the Greek writer Hesiod (c 700 BC). The Titans were the children of Heaven and Earth, together with the Cyclopes and the hundred-handed monsters, but they were not able to reach the light until Cronus, the youngest Titan, castrated his father with a sickle and so separated heaven from earth. As king of the gods, Cronus married his sister Rhea, who bore him six children: Hestia, Demeter, Hera, Hades, Poseidon and Zeus. Earth and Heaven had prophesied that one of Cronus's children would overthrow him, and he tried to prevent this by swallowing them as they were born. But Rhea smuggled the last child away to Crete, delivering to Cronus a swaddled stone, which he duly swallowed. Zeus grew up safely, and somehow made Cronus regurgitate his other children; after a ten-year was between the older and younger gods, Zeus defeated Cronus and the other Titans and fettered them in Tartarus, where they remain.

It was formerly assumed that the myth reflected a historical displacement by the worship of Zeus of an earlier, no doubt pre-Greek cult of Cronus. Hittite tablets, however, have revealed that a curiously similar story was current in Asia Minor before 1200 BC. The counterpart of Cronus is Kumarbi, who becomes ruler of the gods by biting off and swallowing the genitals of Heaven (a combination of the castration and swallowing motifs). As a result, Kumarbi conceives a son, who becomes the weather god (the chief deity, corresponding to the Greek Zeus). Like Cronus, Kumarbi wishes to destroy his offspring, and probably swallows a stone in an attempt at abortion – the same action as in the Greek myth, but differently motivated. The attempt fails; the weather god is born, he fights a battle, and emerges triumphant.

Cronus castrated his father Uranus, 'Heaven', in order to free himself and his brothers and sisters from their prison in the depths of the earth *Above* 16th century painting on the ceiling of the Palazzo Vecchio, Florence, showing the infant Cronus mutilating his father *Below* Another version of Uranus's castration: Gaea, wife and mother of Uranus, and mother of Cronus, looks on with approval



Mary Evans Picture Library

It was probably in the period before 1200 BC, when eastern contacts were strong, that the Greeks took over the Asiatic myth, though some scholars put it shortly before Hesiod. We should like to know what Cronus was before he had oriental castrations and swallowings foisted on him, and why he was chosen for that role. Possibly he was already the father of Zeus, though his name indicates non-Greek (possibly pre-Greek) origin and the relationship cannot go back to Indo-European times. If he had special functions, they are obscure. For the Greeks of the historical period, he is fettered in the underworld, in other words, he plays no part in the world of men and has no influence there. (In 5th century Athens his name was used to mock the old, the stupid and the passé.)

There is, however, an alternative version which says that Cronus's reign was the Golden Age and that he now rules over the fortunate heroes in the Isles of the Blessed (see GOLDEN AGE). It was Zeus's accession that brought hardship and the necessity of tilling the soil. This may be connected with the annual Cronia, or Feast of Cronus, celebrated at Athens and certain other towns. Its date differed in different places, but so far as we can tell, it always fell in the idle period between harvest (May) and ploughing (October), and slaves joined their masters in merriment. If Cronus was a seasonal figure who played a part only at this celebration, the myth can be understood as a construction to go with it.

'We enjoy this feast and this leisure as a legacy from the time when Cronus ruled all the year round; but now Zeus is king, and we shall need our ploughs again.' This relationship between Cronus and Zeus would make a suitable basis for the adoption of the more complex oriental myth.

Child Sacrifice

Other traces of Cronus in cult or myth are scanty and of uncertain significance. Adopting the form of a horse, he mated with the nymph Philyra and became the father of the centaur Chiron. At Olympia there was a Cronus Hill, at the top of which priests known as the Kings made an annual sacrifice to Cronus at about the spring equinox; this may be a pre-Greek survival. Here, before the foundation of the Olympic Games, Cronus and Zeus were said to have wrestled.

Cronus Hills existed also in Laconia in Greece, and in Sicily. Carthaginian influence had been strong in Sicily and it has been suspected that there 'Cronus' may represent the Phoenician El or Moloch. Cronus was identified with this god at least as early as the 5th century BC, probably because of the Phoenician reputation for sacrificing children to him. The identification affected interpretation of the myth of Zeus's birth, child sacrifice becoming attributed to the early Cretans. The Romans identified Cronus with their Saturn for a different but equally superficial reason: the Saturnalia, though held at a different season (December) from the Cronia, had the same character of egalitarian merrymaking.

Like all the main Greek gods, Cronus was affected by attempts at etymology. From at least the 5th century BC the obvious (but false) equation was made with *chronos*, meaning 'time'. This fused with the idea of Time as a divine progenitor, which reached Greece independently from Iran, to give an allegorical sense to the story that he swallowed his children: Time consumes us all, his progeny.

Crook

The hooked staff of a shepherd, and so a symbol of the loving care of a pastor for his flock: a crozier, the hooked staff of a bishop or abbot, may be derived from the shepherd's crook or from the staff of a Roman augur: crozier is also used for an archbishop's cross.

WILLIAM CROOKES

EMINENT AMONG A GROUP of distinguished Victorian scientists who interested themselves in Spiritualist phenomena, Sir William Crookes (1832–1919) was a meticulous and penetrating experimentalist. He was elected to the Royal Society at the early age of 31, following his discovery of a new element, thallium. He was President of a number of learned societies, ranging from the Chemical Society to the Society for Psychical Research, and was President of the Royal Society itself from 1913 to 1915. His extraordinary versatility was reflected in the stream of papers reporting his work published between 1851 and 1918.

The group of scientists who concerned themselves with the fantastic phenomena claimed to take place at the Spiritualist seances which were so common at this time included the physicist Lord Rayleigh, the astronomer Sir William Huggins and the anthropologist Sir Francis Galton. Crookes's investigations, however, went far beyond anything attempted by his contemporaries. His energy was prodigious, and between 1869 and 1875 he undoubtedly attended more seances for physical manifestations than any scientifically qualified investigator before or since.

As a result of his investigations he reported the occurrence of a variety of phenomena in a series of papers published during 1870–1874 in his own magazine, the *Quarterly Journal of Science*. They included levitations of objects and of human beings, paranormal sounds, and the materialisation of hands and complete human forms.

Almost all of Crookes's records of his psychical experiments seem to have fallen into irresponsible hands and been destroyed after his death, so his work must be judged almost entirely from his published reports and the accounts of a few eyewitnesses. His contemporary papers were collected and published in book form: *Researches in the Phenomena of Spiritualism* (1874).

Best documented of all are his seances with D. D. Home, the renowned physical medium (see HOME). Home first arrived in England in 1855 from America, where he had already made his mark. He was at this time a tubercular young man of 22. It has been said that there was hardly a person of note in London who had not attended his seances or who could not consult a friend who had, although most scientific men, including the great Michael Faraday, preferred to keep away. Home's mediumship was unique in that he always sat as one of the 'circle' and not hidden within a cabinet, and his phenomena were normally produced in light rather than in the more usual total darkness so conducive to fraud.

Controversy continued, however, between those acclaiming Home and those denouncing him as a charlatan – albeit without any convincing evidence of fraud being produced. Into the arena of argument sprang Crookes, already an established Fellow of the Royal Society. In a paper published in the *Quarterly Journal of Science* in 1871, he announced that his experiments with Home's mediumship, which he described in detail, and which had been conducted in his own laboratory, appeared 'conclusively to establish the existence of a new force, in some unknown manner connected with the human organisation, which for convenience may be called the Psychic Force.' Before publishing this account he had submitted essentially the same paper to the Royal Society, only to have it rejected. In correspondence with one of the secretaries, Professor G. G. Stokes, he stated: 'I consider it my duty to send first to the Royal Society, for by so doing I deliberately stake my reputation on the truth of what I send.'

He invited the two secretaries of the Royal Society, Professors Stokes and Sharpey, to visit his home to witness the phenomena for themselves – an invitation which neither of them accepted.

Darwin Much Perplexed

There was much consternation in the scientific world over the appearance of Crookes's papers reporting his research with Home, Kate Fox and other mediums. Charles Darwin, writing to the anthropologist Sir Francis Galton on 23 January 1872, said: 'Have you seen Mr Crookes? I hope to heaven you have, as I for one should feel entire confidence in your conclusion.' In 1874 after reading Crookes's *Notes of an Enquiry into the Phenomena called Spiritual*, Darwin remarked in a

letter to Lady Derby, 'If you had called here after I had read the article you would have found me a much perplexed man. I cannot disbelieve Mr Crookes' statements, nor can I believe his results.'

Galton did indeed call on Crookes, and he was soon able to report to Darwin, in a letter dated 28 March 1872: 'Crookes is working deliberately and well.' Three weeks later Galton wrote: 'Crookes, I am sure, so far as it is just for me to give an opinion, is thoroughly scientific in his procedure. I am convinced, the affair is no matter of vulgar legerdemain . . .'

There were, however, critics of a virulent kind, notable among whom was Dr W. B. Carpenter, F.R.S., who made an anonymous and viciously personal attack on Crookes in the *Quarterly Review*. Crookes's reply (included in his *Researches*) was both crushing and devastatingly witty.

The most controversial of all the spiritualistic phenomena vouched for by Crookes were the fully-materialized spirit-forms which walked and talked in the Victorian seance rooms. Crookes described his experiences with 'Katie King', the form materialized by the medium Florence Cook, in three letters to the journal *The Spiritualist*. The fantastic nature of his reports on 'Katie' has led one recent critic, Trevor H. Hall, to conjecture that Crookes and Miss Cook were lovers, and that his published championship of her phenomena resulted from this relationship and a desire to protect her reputation. However, it is known that he also vouched for the authenticity of an equally solid 'phantom' known as 'John King', materialized by another medium, Charles Edward Williams, and it would be going rather far to attribute a similar motivation in this case!

Nothing to Retract

Much of the difficulty in assessing the work of Crookes and his contemporaries stems from the fraud that undoubtedly flourished in the darkness of the Victorian seance rooms. Crookes's comment on this was: 'I have myself frequently detected fraud of various kinds, and I have always made it a rule in weighing Spiritualistic evidence to assume that fraud may have been attempted, and ingeniously attempted, either by seen or unseen agents.' In addition he emphasized that the occurrences he described took place in nearly every instance *'in the light'*.

Crookes finally withdrew from participation in the Spiritualist scene, due to the pressure of his work in the physical sciences, and what he described as the 'calumny, slander, backbiting and abuse from Spiritualists', as well as from fellow scientists, that he suffered during his investigations. Whenever the opportunity presented itself, however, he continued to sit with both physical and mental mediums.

'I have nothing to retract,' he declared in his Presidential Address to the British Association in 1898, 'I adhere to my already published statements . . . I regret only a certain crudity in those early expositions which, no doubt justly, militated against their acceptance by the scientific world.'

Crookes's records of his experiments fall far short (as he himself admitted) of the standards the subject demands. His great scientific achievements may have engendered a certain assumption of omnipotence, for in 1871 he was able to say without embarrassment: 'Others . . . have gone so far as to question my veracity: "Mr Crookes must get better witnesses before he can be believed!" Accustomed as I am to have my word believed without witnesses, this is an argument which I cannot condescend to answer.'

Most present-day parapsychologists are sceptical of at least the more extreme phenomena accepted by Crookes and would consider him deluded. We cannot do better, perhaps, than sum up in the words of his friend Sir Oliver Lodge: 'It is almost as difficult to resist the testimony as it is to accept the things testified.'

CROSS

'Life is but the shadow thrown by the cross of Christ': to Christians everywhere the cross is the supreme emblem of their faith. Ethiopian Christian carrying an ornate cross

Camera Press

Older than Christianity, the cross has been used as a symbol of the world, the sun, fire and life. The Christian cross is an emblem of the triumph of life over death, of good over evil

CROSS

ALTHOUGH THE CROSS is best known as the supreme emblem of the Christian faith, cross symbolism is much older than Christianity. The simplest form of cross, the equal-armed or Greek cross *(crux quadrata)*, has been used since prehistoric times. The oldest examples are those found engraved or painted on flat pebbles, dating from c 10,000 BC, at Le Mas d'Azil, a cave in the French Pyrenees. Other pebbles found there have lines, circles and rudimentary human figures on them, and it is possible that they were 'ancestor stones', believed to contain the spirits of the dead.

In pre-Christian uses of the cross its meaning is usually uncertain. Sometimes it seems to stand for the four directions, or the four directions plus the centre, in which case it can mean 'the world' or 'everything'. Sometimes it is a symbol of the sun, apparently as the four spokes of the wheel which is a common symbol of the sun (see WHEEL). Both meanings reappear in early Christian symbolism, in which Christ is frequently associated with the sun and in which the cross is a symbol of his rule of all things, the arms of the cross stretching out to bring under his sway the uttermost length and breadth, the uttermost height and depth.

The Nazi Cross

The swastika, an equal-armed cross with a line projecting from each arm, has been found drawn on prehistoric clay figures of animals. It was revered as a symbol of the rain god in Central and South America, and the Aztec goddess of rain is depicted carrying a cross. The Aztecs and Mayans linked the cross symbol with the Tree of Life, erecting sizeable crosses in temples which greatly excited the conquistadors. In North America also certain Athapascan Indians used the cross symbol in their rites praising the new moon; New Mexican Indian grave mounds have yielded shells marked with crosses and swastikas; the Dakotas, Creeks, Blackfoot and other tribes brought crosses into rain-making magic; the Pueblos and others used crosses of many shapes as religious decoration, and some Californian tribes at times depict their great mother goddess with her arms and legs splayed on a cross or swastika.

The swastika has also been found in the Greek fortress of Mycenae and among the Etruscans in Italy, on early Christian tombs and on pagan tombs in northern Europe. There are swastikas on sword hilts of the 3rd century AD which were recovered from peat bogs in Denmark, and a fine 7th century scabbard fished out of the Seine has a cross and a swastika side by side.

The swastika usually seems to stand for the sun or fire, and so for life and vigour, perhaps because it originally represented the whirling round of a fire-drill, an apparatus for making fire by revolving a wheel at the base of an upright stick. (It has also been suggested, less plausibly, that the equal-armed cross originally represented the two sticks which primitive man rubbed together to make fire.) The Nazi party in Germany adopted the *Hakenkreuz* or 'hooked cross' as its official emblem, under the mistaken impression that it was a purely Germanic symbol (see SWASTIKA).

The *crux ansata*, shaped like a T with a loop on top of it, is also very old and was originally the Egyptian *ankh*, a symbol of 'life' which appears frequently in Egyptian art, held in the hand of a god or applied to the nose of a dead man to give him life in the afterworld. The Egyptians wore it, usually as the pendant of a necklace, as a charm to prolong life and they buried it with the dead to ensure their resurrection. The ankh looks like a key and may be connected with the symbolism of the key as the instrument which unlocks the gates of death and opens the road to immortality. It is found in some early Christian tombs and was adopted by the Coptic Christians of Egypt.

By This, Conquer

Besides the Greek cross, the principal types of Christian cross are the T-shaped cross *(crux commissa)*, the X-shaped or St Andrew's cross *(crux decussata)* and, most important of all, the Latin cross *(crux immissa)* in which the base arm is longer than the others, and which is generally shown in representations of Christ crucified.

When a man was crucified, his hands were tied or nailed to the cross-piece, and there was often a projection from the upright beam which helped to support the body. It might take days to die on the cross and it was not ouly a cruel death but an ignominious one, reserved for slaves and criminals of inferior social status.

It was probably as much the fear of ridicule, of the sneer that they worshipped a common criminal, as the fear of persecution or the dislike of seeming to ape the pagan veneration of idols, which made the early Christians reluctant to use the symbol of the cross openly. But they evidently regarded it as an important emblem, for they marked their burying-places and tombs with disguised crosses – an X, an anchor or an axe, for example. They also made the sign of the cross frequently, as a mark of their faith and for protection against evil. The 2nd century theologian Tertullian, who had a flair for exaggeration, said that a Christian traced the sign of the cross on his forehead in all the actions of daily life, at every forward step or movement, whenever he went in or out, when he put on his clothes, when he sat down or lit the lamps or went to bed.

The symbol of the cross naturally began to be used much more openly after Christianity had become the official religion of the Roman Empire in the 4th century and crucifixion had been abolished. It was said that the Emperor Constantine the Great was converted to Christianity in the year 312, when he was marching on Rome to deal with a rival claimant to the throne. He saw a towering cross of light in the sky, with the words *In hoc vinces* (By this, conquer). He defeated his rival in battle and attributed his victory to the Christian god. The initial letters of the Latin words, IHV, or later IHSV or IHS, when the phrase was expanded to *In hoc signo vinces* (By this sign, conquer) frequently appear in Christian art, partly because in Greek the capitals IHS are the first three letters of the name 'Jesus'.

Constantine used the cross as a symbol on his coins and statues, on armour and on the walls of his palaces. He was also fond of the chi-rho monogram, an X impaled by a P, being the Greek letters for the 'Chr' of *Christos*. Both symbols were very popular with his Christian subjects.

Finding the True Cross

'Life is but the shadow thrown by the cross of Christ,' wrote an anonymous medieval author, 'outside that shadow is death.' Once the instrument of an ignominious death, the cross became the symbol of eternal life, the emblem of a triumphant death which had brought to all men the promise of immortality in heaven. Suitably enough in view of its shape, the cross became one of the great symbols of the reconciliation of opposites, the opposites of death and life, of punishment and self-sacrifice, of shame and glory, of earth and heaven, of agony and joy.

By c 350 it was believed that the true cross, the cross on which Christ died, had been found. St Cyril, a bishop and lecturer at Jerusalem, said that pieces of its wood had been distributed all over the world. By the end of the century Christian writers in Italy knew the story that Constantine's mother, the Empress Helena, had discovered the true cross at Jerusalem in 326. Directing excavations on the site of Christ's execution, she uncovered three crosses, the nails which had pierced Christ, and the mocking inscription 'This is the King of the Jews'

To Each His Cross

Foreign crosses, other men's merits are not mine; spontaneous and voluntary crosses, contracted by mine own sins, are not mine; neither are devious and remote and unnecessary crosses, my crosses. Since I am bound to take up my cross, there must be a cross that is mine to take up; that is, a cross prepared for me by God, and laid in my way, which is temptations or tribulations in my calling; and I must not go out of my way to seek a cross; for, so it is not mine, nor laid for my taking up. I am not bound to hunt after a persecution, nor to stand it and not fly, nor to affront a plague and not remove, nor to open myself to an injury and not defend. I am not bound to starve myself by inordinate fasting, nor to tear my flesh by inhuman whippings and flagellations. I am bound to take up my cross; and that is only mine which the hand of God hath laid for me, that is, in the way of my calling, temptations and tribulations incident to that.

John Donne *Sermons*

C. M. Dixon

Radio Times Hulton Picture Library

Besides its Christian associations forms of the cross have been used as potent symbols of many other beliefs. In ancient times it could mean universality, representing 'the world' or 'everything' *Left* This carved Pictish swastika from Perthshire, symbolizing life and vigour is formed by human bodies *Above* 'Jews are not welcome here'; the Nazis adopted the *Hakenkreuz* or swastika in the mistaken belief that it was a purely Germanic symbol *Below left* Egyptian animal-headed gods holding looped crosses or *ankhs*. As a life-giving symbol the ankh customarily accompanied the dead to ensure everlasting life in the afterworld *Below right* Human bodies reappear in this curious cross, once owned by Montague Summers, an authority on witchcraft and demonology: now in the Witches' Mill, Isle of Man

which had been fastened to his cross. There was no way of telling which was Christ's cross and which were those of the two thieves crucified with him, until the crosses were taken to the bedside of a dying woman and the true cross revealed itself by miraculously healing her.

The inscription and a piece of the cross are preserved at the church of the Holy Cross in Rome, which was built on the site of one of Helena's palaces. One of the nails is said to form the inner circlet of the famous Iron Crown of Lombardy, at Monza. Pieces of the true cross were indeed distributed all over the world, in such quantities as to arouse cynicism.

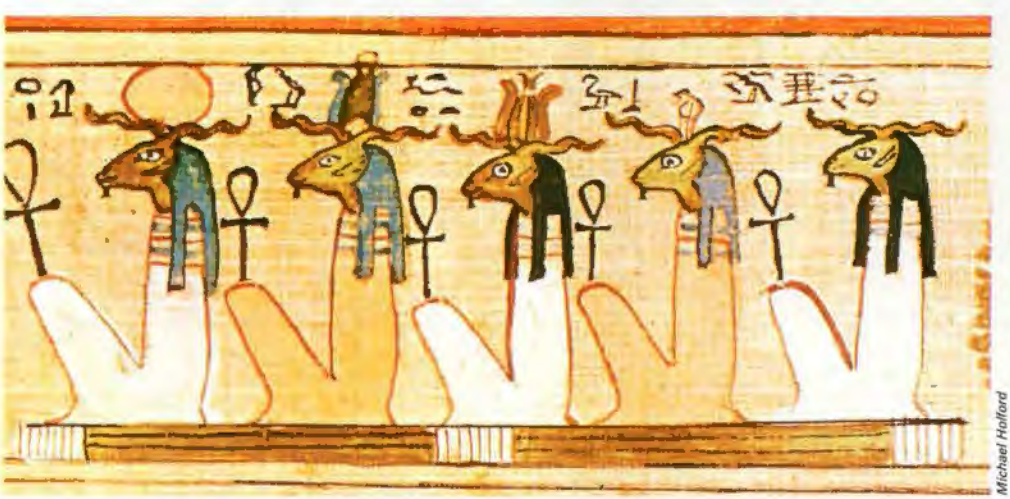
In 884 the Pope sent a piece of the wood of the true cross to King Alfred in England, an event which inspired poets to write expanded versions of an earlier Anglo-Saxon poem called 'The Dream of the Rood' (rood is an old English word for cross). The earliest surviving version of the poem is carved in runes on the 8th century cross at Ruthwell in Dumfriesshire.

The Glory-Tree

In the poem the true cross, 'the glory-tree', describes how it was hewn down and made into a scaffold, how it was set up on a high hill and how 'mankind's brave King' mounted it. And the cross goes on to tell how, when Christ's body had been taken down, it and its two companions were buried in a deep pit where 'friends found me', a reference to the legend of Helena.

Christian missionaries in northern Europe carved crosses on standing stones already venerated by pagans, to Christianize them. The eventual result was the Celtic standing cross, a stone pillar which sometimes has no cross-piece at all. When it does, there is often a circle round the point where the four arms join, the circle possibly standing for eternity and immortality (see CIRCLE).

Some early crosses in northern Europe dramatically combine Christian and pagan motifs. One side of the Gosforth Cross in Cumberland shows the Crucifixion but on the other side are scenes from pagan mythology of the destruction of the gods at the end of the world. This was evidently to show that in his death and resurrection Christ had overthrown the powers of hell,



Michael Holford

FDT

the false gods of the heathen who were regarded by Christians as devils.

Similarly, the Scandinavian world-tree which stood at the centre of the universe (see ASH) was replaced by the 'glory-tree', the cross on which the Saviour hung in death and in triumph at the exact centre of the world. In medieval art the cross is often shown as a tree. An example is a 16th century engraving showing Christ crucified on a tree whose branches are heavy with fruit, which men and women are picking, a symbol of the fecundity of Christ's sacrifice, the hope of immortality which his death brought to all men.

Christian artists and story-tellers frequently identified the cross with either the tree of life or the tree of knowledge in the story of Adam and Eve (see FIRST MAN). One widely accepted story was that when Adam lay dying, he sent his son Seth to Eden. The angel who guarded the gate of paradise gave Seth three seeds of the fruit of the forbidden tree. Seth placed them on Adam's tongue and Adam died happy, knowing that mankind would be saved from the consequence of his crime in Eden. The three seeds grew into a great tree, from which the cross was fashioned. Christ was crucified on it at the centre of the earth, the place where Adam had been created and where he had been buried. And Christ's blood falling onto Adam's skull redeemed him too at last.

Once the instrument of an ignominious death, usually reserved for common criminals, the cross became the symbol of eternal life, the emblem of a triumphant death which had brought to all men the promise of immortality in heaven. Raphael's *Crucifixion*

Michael Holford

The T For Protection

The figures shown beside the cross in medieval representations of the Crucifixion were used to point the moral that in founding the Church, Christ had abolished the authority of the Jewish Synagogue. Sometimes the Church is shown as a figure on Christ's right, catching in a bowl the flow of blood and water from his wounded side, the blood and water standing for the Mass and Christian baptism. On the other side is the Synagogue, a blindfolded figure holding a broken staff. Or the Church may be represented by the Roman centurion, who pierced Christ's side with a lance but then recognized him as the son of God, while the Synagogue is the man who held a sponge filled with vinegar to Christ's lips, the sour vinegar being the outmoded doctrines of the Jews. Or the penitent thief may be the Church and the impenitent one the Synagogue.

Even when the Virgin Mary and St John are shown beneath the cross, the Virgin may stand for the Church, the second Eve, born of the second Adam, and St John for the Synagogue. The oddity of this was explained by pointing to the story in St John's own gospel (chapter 20) of how he arrived at Christ's tomb before St Peter, but then hung back and let the impetuous Peter go in first. This showed, it was said, that the Synagogue must give place to Peter, to the Church.

Making the sign of the cross is naturally a common Christian defence against evil and the Devil, and magicians conjuring up evil spirits drew crosses inside the magic circle for protection. They also used the T-shaped cross for the same purpose. The origin of this is a passage in Ezekiel (chapter 9). The prophet saw a vision in which God ordered a mark to be made on the foreheads of the righteous inhabitants of Jerusalem. Those who had this mark would be spared when the city was destroyed and its people slaughtered.

The Jews believed that this mark was a T, the last letter of the Hebrew alphabet and so a fitting symbol of 'the end', 'the last days' when the world would be destroyed and made anew. Many Jewish burial urns of the 1st century AD in Palestine have T-crosses carved or scrawled on them in charcoal (though some authorities believe that these were Christian burials). The tradition that the letter T is a mark of protection became firmly entrenched in European magic.

Fragments of messages purporting to come from beyond the grave from several distinguished psychic research investigators were received by a group of eminent people who were interested in automatism at the turn of the century

CROSS CORRESPONDENCES

THE AUTOMATIST, Mrs Verrall, invented this term early in the present century to describe any concordance between the automatic scripts or trance utterances of two or more automatists operating independently (see AUTOMATIC ART).

The idea that such concordances might occur or might be experimentally induced was not entirely new but favourable conditions for testing it arose only after the death in 1901 of F. W. H. Myers of the Society for Psychical Research and the posthumous publication of his famous book, *Human Personality and its Survival of Bodily Death*. At that time a number of people who had been impressed by Myers began to produce automatic scripts purporting to come from Myers himself or from his friends and collaborators Edmund Gurney and Professor Henry Sidgwick, and comparison of their scripts soon began to reveal apparent concordances. The most important of these automatists were Mrs Verrall, a Lecturer in Classics at Newnham; her daughter Helen Verrall, afterwards Mrs W. H. Salter; Mrs Holland, pseudonym of Mrs Fleming, a sister of Rudyard Kipling; and from 1908 onwards Mrs Willett, pseudonym of Mrs Coombe-Tennant, who was a prominent public figure and a British delegate to the Assembly of the League of Nations.

All these were amateurs of the highest standing. The only professional 'medium' concerned was the famous American, Mrs Piper, who played a leading part in some of the earlier cross-correspondences. Later on, other amateur automatists were drawn into the group, which continued to function down to about 1930. By that date it is said to have produced over 2000 scripts – by far the largest body of 'automatic' material now in existence anywhere. These scripts were carefully transcribed, compared and annotated by a number of experienced investigators, of whom the most active were Alice Johnson, an official of the Society for Psychical Research, J. G. Piddington, President of the Society 1924–5 and Gerald Balfour, afterwards the 2nd Earl of Balfour. Many scripts showing cross-correspondences have been published and discussed in the *Proceedings* of the Society.

Spheres of Influence

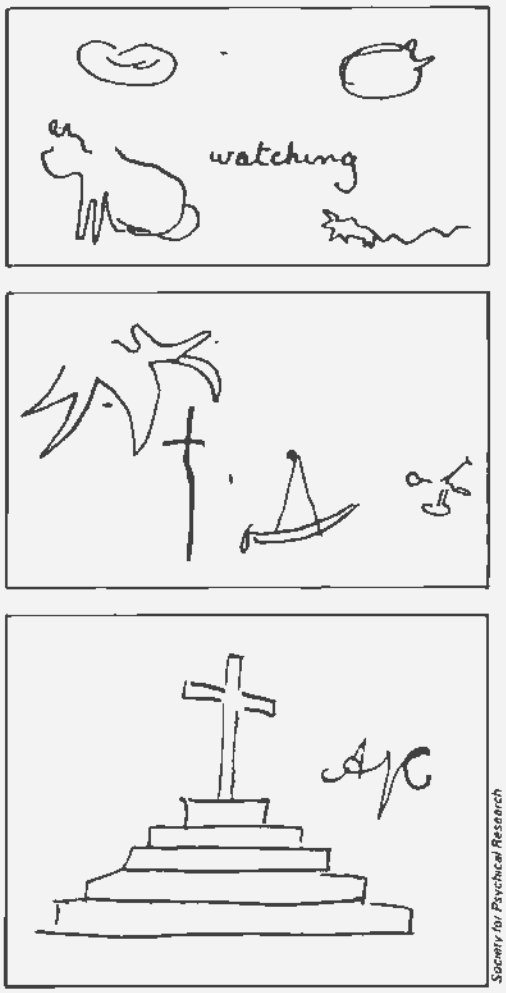
Cross-correspondences can be classified in various ways. Most of them occurred spontaneously, without any prompting by the investigators; but there are one or two experimental cases in which the 'script-intelligence' of one automatist was asked to introduce a specified topic into the script of another and more-or-less successfully complied. The following is a curious instance.

On 28 January 1902, Mrs Piper's script-intelligence, which called itself 'Rector', was asked to show itself to Helen Verrall with a spear in its hand. 'Why a sphere?' asked 'Rector'. The mishearing was corrected, but the confusion apparently persisted, for on 4 February 'Rector' claimed to have shown himself to Helen Verrall with a 'sphear' (so spelt). The claim was unsubstantiated so far as Miss Verrall was concerned; but on 31 January Mrs Verrall was seized by an impulse to write automatically and produced a brief script in a mixture of Greek and Latin which was only in part intelligible but contained *both* the word 'sphere' (in its original Greek form *sphaira*) *and* a Latin phrase descriptive of a spear (*volatile ferrum pro telo impinget*). This looks pretty much like a successful experiment in telepathy between the living, save that the telepathic 'message' was picked up by the mother instead of the daughter. That it emerged in a mixture of Greek and Latin is not particularly surprising: Mrs Verrall was conversant with both languages, and her earlier scripts were mostly written in dog-Latin and Greek.

Another distinction is that between 'simple' and 'complementary' cross-correspondences. The most obvious kind of simple correspondence is one in which the same thought is independently expressed, preferably in the same words and at about the same date, in the scripts of two or more automatists. Examples of this have occurred occasionally. A good instance is the 'Thanatos' correspondence, where within a fortnight the key idea 'death' was independently expressed in three different languages by three different automatists – Mrs 'Holland', Mrs Piper and Mrs Verrall (see AUTOMATIC WRITING). The weakness of this case is that in a series of communications purporting to come from the dead the theme of death is, to say the least, a pretty obvious one. It does raise an interesting question: how did Mrs Piper, who knew no Greek, get hold of *thanatos*, the Greek word for death, which seems to have conveyed nothing to her conscious mind?

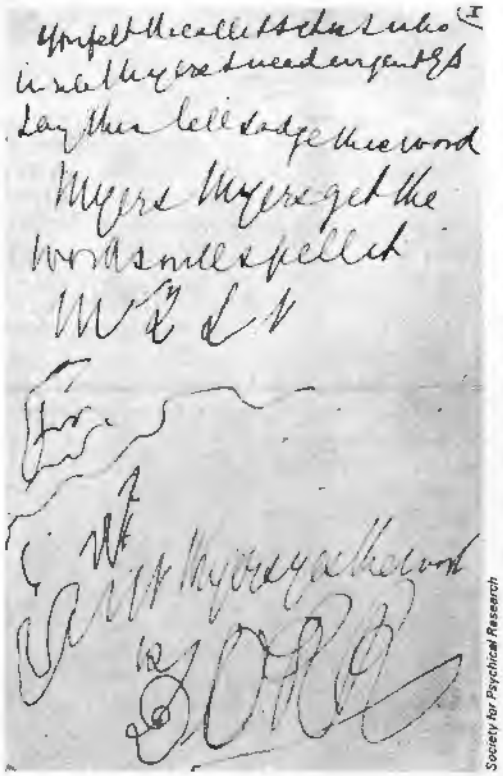
Psychic Jigsaw

More frequent and more important, is the complementary type; indeed, some writers recognize only this type as constituting a true cross-correspondence. The ideal complementary case would be one in which a coherent and significant message was split into several fragments, each meaningless by itself, with each being successively communicated through as many different automatists; the sense of the whole appearing only when their contributions were put together, forming a kind of jigsaw puzzle. It must be admitted that no actual cross-correspondence fully conforms to this ideal model. The 'complementary' fragments are usually found interspersed with irrelevant matter; the interval of time between one such fragment and the next is often rather



Society for Psychical Research

Three individual examples of automatic scripts, believed to be communications from the dead, which were received early this century by Mrs Verrall, a lecturer in Classics at Newnham College, Cambridge. On their own they were virtually meaningless, but when compared with messages and incidents encountered by other psychical researchers, they seemed to form a pattern. *Above* Message received on 11 March 1902, advising Mrs Verrall that there is no information today, but that she should watch for further communication *Centre* On 28 August 1901, Mrs Verrall produced an automatic script in Latin which made specific reference to fir trees in a garden; the script, signed with a scrawl, also included sketches of a sword, a bugle suspended by a nail and a pair of scissors. Unknown to Mrs Verrall, another researcher, Mrs Forbes, was at the same time receiving messages from her dead son, Talbot, a soldier killed in the Boer War. When the two subsequently met and compared notes, it was found that Mrs Forbes had several fir trees planted from seeds sent by Talbot. A further link was Talbot Forbes's regimental badge, a suspended bugle surmounted by a crown *Below* Between April 1903 and March 1906, Mrs Verrall received several messages alluding to a cross mounted on five stone steps, with a fresh green wreath, bearing the inscription AJC. Later at the home of another experimenter, Miss Curtois, Mrs Verrall's attention was drawn to a photograph which resembled in detail the cross of the scripts. She was told that it was a memorial to Miss Curtois's mother, whose initials were AHC



Society for Psychical Research

'You felt the call it I it is I who write Myers.' Automatic script produced by Mrs Willett, containing a message from F. W. H. Myers to the eminent psychical researcher Sir Oliver Lodge

long; and the 'message' when finally deciphered is not always so meaningful as could be wished. There are, however, a large number of cases which approximate in varying degrees to the ideal type. Most of them are highly complicated, turning as a rule on obscure literary allusions. For that reason they can be appreciated only by intensive study and are virtually impossible to summarize. All that can be done here is to quote briefly a single, relatively straightforward, example.

On 16 January 1907, Piddington asked Mrs Piper's 'Myers' intelligence to mark attempts at cross-correspondences in some way, say by drawing a circle with a triangle inside it.

On 28 January Mrs Verrall's script opened with the word *aster* (Greek for 'star'), followed by a number of what seem to be free associations with the word. Then came the following passage (the words italicized are partly quotations from, partly garbled reminiscences of, Browning's poem *Abt Vogler*): 'the hope *that leaves the earth for the sky* – Abt Vogler *for earth too hard* that found itself or *lost itself – in the sky*. That is what I want. *On earth the broken sounds – threads – In the sky, the perfect arc. The C major of this life.* But your recollection is at fault.' After this came two drawings of a triangle inside a circle, with a further reference to 'the part that unseen completes the arc'.

On 3 February Miss Verrall's script included drawings of a star and a crescent moon, with the words 'the crescent moon, remember that, and the star'.

On 11 February 'Myers', writing through Mrs Piper, claimed to have referred through Mrs Verrall to 'Hope and Browning' and also 'Star'.

On 17 February Miss Verrall's script contained another drawing of a star and the words 'the mystic three(?) and a star above it all'. (This has been taken as an allusion to the line in *Abt Vogler*, 'That out of three sounds he frame, not a fourth sound, but a star', which is an apt analogy to a complementary cross-correspondence.) Finally, on 8 April 'Myers', writing through Mrs Piper, stated that through one of the other automatists he had drawn a star and a crescent.

Voices from the Grave

The question of how such complementary correspondences are to be explained, is one of the most difficult and disputed questions in the whole field of psychical research. Four different explanations are theoretically possible: fraud, chance, telepathy from (or possession by) the dead, and telepathy between the living. The first of these, however, can be discarded with confidence. That a large number of persons of high intelligence and high moral standing should without apparent motive have conspired together to deceive the world and should have kept up the deception for some 30 years is psychologically incredible. The very ambiguity and vagueness of even the best cross-correspondences is the surest proof of the automatist's honesty.

The hypothesis of sheer chance has a different status. No exact limit can ever be set to the possibility of chance coincidence, and the sceptic can argue a number of considerations which suggest that chance may have played a greater part in the production of correspondences than the investigators have been willing to admit. But the fact remains that very few who have made a careful study of the complete evidence have found it possible to regard the correspondences as *purely* accidental.

There remains the alternative choice either of postulating a rather unusual kind of telepathy between the living or of accepting in some form the actual agency of the dead. Most of the original investigators came to prefer the second view for three main reasons. There was, first, the testimony of the scripts themselves: if the true agents were the subconscious minds of the automatists, why did they persist in calling themselves 'Myers', 'Gurney', and so on? Would not this have been a joint 'conspiracy to deceive' such as we have already rejected? Second, and more important, there was the argument from design. 'Simple' correspondences might indeed be explained by telepathy between the automatists, but how could this apply to 'complementary' cases, where the overall design was not understood by any of the automatists until their scripts were put together and compared? If none of them knew the design, none of them could have invented it. And thirdly, if one of the automatists was nevertheless the designer, how did she collect the materials for her design, some of which were outside her normal knowledge? Are we to picture her subconscious mind rummaging in the minds of her colleagues, until she came on precisely the items required for building up the correspondence? Such *selective* telepathy, it was urged, was unexampled and hard to conceive.

Unsolved Problem

To these arguments tentative answers have been offered by a number of critics. (1) To the argument from the consensus of the scripts their reply is that such dramatization is characteristic of all subconscious products, including ordinary dreams, and that at this level no real distinction can be drawn between believing and make-believing. Since it was Myers's death which set the whole movement going, 'Myers' naturally becomes the hero of the drama; and a dissociated fragment of Mrs Verrall's mind groping after an identity, may declare 'I am Myers' with a confidence as innocent (and perhaps as temporary) as that of the small child who states 'I am a steam engine'. (2) The argument from design has been countered by pointing out that 'complementariness' does not in itself prove intention. Ordinary telepathic impressions often emerge undesignedly in just the same fragmentary and enigmatic way: the famous Gilbert Murray experiments furnish good examples. (3) If, however, we concede that some correspondences do involve deliberate planning, the critic may urge that it is still unnecessary to attribute the planning to the dead. We do not know how telepathy works, in this case or in any other, but we need not imagine it in terms of picking out bits of the jigsaw from someone else's mind; we are equally free to think of an automatist subconsciously constructing the puzzle out of material already available to her, some of it familiar to her conscious self, some of it once familiar but now dropped out of conscious memory, and some which has drifted in on the accidental winds of telepathy. And if we ask 'What automatist?', a case can be made for replying 'Mrs Verrall'. She had known Myers well; she was the first of the group in the field and the first to hint at correspondences in her script; she possessed most of the classical learning needed for the construction of certain recondite puzzles; she had reported cases of spontaneous telepathy from her husband and her daughter long before she took to automatic writing; and, finally, after her death in 1916 there was a marked falling off both in the quantity and the quality of alleged correspondences.

There for the present the discussion rests, and there it is perhaps likely to remain until the complete body of script material is made available for study and analysis.

E. R. DODDS

FURTHER READING: The cross-correspondences have been published in Britain in a long series of articles in the *Proceedings of the Society for Psychical Research* from vol. XX (1906) onwards. A detailed list will be found in H. F. Saltmarsh's *Evidence of Personal Survival from Cross Correspondences* (Arno, 1975); E. D. Mitchell's, *Psychic Exploration* (Paragon, 1979) is also well worth reading.

CROSSROADS

THE PHRASE 'dirty work at the crossroads' sums up the ominous significance of places where roads meet. In Russia vampires lurked at crossroads and attacked travellers at night. In Japan phallic symbols used to be set up at road junctions to protect passers by, and in India offerings were made at crossroads to Rudra, the god who ruled ghosts and evil powers. A crossroads is an uneasy and uncanny place, perhaps because it imposes a choice of routes or symbolically of paths through life, with dangerous possibilities of choosing the wrong way and with the threat of the nightmare childhood experience of being lost.

In classical Europe offerings of food called 'Hecate's suppers' were placed at crossroads for this sinister goddess (see HECATE), whose image was often to be seen there, frequently in triple form – a statue with three faces looking three ways, or three wooden masks on a pole.

The 'suppers', which sometimes included cakes set with candles like our modern birthday cakes, also placated the malevolent ghosts which were believed to follow the goddess, ghosts which could not stay quiet in their graves but which roamed the earth hunting human prey.

It was an old custom to bury at a crossroads the body of a suicide, whose ghost could be expected to be restless and vengeful, with a stake driven through the corpse's heart to prevent it from walking. Criminals, whose ghosts would also be vengeful, were often executed at crossroads. On the other hand, some American Indians buried dead babies at crossroads, intending that the ghosts would 'enter' passing women and so be reincarnated.

The connection of crossroads with evil powers and ghosts made them suitable places for witches' meetings, for making a pact with the Devil and for operations of black magic – and sometimes white magic, as in many United States folk cures and marriage divinations that are required to be performed at crossroads.

Michael Busselle

According to one legend, the downfall of Britain will follow swiftly if the ravens in the Tower of London are harmed in any way

The sinister crow in its rusty black plumage is associated with death and disaster. In ancient times it had the reputation of being wily and knowing, the confidant of the gods and the messenger of man

CROW

THE CROW FAMILY form a group of conspicuous, large birds with a wide distribution throughout the world from the arctic to the tropics. In particular the raven and crows proper, of Europe and Asia, have attracted man's attention, and much folklore is connected with them. These associations arose primarily from their carrion-feeding behaviour; hunters in ancient times, aware that the presence of the birds provided clues to the whereabouts of game, and often of carcasses, would regard them as endowed with knowledge and insight surpassing their own. As death has long been a mystery to mankind the observed close association between carrion-feeding birds and corpses meant that they aroused disquieting responses.

The raven's habit of picking out the eyes from a corpse before eating the flesh was commented on by Aristophanes in *The Birds*. In the Bible, in Proverbs (chapter 30) it is said: 'The eye that mocks a father and scorns to obey a mother, will be picked out by ravens of the valley.' In Bohemia it used to be said that crows picked out the eyes of St Lawrence. One of the crows in the Scottish ballad '*The Twa Corbies*' says of the fallen knight, 'I'll pike out his bonny blue e'en.' By the odd kind of inversion which sometimes occurs in folklore it was said in Wales that blind people who showed kindness to ravens would regain their sight. In Czechoslovakia there was a tradition that a man who ate three ravens' hearts reduced to ashes would become a crack shot. The notion that by partaking of the heart or flesh of a creature one could acquire some of its qualities was extremely widespread and in this instance it was evidently supposed that the raven's farsightedness could be acquired. According to the Greek writer Porphyry (3rd century AD), by eating the hearts of crows one might acquire the birds' prophetic powers.

Why the Raven Croaks

Black, the colour of the crow, has long been associated with death and disaster; and because large birds of this colouring are relatively uncommon, a need was felt to explain their dark hue. A number of legends purport to explain how they acquired it. Thus, according to the Greek geographer Pausanias (2nd century AD) and other writers, when Apollo became the lover of Coronis, the mother of Asclepius, he commissioned a snow-white crow to mount guard while he went to Delphi; despite this, Coronis although already pregnant by him, became unfaithful with Ischys. Before the crow set out with the news Apollo divined what had happened and, infuriated that the crow had not picked out Ischys's eyes, turned the bird black.

Another story relates that the gods were sacrificing and the raven was sent to bring water from a fountain for a libation but he dallied, waiting until some figs were ripe. So the bird was condemned to suffer from thirst in summer – and that is why the raven croaks so hoarsely.

The frequent allusions in folklore to the association between the raven or crow and water might seem unaccountable, for these birds are not especially partial to damp habitats and, indeed, sometimes frequent rocky outcrops and ruins in desert country. The association has apparently arisen through ravens being frequently seen circling among black storm clouds. Thus the species was credited with some of the qualities of a storm bird such as were attributed to large high-flying, and sometimes mythical, birds in Asia and elsewhere. Among the Greeks and Romans the crow was likewise considered to be a weather prophet. Many Greek writers refer to the raven as presaging tempests, though some characteristics of its behaviour were interpreted as prognosticating good weather. The raven's association with clouds and rain meant that it was often regarded as a thunderbird.

Perhaps the most familiar episode in which the raven is associated with water is the account in Genesis of the sending forth of a raven by Noah from the Ark to search for land. This is derived from an older myth of the Deluge originating in the ancient city of Acre in Israel, in which the dove, swallow and raven are sent forth in turn to discover whether the waters had subsided. It is recorded that at Krannon in Thessaly there were two ravens and never more – a detail perhaps based on observations that the birds pair for life – but at Krannon the ravens were connected with a magical rain-making ceremony. Coins of the 4th century BC depict two ravens on a small wagon containing a jar of water with pieces of metal suspended from it. By jolting this contrivance the jangling sounds and splashing water simulated a miniature thunderstorm. It was believed that in this manner rain could be induced.

Messenger and Guide

In common with the eagle and some other conspicuous, large birds the raven was regarded as being in contact with higher powers; and in this capacity it was regarded as entrusted with carrying information, water or fire, or performing other missions. In what seems to be a variation of the Deluge story the culture hero of a Siberian tribe, the Koryak, comes to the rescue during a period of incessant rain by flying up to heaven and stopping the leak. The mythical association with water was apparently carried to the New World where we find an American Indian culture hero Yetl transforming himself into the form of a raven in order to obtain and escape with fresh water. He was surprised in the act and was turned from white to black. However, he succeeded in flying to earth and disgorging the water to become streams, rivers and lakes.

The mythological figure Raven is of course the major culture hero and trickster of all tribes of the North Pacific coast. (Crow is a lesser figure in Indian myth, being a minor trickster of the Canadian Chipewyan and some Plains tribes.) For the Kwakiutl, Haida and other North Pacific tribes, he is the transformer who brought mankind into being (out of a clamshell), gave them fire, water, game and the wealth of Nature. As a trickster, he is a great stealer of food, usually thwarted laughably (see TRICKSTER). Raven appears too in Jicarilla Apache myths, where he is responsible for making man mortal; while in Iroquois and other woodland Indian ceremonials Raven is often evoked for curing rituals.

Death is a Hooded Crow

As a wise bird flying hither and thither and at times reputedly in touch with the gods the raven was said to act as messenger, informant and guide. Ravens led the Boeotians to where they founded a new city and they guided Alexander to the shrine of Jupiter Ammon in the oasis of Siwah in Egypt and later foretold his death. It was said that when the people from the island of Thera in the Aegean emigrated to Libya ravens flew alongside their ships to guide them. The Emperor Jimmu of Japan marched to war in the 7th century with a golden raven as guide. Pausanius recorded that a crow indicated the grave of the Greek writer Hesiod; according to Aelian a crow

carried messages for King Marres of Egypt. Odin's two ravens, Huginn and Muninn, went forth each day prying into what was happening in the world and returning to perch on his shoulder and whisper their news into his ear.

In Celtic areas the importance of the raven and crow was once great though it is uncertain to what extent we are justified in speaking of a raven divinity or crow god. Various supernatural female figures appeared in the form of ravens or crows. Odin was called Hrafna-gud, god of the raven. The goddess of slaughter who came to the Celtic hero Cu Chulainn when he was mortally wounded appeared with her sisters as hooded crows and perched on his shoulders as he was dying.

Scottish folklore still holds reminiscences of these ferocious beings in the person of the dread Cailleach, a female who can appear as a raven, hooded crow or other birds. In Anglo-Saxon poetry the raven is constantly associated with battles. The similarities between Germanic and Celtic raven and crow traditions are such that we may assume with some confidence that their origin dates from the period when the peoples concerned lived in close proximity to one another. According to the *Prose Edda*, while his body lay sleeping, Odin could take the shape of various creatures, including that of a wild beast or bird. Odin's ravens were not fierce flesh-eating birds; Huginn and Muninn represented Thought and Memory – the mind's ability to go roving as in a shaman's trance. On a 7th century helmet from Sweden he is shown on horseback with two birds presumably ravens flying round his head.

In Christian Europe the raven had sinister significance, derived from Roman ideas concerning augury, dim recollections of the raven's connection with pagan gods, and from its dark plumage and deep croaking. Shakespeare refers several times to the ominous raven, and its association with death and fortune. In 1650 Dr Nathaniel Hone wrote: 'By the flying and crying of Ravens over their houses, especially in the dusk of evening and where one is sick, they conclude death.'

Apparently there has been a transference of oracular beliefs from the crow to the magpie, another member of the family, and the sayings and rhymes, and even minor ritual, such as taking off one's hat to it in Wales, seem to be derived from Roman crow augury.

The raven and grey (hooded) crow still retain in parts of the British Isles something of their reputation as oracles. There is an Irish phrase 'raven's knowledge' meaning to see and know all. It is also said in Ireland that the raven and grey crow 'tell the truth'.

The references in the Bible to Elijah being fed by ravens and to ravens being fed by God predisposed Christians to regard the bird as benevolent but, on the principle that the gods of a defeated faith may become the evil spirits of its successor the raven was sometimes viewed with suspicion – not surprisingly in view of its many heathen associations. St Ambrose wrote at length on the bird's impiety in not returning to the Ark. Jewish, Moslem and Christian legends regarded it as blameworthy for remaining to eat carrion and it was said that henceforth it was condemned to eat carrion. In the Koran the raven is sent by God to show Cain where to bury Abel but this is a version of an older Jewish legend. We hear of desert saints being assailed by devils in the form of 'black stinking ravens'. In Germany witches were said to ride on them. When St Vincent was thrown to the beasts at Saragossa his body was defended by ravens and when at length it was buried at Cape St Vincent ravens kept guard. Shakespeare makes use of both traditions malevolent and benevolent. In a single scene of *Titus Andronicus* (Act II Sc. 3) he mentions the 'fatal raven' and quotes 'ravens foster forlorn children' – an extension of the story of Elijah's ravens.

The ravens at the Tower of London remind those who are interested in ancient traditions of the significance which these birds have possessed in the British Isles and elsewhere for many centuries. It is said that disaster to these ravens would presage Britain's downfall. At one point in the Second World War, people were disquieted by the rumour that the Tower ravens had not croaked for five whole days.

Sun-Crow of China

The most interesting of the many fables concerning ravens and crows is the War of the Owls and Crows which appears in Indian as well as classical sources. It seems to embody reminiscences of very ancient beliefs with regard to the heavenly bodies, the owl representing the moon and the crow the sun. In China the three-legged sun-crow is an important symbol. The tradition that a crow never enters the Acropolis at Athens appears to be based on the tradition of the enmity between Athene, whose symbol was an owl, and the crow.

The raven and crow have been the subjects of a number of heterogeneous beliefs. Parts of the raven were used in medicine, according to Pliny, and raven's eggs were used by the Greeks in homoeopathic magic. Ovid, in *Metamorphoses*, refers to the witch Medea infusing into the veins of the elderly Jason a decoction of an aged deer and the head of a crow that had outlived nine generations of men. Folklore attributes a very long life to birds of the crow family. Aelian states that raven's eggs dye the hair black but unless you filled your mouth with oil while you applied this remedy for grey hair you would find that your teeth also had become indelibly black.

Despite its widespread reputation as a bird of ill omen, Christians were generally more kindly disposed towards the raven: for according to the Bible the prophet Elijah, while in hiding, was kept alive with bread and meat brought to him by ravens. 666

An air of unsavoury mystery still surrounds the life and teachings of Aleister Crowley nearly a quarter of a century after his death. Violently hostile to Christianity and its God, he saw himself as the Messiah of a new religion

ALEISTER CROWLEY

POET, NOVELIST, WRITER of books on magic, eccentric – Crowley (1875–1947) was all this and more. He strove hard to assume the mantle of magician, and long before he died he knew that he had succeeded. He is thus in direct line of descent from Sir Edward Kelley, Cagliostro, the Comte de Saint-Germain, Eliphas Levi and Madame Blavatsky, all of whom were credited with remarkable, if not miraculous powers. Crowley's father was a successful brewer, the manufacturer of Crowley's Ales, but whose main interest by the time Aleister was born was that of travelling about the English countryside preaching the doctrines of the Plymouth Brethren and trying to gain converts to his sectarian views. The first important fact, therefore, about Aleister Crowley is that he was brought up amid the mysteries of the Christian religion; at the age of 11, however, when his father died, he grew to detest the faith in which he had been brought up and, without knowing why, went over to the side of Satan. While still a Christian and subjected to daily Bible readings in the Crowley household, he had taken a fancy to the 'False Prophet', 'the Beast whose number is 666', and the 'Scarlet Woman', characters or archetypes which were to play a prominent and decisive part in his later life.

Educated at Malvern and Tonbridge schools, and later at Trinity College, Cambridge, as a young man Crowley began to write verses after the manner of Swinburne. His real seat of learning, however, which suited his peculiar talents, was the magical society known as the Hermetic Order of the Golden Dawn, the leading light of which was a man of considerable magical potential, Samuel Liddell Mathers, known as MacGregor Mathers.

The Secret Chiefs

The Golden Dawn, which had about 100 members spread among several lodges, taught the use of magical weapons, how to consecrate talismans, set up magic circles, travel astrally and so on. It also gave instruction in the use of that ground plan of Western magic, the Cabala. In a word, it taught and practised ceremonial magic as opposed to magic which used other aids such as drugs or sex (see also GOLDEN DAWN).

Although one member at that time, 1900, described the Golden Dawn to the present writer as 'a kind of club, like any other club', it was quite unlike any other club in one respect: its constitution was not derived from its governing body but from superior beings or intelligences called (following Madame Blavatsky) Secret Chiefs. Mathers, it was said, had met the Secret Chiefs one night in the Bois de Boulogne in Paris. Crowley joined the Golden Dawn in 1898. Accepting all the vows and obligations, he took the magical title of Perdurabo (I will endure to the end).

At this time, Crowley was living in a flat in London's Chancery Lane and describing himself as Count Svareff, a Russian nobleman. Under this and other names, he published at his own expense several books of verse and, anonymously, a work of pornography entitled *White Stains* (1898).

Mathers was also a scholar, and translated and edited three important works: *The Kabbalah Unveiled*, *The Key of Solomon* and *The Book of the Sacred Magic of Abra-Melin the Mage*, 'as delivered by Abraham the Jew unto his son Lamech, AD 1458'. *Abra-Melin* inflamed Crowley's spirit; he described the book as one which is in marked contrast with all the puerile nonsense written on the subject. The technique of this magic has something in common with yoga: a secluded spot and a long period of purification are necessary before one's Holy Guardian Angel or Higher Intelligence can be invoked. Crowley searched the Lake District and Scotland and found what he wanted in Boleskine House, near the village of Foyers, in Inverness. He dropped the title of Count Svareff, assumed that of Lord Boleskine, constructed his oratory and began the operation. But instead of his Holy Guardian Angel appearing, he merely attracted a host of evil spirits.

He quarrelled with Mathers and was expelled from the Golden Dawn. Crowley retaliated by denying that Mathers had met the Secret Chiefs in the Bois de Boulogne and been confirmed by them as Head of the Order. Mathers, he said, had only bumped into some evil demons. He continued to pour out a torrent of verse and to climb mountains, in Mexico and in the Himalayas. He acquired a wife, Rose, and wrote for her the pornographic *Snowdrops from a Curate's Garden*. His greatest need was to make his own link with the Secret Chiefs or Mahatmas; without such a link he was a negligible force.

This uncertain state of affairs did not last long. Towards the end of 1903, when Crowley was 28, he went with his wife on a trip to Ceylon. In the new year, he decided to return home, and on the way back stopped for a while in Cairo. Wearing a turban with a diamond aigrette, a silken robe and a coat of cloth of gold, he gave out that he was Prince Chioa Khan. He was driven with Princess Khan (formerly Rose Kelly, the daughter of the Vicar of Camberwell) about the Cairo streets, with 'two gorgeous runners to clear the way for my carriage'. Despite his style of living, Crowley was undecided about his future and growing short of money. Then an event occurred which put at last some magical ground under his feet. This was 'the Great Revelation in Cairo'. The old world of Christianity came to an end for Crowley and a new world, of which he was prophet, was born.

Aiwass, also spelt *Aiwaz*, the name of his Holy Guardian Angel whom he had tried with only partial success to invoke at Boleskine House, appeared to him in his Cairo flat and commanded him to take down a message for mankind. After an hour's dictation, Aiwass disappeared, but he was back again the following day at the same time, noon. Aiwass described himself as the minister of Hoor-Paar-Kraat (the Graeco-Egyptian god Harpakrad or Harpokrates), that is 'a messenger from the forces ruling this earth at present'. Aiwass came on three occasions and each time dictated a chapter of *The Book of the Law*, as the work is called. In other words, a new era, or rather aeon, in the world's history had begun, one which will last for 2000 years. The heart of Crowley's magic is derived from this work; it is the text behind his magic and his philosophy which he summed up in the phrase *Do what thou wilt shall be the whole of the Law*.

The Number of the Beast

Just before Aiwass appeared in Crowley's Cairo flat, a curious incident occurred in the Boulak Museum (now the National Museum). Rose had been in a strange, dazed state of mind and in this condition she had been mumbling something about Horus. 'Who is Horus?' asked Crowley, who was not aware that his wife knew anything about Egyptian religion. 'There', said Rose, pointing, 'there he is'. She was indicating an ancient Egyptian stele on which was painted Horus in the form of the hawk-headed Ra-Hoor-Khuit (Ra-Hara-khte). Crowley went forward, then fell back in amazement. The exhibit bore the number 666, the number of the Beast, his number!

Many years later, in 1946, I asked Crowley, 'Why do you call yourself the Beast?'

'My mother called me the Beast,' he replied briefly, presumably not wishing to go into the deeper aspects of the subject. Crowley's mother was a pious woman and the behaviour of her son reminded her of the Beast of the book of Revelation that came out of the depths of the sea, with horns on his head, blaspheming God.

The cosmology of *The Book of the Law* is explained by Crowley thus: there have been as far as we know, two aeons in the history of the world. The first, the aeon of Isis, was the age of the domination of the woman, of matriarchy. The choice of Egyptian names for these aeons is purely arbitrary and does not imply that they are confined to Egypt. The second aeon, that of Osiris, was the aeon of the man, the father; it coincides with the Christian period, also with that of Judaism, Buddhism, Mohammedanism. It was superseded in 1904 by the aeon of Horus, the child. He explained that the emphasis for this present period, that of Horus, is on the will *(thelema)* or true self in man as opposed to external authority, priests and gods. 'Be strong, o man! lust, enjoy all things of sense and rapture: fear not that any God shall deny thee for this.'

Portrait of Aleister Crowley, the 'Great Beast', the most famous – and infamous – magician of modern times; he reviled the Christian God and sought by magical means to set himself up in his place

The Silver Star

On his return to Europe in the spring of 1904, Crowley wrote to Mathers informing him that the Secret Chiefs had appointed him the head of the Order and declared a new magical formula – thelema. 'I did not expect or receive an answer,' said Crowley, 'and I declared war on Mathers accordingly.'

The following year Crowley led a disastrous climbing expedition to Kanchenjunga and added to his evil reputation by deserting his comrades on the mountain. In 1910, he published the curious and obscene *Bagh-I-Muattar* or 'The Scented Garden of Abdullah the Satirist of Shiraz'. This was a volume of homosexual love poems, supposedly translated from the medieval Persian.

But all this was marginal activity; his work was to spread the good tidings. A new world had been born and a new aeon had arisen. To this end, he founded his own magical association, the A.·. A.·. (*Argenteum Astrum*, the Silver Star) which constituted the Inner Order of the Great White Brotherhood; the Outer Order was the Golden Dawn. And he brought out his own publicity organ, *The Equinox*. This was issued for several years at the rate of two bulky volumes a year. Its articles and reviews were mainly written by Crowley under a variety of names. The series entitled 'The Temple of Solomon the King' contains details of Perdurabo's ascent in the Great White Brotherhood. No 7 contains *The Book of the Law* with his first brief comment; he thought it time to give it out to the world, but it caused no stir whatsoever. Between whiles he went off on any magical adventure which offered itself, during which he probed the gods for further guidance.

One night during 1912 Crowley received an unexpected visit at his flat in Victoria Street, London, from Theodor Reuss, a high ranking German Freemason. They were strangers to each other and Reuss had apparently come over from Germany for the express purpose of meeting Crowley. Without beating about the bush, he accused Crowley of giving away magical secrets. Reuss wore a handle-bar moustache and pince-nez; he was alleged to be a member of the German Secret Service. Crowley denied the accusation. Reuss replied by going to the book-shelf and taking out Crowley's *Liber CCCXXXIII: the Book of Lies*. He opened it at the page which begins, 'Let the Adept be armed with his Magical Rood and provided with his Mystic Rose,' and showed it to Crowley.

The secret that Crowley had been giving out to all the world was that sex can be used ritually or magically; but as he had been expressing it in veiled language, as in this extract, Reuss's point is difficult to see. The previous head of the order to which Reuss belonged, a wealthy German ironmaster called Karl Kellner, had learned this so-called secret from Tantric yogins in India during the last decade of the 19th century. He had been introduced to the ritual of *maithuna* (sexual union), in which the mind, the breath and the semen are held still. And on his return to Germany, he had expounded the delicate subject to his fellow Freemasons, among whom was Franz Hartmann, one of the companions of Madame

Blavatsky, and proposed that they should start a new magical society to embody these sex and yoga teachings. Thus in 1902 the *Ordo Templi Orientis*, or Order of the Templars of the East, was founded. It claimed that it could communicate in nine degrees the secrets not only of Freemasonry but of the Rosicrucians, the Illuminati, the Order of the Hidden Church of the Holy Graal, the Knights of the Holy Ghost, and those of St John, of Malta, and of the Holy Sepulchre – in fact, of every mystic order that they could think of. 'Our Order possesses the KEY which opens up all Masonic and Hermetic secrets, namely, the teaching of *sexual magic*, and this teaching explains, without exception, all the secrets of Nature, all the *symbolism* of FREE-MASONRY and all systems of religion.'

Sexual Magic

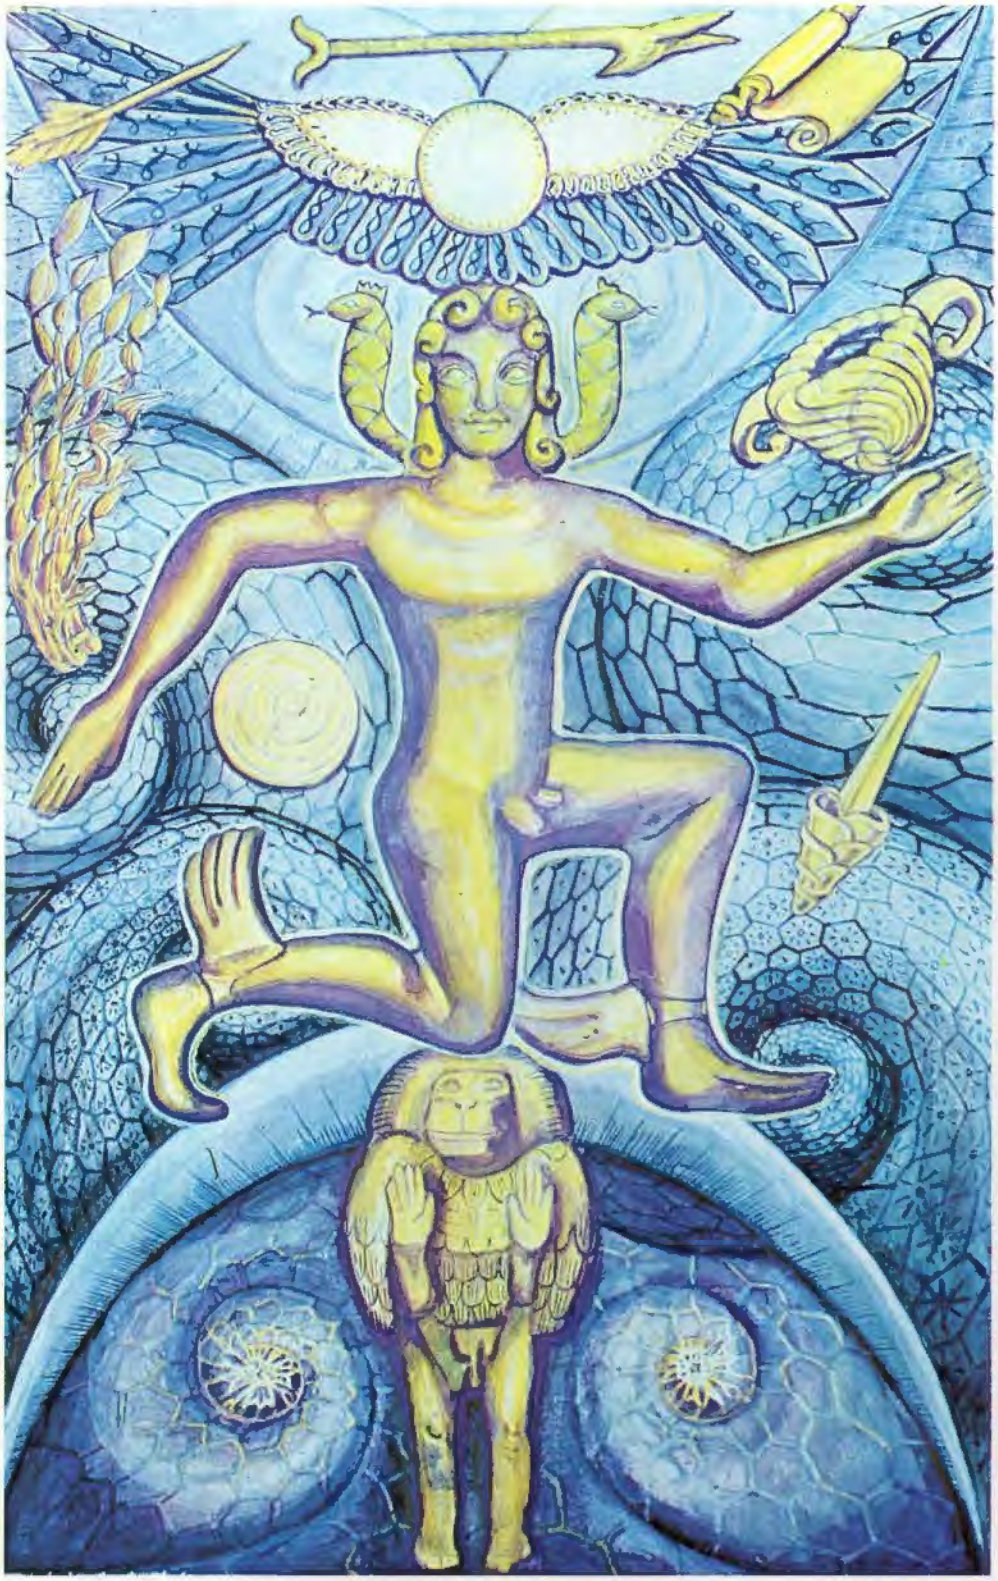
Crowley and Reuss talked long into the night. 'Since you know our hidden sex teachings,' said Brother Merlin (Herr Reuss's magical name), 'you'd better come into our Order and be its Head for Great Britain.' Crowley, who never declined a dinner, an adventure or a title, readily agreed. After a journey to Berlin, he was transformed with due ceremony into 'the Supreme and Holy King of Ireland, Iona, and all the Britains that are in the Sanctuary of the Gnosis.' And with that keenness and audacity of mind which sees and seizes the main point, he gave himself the magical name in this secret society of Baphomet; this was the name of the idol which the original poor Knights of the Temple were accused of worshipping (see BAPHOMET).

One could not join the Order and start attempting to perform maithuna. The aspirant had to work his way diligently up to the IX°. One more degree was added by Crowley, the XI°, that of homosexual workings (or IX° inverted). In Paris during 1914 he worked this XI° O.T.O. with his pupil Victor Neuburg on 24 different occasions, the whole being known as The Paris Working. The X° was of an honorary character to distinguish the 'Supreme and Holy King' of the Order in each country where the Order was established.

The Ordo Templi Orientis claimed that the teachings of the Knights Templars (whose Order was disbanded amid a great scandal at the beginning of the 14th century) were known and continued by them, but this is wishful thinking. And the prostitutes whom Crowley frequently took as partners in his practice of sexual magic, apart from their not being trained in this form of worship, were completely ignorant of what he had in mind. His descriptions in *The Magical Record of the Beast* of these activities are quite out of keeping with the tone and elaborations of maithuna.

At the outbreak of the First World War, Crowley transferred his activities to America. The one important magical event which happened to him at this time, apart from his meeting with Leah Hirsig, the Scarlet Woman who outdid all other Scarlet Women in the Beast's Life, was his assumption during 1916 of the Grade of Magus.

Since 1909, he had been a Master of the



Temple, an exalted grade which enabled him to join the Secret Sanctuary of the Saints or the abode of the Secret Chiefs; now he went one higher. These upper stages in his career were implied in the Great Revelation in Cairo, that is to say in his being the vehicle of *The Book of the Law*. At last, he was ready to assume the throne and proclaim his word, thelema or 'do what thou wilt,' which ushers in the new aeon of liberty, as opposed to the old aeon of suffering (Christianity and other slave religions). The words of the ceremony which he performed, and during which he crucified a frog, make this clear.

'Night being fallen, thon shalt arrest the frog, and accuse him of blasphemy, sedition and so forth, in these words: *Do what thou wilt shall be the whole of the Law*. Lo, Jesus of Nazareth, how thou art taken in my snare. All my life long thou hast plagued me and affronted me. In thy name – with all other free souls in Christendom – I have been tortured in my boyhood; all delights have been forbidden unto me; all that I had has been taken from me, and that which is owed to me they pay not – in thy name. Now at last I have thee; the Slave-God is in the power of the Lord of Freedom. Thine hour is come; as I blot thee out from this earth, so surely shall the eclipse pass; and Light, Life, Love and Liberty be once more the law of Earth. Give thou place to me, O Jesus; thine aeon is passed; the Age of Horus is arisen by the Magick of the Master the Great Beast.' And so on and so forth.

Do What Thou Wilt

With the end of the war, Crowley returned to England; he did not stay in England for long but departed with small means and two mistresses, one of whom was his Scarlet Woman, Leah Hirsig, for Sicily. At Cefalu, he rented a villa, consecrated a temple to the New Aeon in one of the rooms, and painted on the front door the words DO WHAT THOU WILT. This was his famous 'abbey', his Collegium ad Spiritum Sanctum; here, during three years, he had time to add copious details to his diary, to paint pictures which reveal his remorseless vision, and to try to fuse together the bits and pieces of his life. His aim at Cefalu was to create a world centre for the study of occultism, but few availed themselves

Cards from a Tarot pack designed by Crowley and painted by Frieda Hariss ***Left*** **The Magician or Juggler: Mercury with the ape of Thoth, his Egyptian counterpart, the whole symbolizing the creative will of God and man** ***Centre*** **Death, the skeleton and scythe, performing the whirlwind dance of change** ***Right*** **The Hierophant or Pope who holds the key of heaven and hell: the pentagram which contains the dancing child symbolizes Crowley's belief in the new age of Horus**

of the opportunity of going there. Furthermore, the Beast's increasing dependence on heroin undermined his driving-force and the discipline of the abbey. However, during this period, he was revived by a commission from Collins, the publisher, to produce a novel about the drug traffic and to write his confessions; he set to work with unexpected vigour. The good produces the bad: *The Diary of a Drug Fiend*, 1922, was the initial cause of his expulsion from his abbey following the review of the novel, and a general attack on Crowley and his creed in a Sunday paper.

But Crowley had uttered his word, thelema, and done his work; it remained only for him, the Logos (word) of the New Aeon, to publish some more magical writings and attend to the affairs of the Order. The turn of the wheel of fortune produced new followers in Germany, and the Mandrake Press which brought out during 1929 two of the projected six volumes of his *Confessions* which Collins had dropped. He also published about this time his magnum opus, *Magick in Theory and Practice*.

Crowley, who behaved as if the world was only an exhalation of his own being, wound the vast subject of magic round himself and the petty incidents of his life, with the result that *Magick* is a city within a city. Whoever penetrates into the inner city will find there Perdurabo, the false god, choking with guilt from having set himself up in God's place.

CROWN

A CROWN is an object placed on the head, and so it is a symbol of pre-eminence, of having reached the top. We call the top of the head itself the crown, and we use the same word for the top of a hill.

The custom of placing an object on a person's head as a visible sign of success, of having reached the summit, as it were, is very old. The Greeks gave wreaths of wild olive to victorious athletes at the Olympic games. A Roman general celebrating a formal triumph wore a wreath of laurel or bay leaves, and wreaths were presented to soldiers for bravery, and to poets or artists for excellence. We still call the greatest success of a man's life his 'crowning achievement' and if his work bears fruit we say it is 'crowned with success'.

Something placed on the head could also be meant to protect the part of the body which contains the intelligence and also the breath, and hence the life and soul of a person. In Rome suicides or people who knew they were about to die veiled their heads: when Julius Caesar was confrooted with the daggers of his assassins, he drew the top of his gown up over his face. The same idea may be behind the old custom of putting a wreath on the head of a dead man before his burial, to keep his soul from harm. We continue this custom, though we now put the wreath on top of the coffin. It is circular and made of evergreen leaves, both as symbols of hoped-for immortality.

Another old custom, still continued, is for a bride to wear a veil and a circlet of flowers, which again may have been meant to protect her against evil. Guests at Greek and Roman banquets wore wreaths of flowers, apparently to keep their heads clear and prevent them from getting drunk.

Crown Royal

Gods and kings wear crowns to show their pre-eminent authority. Kings are 'crowned heads' and the ceremony in which a man is acknowledged as a king is called a coronation, or literally 'a crowning'. In Mesopotamia deities and kings were shown wearing a high conical head-dress rising from between pairs of horns, apparently as a symbol of fertile vigour and of rising upwards, the top, the summit. The royal head-dress of Egypt, which was itself regarded as divine, was a curiously shaped high cap. Persian kings also wore high caps, studded with jewels. The Byzantine emperors followed suit and the high cap with one, two and eventually three bands round it became the tiara of the popes.

In the early Christian centuries small crowns, circlets of gold or some other metal, were hung up in churches as offerings to God. It is likely that the celebrated Iron Crown of Lombardy, probably dating from the 9th century, was originally one of these. Only six inches wide, it is a circle of six rectangular gold plates with a narrow band of iron on the inside, believed to be made of a nail from Christ's cross (see CROSS). Napoleon set it on his own head when he was crowned King of Italy in 1805.

As a symbol, almost an incarnation, of kingship, the old royal crown of England, St Edward's crown, was destroyed in the time of the Commonwealth. A new one, as nearly as possible a copy of the old, had to be made for Charles II. A special crown was made when George V was crowned Emperor of India at Delhi in 1911, because by British law the royal crowns could not be taken abroad, a striking example of the intimate connection between the crown, the king and his country.

Crusade

Christian term for a holy war, first applied to the armed expeditions to recover the Holy Land from the Mohammedans, later to other wars officially approved by the Church, including the Albigensian Crusade against heretics in southern France: more geuerally, any aggressive campaign against an evil; derived from the same root as 'cross'.

Barnaby's

CU CHULAINN

THE CENTRAL CHARACTER in a group of early Irish stories known as the *Ulster Cycle*, Cu Chulainn is the supreme example of the ideal Celtic hero. The pagan Celts venerated god and hero alike; the hero possessed many of the qualities of the tribal god – bravery and near-invincibility in conflict, for example – but both were capable of surrendering to superior forces, natural or supernatural. Both hero and god had strong intellectual capacities, and a quickness of wit which resulted in martial success as frequently as did mere brute force and the clever handling of weapons. Both were often in possession of some especially potent weapon, in Cu Chulainn's case the mysterious *gae bolga*, the spear he had obtained from a warrior goddess, once it penetrated the body it could not be withdrawn without inflicting fatal wounds from its barbed sides. This concept of the hero, like the Celtic concept of deity, allowed of no unintelligent, handsome brute, blundering along and succeeding only by means of his phenomenal strength. Beauty the hero must have, and great physical stamina, but he must also be intelligent, and educated according to the standards of his time. He must be able to outwit the hostile forces, not only of this world but of the supernatural, by his superior knowledge and by his quick wit.

A Law unto Himself

The stories of the *Ulster Cycle* were written down in the form in which we now have them c 1100 AD, but their manuscript origins were much earlier. They are concerned with the *Ulaid*, the people of Ulster, in northern Ireland, about the turn of the Christian era. The main story in the cycle is that of the cattle raid of Cualnge (*Tain Bo Cualnge*), the splendid epic which deals with the rivalry between the provinces of Connaught and Ulster, and with Cu Chulainn's heroic defence of the Ulstermen.

Cu Chulainn knew the secret language of the poets, for the great *fili* or poet, Amairgin, had been his foster-father, and had instructed him in the poetic and juridical arts. He first outraged, then pacified, the society into which he entered, in true heroic fashion. He had physical beauty of a kind that was extraordinary because it differed from the physical ideal of his tribal background and yet it was striking enough to impress favourably all who saw him. He was small, in a society in which height was revered; dark, where fairness was in vogue; a beardless boy, not a mature bearded warrior. He was called a *sirite*, 'sprite', a law unto himself, nevertheless upholding the honour of his people against impossible odds. He was known as *siabartha*, 'distorted one', because of the terrible change in his appearance when his battle ardour was

Irish Tourist Board

aroused. He was the fear of every warrior, the beloved of all women who looked upon him in his full beauty. He was the son of the great god Lugh, the lover and subjugator of the goddesses, arousing the desire even of the terrible Morrigan, the war goddess, with her dark bird-form and her terrifying magical and prognostic powers.

The *Ulster Cycle* contains some historical material, but the main characters and episodes are of a manifestly mythological nature. It reflects a society which is strikingly similar to that described by the classical commentators on the continental Celts, and suggested by archeological evidence and Roman writings for parts of Britain. It was an intensely aristocratic society, and Cu Chulainn was a youth of noble birth and connection. His mother was Dechtire, sister of the high king Conchobar mac Nessa, the wife of the warrior Sualtaim, who is then Cu Chulainn's earthly father. According to one version of the conception of the hero, his birth is the result of an incestuous union between Dechtire and her brother the king. By the time Cu Chulainn is seven years of age he has left childhood far behind him, being the equal of a 14 year-old youth and clamouring for action.

The Heat of Battle

While still a small boy, Cu Chulainn sets out for Emain Macha, the court of Conchobar; he is equipped only with his toy weapons. He bursts into the precincts of the royal residence and attacks and overcomes the 150 youths who are practising games on the playing field there. The *Tain Bo Cualnge* contains the fascinating account of the young hero's progress, describing the various ordeals he undergoes in his journey from childhood to the status of a hero. His great boyhood feat is that of killing the monstrous hound of the smith Culann. The smith bewails his loss, and the boy promises to act as watch dog for him until another beast shall have been reared. He is then known as Cu Chulainn, Culann's Hound, and so acquires his name.

Next, he gains weapons by treachery. He has heard the Druid Cathbad saying to his pupils that 'a boy who would take up arms (on that day) would be splendid and famous, but would be short-lived and transient'. Cu Chulainn goes to the high king and demands weapons, leading his uncle to believe that Cathbad has sent him. He breaks all the weapons which are given to him, only those of the high king himself enduring. Against all advice, he goes off to try his luck as a warrior and has phenomenal success against great odds.

He returns to Emain Macha in a great state of triumph and exhilaration. The watchers at the fort are disturbed when they see him approaching, because they recognize that his dreaded battle ardour which distorts his appearance has come upon him; he is berserk. They try various ruses to calm him. Naked women are brought before him, and when he hides his face he is seized and placed in a vat of cold water, which boils and bursts open. A second vat is brought, and this also he heats in the same way. A third calms him, and he is then restored to his normal appearance. He is dressed and brought before the king.

A dramatic description from the same story demonstrates the non-normal appearance of this supreme Celtic hero. 'His comely appearance was restored, and he blushed crimson from head to foot. He had seven toes on each of his feet, and seven fingers on each of his hands. He had seven pupils in each of his royal eyes, and seven gems sparkling in each pupil. Four dimples in each cheek, a blue dimple, a purple, a green and a yellow. Fifty tresses of hair he had between one ear and the other, bright yellow like the top of a birch-tree or like brooches of pale gold shining in the sun. He had a high crest of hair, bright fair as if a cow had licked it. He wore a green mantle in which was a silver pin, and a tunic of thread of gold. The boy was placed between Conchobar's knees, and the king began to stroke his hair.'

Cu Chulainn epitomizes the concept of the Hero for Ireland. We must suppose it to have been a concept common to the early Celtic world, where magical powers and superhuman battle feats were believed to be accompanied by fierce physical distortions and strange emanations such as the 'hero's light'. In the *Tain* it is said of Cu Chulainn: 'The hero's light rose from his forehead, so that it was as long and as thick as a hero's whetstone. As high, as thick, as strong, as powerful and as long as the mast of a great ship was the straight beam of dark blood which rose up from the very top of his head and became a dark magical mist, like the smoke of a palace when a king comes to be attended in the evening of a wintry day.'

Kiss for a Severed Head

The epic of the *Tain* is concerned with the hero's single-handed defence of the province of Ulster, when the rest of the male population were suffering from a debility that rendered them utterly incapable of physical effort. Cu Chulainn is immune from this affliction, perhaps another indication of his foreign origin. He engages in a series of triumphant single combats, which are described in detail.

He has various taboos, and the violation of these must inevitably lead to destruction. He is named after a dog, and so must never taste the flesh of this animal. But the hostile forces of the otherworld combine to destroy him. He is tricked into tasting canine flesh, thus violating his taboo, and from then on his end approaches swiftly. He dies, fighting against his enemies to the last. His head is struck off and, when placed on a rock, splits it with its enduring battle-heat. His wife Emer, whom he had won in true heroic fashion from her father by violence, kisses the lips of the severed head and dies with her husband.

The character of Cu Chulainn, then, epitomizes all that pagan Celtic society venerated and desired. His skills, his intellectual powers, his chariot feats; his harnessing the powers of the otherworld, his acceptance of fate and the choice of a brief, violent, glorious career rather than a long, safe, mundane existence; his colourfulness and his aggressiveness; his aristocratic nature and his great physical beauty. All these qualities are those we know the early Celts to have desired in their gods and in their heroes alike. Such stories must have been told in the crude houses of the rich Celtic chieftains throughout the pagan Celtic world and, although the names of the hero and the deities concerned must have differed, the basic concept must have been recognizably similar. And so enduring that it has persisted, and come down the ages to survive today in vestigial form in the hero tales told in the humble homes of the Celtic-speaking survivors of this pagan Celtic past, on the fringes of the western world.

ANNE ROSS

CUCKOO

THE LOUD CALL of the cuckoo, heralding the arrival of spring, is of greater importance in folklore than its other well-known habit of laying its eggs in the nests of other birds. None of the familiar birds visiting Europe announces the advent of spring with so loud, reiterative, and distinctive a call – a call whose pitch and other characteristics make it easily imitated by the human voice. Other birds with call-notes having some resemblance to the human voice, such as the great northern diver and some owls, are commonly regarded as mysterious and have also achieved prominence in folklore.

The 13th century song 'Sumer is icumen in, Lhude sing cuccu' reminds us that to our forefathers, as to us, the cuckoo was a welcome harbinger of increasing sunshine, warmth and growth. Its arrival was a notable date in the calendar, as is indicated by local traditions in the English counties that the cuckoo arrives for the local fair – for example, in Hertfordshire, where it is said to come to Sawbridgeworth fair. In Siberia some of the tribes timed their spring ceremonies by its call.

It was a small step from noting correlations between birds' calls, weather and farming operations to assuming that correspondences between the cuckoo's calling and human affairs were such that personal fortunes could be predicted by noting the bird's behaviour. Thus, in England, Scotland and on the Continent it was said that a person could tell how long he had to live by noting how often the cuckoo called. All was well if, as often in spring, the cuckoo called incessantly – but probably such sayings were never taken very seriously. It was also said that a girl could ascertain how long she would remain unmarried by counting the calls; but in Germany, if the cuckoo called more than ten times in such circumstances, it was generally regarded as bewitched and unreliable. In the United States it is said that a cuckoo's call, especially if from low-lying lands, is a forewarning of rain. And another American

Radio Times Hulton Picture Library

superstition states that, whatever you are doing when you hear the first cuckoo of spring, that activity will predominate in your life for the rest of the year.

A belief dating from the time of Aristotle or earlier, and still lingering in the countryside today, is that the cuckoo turns into a hawk in winter; this arose, no douht, to explain the bird's disappearance. Plausibility was given to the notion by the similarity between the cuckoo and the merlin, a kind of falcon, together with the disappearance of the merlin from much of its winter range to its breeding haunts about the time the cuckoo arrives.

There was a widespread belief in Europe and North America that on hearing the first cuckoo of the year one should wish, and there are still people who make a ritual event of the occasion by turning the coins in a pocket, for luck. It is said that if you have money in your pocket on hearing the bird, you will not want for it throughout the year. In parts of Germany it was the custom for rustics to roll on the grass when the bird was first heard, claiming that by so doing they could avoid suffering from lumbago. In Norfolk and Sussex it was unlucky to hear the first cuckoo while in bed, as this was a warning that someone in the family would become ill. In the Scottish islands and in France it was undesirable to hear the cuckoo before having broken one's fast. The Scots expected bad luck to follow, but the French said that the person who heard the cuckoo while fasting would suffer from numbed limbs or become a good-for-nothing idler.

The similarity of the cuckoo's two syllable call to words in various languages has led some people to regard it as a bird endowed with the gift of prophecy: from the title page of Andrew Borde's *Merry Tales of the Madmen of Gotam*

There appeared in print as far back as 1685 a procedure for obtaining a clue to one's future spouse. It was said that if a man looked under his left shoe on first hearing the cuckoo he would find a hair of a similar colour to that of his future wife; a woman could discover her future husband in the same way. There were various other somewhat similar procedures.

Prophetic Bird

Augury and ornithomancy are based on notions that bird behaviour has ulterior and sometimes supernatural significance. Thus in Cornwall to hear the cuckoo on the right presaged good fortune, while to hear it on the left boded ill. In Norway more elaborate prognostications were made according to the point of the compass from which the bird was heard calling. As bird augury was practised on a considerable scale by the Romans, some of the associated notions may have been carried north and have influenced regard for the cuckoo. They must also have been carried to the New World, for an old rural American belief reads similar meanings into the location of the bird – especially the first of the year. If it calls from the south, a good harvest is presaged; if from the north, death or other tragedy; from the east, luck in love; from the west, general good luck.

The similarity of the cuckoo's two syllable call to words in various languages has formed a basis for some traditions. A Bohemian legend relates that the cuckoo is a metamorphosed girl calling for her lost brother or, alternatively, if the words are interpreted differently, announcing that he has been found. The theme of a Serbian song is that the spirit of a dead man could not find release because his sister wept so incessantly at his grave. So she transformed herself into a cuckoo and cries continually, 'Ku ku, Ku ku,' meaning 'Where are you?' There may be some connection between these two stories and a belief that the cuckoo goes to a mysterious realm, the land of the dead, in winter. This is supported by an odd Estonian legend according to which Christ came to a cottage after a wicked stepmother had murdered two children and told the father that they would appear in spring as two living creatures. They emerged as a cuckoo and a swallow.

The cuckoo has often been associated in the past with cuckoldry: Shakespeare speaks of the cuckoo who 'mocks married men'. In the *Asinaria* of the Latin dramatist Plautus (c 250–189 BC), a man's wife, finding him in adultery, shouts at him: 'What? is the cuckoo lying there? Get up, gallant, and go home.' The connection between the cuckoo and cuckoldry appears to have arisen from its nesting behaviour and its consequent reputation as a usurper.

EDWARD A. ARMSTRONG

CULT OF THE DEAD

Baschieri Salvadori

Man, in contrast to other animals, treats his dead with love, hatred, awe or sorrow: he rarely ignores them completely. Behind this is the hope that they live on after death, and very often the belief that they will help those who survive

Left **Papuan natives blow through tubes into figures which represent their ancestors, perhaps to keep them alive with breath**

Right **Among the Kraho Indians of Brazil women weep for their dead relatives by the special logs made to receive the souls of the dead**

Harald Schultz

The appeasing of ancestors by human sacrifice is a far cry from Poets' Corner in Westminster Abbey or the Lenin mausoleum in Moscow. But the basis for these is the same – the impulse to forge a link between the living and the dead

IN THE GUATTARI CAVE on Monte Circeo, on the Italian coast north of Naples, there was found in 1939 a solitary skull, lying on a platform of earth and stones. Round the skull was a circle of stones, and strewn about the floor were the bones of deer, buffalo and horses, and also the lower jaw of another human being. The skull belonged to a man aged 40 or 50, who had been killed by a blow on the right temple with a sharp weapon. There were indications that the brain had been extracted, perhaps to be eaten. The skull may originally have been set up on a stake, the ring of stones suggests a magic circle and the animal bones may be the remains of offerings to the skull or of meals eaten in its presence.

Since prehistoric men left no written explanation of themselves, much of what can be said of them is highly speculative but it looks as if this skull was worshipped in some fashion, though it is not certain that its owner was murdered: he may have been killed in battle or by accident. What is certain is that one of the most striking differences between men and other animals is that animals ignore their dead and men do not. Men treat their dead with love, hatred, awe, sorrow, or even with appetite, but rarely with casual disregard.

Lying behind this is an even more important distinction. Unlike the other animals, a man is aware that he himself will eventually die. The effects of this realization on human behaviour have been incalculably great. It is the root of the hope for a life beyond death and it is probably one of the roots of belief in supernatural beings which do not die, which create and maintain the order of Nature, on which each man depends for his brief earthly existence.

The Dear Departed

The men or man-like creatures who lived in the Choukoutien caves near Peking about 500,000 years ago already used fire and made rough tools. They may also have been cannibals who ate the brains and the marrow of the bones of their dead. Perhaps they did this (if they did it at all) merely because they liked the taste, but if they believed that in eating the dead they acquired their strength and skill, or that the dead lived on in the bodies of their eaters, this is the earliest trace of a cult of the dead, in the sense of a belief that something survives death and that what survives has power and requires special treatment.

Later, though still very early, burials suggest concern for the dead and possibly fear of their power. In the Teshik-Tash cave in Uzbekistan, in central Asia, a child had been buried in the middle of a circle of ibex skulls. In a cave on Mount Carmel in Palestine the bodies of five men, two women and three children had been trussed up with their knees drawn up to their bodies. This may have been done to save space and so make grave-digging less taxing. Or it may have been a magical attempt to help the dead to be reborn, by arranging them in the position of a foetus in the womb. Or it may have been meant to stop the dead from getting out of their graves and attacking the living. Or death may have been seen as a kind of sleep and the bodies arranged in a sleeping position, in which case our euphemism 'laid to rest' is an extraordinarily old one.

Later still, though before true man had emerged, Neanderthal burials in Europe show care and respect for the dead, possibly tinged with fear. Of six skeletons discovered near La Ferrassie in central France, all except one had been buried facing west. The west is the direction of the dying sun in the evening, and it was later widely believed that the far west was the home of the dead. The single exception was a body which faced east and had been trussed before burial with the legs drawn up. Perhaps this elderly woman had been feared in life and was still feared in death.

But Neanderthal burials generally suggest an affection for the dead. They were buried under the floors of the caves in which the people lived, sometimes near the hearth, presumably to give the cold corpse warmth and perhaps with the feeling that the departed was still one of the family and should keep his accustomed place by the fire. The fact that tools and joints of meat were buried with the dead suggests that they were thought to be still alive somehow, somewhere, and that it was the duty of the survivors to help them.

The Place of Skulls

In the Upper Paleolithic period (c 30,000 to 10,000 BC) *homo sapiens* himself, with a brain markedly larger than that of the average modern man, spread from Asia into central and western Europe, and across northern Africa into Spain. He again buried his dead with care, close to the living, and often sprinkled red ochre on them, apparently to give them the blood-red colour of renewed vitality. The dead were dressed in their best, hung with valuable ornaments, and generously equipped with food and weapons, which means that the

living made real sacrifices, in the literal sense of the term, for their dead.

Dating from the Mesolithic period in Europe (c 10,000 to 3500 BC) are the 33 human skulls found in the Great Ofnet cave near Nördlingen in Bavaria. All of them faced west and were covered with red ochre. At least five, and possibly 21 of these people had been killed by hatchet blows. This collection of relics may have belonged to headhunters, who thought that by taking their victims' heads they acquired an extra supply of human energy. Or the heads may have been buried with ceremony to pacify the angry ghosts of the murdered.

These heads, like the Monte Circeo skull and the human skulls found at Catal Hüyük in Turkey, resting on what was apparently an altar of the great mother goddess (see ALTAR), suggest that the head was already regarded with particular awe, as it certainly was later. The head is the part of the body with which a man breathes, sees, hears, eats, talks and thinks. It is the part which you think of as pre-eminently *you*, the home of your personality, and it was perhaps already believed to contain the essence of a person's life-energy and character (see also HEAD; SKULL).

The earliest surviving realistic portraits of human beings were found at Jericho in Palestine, dating from not later than 6250 BC. They are human skulls covered with plaster, in which the features were modelled, with eyes made of shells. They probably come from a family portrait gallery and represent ancestors who were venerated by their descendants. The practice was apparently fairly common at Jericho, because quite a number of decapitated skeletons were found buried under the floors of houses.

The Panoply of Death

The Neolithic period (from c 3500 BC) saw the spread of the techniques of breeding cattle, as distinct from hunting them, and growing crops instead of merely gathering them. Presumably these changes would have strengthened the feeling that a man's land and herds were his because his forbears had owned them, that they were the gifts of his ancestors and belonged to his family – past, present and future – a feeling which lies at the root of ancestor worship (see below). This period has left plentiful evidence of human attention to the dead, especially to those who had been powerful in this life.

At Alaca Hüyük in Turkey the stone-lined graves of chieftains who ruled from c 2400 to 2200 BC contained astonishing quantities of gold, silver and copper objects – daggers, maces, battle-axes, cups and jugs, ornate pins and mirrors. At the same period in Mesopotamia the royal graves at Ur were magnificently equipped, and there courtiers, soldiers and servants had been killed with their masters, no doubt to continue serving them in the afterworld. At Maikop in southern Russia a man was buried under a canopy which was partly supported by golden figures of bulls, and he wore a robe on which were 87 gold plaques representing bulls and lions.

For the living to spend so much on the dead suggests a mixture of affection for them, an obligation to equip them fittingly for the life to come, and a healthy respect for the help and protection which they could give to those who survived them. The earliest written records in human history are concerned with securing a happy immortality for the kings of Egypt (see BOOK OF THE DEAD). In the 14th century BC in China, the rulers of the Shang dynasty were interred with what has been described as 'extravagant pomp'. The king was buried in a wooden room at the bottom of a pit 45 feet deep and 65 feet square.

Even secular societies such as the Soviet Union inter their illustrious sons with pomp and circumstance, and provide for the cult of the dead

Other human beings might be killed and buried with him and in some cases he was given chariots and horses as well.

In the 5th century BC the great traveller Herodotus wrote a famous account of the burial of a Scythian king (in his *Histories*, book 4). The Scythians lived to the north of the Black Sea. When a king died, they slit open the corpse's belly and filled it with pleasant-smelling substances, sewed it up again and buried the body, lying comfortably on a mattress, in a great square pit. They strangled one of the king's concubines and several other members of his household and buried them with him. They also buried horses, golden cups and a selection of his other treasures with him. Then they piled up a mound of earth over the grave and waited for a year.

After a year, they strangled 50 of the king's remaining servants, whose bodies were gutted and filled with straw, and similarly 50 of his finest horses. Then the men and the horses were impaled on spikes and placed round the tomb, each horse with its rider, and left there.

Herodotus also remarked that when an ordinary Scythian died, the body was taken by his family on a round of visits to friends. The friends provided meals, serving the corpse with food just like the rest.

The Megaliths

Meanwhile in the eastern Mediterranean area, burying the dead underground had begun to be accompanied by the building of structures above ground. These structures were sometimes far more imposing than the homes the dead had inhabited in life, like the colossal pyramids built to tower over the mummified corpses of Egyptian pharaohs. Before 2000 BC in Crete, for example, the dead were being buried in caves, or in underground chambers resembling the rooms of houses, or in chambers above ground.

This fashion in burials spread westwards to Malta, Spain, Portugal and southern France. Large stones (megaliths) began to be used for the walls and roofs of the tombs, an architectural style which spread to the rest of France and into northern Europe. Some of the tombs and the stones used were of huge size. Near Seville in Spain there is a tomb close to 70 feet long with a block of granite at the front of it which is 11 feet high, weighs 21 tons and had been fetched from a quarry more than 20 miles away. At New Grange in Ireland, a burial chamber, with a passage 62 feet long leading to its entrance, was covered with a circular mound of earth 265 feet across and about 45 feet high.

Not all megalithic tombs were anything like as big as this but even the smaller ones required human sweat and toil far in excess of what would have been needed merely to tuck the dead neatly away out of sight. The monuments imply a powerful sense of awe and respect for the dead, and possibly an urge to keep them tethered to their graves, close to their kinsmen and descendants for the help they could give.

Many of these tombs seem to have been the burying places of a family, or a larger group of people, used over a long period of time. When a man died, apparently, his corpse was left in the tomb with food, weapons and other equipment, and the door of the burial chamber was walled up, to keep him inside. When the next corpse was to be buried, the door was broken down again and offerings were burned to honour the spirit of the first occupant. This would go on until too many bodies had accumulated, and to make room for newcomers the skeletons already inside were pushed out of the way and piled up in disorderly heaps at the sides of the burial chamber. The apparent disregard of these elderly bones suggests that, not unnaturally, when a person had been long forgotten his remains were no longer treated with great respect.

In Brittany, there is often a menhir (a single upright stone) at the head of a grave and the entrance of the burial chamber inside points towards the menhir. It has been suggested that the people who built these graves believed that the souls of the dead liked to come out to take the air, and that the menhir was both a perch on which the soul could rest and also a marker which would help it find its way back.

The Dead and the Goddess

It is possible that the use of large stones and mounds of earth to wall in and roof over the dead was a development from the older tradition of cave burial, and was connected with the belief that burial under a weight of earth was the right way to put the dead where they belonged, in the domain of the earth goddess. Some megalithic tombs in Europe contain paintings and idols of a goddess, pottery decorated with a face or a pair of eyes, and geometrical patterns which may be symbols or stylized pictures of the goddess. These representations are almost certainly derived from figures of goddesses in Asia Minor and the eastern Mediterranean.

Both in Europe and elsewhere, many of the representations of a prehistoric mother and earth goddess have been found in burying places. Her connection with the dead was a natural one, for the dead were buried in the earth and it was the earth from which the crops sprouted. Perhaps to be committed to the womb of the earth carried with it the hope of a new life, just as the plants which die drop their seeds into the earth and are reborn again in due season.

(See also PREHISTORIC RELIGION.)

RICHARD CAVENDISH

Ancestor Worship

The basis of ancestor worship lies in a feature found in all human societies, the commemoration of the dead. There are obvious reasons why the dead live on in the memory of the living. The greater part of man's behaviour, as well as the material surroundings within which he works, is transmitted to him from his forbears. This body of customs and artefacts that we call culture includes his language, his buildings, his art and his social organization. None of these stand still; each generation makes its own contribution; but each does so in a cumulative way on the basis of the achievements of earlier generations.

This is especially true of simpler societies. There a man is often exploiting the same productive resources as his immediate predecessors. In Australia the territory of a band of hunters is usually one that has been passed down from earlier generations. In agricultural societies, men are yet more dependent upon their forbears. Among the Ashanti of West Africa, for example, land was regarded as belonging to the Earth, a female principle, but it also belonged to the ancestors. When a farmer began to cultivate his land, he sacrificed a fowl upon some mashed yam and said, 'Grandfather, you once came and hoed here and then you left it to me.' It was because his ancestor had hoed the

In the Belly of the Earth

Then Fa and the old woman laid Mal gently on his side. They pushed the great gaunt bones of his knees against his chest, tucked in his feet, lifted his head off the earth and put his two hands under it . . . Mal's fingers were moving aimlessly and his mouth was opening and closing. Fa and the old woman lifted the upper part of his body and held his head. The old woman spoke softly in his ear.

'Oa is warm. Sleep.'

The movements of his body became spasmodic. His head rolled sideways on the old woman's breast and stayed there.

Nil began to keen. The sound filled the overhang, pushed out across the water towards the island. The old woman lowered Mal on his side and folded his knees to his chest. She and Fa lifted him and lowered him into the hole. The old woman put his hands under his face and saw that his limbs lay low. She stood up and they saw no expression in her face. She went to a shelf of rock and chose one of the haunches of meat. She knelt and put it in the hole by his face.

'Eat, Mal, when you are hungry.'

. . . The old woman took handfuls of water and the others dipped their hands too. She came back and poured the water over Mal's face.

'Drink when you are thirsty.'

. . . At a sign from the old woman, Lok began to sweep the pyramid of earth into the hole. It fell with a soft swishing sound and soon Mal was blurred out of shape. Lok pressed the earth down with his hands and feet . . .

The old woman squatted down by the freshly stamped earth and waited till they were all looking at her.

She spoke:

'Oa has taken Mal into her belly.'

William Golding *The Inheritors*

land before him that he himself had the right to farm there.

The commemoration of our dead predecessors in an explicit recognition of our indebtedness to them, whether they are Christian saints, the benefactors of an Oxbridge college or our more immediate forbears. It is as appropriate to secular as to religious practice, and the visits of Soviet leaders to London are regularly marked with excursions to the grave of Karl Marx at the Highgate cemetery. Even secular societies such as the Soviet Union inter their illustrious sons with pomp and circumstance, and provide for the cult of the dead (while rejecting their continued existence in the afterlife). Both the Lenin mausoleum and Westminster Abbey celebrate not only the major political figures of the country, but also 'cultural' heroes like the astronaut Yuri Gagarin and the poet William Wordsworth.

An Influence after Death

It is useful to distinguish ancestor worship proper from the cult of the dead and from forms of memorialization. The interment of Yuri Gagarin does not imply any idea of personal continuity after death, and yet it is difficult to disentangle personal continuity from social continuity, that is, from the influence a man continues to have after his death. The cult of the dead implies a belief in an afterlife of some sort: the worship of ancestors recognizes their participation in everyday affairs; by appeasing the dead, or more often by failing to do so, we bring about their intervention in the world of the living.

But ancestors are not just any dead; they are a man's specific forbears, his lineal kin, those who have socially and physically brought him into being. Hence there is a close association between the kind of kinship groups which a society possesses and the custodianship of the ancestral shrines. In Chinese society, where men belonged to their father's clan, custodianship followed the paternal line; it was the sons that looked after their father's shrine. Indeed, here, as among the Hindus and the ancient Romans and Greeks, a childless man might adopt a son to ensure that he had worshippers at his shrine (and an heir to his property). Even a widow might adopt a son in her husband's name and so preserve, as the Chinese say, the continuity of the incense smoke, which is burnt at the ancestral tablets.

Incense is burnt daily; other offerings, such as fruit, preserves, sweets, rice sprouts, fragrant wood, lotus flowers and cooked food are made on festive occasions. At the same time the richer families employ a priest to read from the scriptures and perform certain rituals before the shrines. His function is to report the names of the dead (he has a complete family genealogy) to superior deities and to uplift them by reading the scriptures so that they are able to proceed to the Western Heaven of Happiness as soon as possible. (See also CHINA.)

The Hell Named Kalasutra

In India the ancient Hindu Law of Manu recognized the obligation of a man's sons, by birth or adoption, to provide food for the dead. 'The ancestors of men are satisfied a whole month with sesame, rice, barley, black lentils or vetches, water, roots and fruit, given with prescribed ceremony: two months with fish, three months with venison, four with mutton, five with the flesh of such birds as the twice-born may eat . . .' Such offerings are made mainly at the *Sraddha* or mind-rite of the orthodox Hindu, when offerings to the ancestors can be made indirectly through the priests. 'Whatever mouthfuls . . . are eaten by the Brahmins are eaten by the ancestors,' writes another lawgiver. The food may be given to a cow, a kid or burned but 'that fool . . . that gives the residue . . . to a man of servile class, falls headlong down to the hell named Kalasutra.'

In societies such as Ashanti in West Africa, where a man belonged to the kin group of his mother and her brother, then the matrilineal descendants, the sister's sons, looked after the shrines. This did not mean that a man could not sacrifice to his father, but he had to do so through a member of his father's clan.

The Watchful Dead

Worship of the dead (of which ancestor worship is one form) varies between simply warding off the dead with gifts lest they should intervene, and asking for their positive blessing in the way the Ashanti did. In the Eurasian continent, ancestor worship often seems to be of the placatory kind. 'Death and life' wrote Sir Edward Tylor, 'dwell but ill together, and from savagery onwards there is recorded many a device by which the survivors have sought to rid themselves of household ghosts.' Funeral ceremonies are full of examples of customs whereby the ghosts are set apart from the living, particularly from their nearest and dearest, the widows and the orphans, who are seen to be in the greatest danger from their loved ones. In more generalized form, such sentiments seem to be associated with many offerings to the tombs of the dead. In China, India and in the classical world, the dead appear actively to intervene if they do not receive their due. When they are treated properly, they are benevolent. But if the Hindu dead do not receive their due, then they wander around as ghosts; if neglected, the Chinese ancestors apparently turn into demons and bring trouble upon the world.

There seems to be a division in Europe and Asia between good, appeased ancestors and bad, rejected ghosts or demons. In Africa such ghosts exist, persons who have not yet reached the Land of the Dead. But the ancestors, as ancestors, seem to play a more positive role, both good and bad, in the affairs of men; translation of their immaterial forms into masks, figures, shrines, is more developed. These differences are partly related to the wider distribution of literate, universal religions in the Eurasian continent. Islam, for example, forbids the representation of the human image; and the worship of the One God allows little room for the propitiation of ancestors. Nevertheless, just as Christianity took over some local shrines and turned ancestors into saints, capable of acting as intermediaries between man and God, so too the Moslems of North Africa turned the graves of ancestors into the tombs of saints.

In addition to these religious influences, there were also some differences in the organization of kin groups and in systems of inheritance which may have affected the worship of ancestors. It is clear that attitudes towards parental figures must affect the attitude towards the ancestors, the dead parents. In China it has been suggested that because a man often took over his share of the patrimonial property during his father's lifetime, his relationship with his parents was less hostile as a result; his advancement no longer depended upon their death. In Africa it is generally those ancestors

Picturepoint London

from whom one inherits that one has most to fear; 'guilt' feelings apart, it is to them that one has a particular debt which needs to be repaid in offerings.

The Shrines of Ancestors

At death the dead make their journey to the other world. But communication with them has to continue from this world. Even the memorialization of the dead inevitably tends to take on material forms; the appropriate behaviour is directed towards and focused upon a grave, or an object associated with the dead man or an effigy, such as a statue or painting. In this context, great stress is placed upon the actual burial, the actual dwelling-place, the actual representation of the dead. It has been argued that drama began with the acts and scenes of burial ceremonies, which incorporated drama and mime. However this may be, many forms of representative art are rooted in ancestor worship and memorialization of the dead. For the living individual, the portrait on the walls of the ancestral home ensures one's survival after death: and the greater the artist, the greater the hope of immortality. For the survivors, the creation of an image provides a point of contact, a living and enduring memorial.

Such memorials and shrines range from the abstract to the representational, these different forms often being found side by side in the same region, though in general it is true that the simpler the society the more abstract the style. In West Africa, the poorer agriculturalists have shrines of mud mounds or earthenware pots, or even of selected stones. Among the Ashanti, with their elaborate state system and richer resources, the ancestor shrine is a carved stool, which is blackened on a man's death.

The Ashanti stool is an example of the complexity of such ancestral shrines. In the first place, it is an outward and visible sign of an individual's status. A child will be presented with a small stool when, after seven days, he goes through the 'outdooring' ceremony and acquires a real human personality. Different chiefships and different clans have their own stools, carved in a traditional way and often illustrating some appropriate proverb.

On such a stool only the office-holder himself may sit; when he rises it is placed on its side. For someone else to sit there would be a direct challenge, not only to a man's office but to his very existence. For so closely is the stool identified with the individual, impregnated as it is with the 'dirt' of his body, that his life itself is threatened by such an act.

The stool is at once chair and throne, the symbol of authority. The Ashanti believe that at the birth of their nation a golden stool descended from the heavens and became the most valued part of their regalia, the symbol of their new-found unity, the 'soul of the nation'. In 1900 when the British Governor of the Gold Coast, Sir Frederick Hodgson, tried to take possession of it in the name of Queen Victoria, the result was insurrection.

The stool represents not only the spirit of the nation, but also the spirit of the individual. At death a man's stool is seized and the white wood blackened with soot. It is then placed in the 'stool-house' of the lineage to which the dead man belonged, normally just a room in the elder's compound. Here it rests among the shrines of earlier dead, receiving offerings of food and flesh from the living members of the lineage. (See also ASHANTI.)

Shrines and memorials may be collective or individual, the former tending to be abstract, the latter representational. Among the Ashanti only the stools of important members of the lineage are placed in the shrine-room. To the north, in the savannah lands of Ghana, each individual Tallensi has a shrine, but only when he has been survived by two generations of descendants and therefore established his own 'house'. Among the nearby LoDagaa every man who leaves behind him a son (or whose widow produces a son to his name by marrying his brother) has an ancestor shrine carved for him during the long course of the various funeral ceremonies.

Few systems of ancestor worship are as elaborate or as specific as these, nor yet so closely linked with organizing the relationships between living men; for to sacrifice together to common ancestors is clearly a unifying bond of the greatest importance. In most societies, it is the more immediate dead that are man's primary concern. But here too the tombs, relics and shrines, both abstract and representational, provide a thread of continuity between the

Lop-Sided into Paradise

A Chinese girl goes to the grave of her mother:

. . . I would return to this place, this being the eighth year of her tenancy, and draw her forth. With a Taoist priest of Macau I would come, which would pay tribute to my mother, and a labourer. I would expose the coffin and lift the lid. One by one I would take out her bones, first hiding the skull under my coat away from eyes. Then I would polish the bones with sand, the little bones of her feet I would polish first and place them at the bottom of the Canton urn. Next the leg bones I would take, and these I would perfume, and lay them next in the urn, then the rib cage, the arms, the tiny bones of the fingers – all these I would place most carefully in the urn lest I bring her lop-sided into Paradise. On these, amid the incantations of the priest, I would lay the skull and cover the mouth of the urn away from flies.

Alexander Cordell
The Bright Cantonese

living and the dead; not only do they represent a continuation of the same personality but they provide a focus for communication between a man and his descendants.

Food for the Dead

Ancestor worship is simply a form of communication between the living and the dead. The forms of the communication vary, though all fall within the range of normal human intercourse. There are verbal forms – prayer, oaths, written formulae. There are visual forms – gesture (usually gestures of obeisance), painting, sculpture, the temple itself, then dance and more extensive types of movement such as the procession and the pilgrimage. Finally there are the offerings of flesh and food which form so important a part of ancestor worship. The worshippers pay homage to a 'divinity' that was once a man, a 'god' who was once a producer and consumer, and in many cases owner of the very means by which the living continue to produce – the land, the oxen or the ploughshare. So the dead continue to be offered the basic food and drink of the country, the bread and the wine, the yam and palm sap, the porridge and the beer.

But service to the dead cannot be the simple duplication of service to the living; the things of this world have a different meaning for those who can no longer enjoy them in the same way. With food the ancestors receive only a part of the whole; with livestock, the whole is offered in sacrifice, but the biggest portion is in fact consumed by those who remain behind. As far as the ancestors are concerned, a major element in the transaction would seem to be not so much giving as repaying; one is in perpetual debt to the forefathers, just as one is to parents who have raised one from infancy; one can repay this debt only by continual piety in the shape of sacrifice.

Human Sacrifice

Sacrifice is of two general kinds. The regular offerings to the dead are made on festivals like the three day period (the period of moon's rebirth, the period of Christ's resurrection) of Hallowe'en, All Saints and All Souls. Then there are the occasional sacrifices made at times of affliction, when one's child is ill and a diviner has pointed to an ancestor as the cause. For the dead, while beneficent to their descendants, can also punish. Indeed recent ghosts and others who have not been properly settled in the land of the true dead, are often plain vindictive, sometimes so that the living will be forced to undertake the correct rituals on their behalf, or to right a wrong that has been done them. Whereas the regular transactions approximate to the payment of debt, to the fulfilment of an obligation, the latter smack more of a gift that tries to repair some damage done. But often the damage has itself been caused by failing to give the ancestors their due, thereby incurring their wrath.

Sacrifice is not, of course, confined to the ancestors: it is a way of communicating

with supernatural agencies of all kinds. But there is one kind of offering of living beings that is often directed towards the dead – human sacrifice. The ritual immolation of human beings was widely practised; it was found among practically all the Indo-European peoples; in early Israel, Samuel 'hewed Agag in pieces before the Lord'; it occurred in India and Japan, among the Aztecs of Central America and in the forest states of West Africa.

But human beings (often criminals, slaves or war captives) were also sacrificed to accompany the dead on their journey to the other world. They were used, as in the West African kingdom of Dahomey, to convey messages from the living to the dead, especially to dead kings. As the 19th century explorer Richard Burton wrote, 'They periodically supply the departed monarch with fresh attendants in the shadowy world. For unhappily these murderous scenes are an expression, lamentably mistaken but perfectly sincere, of the liveliest filial piety . . . Whatever action, however trivial, is performed by the king, it must dutifully be reported to his sire in the shadowy realm. A victim, almost always a war-captive, is chosen; the message is delivered to him, an intoxicating draught of rum follows it and he is despatched to Hades in the best of humours.'

In the United States, Plains Indians went to war after a death so they would not 'grieve alone'. The Natchez of the lower Mississippi, alone among American tribes, practised wholesale sacrifice at important funerals, killing wives, relatives, friends, all to accompany the dead – and others not connected with the dead man often volunteered for the same honour, while parents killed their children as extra sacrifices and thereby gained great status.

Human sacrifice, or 'ceremonial murder', is akin to ceremonial suicide. Again the act is often associated with the cult of the dead. In earlier times Hindu widows were expected to sacrifice themselves upon their husband's funeral pyre (see SUTTEE). So too the Japanese *hara-kiri*, when committed at the funeral of a dead person, is in the nature of an offering to the soul of the dead.

Human sacrifice also lies close to cannibalism. For just as animal sacrifices are consumed by both god and man, so too man may be expected to consume part at least of the fellow humans he has offered. This practice was not very common, except as a ritual gesture. Indeed many societies, especially those following the major world religions, disapproved of the sacrifice of animals, let alone humans.

Royal Ancestor Worship

While the ancestors of ordinary men continue to communicate with their descendants, guarding over them and receiving their due, so the royal ancestors continue to be involved in the affairs of the state.

Indeed one of the strengths of dynasties like that of Egypt or of Ashanti, one of the sources of their legitimacy and a discouragement to their overthrow, was their role as intermediaries between their subjects and their ancestors, the earlier kings.

In Ashanti one can see royal ancestor worship as a simple extension of what occurred among the commoners. But in the Middle East and the Eurasian continent, ancestor worship in the full sense seems largely confined to the royal dynasty. At death in Egypt every dead man became the god Osiris, who was the king of the dead, associated with the idea of resurrection and the annual life and death of the cereal crops. There was no specific worship directed towards the individual, though the relatives of the dead often commemorated them. The worship of individual ancestors was largely confined to the burning of incense for the royal dead who were installed in their monumental stone pyramids in the valley of the Nile.

Crime and Punishment

A belief in the continued influence of the ancestors on human life is often an important factor in maintaining the laws and customs on which social life rests. In Rome, the man who sold his wife was given over to the ancestors for punishment; so too was a child who struck his father and the violator of graves. It is over the most serious offences against one's fellow men, such as fratricide and incest, that the ancestors are often the main instruments of social control, more important than the judges who administer the earthly punishments.

The ancestors are never completely cut off from this world. Often they are seen as returning to the world in the shape of their own descendants, either by the process of reincarnation or by other kinds of spiritual identification. Among the Murngin, a hunting tribe of Northern Australia, the soul of a dying man goes back to the 'totemic well' on the territory of his clan; it is from here too that the spirits of the unborn emerge to find a home in the womb of a wife of a clan member. When a man dies, it is his father's father or other grandparent that escorts him back again. Thus there is a continuous chain of being.

CURÉ OF ARS

THE LIFE OF St Jean-Marie-Baptiste Vianney, patron saint of parish priests, is of great interest from the viewpoints botb of mystical theology and psychical research.

Born in 1786, the second son of a small farmer in the village of Dardilly, near Lyons, he proved exceptionally responsive to his mother's religious teaching. A sensitive and nervous child, he was also robust, lively and vivacious but occupied his mind with religious topics while assisting in the fields. The French Revolution entailed persecution of those Catholics who repudiated the state organized church. Vianney therefore had little schooling and attended secret Masses.

Jean-Marie's sense of religious vocation, the desire to 'win many souls to God', crystallized about 1798 when he was sent to work on his uncle's farm at Ecully, about four miles south of Dardilly. Ecully sheltered several priests including Abbé Charles Bellay who prepared Jean-Marie for his first Communion, administered secretly. In 1805, when religion was restored, his father let him return to Ecully to study at Abbé Bellay's presbytery school. He found Latin agonizingly difficult and only a 60-mile pilgrimage on foot to the tomb of St John Francis Régis at Lalouvesc in the mountains

Dieu de bonté accordez à notre faiblesse les secours de votre grâce; et comme nous honorons la mémoire de la S.te Mere de Dieu, faites que par le secours de son intercession nous puissions nous relever de nos iniquités. Amen

Michael Holford

A visionary and mystic, the Curé of Ars was also a penetrating and intuitive psychologist; in addition various testimonies suggest that he was capable of reading thoughts *Previous page* **Portrait of the Curé: the scenes surrounding his picture illustrate events in his life, including miracles that he is believed to have performed** *Left* **Statue, in wood, of the Curé of Ars: canonized in 1925, he is the patron saint of parish priests**

of Ardèche saved him from despair. As an intending priest registered under the Archbishop of Lyons (Napoleon's uncle), he was exempt from military service, but in 1809 was called up in error.

Falling ill of a 'slow fever', he was sent on to rejoin his regiment. Exhausted he was picked up on the road by a military defaulter who conveyed him to Les Noës in the shelter of the Bois Noirs hills. The Mayor, a confirmed anti-Bonapartist, advised him to stay in hiding.

In consequence of an amnesty he returned to Ecully in 1811 and from 1812 to 1814 he studied at seminaries in Verrières and Lyons. He failed the examinations (conducted in Latin) but was allowed to take them in French. He was ordained priest (deacon) at the age of 29.

In 1818 Vianney was appointed to the tiny parish of Ars, across the Saône about 16 miles from Lyons. One small church of primitive design and four large taverns ministered to the needs of the 230 inhabitants who tended to be indifferent to religion. But the Abbé could not reconcile himself to a single soul eluding Heaven.

The Conversion of Ars

By calling at mealtimes, though himself refusing refreshment, he came to know every family. He spoke to them as peasant to peasant, but never failed gently to insist on the claims of religion. Soon the villagers learned of his fasting and prayers for sinners late into the night and before dawn. In the pulpit he declared innkeepers to be the source of sin and poverty, incapable of salvation. As the church filled the taverns emptied. The innkeepers went out of business, the last one being bought out by the Curé.

An able strategist, Vianney first converted the women, who prevailed on their menfolk to attend church and not work on Sundays. In the confessional the little Abbé ruthlessly withheld absolution until convinced that contrition was genuine and sin renounced. The most prolonged of his struggles was against communal dancing, rustic drunken revelries tending to promiscuity. But by 1824 he had effectively won his battles.

His parishioners soon discovered his remarkable talent as a confessor. He had a wonderful ability to penetrate their secret thoughts, it seemed. His words were few but always perfectly aimed. In time the faithful flocked to confession from Ars, Dardilly, Ecully and Les Noës, and eventually from all France.

His was an incredibly exhausting regime. He became so thin that he seemed but a flame glowing through skin and bone. His large bright eyes, radiant in a shrunken and wraithlike face, gave him the semblance of a saint on earth, and it was not surprising that broadsheets extolled him as if he were already enthroned in glory.

His sermons were as famous as his confessional. He depicted the horror of damnation; but it was not mere 'hell-fire' preaching or 'bible-punching'. Spontaneously he shed tears, as did his congregation, at the plight of souls separated from God and spoke with moving simplicity of the joy of those who perpetually saw God face to face. Bishops and dignitaries came from all France to hear him, as well as writing to him for advice on dealing with moral and pastoral problems.

In later years the Curé was constantly exposed to the temptation to retreat from Ars to a monastic and contemplative existence. He tried to leave the village three times but always returned. At his last attempt, in 1852, he was apprehended by his parishioners. He died in Ars after a brief illness, in 1859 at the age of 73.

The Making of a Saint

In his last years he reluctantly accepted the ribbon of the Legion of Honour. By this time 100,000 pilgrims, it is estimated, visited Ars annually. Consequently the first papal Process for inquiry into Vianney's merits began as soon as 1862. He was declared Venerable in 1872, Blessed in 1905 and canonized as a Saint in 1925, on the basis of two cures effected at his tomb.

The Curé's remains were exhumed in 1904 preparatory to his beatification. The flesh was dried and darkened but intact except for the face which, though recognizable, had suffered damage.

For many of the pilgrims Ars and its Curé had a mystic lustre, and many came in the hope of physical cure as well as spiritual healing. As in all pilgrimages a proportion of the suppliants were cured of bodily ailments. Few of the accounts extant are sufficiently detailed medically for us to decide whether they were natural or supernatural. Since such cures can and do occur outside of a religious setting, we cannot affirm them to be patently supernatural. But, whatever the cause, Ars was as productive of faith-cures as any of the world's famous shrines.

Vianney was a fine intuitive psychologist. His remarks, often humorous and always gentle though firm, revealed a penetrating simplicity. Some of the qualities of G. K. Chesterton's character Father Brown were inspired by the Curé. Numerous testimonies suggest that he had an insight superior to the normal, as if he was literally capable of reading thoughts. In modern terms, we should describe him as a 'sensitive' with a marked capacity for telepathy. From a crowd of pilgrims Vianney would pick out a total stranger and tell him the problem that had brought him to Ars and intimate facts of his life. These stories are based on written testimonies with circumstantial detail. It is possible that the Abbé was also clairvoyant and precognitive.

We are in no position to decide whether he had these powers by nature or by God's

grace as a token of sanctity. Such abilities are not manifested by all saints. Modern sensitives tell us that response to human need is a factor very conducive to the operation of paranormal powers, a suggestion supported by other evidence from psychical research. Also the Curé's austerities rivalled those of any oriental yogi, though whether paranormal powers can in fact be reinforced by asceticism is not yet certainly known.

Ecstasies and Visions

Those who lead lives of spiritual intensity are often visionaries. The Curé would sometimes pass into the state of calm and joyful contemplation, known technically as 'ecstasy'. In ecstasy numerous mystics have believed themselves to be in direct spiritual union with God. The Curé was most guarded about his experiences, but phrases he let slip suggest that at times he felt the close presence of John the Baptist, the Blessed Virgin and St Philomena, as well as Christ himself.

Some witnesses testify that they themselves had visions in the Abbé's presence. In 1840 a Mlle Durié heard a gentle voice talking to the Curé. Entering the room she saw a lady of ordinary stature, in a robe of dazzling white bearing golden roses and with a wreath of stars about her head. Addressing the lady as Mother, Mlle Durié, who believed herself to have cancer, asked to be taken to Heaven. 'Later', said the lady who then vanished. Mlle Durié aroused the Curé from what appeared to be an ecstasy, 'his countenance radiant and his gaze fixed'. When Mlle Durié referred to the presence of 'our Lady', the Curé told her she was not mistaken but must never speak of it again. It appears that Mlle Durié was cured of her presumed cancer after a lapse of three and a half months.

Attacks of the Devil

The Curé's life corresponded to saintly prototypes in a further respect. From 1824 to 1858 he suffered sporadically what he believed to be persecutions by the Devil. At night he heard noises as of rats gnawing or scratching, or of blows on the doors of the presbytery, or of hammering or drumming. Sometimes the Curé would hear the sound of footsteps and a coarse rough voice mocking him as 'a potato eater' and growling abuse and obscenities. A picture of the Annunciation was found smeared with filth. The Curé's bed was shaken and pulled across the room while he lay on it. The testimony of contemporaries suggests that on some occasions only the Curé heard the diabolical speech and noises, and it is natural to suppose that sometimes they were only hallucinatory. The act of vandalism could, in theory at least, be attributed to the Abbé himself in a condition akin to sleep-walking, as with Father John of Castille, of whom it was said that the Devil compelled him to use his own hands to deface pictures of the Blessed Virgin. But there was also testimony from Ars which suggests that some of the happenings, including the voice, were actual objective physical events. And there is no evidence positively to support the sleep-walking theory.

The haunting of the Curé bears a strong resemblance to poltergeist outbreaks, many of which are objective phenomena. Many features common to poltergeist disturbances suggest that a goodly proportion of them are due to obscure natural causes and related to emotional tension in the person on whom they centre. We know that the Curé's heroic virtue in his pastoral office was maintained in the face of a longing for solitude and contemplation, and it is arguable that the internal struggle was externalized in the drama of the Satanic persecution.

The mysterious happenings attendant on the Abbé cannot be surely interpreted as either natural or supernatural by considering his life in isolation from the data of psychical research on the one hand, or the phenomena of the mystics on the other. As a person at first he repels as a reactionary puritan, but in the end the most agnostic of readers is liable to be vanquished by Vianney's strange and improbable charm.

Because Adam and Eve surrendered to the serpent's tempting, and ate the fruit of the tree of the knowledge of good and evil, they were cursed by God, and expelled from the Garden of Eden: 14th century Bible Historiale

CURSE

SWEARING IS NOT TAKEN very seriously in our society but its old religious and magical connotations linger on. The word 'oath' usually means a careless imprecation but it can also mean a solemn statement, backed by a man's honour or by an appeal to God. To swear is generally to use 'bad language', a socially incorrect and ill-mannered activity, but to swear on the Bible in a court of law is a socially correct action, still likely in practice to make a witness more reluctant to tell lies than he might be otherwise.

Old-fashioned people object to swearing not only because they consider it vulgar but because it is blasphemy (a word whose meaning is now commonly restricted to swearing, in fact). The old phrase for it is 'taking the Lord's name in vain' or, in other words, trying to use God's powers for your own trivial or wicked purposes.

A curse is still the product of inner tension, which it still relieves. It still frequently achieves its basic object of bullying others into compliance, even though few of us any longer expect the curse to do physical damage to its victims. In societies which do expect a curse to

Michael Holford

harm its victim, it is part of the accustomed armoury of the magician and its effects can be damaging and sometimes even lethal. In 1956 an Australian aborigine was taken to hospital in Darwin, apparently dying because he knew that a death-spell had been cast against him. Placed in an oxygen tent and fed intravenously, he gradually recovered because he believed that the white man's magic was stronger than the aborigine sorcerer's.

Claude Lévi-Strauss has described the deadly effects on a man who knows he is the victim of hostile magic, in a society which believes and has conditioned him to believe that sorcery will kill him. The man himself is certain that he will die. His family and friends are equally certain, and treat him as if he was already dead. The victim's fear and his rejection by everyone around him may in practice prove fatal.

In this light, the effectiveness of excommunication, the solemn Christian ritual of cursing, in the Middle Ages is less surprising than it might seem at first sight. In his *History of the Inquisition* H. C. Lea described the plight of a man who had been excommunicated, in terms very like those of Lévi-Strauss. 'To the public law of the period he was an outlaw, without even the right of self-defence against the first-comer, for his very self-defence was rated among his crimes; in the popular faith of the age he was an accursed thing, without hope, here or hereafter. The only way of readmission into human fellowship, the only hope of salvation, lay in reconcilation with the Church through the removal of the awful ban.' And the *Catholic Encyclopaedia* echoes the same theme in saying of the excommunicated outcast that he can be 'considered as an exile from Christian society and as non-existent, for a time at least, in the sight of ecclesiastical authority.'

In most cases a curse is not meant to be either fatal or permanent. It punishes an enemy until he makes amends, when the curse is formally removed. Nor need a curse always be spoken aloud. For instance, there is an Eskimo belief that you can injure a person by spitting on the ground in front of him, meanwhile formulating a malevolent wish against him in your mind. In Europe and the United States witches have long been thought capable of harming people by 'ill wishing' them, usually by means of some magical action that may be as simple as spitting, pointing a finger, or a mere glance of the eye. And this is no dead and forgotten folk belief: it still prevails in civilized times. In 1906, a farmer in Pennsylvania paid a woman a large sum of money to remove her curse or spell on his

livestock, which had been inexplicably dying one by one for a year. More recently, in 1953, an Arizona rancher shot and killed a woman whom he (and everyone in the area) thought was putting a curse on his wife. In Limoges, France, in 1963 an old woman was investigated by police for alleged 'witchcraft' activity, though she claimed to be a lifter of spells, not a caster. And in southern Germany, where the witch belief is especially strong, a farmer in 1964 accused his wife of having cursed his cattle, so that cows went dry and calves died.

But cursing need not always be malevolent. In writing about the Lugbara people on the northern borders of Uganda, John Middleton has explained how the head of a family invokes the ghosts of his ancestors to punish with sickness any of his relatives who need to be disciplined. He does this by sitting near the shrines of the ancestors and thinking the words of the curse in his mind. If he says the words aloud, if he 'whispers into the shrine', the effect will be so drastic that the victim is likely to die. 'Silence in the face of offence, or merely the words "you will see me later" from an elder or kinsman of the same family cluster, are ominous and tantamount to a threat to invoke the ghosts.'

This is an example of the curse as a support of authority and established order, a threat which ensures good behaviour. In an essay on 'Zande Blood-Brotherhood' E. E. Evans-Pritchard has described the Azande ritual in which two men (or two groups) form an alliance by drinking each other's blood. The blood each man has swallowed will take vengeance on him if he betrays the alliance. 'If you see someone struggling with your blood-brother and you run and attack him also and strike him violently, may you not recover from the vengeance of the blood. If a child of mine is in danger of the law and hides in your hut and you give him away so that he gets into trouble, may you die from the blood . . .'

Often the speaker takes a piece of cord, holds it in his blood-brother's hair and twists it round and round on top of his head while the spell is pronounced. The twisted cord stands for the grip which the blood will take on the other's vitals if he breaks the alliance.

If one of the men is false to his blood-brother, the blood in his stomach is expected to take vengeance by itself but sometimes the injured partner will take the cord which he used during the ritual and wind it into a ball, meanwhile calling on the blood to exterminate the offender and his family, to bring upon them leopards, lions, snakes, thunder, dysentery, leprosy and other evils. He wraps the ball in leaves and hides it in the roof of his hut. If the offender comes to make amends, the ball is taken down and unwound, and the blood is ordered to release the man from its grip.

The Well of St Elian

This type of curse, which is to strike someone only under certain stated conditions, is known from many parts of the world as a way of ensuring that obligations which have been undertaken will be met, and so of preserving social harmony. According to the Roman historian Livy, when the Romans made a treaty with their neighbours the Albans, the Roman spokesman prayed to Jupiter: 'If the Roman people shall knowingly and of set purpose depart from the terms of this treaty, then smite thou them, O Jupiter, as I smite this boar-pig today.' And he killed the pig with a flint knife.

The use of the cord in the Azande blood-brotherhood ritual recalls the prominence of the idea of 'binding' in curses from the ancient world. In the *Republic* Plato condemns magicians who, 'if anyone wishes to injure an enemy, for a small fee they say they will bring harm on good or bad alike, binding the gods to serve their purposes by spells and curses (*katadesmoi*).' The Greek word means literally 'bindings' and refers to curses scratched on lead tablets or bits of pottery and placed in tombs or buried in the ground. Sometimes the lead tablet was tied round with wire, to 'bind' the victim more effectively. A curse scrawled on a piece of pottery and dating from c 400 BC says, 'I put quartan fever on Aristion to the death'.

These curses were frequently intended to disable opponents in a legal action. A late 4th century example from Athens says, 'I bind Theagenes in tongue and soul, and the speech that he is preparing. I bind also the hands and feet of Pyrrhias the cook, his tongue and his soul and the speech that he is preparing.' Two other hostile witnesses are similarly 'bound' and the curse ends, 'All this I bind, obliterate, bury, impale'. In some cases the curse was believed to be effective by itself but sometimes the spirits of the dead or the underworld deities were also called upon.

This method of cursing is not as far from us in the modern West as we might like to think. The cursing well of St Elian at Llanelian-yn-Rhos, near Colwyn Bay in Wales, was doing a flourishing trade in the mid-19th century. The procedure was to write the name of your enemy on a piece of paper, put it in a lead box and tie it to a slate on which you wrote your initials. You took it to the keeper of the well and paid him a fee. Your curse against your victim was then recited and the lead box was thrown into the well.

The keeper would probably also receive a fee from the victim, who would hurry to pay for the curse to be removed. The keeper would read two psalms to him and make him walk round the well three times. Then he would draw up the curse in its lead box from the well and give it to the victim.

Another long-lived use of a curse was to deter robbers from violating graves. Many curses of this sort have been found in funeral inscriptions from the ancient world, especially in Asia Minor, and in northern Europe curses were written in runes on gravestones (see ALPHABET). The fear of being disturbed in the grave and the use of a curse to prevent it survived into Shakespeare's time. The epitaph which he chose for his tomb at Stratford says:

> Good friend, for Jesu's sake forbear
> To dig the dust enclosed here.
> Blest be the man that spares these stones
> And curst be he that moves my bones.

The idea is still by no means dead, as the

Death by Magic

An individual who is aware that he is the object of sorcery is thoroughly convinced that he is doomed according to the most solemn traditions of his group. His friends and relatives share this certainty. From then on the community withdraws. Standing aloof from the accursed, it treats him not only as though he were already dead, but as though he were a source of danger to the entire group. On every occasion and by every action, the social body suggests death to the unfortunate victim, who no longer hopes to escape what he considers to be his ineluctable fate. Shortly thereafter, sacred rites are held to dispatch him to the realm of shadows. First brutally torn from all of his family and social ties and excluded from all functions and activities through which he experienced self-awareness, then banished by the same forces from the world of the living, the victim yields to the combined effect of intense terror, the sudden total withdrawal of the multiple reference systems provided by the support of the group, and, finally, to the group's decisive reversal in proclaiming him – once a living man, with rights and obligations – dead and an object of fear, ritual and taboo. Physical integrity cannot withstand the dissolution of the social personality.

stories of curses alleged to have overtaken those who have disturbed the rest of Egyptian mummies show.

A curse may also overtake a man as the result of some crime which not he but his ancestors committed. The hereditary curse which haunted the house of Atreus, kings of the Greek city of Argos, played a part in the murder of Agamemnon, leader of the Greeks in the siege of Troy, by his wife Clytemnestra, as told in the *Agamemnon* of Aeschylus.

Bell, Book and Candle

In Greece an official curse could be pronounced by magistrates or priests against an enemy of the state or an offender against the laws, and evidently had a terrifying effect on the victim. In the Old Testament, chapter 28 of Deuteronomy contains a catalogue of maledictions against those who do not obey the voice of the Lord God, so comprehensive and so drastic that Jewish congregations were frightened of hearing it read at all, in case it brought the curses down upon them.

These official curses are the predecessors of the Christian ritual of excommunication, in which the notion of 'binding' appears again, for the Church based its right to curse, with effects reaching even beyond the grave, on Matthew 18.18, where Jesus tells his disciples that 'whatever you bind on earth shall be bound in heaven, and whatever you loose on earth shall be loosed in heaven.'

The most ceremonious form of the rite of excommunication is popularly known as bell, book and candle because the officiating cleric closes the book from which he has read the curse, a bell is tolled as for a dead man, and candles are extinguished as a sign that the soul of the offender has been removed from the sight of God. Of course, the excommunication can be lifted if the offender repents.

In the 8th century Pope Zachary devised a formula for popes to use in pronouncing anathema (another word for ceremonious excommunication). The pope was to wear violet vestments and his mitre, and to be assisted by 12 priests carrying lighted candles. He formally deprived the offender of the Mass and separated him from the society of all Christians: 'we exclude him from the bosom of our Holy Mother the Church in heaven and on earth . . . and we judge him condemned to eternal fire with Satan and his angels and all the reprobate, so long as he will not burst the fetters of the demon, do penance and satisfy the Church.' Finally the pope and the 12 priests threw their lighted candles to the ground.

CYBELE

THE GREAT GODDESS of Nature and her young lover or son, well-known deities in the Near East, appear in Anatolia (now Turkey) as Cybele and Attis. As figures of classical mythology they are best known from literature of Roman times, both Greek and Latin, but they have a previous history, which this literature reveals in part. They were always known to be foreign to Greece and Rome.

The cult and myth of Cybele as known in the classical world originated with the Phrygians who entered Anatolia from Thrace in the 13th century BC. It contained elements taken over from the native population, among which was perhaps the figure of Attis. Even in ancient times Attis was sometimes identified with the Syrian Adonis, so closely did they resemble each other. But Cybele, though she is akin to such other forms of the Great Goddess as Astarte in Syria and Ishtar in Babylonia, Ma in Anatolia and Rhea in Greece, is a distinctive figure because of her special connection with mountains and with wild beasts.

According to some scholars Cybele is the same as Cybebe of the Lydians (who lived in what is now southern Turkey) and certainly little distinction between them is found in classical literature. Cybebe originates from the South Anatolian and North Mesopotamian nature-goddess Kubaba, 'mistress of doves'. But the name Cybele is likely to be Phrygian, since Cybela or Cybelus was a name of her sacred mountain and apparently meant a place of caves or chambers where she dwelt and had her image. In some Phrygian inscriptions from 700 BC onward she is called *matar Kubile* and Attis *Atte papa*, which suggests that Attis was a male consort.

The original centre of her cult was Pessinus near Ankara in Phrygia (now central Turkey) at the foot of Mount Dindyma or Dindymum. The mountain is now called Gunusu Dagh.

During the 7th century her cult appears to have spread through Anatolia to Lydia and the coast of the Black Sea. From Lydia it reached Greece, where it was little favoured and usually left to Phrygian slaves. In 205 BC at the crisis of the Hannibalic war it was brought direct from Pessinus to Rome. Cybele was accepted there as a goddess who protected cities and maintained life, was established in a temple on the Capitol, and was later honoured with a festival, the *Megalensia*, the Great Mother's Games. Fortune began to favour the Roman armies, and there was even an unprecedented harvest in Italy which repaired the ravages of war. But in spite of its magical efficacy the cult with its rites was found scandalous at Rome, so that it was insulated by special rules. No Roman was permitted to join directly in its rites, still less to serve as a priest. From Rome in the imperial age, when in its train other oriental cults were introduced, it spread to the provinces and lasted until the triumph of Christianity.

The original character of Cybele may be gathered best from the scornful description

Giraudon

Attis, the consort of Cybele: bronze statue in the Louvre, Paris

of the Christian apologist Arnobius who touches on it in a tract written about 300 AD; some of the same details appear in the writings of Pausanias, the Greek geographer of the 2nd century AD, and elsewhere. Cybele was born of the rock Agdus from the seed of Zeus; hence her name Agdistis used in this story. She was at first a bisexual monster of great strength and ferocity. The monster devastated the country and terrified gods and men until Bacchus tricked it by pouring into its favourite drinking fountain a great quantity of the strongest neat wine as a soporific. As it slept, Bacchus tied its male organs firmly to a tree with a rope of twisted bristles, so that when it woke and sprang up, these organs were torn off with a great flow of blood, and it lost its male sex. From the blood the first almond tree grew. One of the almonds was picked for its beauty and put in her lap by Nana, daughter of the river Sangarius. It disappeared, but Nana became pregnant. She was shut up without food by her father, but fed by the Great Mother until she bore her child Attis. By order of Sangarius, Attis was exposed in the open and left to die, but he was fed by a wild goat.

The Black Stone

As he grew up, his beauty attracted the love of Agdistis who hunted with him in the woods and presented him with the game. Midas, King of Pessinus, wishing to deliver Attis from this disgraceful attachment, arranged for him to marry his own daughter, closing the town's gates for the ceremony. But Agdistis burst in, raising the town walls on her head, because she knew that danger threatened Attis if he should marry. Thereupon Attis went mad and castrated himself under a pine tree, scornfully making a gift of his severed organs to Agdistis, who gathered them up and preserved them. Violets grew from them, with which the pine was decorated. But Attis himself died from his wounds. In spite of Agdistis's prayers, Zeus would not restore him to life, but merely preserved his body from corruption and kept its little finger in perpetual motion. Agdistis installed the body in a tomb at Pessinus with castrated priests to maintain a cult.

The childish and dream-like grossness of this form of the myth is surely a sign that it is the original one. Its savagery persists in all later forms. Primitive too is the black stone of Pessinus, the uncarved fetish which was specially identified with Cybele and was later taken to Rome. The high, flat-sided crown that her images wore, explained in this myth as the walls of Pessinus raised on her gigantic head, is a feature which suggests that she was originally conceived as a living mountain or rock, as well as an anthropomorphic goddess. This is borne out by the account of her origin. The myth was toned down and even allegorized by later writers, such as the Emperor Julian (331–363 AD), the last powerful defender of paganism.

The poet Lucretius (c94–55 BC) recognized Cybele as the Great Mother, wearing her 'mural' crown and riding in her chariot drawn by lions, and described her cult. Catullus (c84–54 BC) again describes the cult. The hero of his story is a young Greek, not the mythological Attis. He visits the mountainous area in the north-west of Phrygia to hunt on Mount Ida, is seized by madness, castrates himself and joins Cybele's followers, and when he wishes to escape is driven back into the forest by one of her lions. The versions in which Attis dies by the wound of a boar's tusk are affected by the myth of Adonis. But in some versions of the myth, and evidently in the cult, Attis is said or assumed to rise again from the dead. As a spirit of vegetation, which renews itself every year, he would naturally do so, and it was the purpose of Cybele's cult to maintain life. The castration, which persists in the myth and cult, had the nature of a sacrifice to Cybele. Sacrifices of bulls and rams were also customary.

The cult was unique in the Greek and Roman world for its noise and frenzy. It was psychologically akin to the cult of Dionysus, which was likewise by origin Thracian and Anatolian but much better known to the Greeks, having been long ago adopted by them and controlled. Cybele's procession of eunuch priests marched, danced and whirled through the streets to the scream of flutes, the throbbing of drums, the clatter of castanets and the clash of cymbals. Where this was allowed, devotees who joined it wounded and sometimes castrated themselves. The priests wore long robes like women. The cult had regular beggars, the *metragyrtae*, and municipal officials, carriers of the sacred pine, to administer it. In spite of the decorous statues of Cybele known in classical art, her cult always showed her underlying nature. Traces of the same originally hermaphrodite character are found in other goddesses.

Spirit possession is a characteristic feature of the traditional religion of southern Dahomey. A devotee who wishes to be 'captured' by a particular spirit has to undergo a long period of seclusion, during which his body is marked with ritual scars

DAHOMEY

FROM THE BEGINNING of the 18th century down to the 19th, Dahomey formed one of the most important kingdoms on the old Slave Coast of West Africa. In the complex Dahomean religion, the term *vodun* (from which is derived, through the slave trade, the West Indian 'Voodoo') was a key word in the religious vocabulary of several West African tribes, notably the Fon. Although in European accounts the vodun have often been described as gods or deities organized in a pantheon and constituting a system of polytheism, it would be more accurate to describe them as spirits. A characteristic feature of the religion of Dahomey is spirit possession.

A spirit or group of spirits usually has at least one 'temple', which may be a simple mud hut or a much more elaborate structure. If it is believed to be especially powerful, it may have many temples in different parts of the country. Each temple has its priests, who may be male or female, and whose position tends to be hereditary, although new cults and temples are constantly being founded by persons who become possessed by spirits. The priests minister to the devotees, *vodunsi*, who are attached to their temple and who have been initiated by them into the cult of that spirit. Often the devotees, the majority of whom tend to be women, have sought initiation in gratitude for, or in anticipation of, benefits conferred by the spirit, such as good health, fertility and prosperity. Membership in a cult may also be inherited.

The normal initiation ceremony can be very elaborate and expensive for the initiate and his kin who must pay the priest and sacrifice frequently to the spirit. It often includes a long period of seclusion at the temple, during which the initiate is said to have been 'killed' by the spirit and then to have been 'revived' or 'reborn'. While he is in seclusion, an initiate is marked with the body scars peculiar to the cult, is taught the language (often that of another tribe) associated with it, and rehearses its special songs and dances. Towards the end of his seclusion, he is 'captured' by the particular spirit which has 'declared war' on him and which 'enters his head' to take temporary possession of him. This condition is indicated by a trance-like state which normally occurs during dances in which the devotee is dressed in a costume special to that spirit and in which he imitates behaviour said to be characteristic of the spirit. Since the devotee acts in this way as a vehicle for the spirit, he hopes to derive benefits from it. After his initiation is completed, the devotee is expected to continue supporting the temple and its priest; to observe days dedicated to the spirit by abstaining from work and sexual intercourse; and to join in the dances which bring on possession and which are held periodically for the spirit. When he eventually dies, his fellows, led by the priest, conduct special ceremonies for him.

Shades of the Ancestors

This brief summary of the complex cult organization may give the impression that all spirits are much the same but in fact there is an extraordinary variety. One important class comprises the ancestral spirits who are called *tovodun*. The Fon and the other tribes in the area are divided into clans and lineages, membership of which is normally transmitted in the male line, and the ancestors of these groups can influence the fortunes of their living members. Each lineage confirms its identity as a separate branch of the clan to which it belongs partly by building and consecrating a shrine to its own ancestors. The shrines of the senior lineage include some which are used on behalf of the clan as a whole. Each lineage makes annual sacrifices to its dead and at less frequent intervals they are honoured with more lavish ceremonies. Periodically, too, the more recent dead have to be properly 'established' as ancestors. In other words, they do not become tovodun merely by dying, but are given this status in rituals performed by their descendants who hope for some return from them. Many of these ceremonies can only be performed by a 'priest of the ancestors' whose training and appointment is (or was) partly controlled by

the monarchy. A prominent feature of the ceremonies is the possession of lineage members by the spirits of their ancestors.

Within the general category of tovodun, some receive special attention. Each clan, with one or two exceptions, is said to stem from the mating of a woman with an animal or vegetable, which is regarded as the embodiment of a spirit. The first son born of this miraculous union is known as the clan-founder, *tohwiyo*. It is he who transmits to his descendants the special observances laid down for them by his non-human parent. These include prohibitions on eating certain foods and the use of particular tattoos. The tohwiyo is believed to concern himself with the affairs of the living, such as births, marriages, divorces and deaths, and should be informed or consulted about them at the shrine which each lineage of the clan has dedicated to him. At the annual ceremonies for the ancestors, one dancer impersonates and is possessed by him.

The beliefs about the clan-founder and his parents represent the notion that the origin and persistence of the clan depend on the conjunction of the human and non-human – the vodun, in fact. The tohwiyo is appropriately the intermediary between the two spheres, because he is the product of their conjunction and is therefore both human and spirit. He and his father also signify which practices are peculiar to that clan and distinguish it from the others.

Some tohwiyo acquire such a reputation that they attract devotees from outside their own clans. A conspicuous example is the founder of the royal clan, supposed to be the son of a princess and a leopard. The kings of Dahomey encouraged commoners to participate in this cult, and at the same time prohibited members of their own clan from joining the cults of other vodun – a striking case of the political uses of religion.

These vodun are commonly associated with a few clans which trace their origins, not to partial but to complete human beings who came down from the sky or out of holes in the ground. These clans are therefore

Dahomey fetish: dominated by a multitude of spirits, Dahomeans worship inanimate objects which they believe to have magical powers

Almasy

William Sargant

Priests, either men or women, are attached to the temples dedicated to each of the many spirits or groups of spirits in Dahomey: their position is usually hereditary, although new cults and temples are founded by people possessed by spirits

sometimes said to have no tohwiyo, their place being taken by the so-called 'gods', the most famous of whom are called Mawu-Lisa, Sogbo and Sagbata. There is evidence that these vodun and the clans associated with them originated amongst the Yoruba peoples who live mainly in western Nigeria, but are also found in Dahomey.

There is certainly a close correspondence between the spirits known to the Fon as Mawu-Lisa and to the Yoruba as Odudua-Orishala (Obatala). These spirits form a composite being, described sometimes as a hermaphrodite, sometimes as a pair of twins. They clearly symbolize an idea of duality in the world, since Mawu is female and is also the earth, the moon, the west and the night, whereas Lisa is male, the sky, the sun, the east and the day. At the same time, they express the unity achieved through the interaction of these dual elements and are commonly represented by the two halves of a gourd which are carefully joined together, suggesting the junction of the earth and the sky. In some myths, they are credited with having created the world, and they are then supposed to have divided the various features of it amongst their 'children', who are other vodun, born of their union. This multiplication of spirits within one cult is common in Dahomey.

Somewhat similar ideas are held about the group of spirits led by Sogbo, who is very like the Yoruba Shango. Sogbo is another hermaphrodite, supposedly living in the sky, who, like Mawu-Lisa, produced a number of 'children' to whom control over different natural phenomena was given. Considered together, these 'children' represent a dual division of the world, in which the sky again stands for everything above, but it is the sea, and not the earth, which represents everything below. This feature is perhaps explained by the fact that the cult, in this form, originated at a village near the coast. Certainly, the beliefs about these vodun reflect a preoccupation with water, whether as the sea, the rivers, the lagoons or the rain. The 'sky spirits' in this group are also associated with thunder and lightning, which is one means by which they may attack human beings, who therefore have to placate them.

The third group of vodun is dominated by Sagbata (Yoruba – Soponna), who is called 'king of the earth'. He too is sometimes a single being, sometimes a pair of twins, and propagates 'children' who are the spirits of different aspects of the earth. The notion of duality is not very evident in the cult itself but there are myths in which Sagbata and Sogbo agree, after a quarrel, to divide the universe between them, the one taking the earth and the other the sky. These are clearly attempts to explain the overlapping and often contradictory claims of the cults.

The Smallpox God

One unpleasant way in which Sagbata manifests himself to human beings is by afflicting them with smallpox or other eruptive diseases, and Europeans have therefore often called him the 'smallpox god', just as they have called Sogbo the 'thunder god'. They and Mawu-Lisa are in fact vodun which have been especially successful in competing with others to attract devotees. Some legends say that, like the tohwiyo, they were originally ancestral spirits and that their cults have only become more general in relatively recent times. Why they spread is not very clear, but they could hardly have done so if they had not appealed to human desires for security and well-being. Even so, they did not satisfy these desires completely for there are other successful vodun, several of which are especially concerned with the personal fate or destiny of individuals. The most well known of these are Legba, Dan and Fa.

Legba is a spirit for whom a common material representation is a figure with an exaggerated, erect penis, which symbolizes his inordinate demands for attention and his freedom from normal constraints. He has this character because he is a 'messenger' between all the other vodun who cannot communicate directly, since they 'speak different languages', and between them and mankind. Therefore, if he is not given the sacrifices he constantly requires, he may disrupt communications and thereby bring about natural calamities and individual misfortunes. The idea of Legba thus provides an explanation for those disasters which occur even when men have apparently discharged their obligations to other spirits.

Dan, who is commonly figured as a snake holding its tail in its mouth, is associated with the rainbow, with water and with smoke, and in general is said to represent the idea of motion. Primarily though, he is envisaged as a source of individual success or failure in gaining wealth. Therefore, he has to be treated carefully because, like Legba, he is notoriously fickle and can withdraw his favours if insufficient attention is paid to him. Both Legba and Dan are connected by Dahomeans with their most elaborate system of divination, which they probably acquired from the Yoruba. Its vernacular name is Fa and, besides revealing what good or ill the future may hold for an individual, it offers him the means of securing or evading it. Therefore, as well as being a technique of divination, Fa is a cult with its own metaphysical doctrine of man and nature, which some of its practitioners can expound in great detail. Indeed, Fa is often spoken of as a vodun. That this should be so may serve as a fitting final comment on the complex religion of Dahomey, which provides individuals with so many alternative ways of trying to interpret experience and to control it.

DANCE

Camera Press London

Initiates have learned the secrets, they have symbolically died and have awakened to a new status

Man has always expressed his feelings in movement, and dancing is one of the oldest arts. But it is also a means of marking the crises of life, or encouraging the crops or healing the sick soul and body. Behind many ritual dances is the belief that it is through the dance that man speaks directly to his gods

WHILE WESTERN MAN generally regards the dance as a pastime, many other people, especially in non-literate societies, still dance as a form of prayer or magic, directed to a variety of practical ends. Ritual dances of today serve many functions, particularly as celebrations of life's crises, for healing or as efforts to promote the fertility of crops.

Puberty rites survive among aborigines in various parts of the world. The *waiang-arree*, for example, is the circumcision rite of the tribes of Broome on the west coast of Australia. After initiations and a climactic group dance by men and boys in a double circle, the novices become fully fledged members of tribal society. They have learned the secrets, they have symbolically died and have awakened to a new status.

Women may hold their own rites for pubescent girls. Choroti and Lengua women of South America danced for a month, circling the girl with slow steps, and striking the ground with bamboo staffs topped by deerhoof rattles. In this rite for demon exorcism they had the aid of four singing medicine-men. In the Maipure tribe of Venezuela the older women chase away demons, who are really masked men miming wild beasts. An Apache girl of New Mexico joins in a circle dance with attendants. For four days four men, the masked *gahe*, impersonate horned mountain spirits with pointed swords and angular gestures. During the ceremony the girl practises her future tasks as a woman. Such instruction is an important function of these rites.

Therapeutic dances may also take the form

Although dancing, in the West, is generally regarded as a social pastime, or entertainment, dances in Africa still retain their ritual character *Previous page* Nigerian stilt dance, a test of skill *Above* Basuto girls, their faces symbolically concealed behind masks made from beads, perform an initiation dance

The Dance of Life

In the ecstasy of the dance man bridges the chasm between this and the other world, to the realm of demons, spirits and God. Captivated and entranced he bursts his earthly chains and trembling feels himself in tune with all the world . . . The dance, inherited from savage ancestors as an ordered expression in motion of the exhilaration of the soul, develops and broadens into the search for God, into a conscious effort to become part of those powers beyond the might of man which control our destinies. The dance becomes a sacrificial rite, a charm, a prayer, and a prophetic vision. It summons and dispels the forces of nature, heals the sick, links the dead to the chain of their descendants; it assures sustenance, luck in the chase, victory in battle; it blesses the fields and the tribe. It is creator, preserver, steward and guardian.

From its deep and far-reaching influence it will be apparent that in the life of primitive peoples and of ancient civilizations scarcely anything approaches the dance in importance. It is no art that disregards bread; on the contrary it provides bread and everything else that is needed to sustain life. It is not a sin, proscribed by the priest or at best merely accepted by him, but rather a sacred act and priestly office; not a pastime to be tolerated only, but a very serious activity of the entire tribe. On no occasion in the life of primitive peoples could the dance be dispensed with. Birth, circumcision, and the consecration of maidens, marriage and death, planting and harvest, the celebrations of chieftains, hunting, war and feasts, the changes of the moon and sickness – for all of these the dance is needed . . . the dance in its essence is simply life on a higher level.

C. Sachs *World History of the Dance*

of circling or demon impersonations. They may show startling, individualistic whirls or spasms, depending on the purpose and location. They achieve therapy by inducing ecstasy, by curing a disease, or both. Ecstatic dances bring worshippers into communion with supernatural beings, by means of regulated movements, hypnotic musical accompaniment and sometimes with the aid of narcotics. The most spectacular mystic cult is that of the Turkish dervishes. Rufai or howling dervishes stamp and spring in a double circle, swaying and jerking their bodies. Mevlevi dervishes whirl individually, faster and faster, while the upraised right hand receives supernatural power and carries it to earth through the lowered left hand. (See DERVISH.)

Balinese men dance themselves into a near-suicidal trance, as they direct their kris daggers against their own breasts. The frenzy of the Asiatics brings to mind medieval dance manias – the St Vitus tremors which are now extinct, and the self-flagellant ecstasy of Penitentes, who still celebrate their Easter rites in New Mexico and the Philippines, to atone for their sins.

Asiatic shamans whirl themselves into a trance not only for mystic experience, but also for the cure of illness. Siberian shamans of the Tungus and Yakut tribes commune with the spirits of ancestors or animals and they effect cures by means of a revelation. Noisy exorcisms are the aims of the masked Devil Dancers of Ceylon and the Nalke and Paraiyan castes of India. These inspired men (rarely women) have their counterparts in the New World, especially among the Eskimo and the tribes in the jungles of the Amazon. They restore sick patients by bringing their souls back from the spirit land.

The New World received other ecstatic cults from Africa, under various names. Negro slaves brought the *vodun* cult (from which the word Voodoo is derived) to Haiti from Dahomey. The Bantu perpetuated their Macumba in Brazil, making many adaptations to the new environment. For instance, they know their ancestral gods by the names of Catholic saints as well as by the tribal names but they have preserved the essence, the traditional movements, songs and drums, and retain the strict ritual organization, with male and female priests. The worshippers impersonate deities in traditional movements, such as undulations for the snake god. As the deity 'rides' a worshipper, he or she may lose consciousness or become violent. Priests, who remain conscious, must often restrain ecstatic individuals, and help them regain consciousness. Though these rituals appeared malevolent to missionaries, they actually benefited the participants by relieving psychic tensions and by effecting better rapport with fellow human beings.

Masks with Staring Eyes

Missionaries saw such ecstasy arising within the groups of Christian converts. The Shouters and the Holy Rollers are among the sects which seek communion with Jesus in a semi-trance. Any member of a congregation can start a gospel song. A pianist and steel guitarist pick out counter rhythms; then the entire assembly syncopates the melody with hand-clapping, tambourine or triangle. As the worshippers rise from their chairs, some flex their knees rhythmically; some shuffle their feet; some skip in the aisles with spasmodic foot twists. They jerk their torsos or sway with upraised arms, shouting 'Halleluia', 'Thank you, Jesus!'.

In the New World, medicine dances of native origin cure mental and physical ailments. The Iroquois of New York State and Canada hold many medicine dances with traditional songs. At midwinter the Society of Maskers represents disease spirits and exorcises spirits which have afflicted members of the traditional native religion. In wry, wooden masks with staring eyes and long hair, they enter the sanctuary, the specially sacred area of their meeting place, crawling, whinnying and knocking turtle-shell rattles on floor and door. They hop about grotesquely, causing mingled awe and mirth. From a fireplace they collect ashes and rub them on the hair and arms of patients who are suffering from toothache or some other ailment. Finally everyone joins in a circle dance and a subsequent feast of corn mush. The Iroquois hold equally jolly medicine dances to propitiate the spirit of an animal that has taken offence at some ritual misdemeanour and has afflicted a man or woman. If a shaman decides that a bear spirit has caused cramps, for instance, he recommends a ritual for the bear. After a prayer and a tobacco offering, ritual conductors lead a circle dance, imitating bears with waddling and growling. Then the spectators join in a mimetic counter-clockwise circuit. They stamp, kick, eat nuts and berries, the bear's favourite food, and end by greatly cheering the patient.

Other tribes, like the Navaho of Arizona, hold long curative ceremonies, with singing and sometimes with masked spirit impersonations. They have special success with emotional ailments, by virtue of the musical and dance rhythms. They do not try to cure ailments brought by the white man from Europe.

To encourage a plentiful supply of food dances are performed to honour animal spirits in hunting rites, and plant spirits in agricultural rites. They vary greatly in accordance with the environment, fauna and flora. Animal dances, which are usually imitative, please animal spirits before a hunting expedition and appease them after a successful kill. Early man and some groups of modern men have held beasts in awe, not only because of their food value but also because of their agility and power. These animists endow all creatures with souls. Their animal mimicry is often very realistic. Boys of the Australian Kemmirai tribe imitate kangaroos by jumping, holding up their hands before their chests, or scratching themselves. African mimes can be great comics, such as the monkey men near Odienne of the Ivory Coast of West Africa. Tewa Indian men of New Mexico act like deer in some animal ceremonies; they gallop lightly or stand and tremble, nervously turning their antlered heads from side to side. In another version, however, they have stylized the mime; they stand erect as they sing and tread the ground.

Many animal dances survive as entertainments. Japanese folk festivals include realistic masked deer, bears, dragons, herons, cocks, and a comic lion imported from China. Turkish festivals enliven begging processions with camels and foxes in skins. England's prehistoric dramas survive in the Mummers, with real skins or shaggy imitations made of newspaper. The stylized reindeer of Abbots Bromley are six men who hold antlers in front of their heads as they face each other in two files, cross over and interweave sedately (see HORNS).

Agricultural dancers of today rarely impersonate plant deities. The Aztecs appointed elaborately garbed priests or

priestesses for the impersonation of deities like Cinteotl, god of maize, in their seasonal ceremonial dances. The ancient Egyptians and Greeks also visualized their agricultural deities, like Dionysus, god of wine and seasonal rejuvenation. Iroquois women, however, merely symbolize the spirits of corn, beans and squash, without imitative attributes. Tewa women represent corn in great communal dances for the harvest, huge circuits and intricate lines danced by hundreds of men, women and children.

As in the case of animal mimicry, some agricultural dances are losing their religious significance but retain their ancient patterns. Balkan peasants still celebrate the harvest with circle dances by men and women – *kolos* of Serbia, *horas* of Rumania, Greece and Palestine, descendants of the ancient Greek *choros*, yet even more complex in steps and rhythms. The Tarascan Indians of Mexico still perform a sowing dance for women.

Folk dances and singing games preserve the forms of other occupational dances besides the hunt and agriculture. The Spanish *Filada* mimes spinning; the German *Webertanz* represents weaving; the Danish Shoemaker's and Tinker's Dance, the English Sailor's Hornpipe and Cobbler's Jig indicate these occupations.

Dancing Class Distinctions

The various classifications of people within a society, by birthright, occupation, age and sex, affect dance participation. In Western society such classifications are not rigid, but in many parts of the world social status determines a person's rights as a dancer.

Social organization, which may involve ritual organization, has evolved an infinity of patterns and restrictions. India's caste system is probably the world's most rigid division of people into gradations of prestige and occupations (see CASTE). The low-caste, the Paraiyans, clatter in masked, shamanistic trance movement, the purpose of which is curative. Peasants of Maharashtra in south-west India perform calendric festive dances, such as the *kolattam* stick dances. The Devadassis (female temple dancers) excel in the fine art of Hindu *Bharata Natyam*. Hilltribes like the Todas cling to ancient round dances.

Past civilizations have similarly, though less rigidly, divided people into social and

Brian Shuel

Brian Shuel

The Syndics of the Fitzwilliam Museum, Cambridge

choreographic classes. Europe's medieval feudal system separated people by location and simultaneously by occupation. Aristocrats in their castles held lavish festivals with comic dances by professional clowns and paired dances by the elegant men and women, including *caroles* and later on *pavanes* and *gaillardes*. Burghers in the cities tried to emulate the aristocrats, but they also took over dances from the peasants like the rough *weller*, which they eventually developed into the waltz. The peasants or serfs were the custodians of ancient, pagan ritual dances. Partly as tradition, partly as release from an arduous life, they continued to impersonate the awesome animal maskers at Twelfth Night and Carnival. In many parts of Europe, the descendants of these peasants perform folk dances for harvests, for weddings and for tourist shows.

In Mexico the Aztecs developed a similar class system between the 12th century and the 15th. They expressed their social-ritual divisions during huge seasonal ceremonies. Priests and war captives, who were also sacrificial victims, impersonated deities. Warriors held ritual combats, not unlike the sword dances of northern Europe. Nobles held special dignified dances, in double file. Women had special roles, as priestesses. In some serpentine dances harlots were the partners of warriors; in other serpentines respectable virgins of the merchant class joined youths of their class. Serfs never participated; they watched the ceremonies, or were drafted as sacrificial victims.

Telling the Men from the Boys

The Aztec caste system was exceptional in the New World. Most native tribes had a comparatively democratic organization, based on clans, and some still do. Iroquois society is divided into hereditary clans, which are traced through the women. All social and ritual activities hinge on the interaction of two groups of clans, termed moieties by anthropologists. Members of each moiety have their assigned places in the sanctuary and in the dance line. They must sit at opposite sides of the sanctuary. Generally they participate in the same ceremonies. In New Mexico, however, the members of the two moieties often have separate ceremonies. The summer moiety manages the summer dances for crops,

The devil dances of Liberia, West Africa, are performed on occasions such as the death of a king or at harvest time. The dancers *(right* and *facing page, below)*, made anonymous by their costumes and usually wearing terror-inspiring masks, represent malignant supernatural powers or devils: by imitating these evil spirits they hope to propitiate them *Facing page above* War dances, in preparation for battle or to celebrate a victory, also attract attention to the masculinity of the participants: Chuka dancers in Kenya

Popperfoto

while the winter moiety is in charge of winter ceremonies for animals.

Age grades nowadays have little effect on dance arrangements, except that in Europe and America children keep up singing games. In some aboriginal esoteric rites children are not admitted. In puberty rites they are the leading performers. In the now obsolete war societies of the Indians of the American Great Plains the boys were members of certain societies according to their particular age grade. Today in most American Indian and other folk dances, children participate, usually at the end of a dance line, copying their elders. While aboriginal dances involve elders as vigorous as their grandchildren, Western man tends to assume that energy is a prerogative of youth. The idea that modern dancing is for the youngsters has a long history. In the Middle Ages it was customary for the older couples to march slowly through the *branle double*, for younger couples to engage in the *branle gai*, and for youngsters to leap through the lively steps of the *branle de Bourgogne*.

Another form of segregation, according to sex, has deep-seated biological and sociological motivation. Men dance for war and the hunt, but women for peace and horticulture. The sexes may dance alone in their special rites, or they may occupy separate parts of a dance line, perhaps with different steps. Rarely are women the partners of men. That is a recent development in the social and stage dances of Europe and America.

The Geometry of Dance

The dance functions, organization and inter-personal relationships find expression in visible and audible patterns. The ingredients of the visible pattern are posture, arm gestures, footwork and geometric formations. They are usually synchronized with sound effects. Some rituals call for imitative body postures or special gestures. Other rites, as for harvests and most sociable dances, emphasize steps that carry the dancers over the ground in simple or elaborate formations. Local factors also determine the kind of ingredient. That is, different peoples emphasize certain ingredients in special ways called style. Many African tribes and their New World descendants move the whole body expressively, even acrobatically. India's art dancers emphasize arm gestures. European peoples like footwork – small, intricate steps in the Balkans, high leaps and kicks in the Basque Provinces. In southern Spain the men and women of Andalusia excel in sinuous torso and arm movements as well as in intricate footwork. Peasants of northern Spain prefer circle dances or interweaving 'longways'; this term is used for dances performed by two rows of dancers standing opposite each other in parallel lines. Ireland's folk dancers are masters of every kind of geometric floor pattern.

Postures have certain universal connotations. Dirges and other sad dances produce flexed bodies, while in gay moods the torso is thrown out and the head raised. Heavy animals like bears or buffalo suggest a bowed position in mime; while birds suggest light, upward imitation of flight. At the same time, every tribe and national group shows local posture tendencies. West African Negroes and Spanish flamenco dancers exaggeratedly extend their backs; English Morris dancers tilt backwards; Basques hold themselves erect; Serbians and Indians of North America tilt forwards or even flex their bodies. Within these regional postures, age grades cause variations. American Indian war dancers remain fairly erect, if the men are old; they flex and extend to extremes if they are young.

Speaking with Their Hands

Sex also has an effect on traditional postures. In many parts of the world, from America to Russia, women are supposed to dance with a meek posture, head bowed, feet close together, while men may expand and stretch. In Chinese theatre, male characters often assume a straddling posture, but female characters hold legs and arms closed in. Within these conventions there are also individual variations. Even in stylized group dances some individuals move joyously and others meekly. In mime some experts have more extreme interpretations of flexion and extension than others. Also – a more elusive constituent – some dancers use more force than others, in their more emphatic exhibition.

Gestures of the arms and hands similarly express universal moods and thoughts, and also regional and individual variations.

Syndication International

Spear dance by the Wogogo tribesmen of East Africa: one of the many versions of the war dance, performed throughout the world with sword or shield, spear, sticks or bow and arrow

Dance gestures, which ultimately derive from daily gestures, are always stylized; they may be simple and intelligible or elaborate and obscure. The gestures of European folk dancers are simple compared to the code of India. Everywhere gestures can be imitative or symbolic, involving the whole arm or just the fingers, executed with or without props. They can be realistic, expressive of emotions, or decorative. In ancient and modern India *nritya* signifies narrative, stylized gestures, while *nritta* is decorative. Both types contrast with the forthright, realistic gestures of European dances such as the Swedish flax-reaping. For an understanding of nritya and of Katha-Kali folk dramas, the spectator must know the sacred myths, the tales of Krishna, Shiva and legendary heroes. He must also know the meaning of the hundreds of finger positions and arm positions. The gesture code has been simplified in the ritual dances of Manipur in north-east India, the Indonesian enactments of the *Ramayana* and *Mahabharata*, in the narrative gesture dances of Samoa and the Hawaiian *hula*.

The only American Indians with a gesture code are the tribes of British Columbia, though the Aztecs and Maya apparently had ritual codes. Their manuscripts show gestures similar to those of Balinese priests lowering their hands to the earth or raising them to the sky. These codes of Asia and native America have had little or no effect on art dances of Europe and America. Ballet dancers persevere in a set of conventionalized positions for love and sorrow; followers of the American pioneer, Isadora Duncan, invent their own gestures; followers of the German pioneer, Mary Wigman, show the influence of Indonesia's decorative hand positions with overstretched fingers. In general, dancers of the Western world neglect gesture in favour of footwork. (See also GESTURE.)

Focus on the Feet

Footwork or steps may be the basis of a dance, a rhythmic background to gestures, or a means of progression. The leaps of Basque men, the intricate crossing of the feet of the Scottish dancer, the brushes and flaps of an American tap dancer take the full attention of performer and audience, perhaps formerly as ritual, certainly now as exhibition. The high leaps of the Basques and the similar leaps of the men of the Ukraine and Georgia may hark back to ancient vegetation rites to promote the leaping of plants into life. The jumps and turns of Balkan folk dancers and of England's Morris men may also have ancient roots in supplications to the earth and the seeds.

On the other hand, the footbeats of India and southern Spain appear as rhythmic backgrounds to the filigrees of arms and hands. In contrast with such virtuoso uses of feet and legs, the simpler steps of most folk dances serve as a means of progression. In their forward, backward or sideways movements European groups and couples may use the polka or waltz steps. More frequently they run through their formations as do people in other parts of the world.

Closed or open circuits are the most commonly found ground patterns of dance. In closed circuits the participants may move in the direction of progression or they may face the centre and then step sideways. They can move clockwise, as commonly in hunting cultures and in north-west Europe, or counter-clockwise, as in agricultural rites of south-east Europe and Africa. Some peoples regard the latter direction as sinister and evil, as the Algonquins of America's Great Lakes and the medieval English, who considered 'widdershins', meaning against the sun, as the witches' direction. The closed circle, single or double (in couples) has its limitations. The open circle is really a follow-my-leader line and offers many possibilities of serpentining, winding into a spiral, and so on. It is known among the Bambuti Pygmies of Africa, the French Provencale *farandole* dancers, and agricultural American Indians.

Straight lines are less common than circling patterns. They take many forms. Simplest are the multiple stationary lines of the Maori in New Zealand, and of Africans such as the Watusi, who lay more stress on gestures and leaps than on formations. Two parallel lines offer more artistic possibilities,

Maze, Snake and Goddess

Among later Greek writers there is a persistent tradition of a maze or labyrinth dance in Crete, in which the dancers pursued a winding course suggestive of the devious passages of a maze. The fact that the palace at Knossos . . . is complex in plan and suggests the Labyrinth of legend, perhaps lends some support to this tradition. Dances of the maze type are common to many early peoples in various parts of the world, whether they have Labyrinthine buildings or not. Some historians trace them all to a very primitive dance form which is really an imitation of the crawling of a serpent. The importance of the snake in Minoan religion is well attested, and it is possible that in primitive times a python or other large snake . . . was kept as an embodiment of the goddess. Some students think that a snake-line dance was performed in the gloom of the many caves in the mountains near Knossos, and that it was climaxed by the exhibition of a living python. Such a performance would have been weird and spectacular in the highest degree.

Certain figurines indicate also that there were in Crete snake-handling rituals, in which woman votaries carried small living snakes in their hands. Earlier, such figurines were interpreted as 'snake goddesses', but recent studies have shown that they portray worshippers, dancers, or priestesses. Snake-handling rituals in the United States and in other parts of the world are usually accompanied with shouts and hymns, and with a shuffling sort of dance.

Camera Press London

Couple dances, with women partnering men, are rare in many parts of the world: men traditionally dance for victory in war, women for peace. 18th century Turkish miniature from the Topkapi Library, Istanbul

and have greater scope for dramatic expression. The facing lines may be two groups of warriors, or two lines of men and women in a mime of courtship repulsion and magnetism. The former type has shown most elaborate developments in the sword dances of Europe. The latter type persists in various parts of Africa, in simple patterns; it has evolved into the intricacies of the 'longways sets' of Scottish and New England country dancing and also into the patterns of Pueblo Indian harvest dancers. In many of these longways the approach-and-recede pattern is combined with the serpentine motif of the open circle, as in the Virginia Reel. In this and many other longways the arch pattern introduces an ancient tree symbolism into geometric formations: successively, partners hold up their joined hands and other couples run through the arch. American Indians have adopted this ornamental pattern, Yucatan Indians with the aid of actual flower arches, and Great Lakes Indians by holding hands.

Group formations may combine with couple patterns in European folk dances, from Palestine to Finland. In Moravian dances the couples circle counter-clockwise. At the same time they change from parallel progression with joined hands to separation, reunion, pivoting, and so forth. In the French quadrilles and American square dances all circle and then the four couples successively cross over, break up into small circles, finally spinning by twos in the swing. In these folk dances couples and individuals conform to regulations, unlike the undisciplined dancing that takes place in the modern ballroom.

Patterns in Time and Space

The various ingredients of the dance are combined into structures by patterns in tempo or variations of steps. Quadrille types open with the circling, continue with a 'body' of distinctive formations, and close with a promenade and swing. The original French quadrilles were suites, with precise, named sections, like the Morris dances with their five successive dances. Many dances have simpler forms. Some, like the Palestinian *hora*, continue with the same step and formation of an open circle, but they build up excitement by a crescendo in speed and intensity. Others use the simple device of contraction, like the German *Siebenschritt*, with its ever shorter and shorter series of steps. A common device is the two-part set of slow and fast dance, like the Renaissance *Pavana* and *Gaillarda*, the later Minuet and Rondeau, the present Hungarian *Lassu* and *Gyors*, the Norwegian *Gangar* and *Springar*, and the Tewa Harvest slow and fast dance. Each part has distinctive steps, first processional, then lively and leaping; and special music.

Dances often combine with other activities into traditional dramas, with preparations, intensifying action, and aftermath. African possession cults and the corresponding Holiness Church services start with prayer and solemn music; work up to a climax of frenzied solo and circle dancing, with interludes for speeches; and they calm down into a benediction and song, with in Africa a concluding feast. This is the structure of the Greek Dionysian rites and the resultant Greek dramas and medieval Passion Plays. While these dramas last only a few hours, some rituals occupy many days, like the 27-day Midwinter rites of British Columbia tribes. (See also DRAMA.)

Dance Music

Over thousands of years dances have developed an infinite variety of musical accompaniments, costumes and settings. Musical accompaniment may involve separate musicians, single or grouped. Drums of many sizes and shapes are almost ubiquitous; they are most advanced in Africa. Stringed instruments have spread from the Near East to most of Asia and Europe, and thence to the Americas. Gongs characterize Southeast Asia. Flutes and other wind instruments are sporadic, varying from the tiny flute of the one-man flute-and-tabor music in England, Spain and Mexico, to the enormous horns of Tibet and native Chile. Europe has evolved the most complex instruments and ensembles of strings, accordions, pianos and other instruments. The most elaborate ensembles, the orchestras of the modern world, have the least significance, while the drum-and-voice combinations are closest to the original magical intentions.

These separate accompaniments generally conform to the mood, tempo and metre of the dances, and they have the same structure. They may thus be in triple or double time; or in irregular metres. They may synchronize with the footwork of the dancers and with each other, or they may be in syncopation or antiphony. The relationship is closest when the dancers produce their own accompaniment, as the sole musicians, or as enrichments of the background music. Dancers may manipulate their instruments, as they sing or chant, or move them automatically as part of their clothing, or create rhythmic sounds with parts of the body.

Sometimes drummers dance, kneel, leap, as they beat the rhythms. Small drums are used by tribesmen of New Guinea; the Santals and Oraons of Bihar in India have more cumbersome ones slung around their shoulders; gypsy men of Turkey and Macedonia perform remarkable feats with huge, double-headed instruments. The tambourine players in the Italian *tarantella* have a relatively lightweight instrument with a simple playing technique. Almost as impressive as the gypsy drumming is the self-accompaniment of Mexico's Concheros, who strum rhythmic chords on a lute-like instrument, made of an armadillo shell, as they stamp out their dance steps. In the New World such music may be a substitute for ancient native rattles. Iroquois men shake horn or turtle-shell rattles. Many tribes shake tortoise rattles for rain. The Siouans of North America and the Yaqui of Mexico use deer-hoofs, on sticks or on their belts. Yaqui clowns, who play an important role in the dance, strike a rattle with brass discs on the palm of the left hand. At the same

The shift from faith to fun has not destroyed all native ritual, and even in urban society serious artists are seeking a return to faith or to a deep, almost ritualistic dedication

time they wear bells dangling from their belts, and rustle anklets of butterfly cocoons filled with gravel. Many dancers wear such jinglers on their belts, hems or ankles.

More skill is involved in the manipulation of castanets, held in the hands, with different timbre for the right and left hands. The castanets of Spain are descendants of ancient finger-cymbals; Andalusian women often have the same poses as the cymbal players of Egypt and Greece. At the same time they and their partners stamp out intricate sounds with their hard-heeled shoes. Flamenco dancers also stamp *zapateados* but they clap their hands or snap their fingers. They belong to a widespread cult of stamping either with or without shoes and of handclapping in counter-rhythms.

Dressing for the Dance

Costumes sometimes add such sound effects to the visual designs. Morris men jingle the bell pads on their shins as they leap and simultaneously wave kerchiefs or strike sticks. Nautch dancers of India jingle ankle bells and stamp while they pirouette and whirl voluminous skirts. But many props are soundless, like the fans of Japanese geishas or the long sleeve extensions of Chinese theatre dancers. The manipulations of the fans are symbolic and represent falling leaves, waterfalls, and many other things. Some props are realistic or descriptive, or simply decorative. Tewa men manipulate feathered wings to simulate eagles. An American stage dancer, Loie Fuller, whirled hundreds of yards of cloth as flames under red lights. Isadora Duncan's disciples wafted silk scarfs merely for an effect of lightness.

Masks similarly serve many purposes, most importantly symbolic or imitative purposes. The Iroquois False-Face masks and the Tewa eagle half-masks with beaks represent supernatural beings without impeding dance movements. But many ritual masks are so huge as to preclude any dance movement except for a walk, such as the huge disc worn by impersonators of the Inca sun god and the towering demon masks of Melanesian and West African dancers. Some masks require special manipulation. Thunderbirds in British Columbian dances move their beaks on hinges. Other masks heighten character acting, like the demons, heroes and court ladies of Japanese theatre, and the comic Old Men of the Tarascan people of Mexico.

Special garments are prescribed for the effectiveness of the masks. The dancers may be completely covered in bulky grasses or in stiff and decorative kimonos. At the other extreme, they may be nude but for painted stripes. Without masks, costumes rely on other devices for their effect. Tewa Indians decorate their tunics or kilts with magical designs, zigzags for lightning, terraces for clouds and rain. Folk dancers of many lands emphasize their femininity and masculinity by costume patterns and rich ornaments. Women wear layers of full skirts which they whirl as they turn and sometimes flip with their hands. Men exaggerate their strong chests with bouffant sleeves. (See also COSTUME; MASKS.)

Settings enhance the meaning and effectiveness of dance movements and props. Maypole dancers belong on a village green. Tewa dancers belong in their sunny semi-desert, against a horizon of snow-capped mountains, their turquoise, red, black and white costumes brilliant against the beige adobe of the homes around the dance plaza. British Columbian maskers appear more weird than ever in the dimly lit dance house, by a flickering fire. But Melanesian and Polynesian dances are set against the background of jungle or sea, the sun, and the fragrance of exotic flowers.

Environments have often changed for dances, as people have migrated to new lands, have conquered or visited other peoples. Such migrations have resulted in the diffusion of dance forms, with adaptations to their new homes, and in mixtures. Other changes such as secularization and professionalization have taken place locally and also through migrations.

Recent dance importations to North America followed the immigrations of the 19th century. Some of the immigrants have tried to re-create their seasonal festivals in the new environment. In settlements like Heightstown, New Jersey, Slovaks and Moravians attempted processionals through the streets of the village, imitating their native harvest festivals. In big cities, like New York and Detroit, they have tried to stage fragments of their dance rituals or have invented plays representing their custom.

Mixtures generally result in the course of transfers. Some of the mixtures are among the world's most picturesque dances, such as a dance representing the battles of Moors and Christians, with a Spanish libretto and Aztec movement styles. America's most accessible mixtures are the square dances, which started as diversions of British immigrants, then added Scottish motifs, later on, Danish and Norwegian motifs in the Middlewest, and, in the Southwest, figures from Spanish *cuadrillas*. Such mixture has affected art dance, too, but in a more self-conscious manner. Americans such as Fred Astaire and Paul Draper have combined European ballet with American tap dancing.

The Joy of Dancing

How can I describe the joy of dancing . . . Voluminous, vast, swelling like sails in the wind, the movements of my dance carry me onward – onward and upward, and I feel the presence of a mighty power within me which listens to the music and then reaches out through all my body, trying to find an outlet for this listening. Sometimes this power grew furious, sometimes it raged and shook me until my heart nearly burst from its passion, and I thought my last moments on earth had surely arrived. At other times it brooded heavily, and I would suddenly feel such anguish that, through my arms stretched to the Heavens; I implored help from where no help came.

Isadora Duncan *My Life*

Dance in the Modern World

Professionalization has had an increasing effect on the forms and settings of dances. Certain gifted individuals in every culture become so expert that they elaborate the traditional forms, or create new routines. In ancient times, as in Pharaonic funerals, and still today, as in India's Katha-Kali dramas, experts who became professional by virtue of their excellence were as dedicated to the gods as to their art. African virtuosi, like the Watusi men, do not expect remuneration. Today in the Western world, however, the supreme performers serve both art and mammon.

Secularization has resulted from professionalization, but the process is not identical. Some professionals, like Japanese Shinto priests, still serve religion. Most secular dancers, as in the ballroom, are

Right In the modern world the dance has become increasingly secularized, as in ballroom dancing, but folk dancing even as a stage or tourist attraction retains many of the characteristics and much of the appeal of its ritual past, when it was a vital part of the community's life: Russian dancers in traditional costume *Centre* The symbolism of a dance is heightened, and it comes closest to its original magical function, when music or rhythm is provided by only one type of instrument: children at Kabul, Afghanistan, dance to the sound of tambourines *Below* According to Hindu belief the god Shiva set the world in motion with a dance, and dancing is an intrinsic and highly formalized part of life in India: Orissa dancers in Delhi

amateurs. The process of secularization has certainly been going on for untold centuries. In many parts of the world rituals survive side by side with pleasure dances, as among the Iroquois and the Basques. For centuries special 'social' dances have been created, like the minuet, polka and waltz; these dances emphasize communications between the sexes instead of communication with deities.

The shift from faith to fun has followed in the wake of Euro-American industrialization and urbanization. Yet it has not destroyed all native ritual, and even in urban society, serious artists are seeking a return to faith, or to a deep, almost ritualistic dedication. The devotees, be they performers, producers, or scholars, believe that the dance plays a role in modern society, even though it is no longer integrated with beliefs and activities.

Ritual dances are taking on new forms, suited to modern Christianity. While ancient dance rituals persist in Africa's Coptic churches and in Spain's cathedrals; while stage performers enact Stravinsky's *Rite of Spring* as a spectacle, a few devotees have tried to reinstate dancing in Christian churches, particularly in the United States where a number of Sacred Dance Guilds have interpreted biblical themes in dignified movements.

Therapeutic dances survive here and there within urban culture. Inside the industrial pattern they may help the mentally ill, the problem child, and the worker on an assembly line. Many experts believe that this ancient healing function of dance has considerable potentialities for exploitation in the future.

Sachs, *World History of the Dance* (Norton, 1937); for an interesting sociological survey, see F. Ruse, *Dance in Society* (Routledge & Kegan Paul, London, 1969).

DANCE OF DEATH

The *Dance of Death*, an allegorical representation of Death leeding all men and women inevitably to the grave was a popular theme in late medieval art: these illustrations from Holbein's series of woodcuts on the subject show Death as a grotesque skeleton who appears to various people and is finally himself engulfed by men and women who have already died

IN DANCES OF DEATH, people reflect their attitude towards this final, catastrophic crisis in human life. Some people have regarded death with horror and they have feared the ghosts of the dead. Some express their grief in mournful ceremonies. Others try to cheer each other and the departed spirit by dance and song. Others again consider death a transfiguration, a door to another, better life. Similarly, the celebrations take many forms: impersonations of the image of death, imageless homage to the deceased, or joyous folk dancing.

Death was often personified as a grotesque skeleton, as in the medieval European Dance of Death. This is best known through frescoes and woodcuts, but it had a foundation in actual miming dances. Death in the form of a skeleton capered in turn with sinners of all classes and ages, cardinal, labourer, child. This dance was an expression of the medieval horror of death, despite the Church's promises of a better afterlife. Clown-skeletons still cavort in ecclesiastical celebrations descended from the Middle Ages. In Catalonia, Spain, skeleton figures dance during religious holidays, notably Carnival and Holy Week, sometimes at Corpus Christi. In the *danza macabra* or *bal de la mort* of the Ampurdàn area of Spain, a quadrille of skeletons carries a scythe, clock and banner. In Mexican *carnavales* Death is a horrid clown, armed with a pitchfork, descended from the Spanish impersonations.

The burial wake is another common manifestation. A motif of cheer and consolation pervades Spanish wakes. The mourners dance a lively *jota* or *canario*. Catholicism has introduced the word 'angelitos' (little angels) for the spirits of recently deceased children. Mourners celebrate wakes with a *baraban* or *lucia* in Sicily and Tuscany, and with a jig in Ireland. Negro wakes in South Carolina work up to a frenzied pitch of dance and song. Food and liquor contribute to the festivity of these wakes.

Banishing the Dead

Another form which the celebration may take is the release or exorcism of the spirits, motivated by fear of their evil potentialities as well as by affection. American Indians of many tribes perform a series of funerary and anniversary rites. The California Luiseno banished the spirit from his familiar haunts with the *tuvish* and *chuchamish* (wake), and in memorials for all the dead of the past year or several years. They imitated the character of the dead persons in the *yunish matackish*. They burned images in the *tauchanish*. Similarly, until recently, the Yuma tribe in the Mohave desert burned rush images in a circular dance and a cremation ritual termed *keruk*. The Tarahumara Indians of Chihuahua, Mexico, perform a *rutuburi* circle dance and a special death dance around their belongings, during a three-week fiesta. After a year they perform other dances – the *yumari* and *pascol*. The Yaqui tribe of Sonora, Mexico holds a fiesta and dance at the wake of a child, similar to a Catalan wake. They hold a special *matachina* dance or a *chapayekas* dance for members of these ceremonial societies. Another ritual finally releases the spirit.

Though ghosts are not feared quite as much among the Iroquois of New York State and Canada, these people do believe in them and make efforts to allay them. In case of a violent death, they dispatch a priest for prayers at the site of the murder. After four nights they sing for the release of the spirit and to aid its trip to the other world. After ten days they reinforce this supplication through song and dance. In the winter women chant and circle in the *ohgiwe* for their ancestors, with drum accompaniment. The assembly concludes with a feast and gay round dances.

Chinese and Japanese Buddhists celebrate the Feast of Lanterns as memorials to their ancestors. Japanese villagers, especially in Asage, circle counter-clockwise in the *Bon Odori*, during mid-July or in August, in connection with harvest celebrations. Men

and women sing as they gesture or clap their hands; sometimes they also have a musical accompaniment.

In some instances there may be a fusion of the concept of death and resurrection. Boys' puberty rites may enact the symbolic death of the initiates and their rebirth to a new status (see DANCE). Funeral rites of antiquity often included the hope of resurrection. The high kicks of Egyptian female mourners symbolized new life. The Egyptian Osiris rituals and the Greek spring festival for Dionysus mimed the death and final resurrection of the deity. Babylonians and Romans had similar customs. In the Middle Ages funeral dances symbolized resurrection by a kiss between male and female performers, with the anticipation of new life. The Hungarian *Gyas Tanc* perpetuates this concept.

Relics in modern children's games of many countries form yet another manifestation. English and American children preserve the actions and song words of ancient funeral rites, as in *Old Roger is Dead*, *Jenny Jones* and *Green Gravel* (see CHILDREN'S GAMES). In their Hallowe'en masks and pranks small children perpetuate All Soul's ceremonies for the return of the spirits and propitiatory food offerings.

Impersonations of death are also found in modern art dances. Two German choreographers visualized death as an ugly thing. In *Totenmahl* or *Feast for the Dead* (1929), Mary Wigman masked her group in white, cadaverous faces, as homage to the dead of the First World War. In his *Green Table* (1933), Kurt Jooss envisaged the figure of death in wartime as a skeleton resembling the great reaper of the Middle Ages. A few years later, in 1937, the American, José Limon, created his *Danza de la Muerte* and Andrée Howard produced *Death and the Maiden* to Schubert's music for the English Ballet Rambert. These modern spectacles echo the anxieties of folk laments.

DANCING MANIA

THERE APPEARED ON THE STREETS of Aachen (Aix-la-Chapelle) in Germany, in July 1374, a body of men and women, belonging almost entirely to the poorer classes, who began to exhibit the signs of an alarming disorder. Its symptoms were convulsive running, leaping and dancing, frequently accompanied by elaborate hallucinations, and those so affected seemed powerless to stop themselves; indeed, attacks could be terminated only by forcible binding, or by the onset of utter physical exhaustion. No one seemed to know how the outbreak started, though we hear of the 'dancers' as having come 'out of Germany' and that they were popularly known as 'St John's Dancers'.

It is this name which provides a clue to the possible origins of the phenomenon. Already in the early Church, the Feast of St John the Baptist had been placed at Midsummer – incidentally, the only example in the Church Calendar of a saint celebrated on the day of his birth, rather than of his death; according to St Luke he was born six months before Jesus. It is common knowledge that in pre-Christian Europe, and elsewhere, Midsummer was a time of celebration, in which dancing, processions and the lighting of fires played their part. These elements were, it seems, transferred bodily to the Festival of St John the Baptist – a measure of which the Saint is unlikely to have approved. It is not known for certain but it appears at least likely that the dancing mania began with the celebration of a semi-Christian Midsummer in 1374. Memories of the Black Death were still strong; there was a widespread sense of fear and insecurity; and the result was a form of mass hysteria which spread with startling rapidity. Within a very short time dancing mania was reported from the streets and churches of Liege in Belgium, from Utrecht in Holland and many other towns and cities.

Predictably the phenomenon was officially attributed to evil spirits, and recourse was made to chapels of St John for the purposes of exorcism; this strengthened the connection with the saint under whose auspices the dancing had begun, though

occasionally the issue became confused by the introduction of St John the Apostle in his place. The common people, too, were convinced that demons were at work but accounted for this by the theory that the persons affected had been invalidly baptized by priests living in concubinage, which added an unpleasant moral and theological dimension to the problem.

Although each separate outbreak came to an end in a few weeks, sporadic instances of the dancing mania continued for the remainder of the 14th century. The next serious wave occurred at Strasbourg in 1418. By this time the original link with St John the Baptist had been forgotten, and those afflicted were taken instead to the chapels of St Vitus (an obscure 4th century Christian saint who had long been thought, for no apparent reason, to protect sufferers from convulsive diseases) to be cured. Again, the saint's day was closely connected with the celebration of Midsummer. The name 'St Vitus's Dance', *Veitstanz*, was applied to this new outbreak, the symptoms of which were identical with previous epidemics; this name has survived to this day as a popular name for convulsive chorea.

Below **This ecstatic dancer in a Los Angeles nightclub is a throwback to the medieval men and women who danced compulsively in the streets of Europe in the 14th century, a phenomenon that was attributed to possession by evil spirits**

Dance of the Spider

These outbreaks of dancing mania in 1374 and 1418 are the best-known, but there is ample evidence to show that the disease itself had appeared earlier; there are records of similar visitations in 1237 at Erfurt in Germany and in 1278 at Utrecht, for example. It continued, though on a smaller scale, well on into the 17th century. In Italy, for instance, an almost identical disease, known as Tarantism, was popularly believed to be caused by the bite of the tarantula spider. The main symptom in this case was extreme lassitude, out of which the patient could be brought by means of music (giving rise to the dance-form the *tarantella*); this induced a convulsive crisis and finally exhaustion, after which the sufferer was regarded as cured. Tarantism was known intermittently from the 14th to the 18th centuries.

In Scotland, three men and four women were burned at the stake at Paisley on 10 June 1697 for the crime of witchcraft, and it seems from the evidence that they were sufferers from some form of chorea. Many of the symptoms exhibited by the Convulsionaries of 18th century France, and in connection with Methodist and other Christian revival movements in Britain and America in the 18th and 19th centuries, were substantially those of the dancing mania, though not known by that name. Other parallel manifestations, ranging from the medieval Flagellants to the more recent Holy Rollers, might also be cited.

Dancing mania was basically a contagious form of hysteria, brought on in a situation of peculiar stress. It was largely psychological in origin, though it was not without its physical causes, such as undernourishment. As an expression of European life in the Middle Ages, its imagery was that of popular Christianity, though pathologically distorted. It is therefore without theological significance, though it has considerable interest for the student of the psychology of religion, not least as evidence of what can happen within the framework of organized religion when individuals and communities are subjected to severe mental strain. In this sense, both the disease and its cure are significant religious facts.

DANIEL

THE BOOK OF DANIEL in the Old Testament is named after its central personality, a noble young Jew taken, with three of his friends, from Judea to the court of the Babylonian king. The book recounts the life, piety and wisdom of Daniel, as well as his visions of the future. The name Daniel seems to be that of an ancient Semitic legendary figure.

The book is written partly in Hebrew and partly in Aramaic, and presents many problems. The first, more biographical part of it tells how Daniel and his friends lived as exiles at court, remaining faithful to their ancestral faith in spite of trials, tribulations and temptations. The best known incident in this connection is that of Daniel's being cast into the lion's den for refusing to give divine worship to King Darius the Mede. An example of Daniel's god-given wisdom was his ability to interpret dreams and to read the writing on the wall in Belshazzar's banqueting hall.

The second – and in later periods more influential – part of the book reports a series of dreams and visions. The symbolism of these – the four beasts, the beast with the horns, the visions of the 70 weeks, the 'son of man' seated on a throne, the final revelations of the angel – refers to the course of history, that is, to the destruction of the four successive world empires and their wicked and idolatrous rule by the kingdom of God and his saints (the 'fifth monarchy').

Although the book purports to date from the period of the Babylonian exile, from the reign of Nebuchadnezzar (605–562 BC) to that of Darius the Mede (521–486 BC), this dating is accepted by few scholars and the general consensus of critical scholarship ascribes the composition of its main part to the time of the persecution of the Jewish religion under Antiochus IV Epiphanes, and the period of the Maccabean revolt (c 165 BC). This would account for many of the

A visionary whose writings form the basis for the millenarian beliefs of some present-day Christian sects, Daniel is probably best known for surviving a night spent in a den of lions: painting from the Ailsa Mellon Bruce Fund

peculiarities of the book as well as for many of its dominant motifs: persecution and martyrdom, the rule of the wicked, the hope for a divinely operated *dénouement* and for the imminent establishment of the rule of the saints. If this dating is correct, then the 'four kingdoms' are the Babylonian, (unhistorical) Median, Persian and Greek (Seleucid dynasty) empires. When Rome became the dominant power symbolizing the rule of the wicked (the 'great whore of Babylon' in the symbolism of the Revelation of St John), the four kingdoms were interpreted to refer to Babylonia, Persia, Greece and Rome. In later periods other identifications were offered: the later medieval *Book of a Hundred Chapters* took them to refer to France, England, Spain and Italy. During the Civil War in England, a radical Puritan sect which was strongly represented in Cromwell's army were known as the 'Fifth Monarchy Men', because of their expectation to establish the rule of the saints.

The original purpose of the book was no doubt to strengthen the faith and the hearts of the persecuted Jews, making them persevere in their uncompromising opposition to the policy of hellenization ('idolatry') enforced by the Greek government and embraced by certain Jewish circles, and holding out hope of imminent salvation by revealing the divinely predestined course of history. The cryptic and symbolic character of the book's visions lent itself to reinterpretation in other analogous historical situations, whenever severe crises and tribulations generated fervent hopes and expectations of a coming end of the world.

The significance and historical influence of the book derive from its powerful apocalyptic character: history is conceived on a wide canvas as the succession of preordained world empires, their turning against God, the triumph of wickedness and idolatry, the ultimate punishment and destruction of the evildoers, and the establishment, in power and glory, of the kingdom of God and his saints. The book consequently became a favourite with many mystics and millenarian enthusiasts, who looked forward to a blessed time to come. Some of the visionary motifs of the book, such as the 'son of man' and the 'Ancient of Days' (both in chapter 7) played a considerable role in subsequent eschatology (doctrines of death, judgement, heaven and hell) including that of the early Church; Jesus refers to himself, in the New Testament, as the 'Son of Man' rather than as the Messiah; and in the mysticism of the Jewish Merkabah visionaries (see CABALA).

The notion of four successive world empires and the cryptic references to the deliverance of the saints after 'a time, two times, and half a time' (chapter 12) and other symbolic details and numbers have frequently stimulated the imagination of millenarian enthusiasts and provided proof-texts for apocalyptic speculations. Throughout the Middle Ages Jewish mystical interpreters of the Bible computed the date of the coming of the Messiah on the basis of the Book of Daniel. Among Christians in the Middle Ages, the Book of Daniel combined with the Book of Revelation and its prophecies of a rule of the saints for one thousand years (the 'millennium') to nourish millenarian speculations.

The Book of Daniel contains certain innovations in angelology, such as the idea that each nation has its guardian angel, Michael being the guardian of Israel (12.1 – see also ANGELS). It also provides the first biblical reference to a belief in a resurrection and afterlife (12.2).

R. J. ZWI WERBLOWSKY

The Great Vision

In those days I, Daniel, was mourning for three weeks. I ate no delicacies, no meat or wine entered my mouth, nor did I anoint myself at all, for the full three weeks. On the twenty-fourth day of the first month, as I was standing on the bank of the great river, that is, the Tigris, I lifted up my eyes and looked, and behold, a man clothed in linen, whose loins were girded with gold of Uphaz. His body was like beryl, his face like the appearance of lightning, his eyes like flaming torches, his arms and legs like the gleam of burnished bronze, and the sound of his words like the noise of a multitude. And I, Daniel, alone saw the vision, for the men who were with me did not see the vision, but a great trembling fell upon them, and they fled to hide themselves. So I was left alone and saw this great vision, and no strength was left in me; my radiant appearance was fearfully changed, and I retained no strength. Then I heard the sound of his words; and . . . I fell on my face in a deep sleep with my face to the ground.

Daniel, chapter 10

Dante's vision encompassed the whole range of human life and destiny; a vision which is as relevant today when man is steadily conquering space as it was in the day of the medieval astronomer

DANTE

DANTE ALIGHIERI'S *Divine Comedy*, as his *Commedia* is generally known, is one of the rare and great works of literature that give a comprehensive vision of the place of man in the universe. It sets in a tremendous panorama the past, present and future; combines poetry and prophecy; and is profoundly concerned with the problems and prospects of human life and destiny. Since it was written, in the early years of the 14th century, this poem in three parts, *Inferno*, *Purgatorio* and *Paradiso*, has made a constant impression, not only in the Florentine poet's own land but on readers in any country – or language. There are beauties of phrase and expression that essentially belong to the Italian original but nothing is lost in translation of the universal meaning inherent in the subject.

The full significance appears when the poem is considered as a whole. To confine attention to the first part, the *Inferno*, which has been a popular tendency, is to miss the point. It is a misconception to think of Dante as a grim sadist who rejoiced in describing the tortures he wished his personal enemies to suffer in hell. The word 'Comedy' of the title has of course no implication of humour but suggests rather a series of events that may lead to a happy conclusion. With Dante one ascends by many stages from the depths to the region of supreme bliss.

The inferno was not merely the place of punishment for those who had done wrong in life. Here it is first necessary to consider the parallel that is maintained throughout between the material inventions of the story and the spiritual condition for which they stand. Hell in the material sense is imagined as an inverted cone extending into the bowels of the earth, in which persons known and named, as well as an anonymous multitude, undergo a variety of torments according to the nature of their wrong doing. But all this has an allegorical meaning as an analysis of the individual or also, if one so chooses to interpret it, the kind of society, that in the exercise of free will has elected to be governed by evil motives and desires and suffers in consequence an inevitable corruption.

The implacable inscription over the gate of hell – 'All hope abandon, ye who enter here' – refers to the impenitent, thus self-condemned. But purgatory for those who had not obstinately and irrevocably persisted in self-ruinous courses represented the dawn of hope and the possibility of redemption. This was to be achieved by active effort to throw off the burden of sin and guilt. Purgatory was not simply an annex of hell, a place of penalty for minor offenders or a kind of waiting-room before admittance into heaven. It is imagined as a vast mountain in the southern hemisphere, to climb which was an expiatory labour.

Virgil, whom Dante so greatly admired and whom he represents as his guide, made the often-quoted remark in the *Aeneid* on the easiness of the descent to Avernus; possibly less often remembered is the observation that followed on the toil of regaining the upper air. Dante likewise, emphasizes the labour involved in getting rid of every taint of error by the ascent of the seven encircling cornices of the mountain, each marking a stage of purification. There was still a progression to be made after the Earthly Paradise was reached at the summit. Above the region and condition of primal purity which it represented, like the Garden of Eden before the fall, there were the heavens to be ascended. The soul was launched radiantly into space and beyond it to its final union with the Divine Will.

The Dual Image of Beatrice

Dante himself was the pilgrim of this visionary journey. It occupied a week at Easter in the year 1300, he being then 35, 'midway on life's road'. It contains much that related to his own experience. Lost in a dark wood (having strayed, this implies, from the strait and narrow path), distracted by wild beasts (symbolic of temptations), he is relieved and delighted to find he has the shade of the great Latin poet, Virgil, to

act as his guide. The appearance of a pagan writer in a context of essentially Christian character may seem surprising. But apart from the respect in which Virgil was held in medieval Italy as supposedly foretelling the coming of Christ and as being a kind of benevolent magician, he had the admiration of Dante as the genius of Rome's imperial order. The city founded by Aeneas, the 'pious' instrument of divine powers, which grew into an all-powerful and all-embracing empire, was the more admirable to Dante in contrast with the disorders and strife of cities and parties in his own time. He favoured the so-called Holy Roman Empire as a continuance of the ancient Roman Empire and his support for the 'new Caesar', Henry of Luxembourg, in his designs on the city of Florence, perpetuated the decree of exile against Dante for his part in the Florentine contentions of Guelf and Ghibelline.

Virgil in the *Aeneid* had also described a visit to the underworld. His Hades provided various suggestions of setting and nomenclature for the *Inferno*. Dante (the author) allows Virgil to be for a while a companion to Dante (the character in the poem) on his journey. He is a guide through the depths of the inferno and an escort up the Mountain of Purgatory but takes his leave as they approach the Earthly Paradise. That Virgil should have accompanied him is explained in the poem as at the request of Beatrice, a haunting presence in Dante's mind and art.

She was Beatrice Portinari, the daughter of a wealthy Florentine. Dante first met her when both were children and Beatrice a year younger than he. Her beauty of feature and character inspired in him an adoration that the years had strengthened. Though they went their separate ways, Beatrice becoming the wife of Simone dei Bardi and Dante taken up with poetry, soldiering and diplomacy, her image remained with him. She died at the age of 24 but for Dante lived on, as he describes in the sonnet-sequence of 'The New Life' (*La Vita Nuova*), the mystically passionate work that long preceded the *Commedia*. He was then already married to Gemma Donati by whom he had several children. In time the image of the Florentine girl he had first loved gained a strange duality or multiplicity; she was at once human and a personification of qualities in the abstract – of love, conscience, maternal tenderness, goodness, religious feeling; even, in an ultimate abstraction, of Christian beatitude. It is thus that she appears in the *Divine Comedy*. Dante creates a complexity of allegorical subtleties, though one may read into them the trace of her actual impact on his life and character. The thought of Beatrice seems in fact to have weaned him from moral lapses, he admits, and given him the hope of salvation.

Thus at the beginning of the *Inferno*, Virgil explains that it is at Beatrice's plea that he has come to rescue Dante from the 'dark wood' of his own moral confusion. Allegorically, she might be thought of as Christian piety enlisting in the person of Virgil the aid of philosophy and reason. But in the *Purgatorio* there is a direct confrontation in which in a very human fashion Beatrice sharply reproaches Dante for his sins. It may be noted that the Pre-Raphaelite image of Beatrice, conveyed by the paintings of Dante Gabriel Rossetti as that of mournful and languorous suffering, departs considerably from the plain-speaking and vital creature whom Dante portrays. It is she and not Virgil the excellent pagan, who must lead him upwards in the *Paradiso* through the heavens, though there comes a point when, having delivered her Christian admonitions and heard his contrition, she at last takes her departure. The soul of Dante goes on to the supreme revelation of the light eternal and divine.

The Ten Circles of Hell

In working out his design, Dante makes use of the classifications by number in which the Middle Ages found a mystical virtue. But in his sense of structure and mathematical proportion he showed also a bent of the Florentine genius that had other expression in painting and sculpture. There were ten main divisions of hell, as also ten heavens. Even the terrifying landscape of hell had its order. Dante clearly thought of the earth as a globe, oriented by Jerusalem. At surface level was the brink of the vast pit and there the ditherers, unable to make up their minds between good and evil, aimlessly ran after banners whirling to and fro.

Across the river Acheron and below was the dizzy descent of circle after circle. Five of them formed the outworks of the infernal city of Dis. The first was the Limbo where dwelt the Unbaptized and Virtuous pagans whose unconscious fault it was to be ignorant of Christianity and to be confined by the material or erroneous nature of their own beliefs. The second was that where the Lustful were driven before a gale that signalized their own tempestuous passions; in the third, the Gluttonous wallowed in the mire; in the fourth and fifth the Hoarders, the Spendthrifts and the Wrathful carried on their futile battles. A nether hell was contained within city walls, with a growing terror of descent into the sixth circle of the Heretics and the seventh of Violence where tyrants boiled in a river of blood, profligates were pursued and torn by hounds, suicides turned into withered trees pecked by harpies and sodomites scorched in a sterile desert under a constant rain of fire. Lower still in the eighth and ninth circles the many variations of Fraud and Malice were contained in the pits of Malbolge; the word means 'evil pouches' and Dante describes the area as an inverted hollow cone intersected with ten concentric valleys. The tenth circle was the frozen lake of Cocytus where icy figures

National Gallery of Art, Washington

Dante Alighieri: in the *Divine Comedy* the reader ascends with him 'from the depths (of hell) to the region of supreme bliss'. In this allegorical portrait, of the Florentine School, the poet is shown gazing across a river, probably Acheron, to the Mountain of Purgatory

symbolized the final extinction of all feeling in wrongdoers and Lucifer was a frosty monster, different in every way from the active Satan, defiantly heroic in nonconformity, of Milton's *Paradise Lost*.

A hidden path took Dante and Virgil from this underground lair at earth's centre to the Antipodes and the healthier atmosphere of the Mountain of Purgatory. The inferno was an unchanging spectacle, purgatory an active process of improvement. The inferno recalled the specific offences of sinners, purgatory was the place of strengthening and purifying, for getting rid of sin. After the quarantine of ante-purgatory (for the excommunicated and the belatedly repentant) and the passage all must take through Peter's Gate, there followed the arduous but salutary regime nicely adapted to the nature of each of the 'Seven Deadly Sins'; in appropriate and modern fashion the taint of gluttony is removed by starvation. Passing through a final wall of flame the pilgrim reached at last the flowery meads and peaceful pine-woods of the Earthly Paradise. There is a beauty that recalls the paintings of Botticelli in the verses describing the setting of a religious pageantry in which Dante again met and was reconciled with Beatrice. His imagination rises grandly to the supreme test of describing the passage through the heavens; his encounters with the souls of many famous persons; his ascent to the highest of the revolving spheres, the *Primum Mobile* that gives motion to the rest; and thence to the Empyrean where in a flash of intuitive vision Dante perceives the human will in the encirclement of the Divine Will.

Dante's thought and purpose in the *Divine Comedy* have several aspects. He gave a version of the Christian story, in the general outline of which orthodox Catholicism could find nothing to object to. In another aspect it was his personal confession as one who had erred but at last found redemption. Then again, it was in part a criticism of his times, his countrymen and native city: a rebuke and exhortation. In the struggle between Pope and Emperor that gave their partisans the names respectively of Guelf and Ghibelline he was on the imperial or Ghibelline side; in the split of the rival party into two, the Black Guelfs and White Guelfs, however, he sympathized with the latter and was exiled when they were. The papal supporter of the Black Guelfs, Boniface VIII, is pilloried in the *Divine Comedy* for many misdeeds including simony (the buying or selling of ecclesiastical preferments), avarice, and greed for temporal power.

The Italy of Dante's time is vivid in the poem and so also are the many incidental stories like the sad tale of Paolo and Francesa and the horrifying confession of Count Ugolino. A question that remains is how far the poem has a significance for the present time, apart from its manifest splendour as a work of art and the interest of its historical associations. The progress of science in modern times has strengthened a materialistic view of the universe far removed from Dante's scheme of things. The present mapping out and proposed 'conquest' of space might seem to make the heavens he wrote of no more than a naive reflection of medieval astronomy. Yet is there any reason why his conception of a spiritual dimension is less valid now than at any other time? In the last canto of the *Paradiso* he leaves no artificial picture of heaven but the feeling of a wonder remaining, the transcendent source of the good which is the soul's objective. The intense feeling, he says (of the glory intuitively perceived for a moment) stayed with him on his return to his earthly life. Without detailed memory of his greatest experience Dante retained the comfort of the love 'that moves the sun and all the stars'. His great 'allegory of the soul' can be fortifying amid the confused welter of today's thought.

ST. JAMES HALL,

ON SUNDAY EVENING, FEBRUARY 23d, 1879.

FAREWELL TOUR!

AFTER SIX YEARS ABSENCE IN FOREIGN COUNTRIES,

IRA E. DAVENPORT

Survivor of the World Renowned

DAVENPORT BROTHERS

—AND—

PROF. J. F. DAY

Previous to their departure to Mexico and South America.

In Unique and Startling Wonders!

Mysterious displays, and unaccountable Mysteries, which have been given in the presence of the Crowned Heads and Nobility of Europe, and before large and intelligent assemblages throughout the civilized World. Their profoundly

MYSTERIOUS POWERS

Have astonished the wisest of all countries, and the most learned have been forced by overwhelming evidence to acknowledge them as inexplicable. *No complicated or glittering apparatus for deception used.*

John Webb

DAVENPORTS

IRA ERASTUS DAVENPORT (1839–1911) and his younger brother, William Henry Harrison Davenport (1841–1877), were two of the most spectacular mediums of the 19th century. Their stage act, with its demonstration of apparently supernatural powers, caused intense excitement and controversy. They first came to public notice while they were still small boys, in the wake of the curious events at the farm of the Fox family in Hydesville, New York. Previous occupants of the farmhouse had been troubled by mysterious knocks in the night. In 1848 one of the Fox children, Kate, allegedly challenged the 'spirit' responsible for the knocks to rap as many times as she snapped her fingers. This the spirit did, and eventually a code of raps was established.

The Fox rappings aroused great interest, some of which spread to the Davenport brothers, in nearby Buffalo, who were able to produce sounds from musical instruments which were hung near them in a darkened room, while they were tied up with heavy ropes. In their later, more elaborate display the brothers were tied hand and foot at opposite ends of a giant box, with doors. When the doors were shut, bells were heard to ring, musical instruments inside the box were played and 'spirit hands' appeared at an opening in one of the doors.

Whether the Davenports had any genuine mediumistic powers, or whether they were nothing more than brilliant showmen and illusionists, was hotly debated. Many people believed in them, and some still do, but stage conjurors of the time, including J. N. Maskelyne and Houdini, the great escape artist who became a violent opponent of Spiritualism, were convinced that they could duplicate the Davenports' effects. In a letter which he wrote to Houdini in 1909, Ira Davenport sat on the fence: 'We never in public affirmed our belief in spiritualism, that we regarded as no business of the public, nor did we offer our entertainments as the results of sleight of hand, nor on the other hand as spiritualism, we let our friends and foes settle that as best they could between themselves.' The friends and foes never did settle it, and have not yet.

Davy Jones
Sailor's name for the evil spirit of the sea, first recorded in the 18th century; his locker is the bottom of the sea, and to go there is to be drowned or buried at sea; a not very probable theory derives Davy from 'duppy', a West Indian spirit, and Jones from Jonah, because of his adventure with the whale.

Barnaby's Picture Library

A grave left open over Sunday 'yawns for another corpse' and it is very unlucky to begin any new enterprise on a Friday. European superstitions about days mingle Christian and pagan traditions, and magicians time their operations for certain hours of the day to capture the influence of the appropriate planet

DAYS AND HOURS

THAT FRIDAYS ARE UNLUCKY is a belief still widely held, and if a Friday falls on the 13th of a month it is doubly ill-omened because of the unluckiness of 13 (see THIRTEEN). The worst day of the year for a wedding is Friday 13 May, as May has been generally considered an ominous month for marriage since Roman times.

The term 'black Friday' is now commonly used for any Friday on which things go wrong but originally referred to 10 May 1886, when there was a severe financial panic in London, and earlier to the Friday of 6 December 1745, when London heard the news that the Young Pretender and his army had reached Derby in their invasion of England. According to legend, an earlier black Friday still was the one on which Adam and Eve ate the forbidden fruit.

You should not start a new job, call in a doctor, move house, turn the mattress on a bed, begin a sea voyage or, if you are a criminal, come up for sentencing on a Friday. In Ireland, however, it is a good day to die on, provided you are buried on the Saturday and prayed for on the Sunday.

Friday is unlucky because it is the day on which Christ was crucified, and a day of fasting, fish-eating and general gloom. In the earlier pagan tradition, however, Friday was the day of the love goddess, a happier association which still survives in the most common version of a well-known rhyme:

Monday's child is fair of face,
Tuesday's child is full of grace,
Wednesday's child is full of woe,
Thursday's child has far to go,
Friday's child is loving and giving,
Saturday's child works hard for a living,
But the child that is born on the Sabbath Day
Is blithe and bonny, good and gay.

There are many different versions of this rhyme (none of them very old) and in some it is Friday's child who is full of woe, which suits the Christian tradition of Friday rather than the pagan one. Two of the other lines fit well enough with the symbolism of the planets for which the days are named. Monday's child is good to look at because of the beauty of the moon, and the lot of Saturday's child suits the toilsome and careworn character of Saturn.

The Ashanti and some other peoples of West Africa gave a child a special name according to the day of the week on which he was born. The habit was exported, with slavery, to the Caribbean and the American South, where Negroes had such names as Quashee (Sunday), Cudjo (Monday) and Cuffee (Friday).

SUN	☉	SUNDAY	Gaining money or support; causing friendship and harmony; finding buried treasure.
MOON	☽	MONDAY	Operations of love; seeing visions; necromancy; invisibility; operations connected with water, travel.
MARS	♂	TUESDAY	Operations of death, destruction, hatred and discord; summoning the spirits of the dead.
MERCURY	☿	WEDNESDAY	Obtaining knowledge or discovering the future; theft and deceit, commerce, merchandise.
JUPITER	♃	THURSDAY	Gaining money, status or friendship; becoming invisible; achieving good health.
VENUS	♀	FRIDAY	Ceremonies of love, lust, pleasure and friendship.
SATURN	♄	SATURDAY	Ceremonies of death, destruction or injury; summoning souls from hell; obtaining knowledge.

Magicians have tried to bring the influence of a planet to bear on an operation by performing it on that planet's day and hour. Symbols of the spirits Bethor, Och and Hagith which according to the *Arbatel of Magic* govern Jupiter, the Sun and Venus respectively

Sunday's Child

The week of seven days was adopted in Rome somewhere about 400 AD, and spread into Europe, but it had been a recognized period of time long before that in the east. It still successfully resists the irritation of tidy-minded calendar reformers, who dislike it because the year does not consist of an exact number of weeks. It was probably chosen to give one day to each of the seven planets known in antiquity.

Our names for Tuesday, Wednesday, Thursday and Friday come from the Germanic deities Tiw, Woden, Thor, and the love goddess Freyja or Frigg.

Friday, Saturday and Sunday are the days round which the greatest number of superstitions have clustered. Friday is generally the unluckiest day of the week and Sunday the luckiest. The child born on Sunday will be not only 'blithe and bonny, good and gay' but also strong, handsome and safe from the machinations of evil spirits. In Scandinavia he will have the power of seeing spirits.

But although Sunday is the best day to be born on, it is not a good day for doing anything else, except going to church and thinking about the things of God. Nails should never be pared on Sundays or Fridays, nor should you have your hair cut on those days (or on any days except Mondays, Tuesdays and Wednesdays). It is very unlucky, and hence very rare, to bury anyone on a Sunday. It is also extremely dangerous to leave a grave open over Sunday. 'It yawns for another corpse', as Christina Hole says in her *Encyclopedia of Superstitions*, 'and a second death in the parish will follow shortly.' If a grave has been dug and must be left unfilled over Sunday, it should be covered over with planks or turf.

The Sabbath For Man

Sunday has this character in Christian societies, of course, because it is the sabbath, the day which is peculiarly sacred to God. In ancient Babylonia the seventh, fourteenth, twenty-first and twenty-eighth days of the month were uncanny days, on which the king was not allowed to perform certain actions, including offering sacrifice, pronouncing judgement, changing his clothes, and eating roast meat. Whether this is the origin of the Jewish sabbath is a matter which is still disputed.

The Jewish sabbath (from sunset on Friday to sunset on Saturday) was and is a positively blessed day, both holiday and holy day. It commemorates the last day of creation, on which God rested from his labours: 'and he rested on the seventh day from all his work which he had done. So God blessed the seventh day and hallowed it . . .' (Genesis, chapter 2). The Fourth Commandment instructs the faithful to keep the sabbath day holy and to do no work on it (Exodus, chapter 20).

The prohibition of work on the sabbath was faithfully observed by many generations of Jews and Christians. It was considered so important that when the army of Antiochus IV Epiphanes (see ANTICHRIST) attacked the Jews on the sabbath, the Jews refused to fight and were slaughtered unresisting, after which it was decided that in war strict observance of the sabbath must be suspended. Jesus and his disciples evidently took observance of the sabbath for granted. Irritated by what he regarded as tiresome legalistic restrictions on what was allowable on the sabbath, Jesus did make his famous remark that 'the sabbath was made for man and not man for the sabbath' (Mark, chapter 2) but the same comment was also made by Jewish rabbis.

The Christians transferred their sabbath from the last day of the week to the first, the day on which Christ rose from the dead, and the day on which they met for worship. In the 4th century Gregory of Nyssa said that Saturday was the memorial of God's creation of the world and Sunday the memorial of the Resurrection, but by this time Christian observance of Saturday was in decline. In the year 321 Constantine the Great, the first Christian Emperor, who had earlier been a worshipper of 'the unconquered sun', ruled that the first day of the week, 'the venerable day of the sun', should be a day of rest. The sun's old association with the first day is responsible for the fact that the Lord's Day of Christianity bears the pagan name of Sunday.

Vampires on Saturday

Saturday is sometimes lucky and sometimes not, perhaps reflecting a mixture of respect for the Old Testament sabbath with hostility to Jews and with the astrological tradition of Saturn's malevolence. Friday night's dreams will come true if told on a Saturday. Traditionally, a couple who marry on Saturday will have no luck at all, but Saturday is now the most popular day for weddings because it is the most convenient. People born on a Saturday are supposed to be able to see ghosts. Down to the 19th century in Greece a vampire was believed to rest in its grave only on Saturdays, so this was the day for digging up the body and burning it.

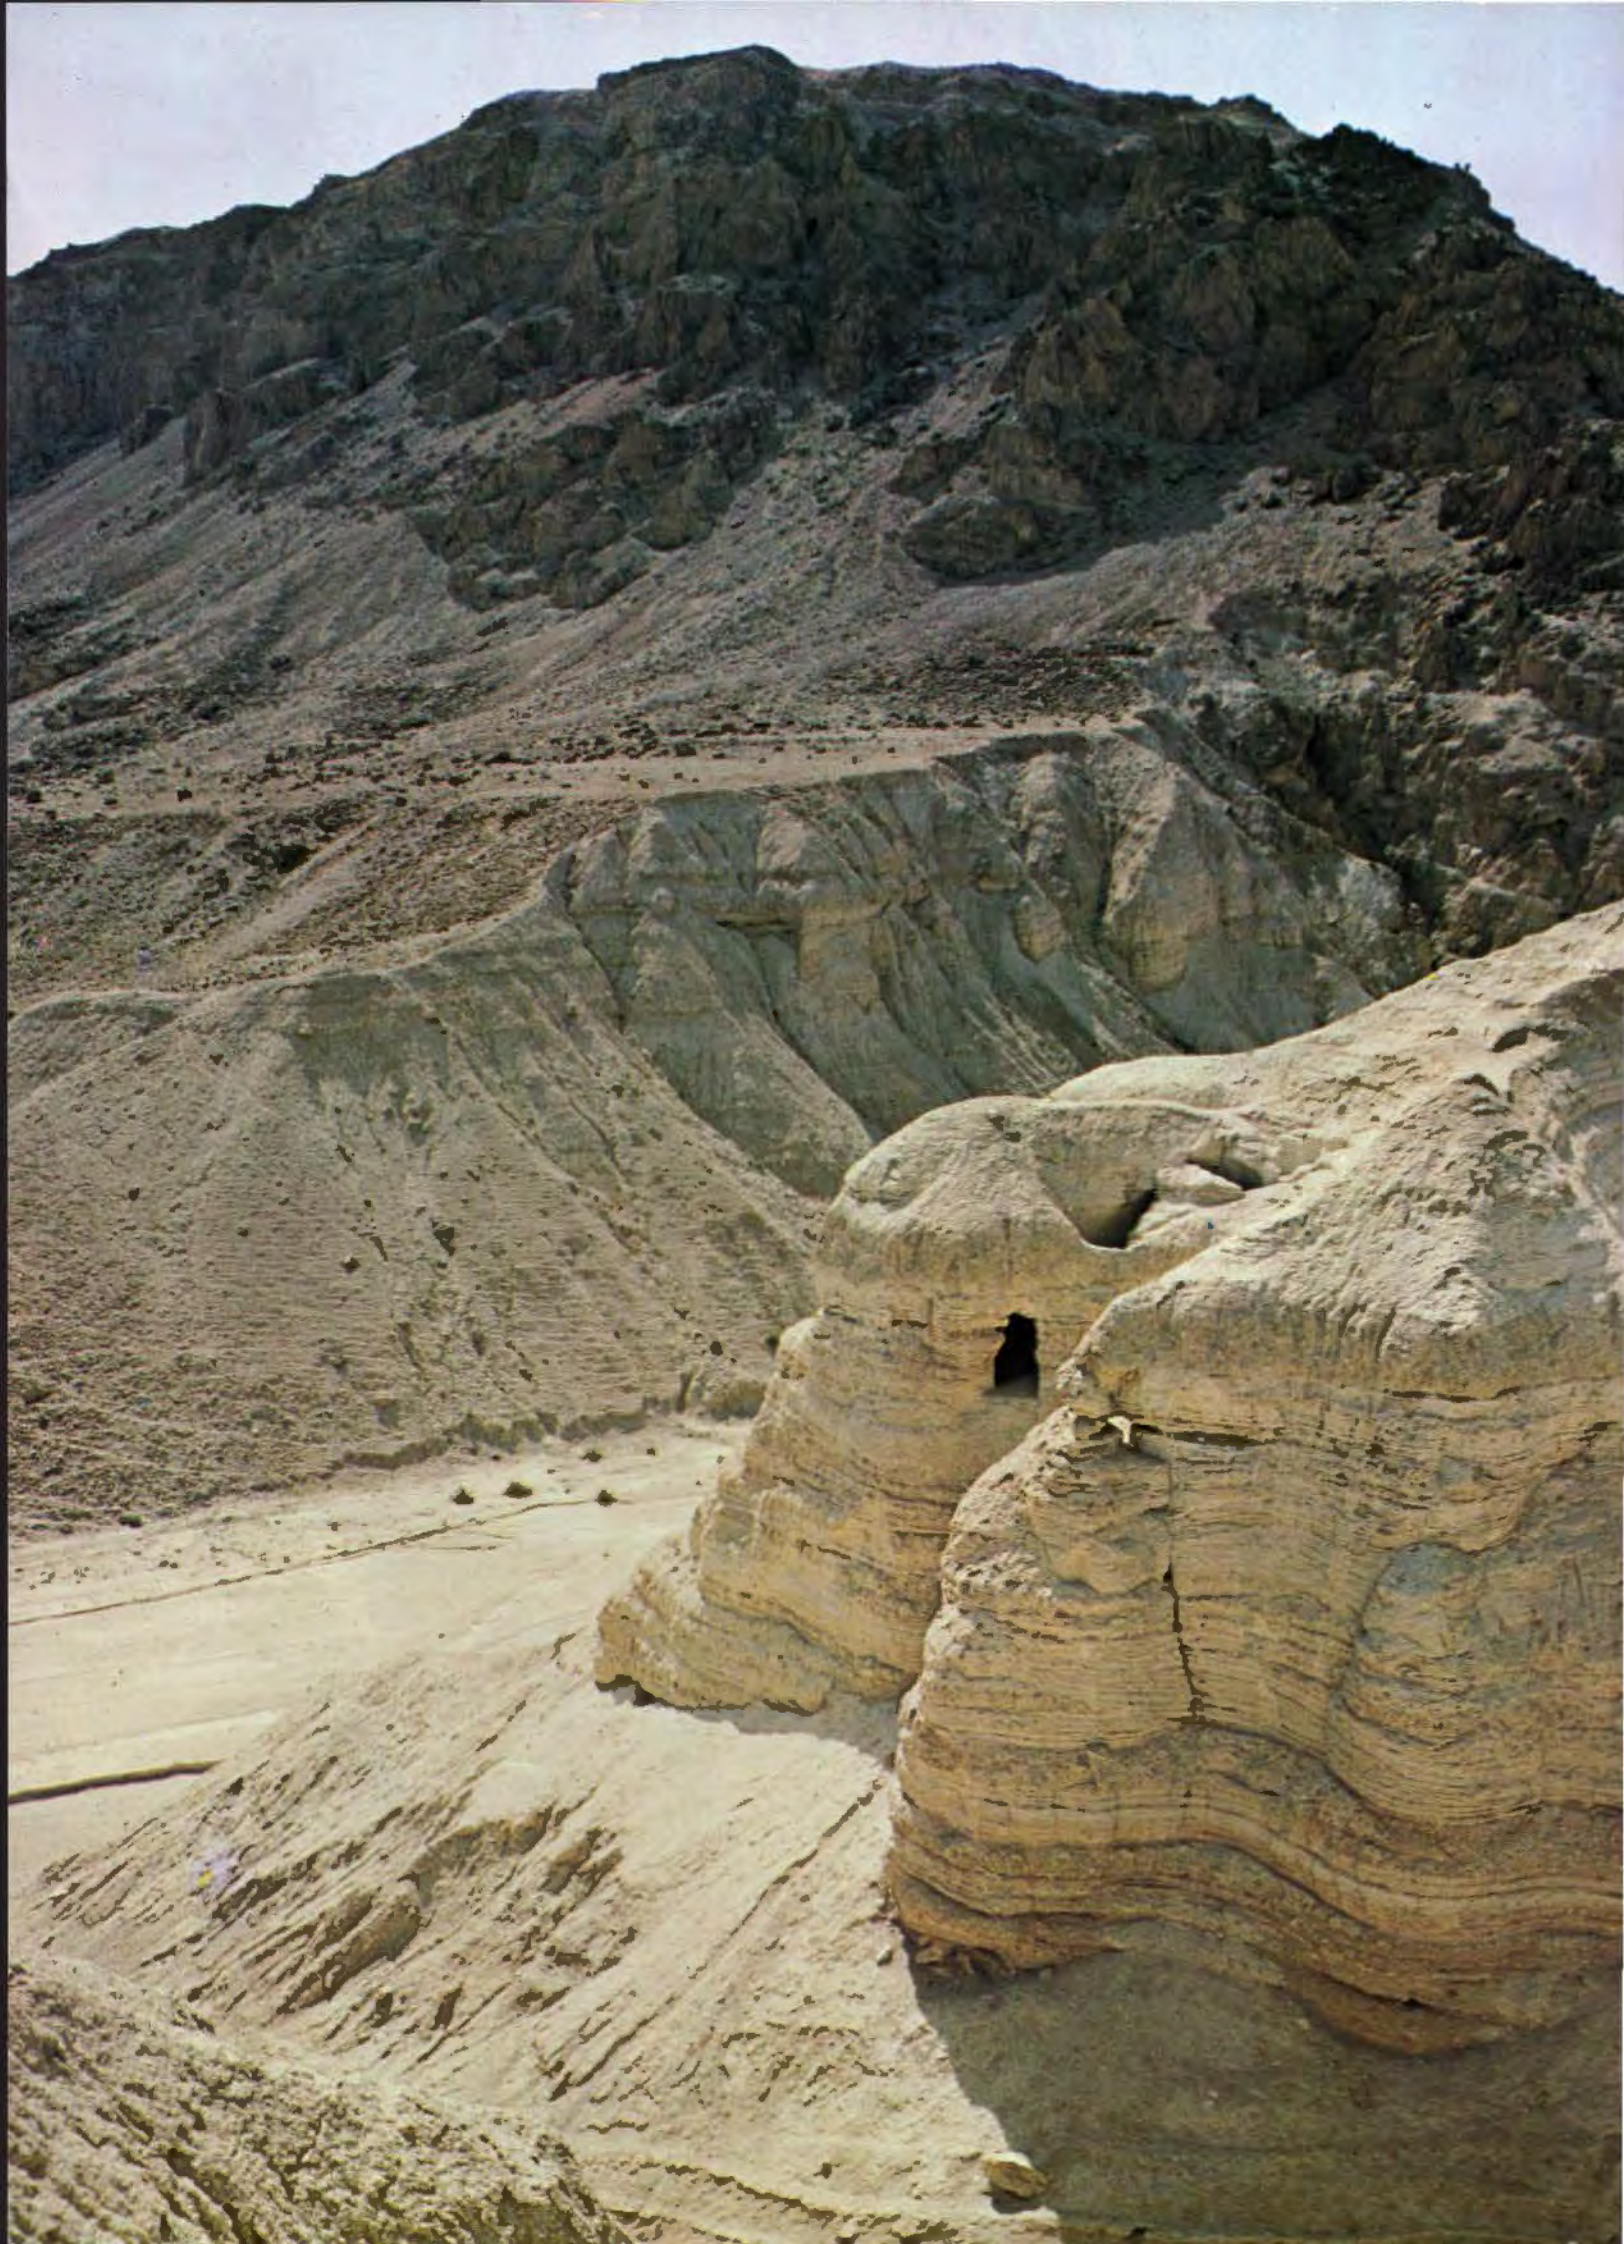
The other days are less important, though in northern England it used to be thought highly unfortunate to meet someone with flat feet on a Monday, perhaps because the flat foot denies the crescent arch that recalls the moon.

Some days, like Christmas Eve and Christmas Day, are especially lucky to be born on but a singularly unlucky day is Childermas, or the feast of the Holy Innocents (28 December), which commemorates Herod's indiscriminate slaughter of children in the hope of eliminating the infant Jesus. In the 15th century Edward IV's coronation was postponed when it was realized that the Sunday which had been chosen for it happened to be Childermas.

Days and Hours in Magic

Astrological considerations have always been important in European magic, and magicians have tried to bring the influence of a planet to bear on an operation by performing it in that planet's day and hour. A list of the operations suitable to each planet is provided by two of the magical textbooks, the *Key of Solomon* and *True Black Magic*. (See diagram opposite.)

Each planet rules the first hour after sunrise on its own day. The succeeding hours are ruled by the other planets in the order Sun, Venus, Mercury, Moon, Saturn, Jupiter, Mars. At sunset this progression is interrupted and the first hour after sunset is ruled by the planet fifth in order from the planet which rules the day. The effect is that each planet rules the first and eighth hours after sunrise and the third and tenth hours after sunset on its own day.



The scrolls found in Palestine since 1947 include manuscripts of books of the Old Testament 1000 years older than any previously known, and have illuminated the background of the New Testament. Some have recognized Jesus in the 'Teacher of Righteousness' of the Qumran community

DEAD SEA SCROLLS

COLLECTIONS OF MANUSCRIPT material found at various sites west of the Dead Sea in Palestine in 1947 and the following years are popularly known as the Dead Sea Scrolls. The most important of these sites are the regions near Qumran, Murabba 'at and Engedi. From caves in the last two areas documents were recovered relating to the Second Jewish Revolt against the Romans (132–135 AD). But the most interesting of the documents are those of a rather earlier date, found in 11 caves in the Qumran district, a few miles south of Jericho.

In one of these 11 caves an Arab goatherd, Muhammad adh-Dhib, lighted by chance in 1947 on the first lot of 'Dead Sea Scrolls' to be publicized, amounting to seven in all. Most of these were in fairly good condition, having been wrapped in linen and placed in earthenware jars for safe keeping. The vast majority of the manuscripts found in the other Qumran caves, however, whether by Bedouin or by trained archeologists, were in a sadly fragmentary condition. Many of the pieces were no larger than postage stamps. Only by an effort of the imagination, envisaging them in their original state, could these be called 'Scrolls'. The task of piecing them together so as to reconstruct as far as possible the original text lasted for several painstaking years.

Most of the documents are written in Hebrew, some in Aramaic (another Semitic language), a few in Greek. The fragments represent over 500 books which apparently belonged to the library of a Jewish religious community. About 100 of these are copies of books of the Hebrew Bible; several Old Testament books are represented several times over, and all of them have been identified except that no trace has been found of the book of Esther. Others are commentaries on Old Testament books, showing how these were understood in the community which owned them. Others again give valuable information about the organization of the community, including one in particular which was found in Cave 1 in 1947, variously called the 'Rule of the Community' or the 'Manual of Discipline'.

Yet others are liturgical documents which throw light on the community's order of worship. One thing that emerges clearly from these liturgical texts is that the community regulated its religious life by a different calendar from that which was officially followed in the Jerusalem Temple and which is still the calendar used by orthodox Jews for religious purposes. The Qumran calendar, of which we had previous knowledge from a work entitled the *Book of Jubilees* (c100 BC), ignored the phases of the moon completely and aimed at being entirely solar. It consisted of 364 days, so that any given day of a particular month must have fallen on the same day of the week year by year. This calendar must have become progressively out of step with the real solar year of $365\frac{1}{4}$ days, but we have no idea what provision, if any, was made to correct the error. The use of a different calendar was one factor preventing the community from participating in the Temple festivals in Jerusalem, but not the only one.

The first scrolls were discovered purely by chance in 1947 by an Arab goatherd in hill caves near the Dead Sea. Many of them evidently belonged to the library of a Jewish religious community

Paleography, the study of ancient handwriting, points to a date in the last two centuries BC and the 1st century AD for the Qumran manuscripts; the same period was indicated when some of the linen in which the Scrolls from Cave 1 were wrapped was submitted to the radio-carbon test.

Dated by Coins

Not far from the caves where the manuscripts were found were some ancient ruins, locally known as Khirbet Qumran, which had never been excavated. Some slight attention had been paid in 1873 to an ancient cemetery lying between the ruins and the Dead Sea, but no firm conclusions were reached regarding its date or use. The discovery of the manuscripts, however, aroused interest in the ruins and the cemetery, and as a result of excavations carried out from 1951 to 1956 a close correlation between these and the manuscripts was established. At the beginning of the excavations, towards the end of 1951, there was found in the floor of an excavated room a jar of a type identical with those in which the Cave 1 manuscripts had been placed, and along with it was a coin bearing a date which, transposed into our system of dating, corresponds to 10 AD. In the course of excavation hundreds of other coins were found and these, together with other material evidence, make it plain that the buildings were occupied in the period during which most of the manuscripts were copied – that is to say, in the two centuries from about 130 BC to 70 AD, the year of the destruction of Jerusalem by the Romans.

The buildings were designed to be the headquarters of a community numbering a few hundred men. They included rooms for public meetings, a refectory, a writing-room, areas for the grinding and baking of flour and for the manufacture of pottery, but no sleeping quarters: the members evidently slept in tents or in caves. The cemetery contained over 1000 burials. The whole building complex had a plentiful water supply, carried in channels from cisterns cut in the hills above to catch the rain and discharged into reservoirs dug at convenient points in and around the buildings.

There were two main phases of occupation of the buildings, separated by an interval of about 30 years during which they lay derelict. Occupation was resumed about 4 BC; it may be significant that this was the year of the death of Herod the Great. Considerable damage was done to the buildings by an earthquake which can be dated, on independent evidence, as having occurred in 31 BC. The second period of occupation was brought to an end violently; the buildings were burned after some fighting, and this destruction cannot well be divorced from the war which was raging at the time between the Jews and the Romans.

In short, the evidence of the manuscripts and the evidence of the buildings fit together so well that we can safely combine the evidence of both to reconstruct the history of the community.

The Teacher of Righteousness

The Qumran community was organized in the second half of the 2nd century BC out of a group of pious Jews – *hasidim*, as they were called – who could not endure life under the existing religious establishment in Judaea.

When, in 168 BC and the following years, the Gentile king Antiochus Epiphanes (175–163 BC) tried to impose Hellenistic paganism on Judaea, steadfast resistance was offered to him by two groups – on the one hand, Judas Maccabaeus with his family and followers; on the other, many of the hasidim who normally took little active part in public affairs, being content if they had freedom to worship God and lead their lives according to the ancient prescriptions of the Jewish law. Because this freedom was threatened, they made common cause with Judas and his militant associates, but when the guerilla genius of the latter led to the restoration of religious freedom, the temporary alliance began to break up. Judas and his brothers (the family of the Hasmoneans) continued to fight, hoping to gain political freedom as well as religious freedom, and this struggle too was crowned with success in 142 BC. The hasidim were not concerned to promote the political ambitions of the Hasmoneans, but they disapproved most strongly of the Hasmoneans' assumption of the high priesthood in Jerusalem. The group of hasidim from which the Qumran community developed maintained that the only legitimate high priests were the sons of Zadok, who had held the sacred office from Solomon's time until the rise of Antiochus, eight centuries all told. Each member of the Hasmonean dynasty of priest-kings was, in the eyes of the community, a 'Wicked Priest'; one member of the dynasty receives this designation in a special degree because he persecuted the community and its organizer, the 'Teacher of Righteousness'.

This 'Teacher of Righteousness', who is never mentioned by his personal name, led his followers down to the wilderness of Judaea in accordance with the command of Isaiah, chapter 40: 'In the wilderness prepare the way of the Lord, make straight in the desert a highway for our God.' He interpreted the ancient prophecies in such a way as to show his followers clearly what their function was in the closing days of the 'present evil age', on the eve of the arrival of the eternal age of perfect righteousness. They were the faithful remnant of Israel, a miniature people of God encamped in the wilderness, awaiting the divine signal to take

The Dead Sea Scrolls have led to a greater understanding of both Judaism and the origins of Christianity. Some of them are copies of Old Testament books, others throw light on the beliefs and organization of the community that produced them *Above left* The Second Isaiah scroll before it was unrolled and examined *Centre* The task of identifying and translating the scrolls has taken several painstaking years. Much of this work has been done by scholars *(below left)* at the Hebrew University of Jerusalem *Right* First sheet of one of the scrolls, showing the damaged and fragile state of many of them, and also the fine penmanship of the scribe

action to bring in his kingdom. It was impossible for them to share in the Temple services while they were polluted by an illegitimate high priesthood, but they believed that their ascetic life, their devotion to the study and practice of the law of God, and their endurance of persecution at the hands of the 'Wicked Priest' and other oppressors, would be sacrifices acceptable in the sight of heaven, and would indeed provide a store of additional merit procuring atonement for the defiled land of Israel.

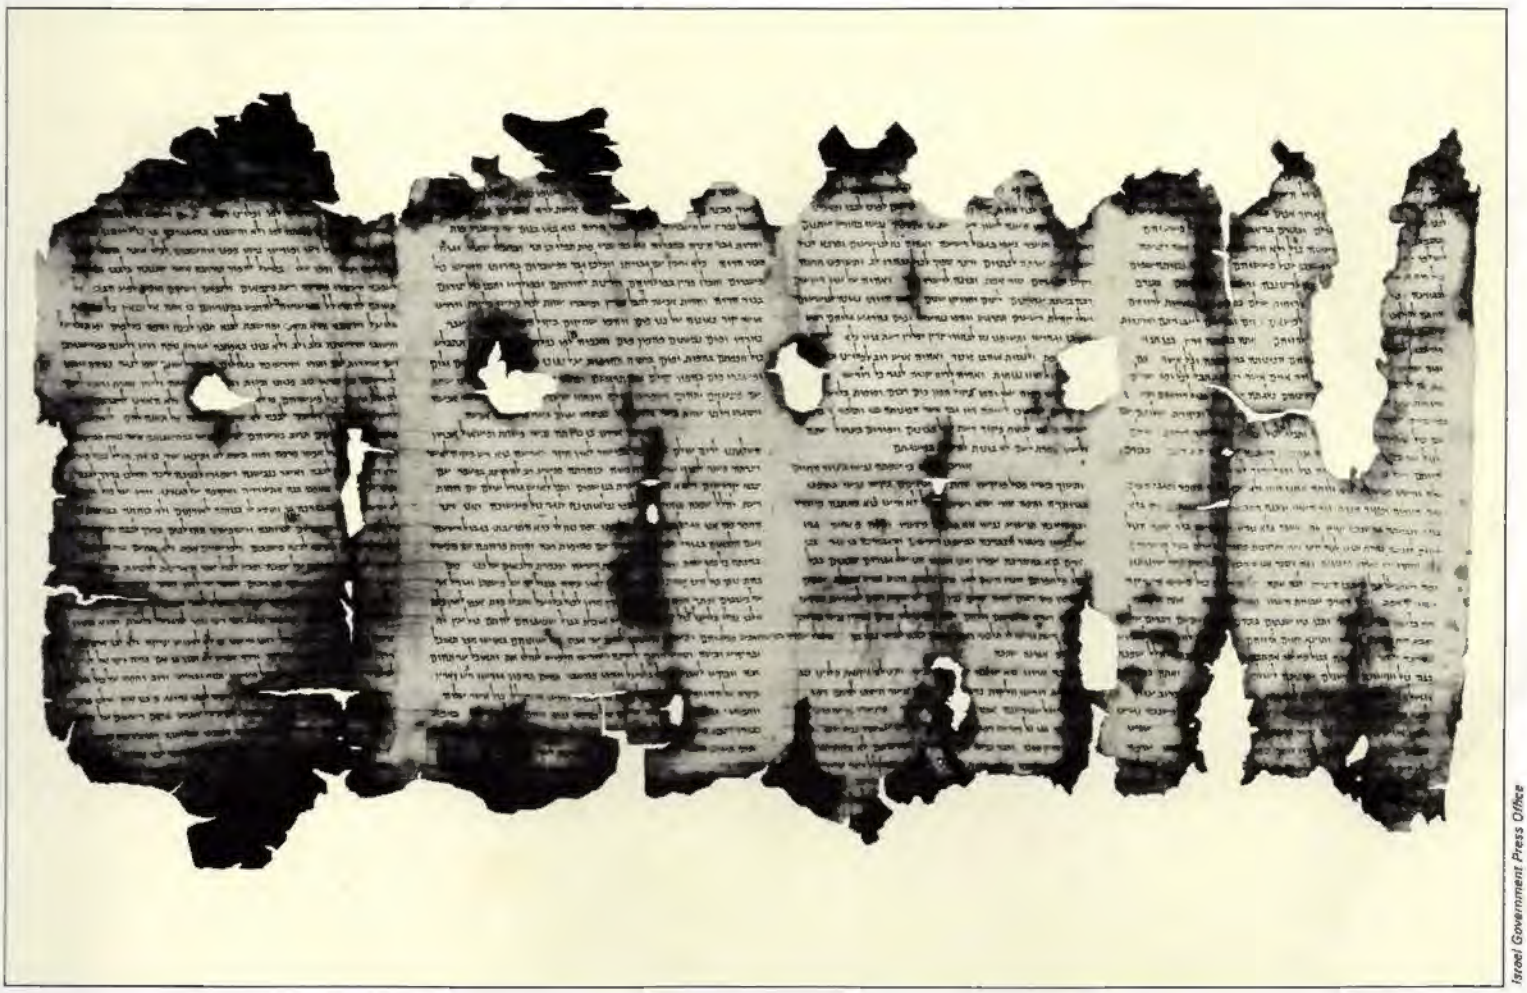
At first, perhaps, they expected the new age to dawn during the lifetime of the Teacher of Righteousness, but his death (about 100 BC, perhaps) brought no diminution of their hope. When, in the middle of the 1st century BC, the Hasmonean power was brought down by the Roman occupation of Judaea, the community saw in this the just retribution of God on an impious dynasty. And if the Romans proved even more oppressive in their turn, they too would suffer retribution, and the members of the community would be the agents of divine judgement against them when the time came to take arms against the ungodly and extirpate them from the earth. The 'War of the Sons of Light against the Sons of Darkness' (to quote the title of one Scroll) would establish everlasting righteousness. It was perhaps with this hope that the community supported the revolt against Rome in 66 AD, only to be cut to pieces and dispersed.

Volunteers for Holiness

What can we say about the significance of this community of 'volunteers for holiness' (as they called themselves), thus unexpectedly brought to light by the discovery of the Scrolls?

First, the information which we have received about them provides us with a new chapter in the history of religion, and that is something of great value in itself. More particularly, it provides us with a new chapter in the history of Jewish religion. Judaism before 70 AD was much more diversified than it became after that year, and we now know more about one of the strains making up this diversity. In this community we can see more certain traces of Zoroastrian influence in Judaism than are found elsewhere in it, although these elements are strictly subordinated to Hebrew monotheism.

A further question in this regard concerns the possible identification of the Qumran community with some Jewish party known to us from other sources. The



Israel Government Press Office

weightiest arguments for such an identification are those which link the community with the Essenes, a mystical sect who believed in non-resistance and whose quietist movement was a feature of the Jewish religious scene during the 200 years preceding 70 AD.

The organization of the Essenes, as described in particular by the Jewish writer Josephus, bears a close resemblance to what we gather of the organization of the Qumran community, as also does the graded process of initiation. There are differences in detail, but some change was bound to take place in the course of two centuries. It might be wisest to think of the Qumran community as one of several Essene groups located in various parts of Palestine and the neighbouring territory. We are assured by archeologists, however, that the headquarters of the Essenes, mentioned by the Roman writer Pliny the Elder (died 79 AD) as being west of the Dead Sea, cannot be identified with any installation known to them other than Khirbet Qumran. The Essenes are described as pacifists, whereas the men of Qumran looked forward to war against the Gentiles. But probably the Essenes were not absolute pacifists; they may have been holding their fire for the final Armageddon.

Illuminating Texts

As for the bearing of the Scrolls on the Bible, the interest which attended their first discovery arose from the fact that here were manuscripts of the Old Testament books in Hebrew reliably dated 1000 years earlier than the oldest datable manuscripts of Hebrew Scripture previously known to be extant. The earlier textual history of the Hebrew Bible has thus been enriched by a wealth of new evidence, although the ordinary reader of the English Old Testament can be assured that no significant changes in the essential message of the books are involved.

It has become clear, however, that the bearing of the Scrolls on the New Testament and the origins of Christianity is even more important. Estimates of their relevance in this respect have varied greatly, from those who find no connection at all to the minority that would go so far as to recognize Jesus himself in the Teacher of Righteousness. We may forget such extreme positions and welcome in the Scrolls an abundance of new background material against which the New Testament can be read with greater understanding. It is difficult to think of any part of the New Testament which is not illuminated in some way by this discovery.

Whereas the New Testament is dominated by the proclamation that in Jesus the Kingdom of God or age of the Messiah has arrived, the Scrolls (even the latest of them) still look forward to its coming, although it is regarded as imminent. Its advent, in the community's expectation, would be marked by the appearance of three figures foretold in Old Testament prophecy – a prophet (a second Moses), an anointed priest (a second Aaron) and an anointed king (a second David, a great military leader). While the early Christians regarded Jesus as the promised Messiah (or 'Anointed One'), the Teacher of Righteousness does not appear to have been a messianic personage either in his own eyes or in those of his followers, but rather a preparer of the way for the messianic age. His role is thus more comparable to that of John the Baptist in the New Testament narrative; and while identity is out of the question, the life and activity of John the Baptist offer one of the most promising areas of common ground between the Scrolls and the New Testament. Another such area may be found in Paul's sojourn in Damascus, a place which figures in one of the most important texts (the 'Zadokite Work') as an outpost of the community.

While the Qumran community's ideal of holiness involved insulation from sinners, the ideal of Jesus and his disciples involved association with them. The rapid spread of Christianity through the Mediterranean world between 30–70 AD meant that it could not be suppressed by the extermination of any one centre of its life, as the Qumran community came to an end with the destruction of its headquarters.

DEATH

Behind innumerable myths of the origin of death lies the urge to find an explanation for man's mortality. Similarly, the need to visualize the appearance of this last, unwelcome visitor has led to death being depicted as a fearful beast, a terrible angel or an animated skeleton

IF MAN HAS ALWAYS felt that the mystery of life must be explained, he seems to have had an equally urgent need to account for the humiliating outrage of death. It is almost as if life, despite its trials, was too good to be true and death, despite its apparent peace, too ghastly to be true. In stories from all over the world, death is an intruder: he was not there at the beginning but made an early entrance. Very frequently he arrives as the result of a mistake, of a message wrongly delivered. Sometimes he is a punishment, visited upon mankind for disobedience, ingratitude or sheer stupidity. In many myths, death comes by agreement, as the outcome of a debate between divinities (one of whom may be malevolent) or among the first men and women themselves.

These three types of myth about the origin of death – the error, the penalty and the decision – are found among many different and widely scattered peoples and it is also quite common for the various features to be combined in a single story. There is a constant recurrence of the idea that death was, in the first days, meant to be temporary and that human beings, but for a tragic and original mischance, would have repeatedly renewed their lives like the moon or like lesser beings such as snakes and crabs which (it was thought) took on a new lease of life when they sloughed their skins or shed their shells. This concept of lost renewal occurs in all the three main types of myth.

The Message that Went Astray

The myth of the mistake, of the message that went wrong, is especially common in Africa. In many versions the chameleon is sent by God to tell the first men that they are to have the gift of immortality; but he dawdles on his way and is overtaken by the lizard, the swifter messenger of death. The Gallas of East Africa tell how God sent a bird with the message that men were to renew their lives by changing their skins.

Far left William Blake's painting of the Fourth Horseman of the Apocalypse, *Death on a Pale Horse*. 'Behold, a pale horse, and its rider's name was Death, and Hades followed him . . .' In Greek art Thanatos, or Death, was frequently portrayed armed with a sword *Left* In medieval art Death is represented as a skeleton, sometimes armed with a dart with which he strikes the death-blow: 15th century brass rubbing from the tomb of Richard Notfelde in the Church of St John, Margate *Right* Sometimes the skeletal figure of Death is shown with an hour-glass, symbolizing his association with Time, whose sands run out for each of us in the end; *The Three Ages of Woman and Death* by Hans Baldung Grien

The bird came across a snake feeding on some meat; he was hungry and promised the snake he would tell him 'God's news' if he gave him a share. The serpent finally agreed and the bird told him that men would grow old and die but that all he had to do was cast off his skin to be young again. In his anger, God punished the bird for his treachery and greed by giving it a painful disease which makes it sit on treetops and bleat sorrowfully, whence it is called *holowaka* or 'the sheep of God'.

In a myth of the Hottentots, the moon sent an insect to tell men that they, like herself, 'would die and dying live'. The insect, going slowly on his way, was met by a hare who asked him his business. The hare said he was quicker and was quite willing to take the message. The insect agreed but the hare (whether through malice or stupidity is not clear) garbled the message and told men that, unlike the moon, when they died it was the end of them. The moon was angry with the hare and struck him with a stick, splitting his lip. Some say the hare, in the struggle, scratched the moon's face with his claws, which is why her surface is pitted. Others declare it was not the hare's fault. He delivered the message correctly at first but the people refused to believe him, shouted at him and so confused him that he finally told them the opposite of what he should.

The myth of the wrongly transmitted message is also found in South-East Asia and Oceania but in these regions most of the death-origin stories seem to centre on the motif of skin-changing. In parts of Polynesia it is said that at the beginning all changed their skins when they grew old and renewed their youth. One day, however, a child cried when he could not recognize his 'new' mother; she was so sorry for him that she put her old skin back on again and later died, as did all other people thereafter. There is a curiously similar African story of a couple who sent their children to fetch water in a basket while they were changing their skins. The children tired of their hopeless task and came back to the hut. The father chased them away but they crept stealthily back and saw their mother half in and half out of her new skin. Whereupon she died and brought death into the world.

visited the earth to see how the first men were faring but they were ungrateful and attacked him. So he took away their 'immortality' and gave it to the lizards, snakes and beetles.

In the Orinoco basin it is believed that God intended that men should be immortal by changing their skins but that an old woman laughed at such a seemingly ludicrous idea. God was offended and sentenced mankind to mortality.

The Great Punisher

The concept of death as penalty or punishment, often for the foolish action of a woman, is found in many parts of the world, besides the story of Adam and Eve in the book of Genesis (see FIRST MAN). The aborigines of New South Wales tell how in the beginning God forbade the people to go near a certain hollow tree in which bees had made their nest. The men obeyed but the women wanted the honey. Finally, one of the women hit the tree with an axe and out flew death in the form of a bat which now claims all living things by touching it with its wings.

In Baganda legend, Kintu, the first man, is permitted, after many trials and tests, to marry one of the daughters of heaven. God sends the pair to live on earth and gives them gifts, including a hen. He tells them to hurry lest they meet Death (the bride's brother) and not to come back if they have forgotten anything. The woman forgets the hen's feed and goes back for it, at which God, in his displeasure, grants Death's request to accompany them. Death keeps claiming the children as they are born but is prevented from taking them. Kintu appeals to God who relents and sends another of his sons (called 'Digger') to take Death back to heaven. God ordains silence during the pursuit as Digger chases Death who has hidden in the ground; but the children's cries break the spell and Death is allowed to remain on earth and strike down living things.

The Algonquin tribes of North America say that immortality was granted to men by the Great Hare, himself the source of vital energy. The gift was in a little package which our first ancestor was forbidden to open. But his wife, the Pandora of the New World, could not restrain her curiosity and peeped inside. As she did so immortality flew away, never to return.

There is a very odd African story, told by people living on the shores of Lake Kivu, which shows God trying to save men from death but giving up in exasperation rather than inflicting a punishment. God made man to be immortal and kept a close watch on Death who was always trying to pick quarrels with men and provoke them to a fight which he knew he would win. One day God was away and Death killed an old woman. She was buried but after a few days her grave began to heave as if she were coming back to life. Her daughter-in-law poured boiling water on the grave and beat it with a pestle, saying 'Die: what is dead should stay dead'. The grave was then quiet and the old woman was really dead. God returned and seeing that the old woman was not there asked what had happened. When he was told, he said he would hunt Death down. Death fled in terror and met another old woman to whom he said, 'Hide me and I shall reward you'. She let him hide under her skirt and he entered her body. God caught them up and decided that, since she was so old, it would

The concept of death as penalty or punishment, often for the foolish action of a woman, is found in many parts of the world

be best to kill her and tear out Death and kill him. But Death slipped through his fingers and this time persuaded a young girl to hide him in her belly. God despaired: if human beings kept on thwarting his efforts to save them he might as well give it up as a bad job. So he let Death do as he pleased.

The Upotos of the Congo say that the immortality meant for men was granted to the moon. This happened because in the first days God commanded the inhabitants of the earth and the moon to attend on him. The moon-men came straightaway but the earth-men delayed. In his wrath, God rewarded the moon with ever-renewed life and visited the earth with death. In the Admiralty Islands it is said that the first man, pursued by an evil spirit, was hidden by a tree within itself. The tree asked for two white pigs as a reward but the man brought one white pig and a black one smeared with chalk. The tree, in its anger, said it would help no more, so the spirits catch men and kill them. In the Celebes there is a belief that the sky, at first, was very close to the earth and God used to lower gifts to the first people on a rope's end. He let down a stone which they refused, and then a banana which they accepted. God therefore decreed that mankind would not be like the stone, immortal, but perishable like the banana.

Fatal Debate

One of the most imaginative myths of the origin of death is that of the Wintun Indians of the Pacific coast of North America. It is said that Olelbis, being about to create men, sent two buzzards, brothers, to build a stone stairway between earth and heaven, at the top of which there were to be two springs, one for purification and the other for drinking – the 'fountain of youth'. As they laboured, Sedit the coyote, the mischievous and clownish creator, came and tempted them. Is all their hard work, he asks, really worth it? Will men and women want to go on ascending and descending the stairway, endlessly repeating their lives? 'Joy at birth', he says, 'and grief for the dead are better, for these mean love.' The brothers are persuaded and destroy what they have built. But the younger says that Sedit too must take his own advice and die. In frenzied terror, Sedit makes himself wings of sunflower petals and tries to fly to heaven; but his wings wither and he falls. Olelbis says his own words have condemned him and hereafter all men will die.

The poignancy of this story is reflected in one told by the Eskimos of Greenland. At the beginning, they say, there was no death and no sun. One old woman declared she would be happy without light if there were no death. But another said that if it were not possible to have the one without the other, it were better to have both, for life without light was unbearable.

This brings us to the third type of death-origin myth – mortality as the result of a debate, a theme that has appeared in some of the stories already mentioned. The tenderness of the last two tales seems to be peculiarly North American: it recurs in a Blackfoot Indian myth of the discussion between the first old man and the first old woman. The man wanted immortality but the woman said there would then be too many people, and, besides, if people died they would be able to feel sorry for one another. They agreed to leave the matter to a sign: they would throw a piece of buffalo bone into the water – if it floated they would opt for immortality, if it sank, for death. The woman, who had magical powers, changed the fragment into a stone and hence we all die.

In Oceania the debate is, it appears, always between two supernatural beings, one of whom proposes life (often by skin-change) and the other death; the second always prevails, since he who has the last word wins. Sometimes one deity is openly malevolent. In the Banks Islands the story is told that Qat, the good god, made wooden images and vivified them by drumming and dancing before them. But he was succeeded by Marawa, the evil and jealous god, who buried his images and killed them.

The Larder of Death

Certain tales are remarkable in that they do not fall into any of these groups. The Aranda aborigines of Australia say that at the beginning first women and then men emerged from the rocks. The leading man was envied and hated by the others because he was nearest to the women, so they pointed a magic bone at him. He fell into a coma, 'died' and was buried. But he was not really dead and his head and neck rose out of the ground; then came Urbura, the evil and enchanted magpie, who stabbed the man in the throat and commanded him to stay dead. The other men and women were turned into lamenting birds. But for Urbura all would have been well.

Perhaps the strangest story of all comes from the Ewe-speakers of West Africa. Yiyi the spider (another example of the cunning and greedy demiurge found in many mythologies) cadged meat from Death during a famine. Death had plenty of meat because he had made a great clearing in the forest and set traps in it. In return for continual supplies, Yiyi gave Death his daughter in marriage. Death told his wife not to go through the clearing when she went to fetch water but one rainy day she did and was caught in a trap. Her husband chopped her up for the larder. When Yiyi discovered what had happened he attacked Death with a knife and ran away in terror to the village with Death in pursuit. Death had never been to the village before and as he lay in wait for Yiyi he amused himself by shooting at the women as they went down to the river for water. He then realized that here was game enough and he had no need to trouble setting traps for animals.

C. DE HOGHTON

Personification of Death

One of the earliest known attempts to depict the horror of death has been found at Catal Hüyük, a Neolithic settlement in Anatolia dating from the 7th millennium BC. It takes the form of representations of gigantic black birds of vulture-like appearance menacing headless human corpses. The mythologies of ancient Egypt and Mesopotamia provide our earliest written evidence of the personification of death. In the legend of Osiris, this divine hero, who became a type of 'Everyman' in the mortuary ritual (see OSIRIS), was killed by the evil god Seth, who came to be regarded as the personification of evil; in art Seth is depicted as an animal with sharp pointed ears or horns, a long muzzle or snout, and a tail splayed at the end. He is never actually portrayed as the death god, however, nor is such a baleful being ever shown as such in Egyptian art. Yet, as the following Coffin Text of the Middle Kingdom (c2160–1580 BC) vividly shows, the Egyptians personified death very realistically: 'Save me from the claws of him who takes for himself what he sees: may the glowing breath of his mouth not take me

Scala

away.' It is possible that, during the Graeco-Roman period in Egypt, the jackal-headed god Anubis, long associated with the Osirian mortuary ritual, became the *psychopompos* (guide of the dead) or even the death god.

The Angel of Death

In ancient Mesopotamia the Babylonians named the death god Uggae; but he does not figure notably in their mythology under this name. However, death was personified in a horrific manner. Thus in the famous *Epic of Gilgamesh*, Enkidu, the unfortunate friend of Gilgamesh, dreams of his coming death as seizure by an awful being:

> . . . he transformed me,
> That mine arms were covered with feathers like a bird.
> He looks at me (and) leads me to the house of darkness, to the dwelling of Irkalla;
> To the house from which he who enters never goes forth.

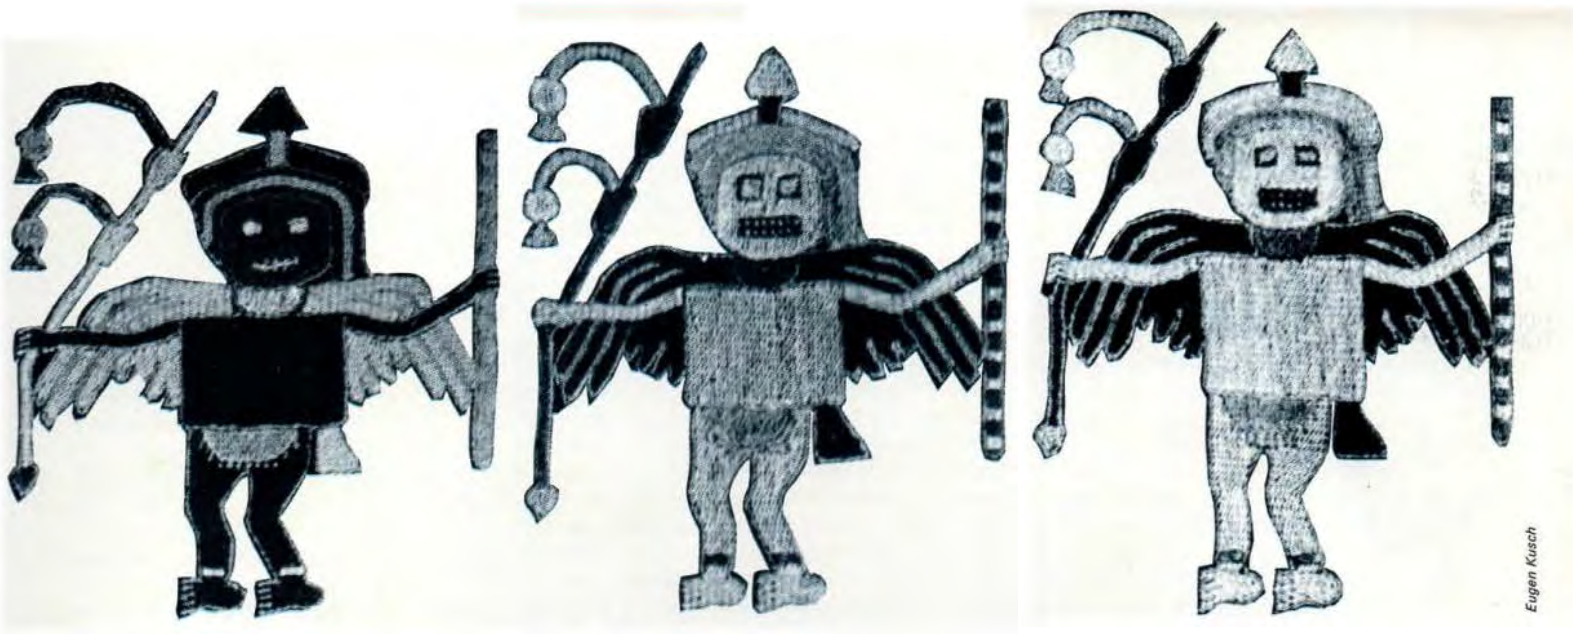
An Assyrian text of about 650 BC actually describes the dread enemy in an account of the underworld, and pictures a grim figure with the hands of a man and the feet of serpents. There was, however, much fluidity of conception in personifying death; for another Assyrian text gives directions 'For making exchange for a man wanted by the Goddess of Death'. Indeed, Mesopotamian demonology provided a variety of grisly monsters associated with the underworld.

In ancient Hebrew literature, although the origin of death is attributed to the sin of Adam in Genesis (3, 19), God is regarded as ultimately responsible for the individual's death. However, Hebrew thought, which tended to separate its god Yahweh (see YAHWEH) from direct contact with human affairs, produced the idea of the 'angel of Yahweh' as the agent of death. In later Jewish folklore the angel of death is named 'Sammael', meaning 'the drug of God', since it was believed that his sword was tipped with gall: the howling of dogs announced his presence in a town.

In Iranian mythology death was closely associated with Time (see TIME), so that Zurvan, the deification of Time, was regarded as the god of death. Thus an ancient Persian text states: 'For Zurvan there is no remedy. From death there is no escape.' The Persians conceived of two forms of Zurvan: one of them 'Time of the Long Dominion' was the form of Time associated with death, since it brings old age, decay and death to all men. There is some evidence that the idea of this form of Zurvan, with whom Ahriman, the personification of evil, was identified, was incorporated into Mithraism, and found expression in its temples in statues of a lion-headed monster, adorned with various symbols of Time.

In the Vedic literature of ancient India a god of the dead is known under the name of Yama. According to the *Rig-Veda*, he was the son of Vivasvant and 'the first of mortals to die and enter that other world'. In later writings Yama becomes the judge of the dead, and in that role he appears in Tibetan, Chinese and Japanese Buddhism. In Chinese belief, under the name of Yen-lo wang, he presides over the fifth hell. As Emma-O, in popular Japanese art, he is depicted seated at his tribunal, a fearsome figure in the robes of a Chinese judge. Hinduism, however, has other personifications of death. Mara, or Mrtyu is death personified. The concept has an important role also in Buddhist mythology, but rather as the personification of evil, being *papman*, 'the evil one'. The Hindu god Shiva, who is conceived as having an ambivalent nature, has on one side of his being Bhairava, 'the terrible destroyer', who haunts cemeteries, and appears wearing serpents about his head and a necklace of skulls. An even stranger conception is the personification of Shiva's destructive energy in the form of the goddess Kali or Durga. This goddess (Kali means Time) is of horrific appearance: her colour is black, she wears a chaplet of severed heads, and her many hands hold symbols of her nature – the exterminating sword, scissors to cut short the thread of life, and the lotus of eternal generation, for existence as an unceasing cycle of birth and death.

Above **In the story of the Harrowing of Hell, in which Christ descends into Hades to succour the souls of the just, Death is identified with Satan, who is depicted as a skeletal figure in chains, prostrate beneath the triumphant Christ: from a mosaic in St Mark's, Venice** ***Above right*** **Detail from an early Peruvian death shroud, embroidered with representations of the grotesque gods of the underworld: Lima Archeological Museum**



The Last Enemy

Greek mythology personified death in two forms. The more ancient conception is the more grim. Homer refers to the *ker thanatoio* (the fate of death), which was probably imagined as a winged harpy that snatched away its victims. The more sophisticated image of Thanatos (Death) was that of a winged youth, of heroic form, armed with a sword, such as he is shown on a column, now in the British Museum, that once adorned the temple of Artemis at Ephesus. Thanatos was actually portrayed in performances of Euripides' *Alcestis*, described as black-robed, winged and armed with a sword.

In Christianity death has also been personified, although theologically it is regarded as the penalty of sin. St Paul proclaims that 'the last enemy that shall be destroyed is death (I Corinthians, chapter 15). In the Revelation of St John (chapter 6), Death is depicted as riding on one of the baleful horses. In the myth of Christ's descent into Hades, Death is sometimes identified with Satan, and in depictions of the event Death often appears as a skeletal figure prostrate beneath the triumphant Christ.

In medieval art Death is invariably represented as an animated skeleton, armed with a dart with which he strikes the death-blow. An interesting development of the idea appears in Holbein's version of the *Dance of Death*, for the skeletal figure of Death is shown with an hour-glass, thus symbolizing his association with Time. Another striking example of this association is seen in Dürer's engraving *The Knight, Death and the Devil*. From this association emerged the Renaissance figure of Father Time, whose scythe, derived from the sickle of the god Saturn, symbolizes the mortal stroke that severs human lives.

Queen Elizabeth I's astrologer and a noted scientist, John Dee claimed to talk with angels. He was also employed in the Queen's secret service. How far his magical activities were a cover for espionage is a problem which remains unsolved to this day

JOHN DEE

IN THE EYES of many of his contemporaries John Dee (1527–1608) was a charlatan, impostor and dabbler in black magic. This portrait of the man was embellished by many writers, especially by Samuel Butler, whose *Hudibras* contains a vicious caricature of Dee, and even the *Biographica Britannica* describes him as 'extremely credulous, extravagantly vain and a most deluded enthusiast'. Although Dee's life story is well documented, little has been done to explain or interpret him. His abundant output of erudite works, his projects and treatises, reveal him as one of the most remarkable of Elizabethan scholars. He was an authority on mathematics, navigation, astronomy and optics, as well as being Astrologer Royal to Elizabeth I.

Dee was born at Mortlake, at that time a village on the Thames outside London. Young Dee had a retentive memory and early proved an apt pupil. At the age of 15 he went to St John's College, Cambridge, where he recorded in his diary that he used to spend 18 hours a day studying.

His reward came in 1546 when he was appointed Under-Reader of Greek at the newly founded Trinity College, shortly after which he was made a Fellow of Trinity and graduated as a BA at his own college. It was while he was still at Cambridge that the first charge of sorcery was levelled against him as a result of an over-realistic stage effect – a mechanical flying beetle – which he created for a production of Aristophanes's *Pax*. All his life he had a passion for mechanical toys.

These early years were spent in travel and study. He went to the University of Louvain in Belgium in 1547, where he made friends with the Flemish cartographer Gerardus Mercator and brought back to Cambridge two of Mercator's globes, together with newly devised astronomical instruments. In one sense Dee can be said to have been the first Englishman to indulge in industrial espionage, for he realized quite early that the English must increase their knowledge of navigational techniques if they were to expand their empire. Consequently he passed back to England all the information he learned from Mercator and others.

Horoscope for the Queen

About this time Dee first took an interest in natural magic, a subject which was then occupying the minds of many Renaissance scholars. A distinction was made both by the scholastic laity and the Church between natural or 'white' magic, and black magic. The view was that the former was a natural and therefore a good force, that it seemed magical because its workings were spiritual and invisible and therefore not normally given to mortals to understand. Black magic, on the other hand, was a force for evil conjured up by men either for evil purposes or through ignorance and superstition. It was the dividing line between science and the occult which Dee found so fascinating. He learned much from the orientalist Antonius Gogava, and from Cornelius Agrippa, who had framed the doctrine that the practice of magic was one of the lawful ways by which man could attain to a knowledge of God and Nature (see AGRIPPA). Thus, while teaching logic and mathematics on the continent, Dee was also pioneering in the perilous fields of natural magic, especially in telepathy.

Dee was a prolific caster of horoscopes and this talent attracted some attention at court in Queen Mary's reign. He was asked to cast horoscopes for both the Queen and her prospective bridegroom, Philip of Spain. Rashly, he developed close ties with the Princess Elizabeth in her semi-captivity at Woodstock, near Oxford. Dee was a cousin of Blanche Parry, who was confidential maid-of-honour to the Princess, and through Blanche he corresponded with Elizabeth and drew for her a horoscope which is in the British Museum today. He was accused of attempting to take Queen Mary's life by poison or black magic and was charged with treason, although the only substantial evidence his accusers could produce was that he had shown Princess Elizabeth the horoscope he had drawn for her sister, the Queen. He was acquitted of the charge, but kept in prison until late in 1555.

When Mary died in 1558 and Elizabeth became Queen, the new sovereign, remembering the horoscopes Dee had already drawn for her, requested him to cast a date that would be propitious for her crowning. From then on the relationship between Dee and his monarch was friendly but not even the Queen herself could afford to make a suspected magician too obviously a key figure in her entourage. It is still not known for certain to what extent Dee was a secret agent, nor how far his dabbling in magic was a cover for espionage. Often he was away for months at a time on mysterious missions on the continent, sometimes for the Queen, more often for Sir William Cecil (Lord Burghley) and Sir Francis Walsingham, who was in charge of Elizabeth's intelligence system.

Secret Ciphers

In 1563, while browsing in the bookshops of Antwerp, Dee came across a copy of a rare and little known book, *Stenographia* by Trithemius, Benedictine Abbot of Spanheim on the Rhine (1462–1516). He was so excited about his discovery that he wrote to the statesman Sir William Cecil about it, saying of the book that its 'use is greater than the fame thereof is spread'. This work was to have a great influence on Dee. For seven years he had been busy preparing one of his most abstruse and controversial books, *Monas Hieroglyphica*. After reading *Stenographia* he completed his work in 12 days. It dealt with the relation of numbers to natural magic and used a code and symbols which could only be understood by Dee himself and by those he had initiated into the secrets of translation. Few pretended to understand it, yet Cecil declared it to be 'of the utmost value for the security of the Realm'.

How could so abstruse a philosophical work be of value to the security of the realm unless in some way it assisted espionage? Trithemius had been an exponent of natural magic but centuries later students of the Abbot of Spanheim were emphatic that *Stenographia* dealt primarily with ciphers. D. P. Walker, one of the leading modern authorities on natural magic, has stated in his *Spiritual & Demonic Magic* that 'Trithemius' *Stenographia* is partly a treatise on cryptography in which the methods of encipherment are disguised as demonic magic, and partly a treatise on demonic magic . . . It should be noted that Trithemius's astrological magic is not only a kind of telepathy; it is also the means of acquiring universal knowledge.'

Dee took over where Trithemius left off and in his *Monas* developed a cryptography of his own. In between producing the first English edition of the Greek mathematician Euclid with Henry Billingsley, and urging the use of telescopes in the Army, he was sent by the Queen on another secret mission, this time to the Duchy of Lorraine. It was probably concerned with the proposals for marriage between Elizabeth and the Duke of Anjou, for whom Dee drew a horoscope. That the mission was important is clear from the fact that the Queen sent two of her own physicians to attend Dee when he was ill.

Crystal-Gazing

Dee's first marriage in 1574 is somewhat of a mystery. Not even the name of his bride is known; there is no record of the marriage and no note about his wife in Dee's diaries until a reference to her death the following year. Curiously, on the very day she died Dee was visited at his home by the Queen who asked her astrologer to show her the 'magic glass of which she had heard so moch'.

Some writers have suggested that the 'magic glass' was the same as that used by Dee in the crystal-gazing experiments which he is known to have made. It is more likely to have been a concave mirror, however, for Dee's account of the incident states that the Queen and her courtiers laughed heartily, which could have been explained if they saw distorted images of themselves in the glass. Most contemporary authorities agree that Dee did not become actively interested in crystal-gazing until 1581. It was on 25 May of that year that he first mentioned in his diary: 'I had sight offered me in crystallo and I saw.'

The experiments with crystal-gazing were preceded by Dee's preoccupation with his dreams. He made frequent mention of strange dreams in his diaries; similarly he noted the dreams of his wife, for he had married for the second time. His new wife was Jane Fromond, a lady-in-waiting at court. His interest in crystallomancy was undoubtedly stimulated by his meetings with Renaissance Cabalists and by his genuine and scientific desire to explore the possibilities of spiritualism and telepathy. Dee did not delude himself that he possessed mediumistic talents; he said many times, no doubt with regret, 'You know I cannot see, nor scry' and he depended entirely on scryers (crystal-gazers). He used a variety of 'glasses', crystals and special stones for his experiments; two which are alleged to have belonged to him may be seen in the British Museum. But in his choice of scryers Dee was unfortunate. The first, Barnabas Saul, was a rogue who may well have been 'planted' on Dee by his enemies to trap him into indiscretions. The second, Edward Talbott, who on entering Dee's employment changed his name to Kelley, was if anything a bigger rogue, though possibly a more competent, if erratic, scryer. Kelley started life as an apothecary who cherished the idea of finding a formula to manufacture gold, turned to crime and black magic, but on joining Dee was sternly admonished to concentrate on 'conversations' with the angels and not the devils.

Dee held fairly positive views on the nature of the angels who appeared in visions. They were intelligent beings, telepathically attuned to a knowledge of the past and future. He was vaguer about devils but accepted that their purpose was to confuse and obscure the truth by introducing chaotic visions. He made careful notes of what he called his 'angelic conversations' and many of these are preserved in manuscript form in the British Museum. A sample of them was published in 1659 by Meric Casaubon under the title of *A True and Faithful Relation of What Passed between Dr John Dee and Some Spirits*. But Casaubon sought only to

Angelic Conversation

Part of a conversation between Dee, Kelley and the spirit Madimi at Mortlake in July 1583. Dee and Kelley were desperately in need of money and were also trying to find out about the future of a Polish nobleman, Count Albert Laski.

DEE Mistress *Madimi*, you are welcome in God for good, as I hope; what is the cause of your coming now?

MADIMI *To see how you do.*

DEE I know you can see me often, and I see you only by faith and imagination.

MADIMI (pointing to Kelley) *That sight is perfecter than his . . .*

DEE In respect of the Lord Treasurer, Mr Secretary and *Mr Raleigh*. I pray you, what worldly comfort is there to be looked for? Besides that I do principally put my trust in God.

MADIMI . . . *Madder will stain, wicked men will offend, and are easy to be offended.*

DEE And being offended will do wickedly, to the persecution of them that mean simply.

MADIMI . . . *Or else they were not to be called wicked.*

DEE As concerning *Alb. Laski* his pedigree, you said your sister would tell all.

MADIMI . . . *I told you more than all your dog painters and cat painters can do.*

DEE You spoke of *William Laski* and *Sir Richard Laski* his brother, of which *William* going into *France*, and then into *Denmark*: and his marriage into *Poland*, came this *Albert Laski*, now Palatine of *Soradia*, etc.

MADIMI . . . *Those were two pretty men for me to meddle withal. When you set yourselves together, and agree together, I will make all agree together.*

KELLEY WILL YOU *MADIMI* LEND ME A HUNDRED POUNDS FOR A FORTNIGHT?

MADIMI . . . I have swept all my money out of doors.

DEE As for money we shall have that which is necessary when God seeth time.

MADIMI . . . *Hear me what I say. God is the unity of all things. Love is the unity of every Congregation (I mean true and perfect love). The world was made in the love of the Father. You were redeemed in the love of the Father and the Son. The Spirit of God is (yet) the love of his Church*

E. M. Butler
The Myth of the Magus

John Dee employed the services of a man named Edward Kelley as his 'scryer', or crystal-gazer, because he did not possess the necessary talents himself. Kelley would sit before the crystal and describe whatever spirits he saw and what they said to him. With a friend named Waring, Kelley was alleged to have dug up a corpse in a churchyard at Walton Le Dale in Lancashire, and by magic incantations forced it to speak: imaginative picture of the scene, from *The Astrologer of the 19th Century*

Res
RAPHAEL

depict Dee as a deluded person. He completely ignored the scientific and philosophical approach of Dee and failed to analyse the true meaning of the 'angelic messages'.

More recent commentators have been kinder. The modern scholar Theodore Besterman described Dee as 'a pioneer in spiritualism' and had little doubt that the visions recorded in the diaries and manoscripts were genuine. 'For there is much in them', he wrote in *Crystal-Gazing* (1929), 'that is in accord with modern experience. In no case, however, can the absolute honesty of Dee be doubted and the absurd reflections . . . which have been made on his integrity, and even on his sanity, are quite undeserved.'

Calling on the Angels

Dee's approach to 'spiritualism' was almost entirely through scrying, though some of his manuscripts suggest that he sought revelations through mystic trances and 'photism' (hallucinatory sensation or vision of light). This was in accordance with the theory of natural magicians that a mystic trance gave a sense of union with God and enabled revelations of importance to be disclosed.

Kelley would sit before the crystal and describe whatever spirits he saw and what they said to him. Dee would record all Kelley told him and occasionally ask Kelley to put questions to the spirits. One figure appears over and over again in the scrying, a spirit-child, half-angel and half-elfin, first described by Dee as 'a Spiritual Creature, like a pretty girl of seven or nine years of age'. She said her name was Madimi (Dee named one of his daughters after her) and she appeared for seven years to Dee and Kelley.

Dee and Kelley preceded their scrying by a system of 'calls', or invocations. These suggest the influence of the Renaissance magicians Agrippa, Campanella, Bruno and Trithemius. Kelley, always a braggart, claimed that the calls were dictated to him in the angels' own language, called Enochian. But the basis of the idea is to be found in Dee's *Monas*. Casaubon dismissed Enochian as 'foolish, fabulous writing' but an analysis of the angelic language and calls shows they can be variously interpreted. They are part natural magic, part mathematical and astrological, part pure cryptography. Enochian is a complete language of its own, with its own alphabet and grammar.

In 1583 John Dee introduced a visitor to England to his scrying experiments. This was Count Adalbert Laski, who represented the King of Poland. Laski had been warmly received by the Queen, who provided funds for Dee to entertain Laski. Shortly afterwards Dee, Kelley and their families went to Poland with Laski. During his absence a mob broke into Dee's house at Mortlake and destroyed his books and instruments.

Dee did not return to England until 1589. He and Kelley visited the King of Poland and the Emperor Rudolph II, attempting to interest each in the 'angelic conversations' and also in Kelley's plans for manufacturing gold. 'Warnings' from the spirit world were passed on to these rulers. Then on 6 May 1586, Dee was told that the Papal Nuncio had submitted to the Emperor Rudolph a document which accused Dee of necromancy. A few days later he and Kelley were expelled from Prague.

They found a new patron in Count Wilhelm Rosenberg, who invited them to his palace in Trebon. About the same time Dee received an invitation from the Czar of Russia to go to Moscow to receive a salary of £2000 a year, a house and 'to be honourably accounted as one of the chief men in the land'. Yet for some reason Dee turned down this offer, remaining with Rosenberg.

Spying with the Glass

About this time Dee was finding Kelley's moods and fits of temper a sore trial. For a while Kelley absolutely refused to scry. Then, unexpectedly, he volunteered to look in the crystal once again. What he related thereafter struck horror into the Dee family and Jane Dee 'fell aweeping and trembling for full quarter of an hour, then burst forth into a fury of anger.' For according to Kelley, the spirit-child Madimi had counselled the Dees and the Kelleys to 'share all things in common, including our wives'. Dee rebuked Madimi for such 'unmeet' words and for a long time refused to have anything to do with the proposal. Nevertheless the counsel of Madimi was eventually obeyed and on 3 May 1587, Dee, Kelley and their respective wives signed a document swearing blind obedience to the angelic commands. There are no records of how the experiment in wife-sharing fared, but there was no more scrying after this and soon afterwards Kelley left the Dees.

Upon his return to England Dee almost immediately had an audience of the Queen, yet his career never really prospered after this. Despite many appeals for posts, all he was given was the wardenship of Christ's College, Manchester, in 1595, a position he does not appear to have enjoyed. In 1605 he returned to Mortlake and died there three years later.

Perhaps the full significance of the 'angelic conversations' will never be grasped. That they comprised a genuine attempt to experiment in spiritualism and telepathy is fairly certain. It is equally certain that what Dee mainly sought was knowledge of the hidden mysteries of the universe. But what complicates any attempt to interpret his motives is that there were also other purposes behind the scrying. Some writers have depicted Dee as the foolish dupe of Kelley; others have suggested that both Dee and Kelley were fraudulently using crystal-gazing to obtain money from Count Laski, the Emperor Rudolph and others. But if it was through greed that Dee exploited the crystal why did he reject the Czar's magnificent offer? What seems more probable is that in various ways the 'angelic conversations' were used as a cover for espionage. What better method of finding out what Laski and Rudolph wanted to know (and many of the questions put to the angels fully revealed the aims of these men)?

Certainly some of the visions can be thus interpreted and to support this theory there are many references to Dee having passed intelligence to Walsingham. It was widely believed on the Continent that Dee acted as an official spy for Elizabeth. But how much of this intelligence was factual and obtained by normal processes, or how much may have been gleaned by occult or astrological methods one can only hazard a guess. But although Dee may have wasted much valuable time on his spiritualistic experiments, he was a sincere seeker after knowledge, a mystic at heart but a scientist in his mind, and in many respects a pioneer in a variety of scientific fields.

Deism

Or 'natural religion', religion without revelation, an important theological movement in the 17th and 18th centuries which numbered Rousseau, Voltaire, Franklin and Jeffersnn among its supporters: the belief that the study of Nature and the exercise of reason are better guides to the existence and character of God than the study of sacred scriptures; deists tended to dislike formal religious observance, ritual and priests, and to believe that all the major religions contain essentially the same message.

Delphi

Site of the most influential oracle of the ancient world, at the temple of Apollo on Mount Parnassus, north of the Gulf of Cnrinth; the oracles were delivered by Apollo's priestess, the Pythia, seated on a tripod and speaking in trance, and were transmitted to inquirers by the priests.

Camera Press London

The favour of Demeter, the ancient Greek earth goddess, was especially important to countrymen. In gratitude for their help in regaining her daughter Persephone, Demeter revealed her Mysteries to the rulers of Eleusis

DEMETER

DEMETER was the ancient Greek goddess of corn, and of agriculture and fertility. The second part of her name, *meter*, means 'mother' in Greek and De (or Da) was in ancient times thought to be a word for the earth. The Greeks in historical times had a separate goddess of the Earth (Ge) and Demeter came later in the genealogy of deities, being a grand-daughter of Ge and sister of Zeus. But in origin she is certainly an earth goddess and as such the author of all crops and vegetation, and so the sustainer of the life of animals and men. Her daughter by Zeus, Persephone, was also called simply Kore, 'the Maiden'. She represented more directly the fruits of the field, but the two were so closely linked that they were often known as 'the Twin Goddesses', and even sometimes as 'the Demeters', a title which demonstrates their original identity.

Because the life of plants between autumn and spring is one of hidden growth under the ground, the story was told how Persephone was carried off by Zeus's brother Hades, lord of the underworld, and compelled to spend each winter with him as his wife. In spring, when the earth was covered in flowers, she would reappear, bringing men joy and happiness. So, as Kore, she was a deity of youth and gaiety, the leader of the nymphs, with whom she was gathering flowers when she was carried off and with whom she looked after the growth of children and young men and women. But as the wife of Hades, she was also queen of the underworld, governing men's fate after death, and in this aspect an awesome and dread goddess.

The Mysteries

As deities of the crops, and also as patrons of the life and growth of children, Demeter and her daughter were regarded as important civilizing influences, drawing men towards a settled life of agriculture and domestic happiness. Since agriculture was the most important source of prosperity in early Greece, the favour of Demeter was essential to all men, and especially to the peasant and the common man. To her, and to the god of the underworld, the farmer would sacrifice at the beginning of his seasonal tasks, and to her he offered his thanks and first-fruits after the harvest. Hence, many of Demeter's festivals coincide with these seasonal activities, ploughing, sowing, reaping, threshing, and the storing of the harvest. One of the most important, the Thesmophoria, took place in late October, the time of sowing, and included ceremonies designed to ensure the fruitfulness of the seed, and also the fertility of mankind. It was celebrated only by women, who as the bearers of children were more suited for such ritual, and much of it was secret. Many of Demeter's festivals included secret ceremonies, and these were often restricted to women. The main reason for this secrecy was perhaps the sense of awe and fear which was aroused by the contemplation of the hidden powers of the earth, the powers governing birth, growth and death, and also the life after death, below the earth.

The most important festivals of Demeter and Persephone were those ceremonies of initiation known as 'Mysteries', and of these the most influential in historical times were the Mysteries of Eleusis in Attica. These were open to both sexes. They guaranteed to initiates, above all, the promise of a happier fate after death. But the favour of the goddesses was also promised in this life, in terms of prosperity, especially agricultural. This was personified as a god Plutus (Wealth), who was the child of Demeter, born from her marriage to the Cretan Iasion, with whom she lay 'in a thrice-ploughed field'. The generation of the earth's fruits is thus represented by the union of the goddess with a mortal in a field that has been prepared for sowing. Plutus is sometimes shown as a little child seated on a cornucopia, which is being handed by Ge to Demeter. The setting of the myth, in Crete, perhaps supports the view of some scholars that Demeter's Mysteries have a Cretan origin.

The Rape of Persephone

The most famous of the myths relating to Demeter is that of the Rape of Persephone. This is closely associated with the story of the origins of crops and the art of agriculture, and of the Mysteries. Many legends told how, when Demeter was searching for her daughter, after Hades had carried her off, she received information about the Rape from the local inhabitants of different parts of Greece and was offered their hospitality. In gratitude she gave them her gifts of agriculture and the Mysteries.

The chief claimants for this honour were Eleusis and Sicily, the most important centres of her cult. The earliest and best-known version of the myth, the so-called Homeric Hymn to Demeter, tells how Demeter came to Eleusis, disguised as an old woman, and was there welcomed by the family of King Celeus. She became the nurse of his baby son, Demophon, and attempted to make him immortal by anointing him with ambrosia, and hiding him in the fire to burn away his mortality. His mother detected her, and Demeter was thus thwarted, but she promised to teach the Eleusinians her mystic rites. She then caused a universal famine, which threatened mankind with starvation and the gods with the loss of their sacrifices. Zeus was forced to order Hades to release Persephone. But Hades gave her a pomegranate seed to eat, and because she had tasted food in the underworld she was compelled to spend part of every year there, returning to the upper world in spring. Demeter, however, restored the fertility of the fields and revealed her Mysteries to the rulers of Eleusis. The poem closes with the promise of happiness after death for the initiated, and of prosperity on earth for those whom the goddesses love.

Sonia Halliday

As goddess of the crops and fertility, Demeter was regarded as an important civilizing influence by the Greeks, drawing men towards a settled life of agriculture and domestic happiness: Bodrum Museum

The famine, in this version of the myth, reflects another form of the belief that the death of vegetation has a divine cause. When Persephone is absent, the earth is naturally barren, but here it is Demeter's anger and grief at the loss of her daughter which causes the death of the crops, and thus endangers the life of men and gods alike.

The Homeric Hymn does not refer to Demeter's gift of agriculture to man after her daughter's restoration, but another version told how she made Triptolemus, another of the Eleusinian rulers, the recipient of this gift, and gave him a winged chariot with which he travelled over the whole world, teaching men the art of agriculture and giving them the corn. Triptolemus was a very popular figure in Athens in the classical period, and his mission was often depicted in art.

Corn and Earth

Ceres, the Roman goddess of corn and of the creative powers of the earth, was in her indigenous worship closely associated with Tellus, the Earth. As a deity of fertility, she was also a guardian of marriage, and as an earth-goddess, she was connected with the cult of the dead. Her chief festival, the Cerialia, took place in April and was essentially agricultural in character. At an early date she became identified with Demeter, and her most important cult, on the Aventine at Rome, was introduced at the beginning of the 5th century BC under Greek influence. She shared this with Liber, god of wine, and Libera, who was sometimes identified with

Persephone. Here, still more than in Greece, her associations were popular. The temple was supervised by the plebeian aediles, magistrates who represented the common people of Rome. As the provider of bread for the populace, and as guardian of the 'sacred laws' *(Ceres legifera)*, she became a protectress of the common people in their early struggles for liberty.

Later, with the growing urban development of Rome, her original importance as a goddess of country life faded, and in the literature and art of the later Republic and Empire she is for the most part a pale copy of Demeter, inheriting with her daughter Proserpina (Persephone) the Greek myths already related. An annual festival centred on the myth of the Rape and Return of Proserpina was introduced, probably in the 3rd century BC, from the Greek cities of southern Italy. This was celebrated by women only, and included secret, initiatory rites. It thus resembled to some extent the Greek Thesmophoria but differed from this festival in that it was celebrated in midsummer, probably at harvest time. The Cerialia, in spring, were also extended in the course of time to include dramatic performances on the Greek pattern. Because these coincided with the time of Persephone's return, they too came to be connected with the Greek myth.

The story of the Rape is a popular one in Latin literature. Ovid relates it on two occasions, in his *Fasti* and *Metomorphoses*, and the late Latin poet Claudian wrote a long epic on the subject entitled *The Rape of Proserpina*. It thus passed into the literature of the Middle Ages. Because of its funerary significance it also became a favourite subject for the artists of sarcophagi. This popularity is perhaps connected with the great proliferation of mystery cults and religions concerned with life after death, which arose in the first centuries AD.

Demons

Evil spirits: derived from the Greek *daimon* (hence 'daemon'), a spirit which might be good or bad: the Christians condemned all pagan spirits as evil beings under the sway of the Devil, which gave the word 'demon' its invariably evil modern connotation.

See EVIL SPIRITS.

Bodleian Library Colour Filmstrip

Demiurge

The creator of the universe in Plato's *Timaeus*: in Gnosticism believed to be a subordinate supernatural power, not the same as the good supreme God; gnostics often identified him as the god of the Jews; derived from a Greek word meaning 'craftsman'.

See GNOSTICISM.

DERVISH

IN BROAD TERMS, the word dervish describes a Mohammedan holy man, usually belonging to a religious fraternity (which may be either cloistered or lay) and following a form of Sufism, a series of philosophical systems designed to improve the workings of the human mind. There are a number of orders and sub-orders, each with its own rule dating back to its founder and with its own ritual. Individual practices vary from the whirling movements or 'dancing' of the Mevlevi sect to the ecstatic rites of the Rufai or 'howling' dervishes. Each order is independent and free to go its own way within Islam. Apart from full members of an order, there is a huge number of lay followers, particularly in the Turkish Moslem world, who are under the obligation of saying certain prayers every day.

Because dervish teaching methods differ so startlingly from those used by both Eastern and Western scholastics, the general impression has been that dervishes are wild fanatics or madmen. Indeed this was the Western image of the dervish in the 19th century: a strange fanatic, wild-eyed, insane, a practitioner of weird rites. Many travellers of the time brought back lurid stories of 'whirling' and 'howling' dervishes – entertaining, perhaps, but offering few clues as to what, if anything, might have been the basis of their strange behaviour.

In Central Asia, on the other hand, at any time in the past several centuries (and even, to a great extent, today), a dervish would largely be regarded as a person of science, culture, literature and philosophy – and perhaps more: a person with perceptions and capacities beyond those of ordinary men, something like saint and magician, with powers of healing and telepathy; capable of miracles.

Dervishes have been known in most parts of the Moslem world, as well as in medieval Spain and other parts of Europe. Dervish textbooks were used by Roger Bacon, the Franciscan, in his lectures at Oxford. The Spanish philosopher Raymond Lull of Majorca (c 1233–1316) has been shown to have derived his theories of love from dervish literature, and Al-Ghazali (1058–1111), known as 'Algazel' to the medieval schoolmen, was a noted dervish thinker.

The Door of Enlightenment

Even today many dictionaries define the word 'dervish' as deriving from the Persian *darvish*, literally a poor man. Yet a symposium published in 1966, containing eyewitness accounts of the activities of contemporary dervish communities, says the word is generally considered to be derived from the Persian verb *der-vekhton* – to wait at a door – the reference being to waiting at the door of enlightenment.

Much new material has been published in the last four or five years. One authority, Idries Shah, Grand Sheikh of the Sufis, lineal descendant of the prophet Mohammed, makes it clear that the understanding of what a dervish might be can never be explained satisfactorily only in words. He says: 'A dervish is a Sufi . . . In Sufi literature the words "Sufi", "dervish" and "fakir" are used more rarely than "knower", "lover", "follower" or "traveller". The others are externalist labels.'

Dervish teaching is based on the concept of 'essence' rather than the concept of God, and dervish teaching, because it is designed to improve the quality of the human mind, may or may not have a religious context. But whatever the context, it will be a vehicle for the self-realization that is aimed at: 'He who knows his essential self knows his God'. A modern traveller, Omar Michael Burke, who has visited dervish groups in Asia and Africa, describes Sufism as 'a way of life said to have been handed down from remotest antiquity. Its training was designed to produce the perfected man – and woman. In order to achieve this, the Sufi had to go through a long training. The difference between this teaching and all other systems was that the Sufi training took place within the world, and not out of it.'

Dervishes claim that there is a form of superior mental activity open to man, which can be manifested on the ordinary plane as well as in some inner sense; but that man in general cannot approach this due to certain

Regarded in the West as fanatic madmen because of their dancing, howling and whirling, dervishes are holy men, whose training is 'designed to produce the perfected man and woman'; from a Persian manuscript in the British Museum

Michael Holford

obstacles which are interposed by conventional thinking.

In consequence, dervishes have specialized in making startling and cryptic utterances which have naturally caused them to be considered mad, unrealistic or otherwise socially unacceptable. Nobody would believe or could verify dervish claims that man was trained ('conditioned') until the events of the Korean war brought Pavlov's work again into prominence. Evolutionary theory stated by dervishes several hundred years before Charles Darwin read like arrant nonsense to people conditioned by the Bible's chronology and accepting it without question. Dervishes today state that their claims about the 'higher faculties of man' – including precognition, bilocation (power to exist in two places simultaneously) and telepathy – await similar confirmation and cannot be challenged by people who have not arrived at a state where they can test the operation of such phenomena.

Blueprint for the Mind

Dervish teaching, perfected in the past by Sufi sages, is through formulations appropriate for the time, the place and the people involved, and by very precise techniques. Unlike conventional universities and colleges, there can never be a prescribed course of study in a dervish school, remaining the same at all times, for all students. Dervish texts will on the whole be revisions of earlier material, redesigned to project the teaching they contain into the current environment. Studies will take into account both the nature of individual pupils, and of the teacher.

Among the many techniques used by dervish masters to engender higher states of mind among their pupils are such revisions, including legends and parables, intended to establish in the mind not a 'belief' but a 'blueprint' or model, to help it operate in another manner. Auditory, visual and other sense-impacts are also used. There are also techniques to free the mind from preconceptions and conditioned ideas, thus making 'space' in it to receive the teaching.

How could the Victorian image of the wild fanatic ever have been generated from a way of life with such a controlled methodology and such a high aim – the perfectability of man and 'conscious evolution'? It could happen surprisingly simply, if the people observing dervish activity had no basis for understanding what they saw. Idries Shah offers an analogy, in a description of a strange rite: 'It is the night of Saturday, especially consecrated to a ritual which is awesome to us, faithfully followed by devotees of a certain cult. Two groups of 12, dressed in colourful costumes, carry out complicated movements in an enclosed space . . . The atmosphere is eerie, partly because of abrupt changes of emotion. . .' The esoteric rite, meticulously observed, turns out to be a floodlit football game. Shah sets against it a Victorian traveller's description of a meeting of 'whirling' dervishes, couched in precisely similar terms. One realizes that the travellers carefully wrote down what they thought they saw. But then, so did the hypothetical observer of the football game.

As well as the lack of a basis for understanding by observers, the permissive attitude of the dervishes, which makes no real distinction between believers in one cult or another, has been largely responsible for the 'bad press' which they have had.

Linked by a Mystic Force

The Sufis appeared in historical times mainly within the pale of Islam, though 'Christian dervishes' were not unknown; the teaching is held to be in the inner reality of all religions. All dervishes are believed to be linked by a force they call *baraka* (grace, lightness, impalpable beauty), and the total baraka of the founders of the Dervish Orders is held to interpenetrate all the Orders. Schools, or Orders, may equally be located in a monastery, a cafe in Western Europe, or even be a linking of people and activities spread over an immense area and invisible to the outsider, since the Sufis believe in the possibility of communication without physical presence. Four of the surviving major Dervish Orders are those of the Chisti, the Suhrawardi, the Qadiri, and the Naqshbandi. Dervish schools are always temporary, a body of people associated for a purpose, the rules ceasing to operate when the objective has been obtained.

There are many traces of earlier dervish activity to be found in Western Europe. Elements can be seen in the troubadours, the Knights Templar, and the witch cults of Western Europe, among others. Another example is in the Chisti community, which specialized in the use of music in their exercises. Wandering dervishes of the Order would play a rousing air on fife and drum when entering a town, and then recite a 'teaching' story. The relic of this may be found in the figure of the jester. Similarly, a dervish in the Middle Ages might move from place to place, dressed in a patchwork garment (the traditional dervish robe) and teach by signs, sometimes in cryptic words, sometimes not speaking at all. The European pronunciation of the Arabic name for such a teacher would be *arlakeen* and there is little doubt that his appearance is perpetuated in the harlequin.

An element of dervish behaviour, it is said, is its 'edge' and unexpectedness. In the words of Arif Yahya: 'Do not expect the way in which they bring their teaching to be wholly within your ordinary way of understanding. A pearl may be carried in a leather purse. The ignorant cry out: "This square object with a flap does not look like the necklace which has been described to me." '

(See also GHAZALI; RUMI; SUFIS.)

Sonia Halliday

A 19th century drawing by an English visitor to Turkey of whirling dervishes who are much respected in the East. They claim that the higher faculties of man include the power to exist in two places at once, telepathy, and an ability to see the future, for which evidence is now mounting in the West

DEVIL

Lucifer in hell, chewing on the body of the arch-traitor Judas, as in Dante's *Inferno*: mosaic in the Baptistery, Florence

FOR GENERATIONS of Europeans and Americans the Devil was a formidable reality – the supreme embodiment of evil, vengeful, intensely malicious, ruthless and subtle. Although belief in him has decayed in proportion with the decline of belief in God, it is not by any means extinct yet. For some Christians, of all denominations, Satan remains the arch-enemy of God and man. In a book called *The Devil*, published in 1953, Giovanni Papini accepted the evil archangel's reality and power, and maintained that he had inspired the writing of Hobbes' *Leviathan*, Blake's *Marriage of Heaven and Hell*, Byron's *Manfred* and Kafka's *The Trial*. In 1947 the *Reader's Digest* published a story about an American girl who had been sent to a reformatory. Anxious for release, she prayed to God, but with no result. So she turned to the Devil, offering him nine blasphemous communions if he could help her. She took the sacrament cursing God, and after she had done this eight times she was let out on parole.

Belief in the Devil has always been assisted by the human tendency to look for a scapegoat, preferably non-human, on whose shoulders can be loaded the blame for evil, violence, pain and misfortune. The *Manual of Discipline*, for instance, one of the Dead Sea Scrolls, says that God created two great spirits, one of truth and one of perversity, the latter being the angel of darkness. 'Through the Angel of Darkness, however, even those who practise righteousness are liable to error. All their sin and their iniquities, all their guilt and their deeds of transgression are the result of his domination; and this, by God's inscrutable design, will continue until the time appointed by Him.'

Similarly, the Christian writer Origen (died 253) said that the simpler Christians of his day believed that evil spirits caused people to sin and if there was no Devil, nobody would sin. Origen maintained that this view was wrong-headed, that men commit sins because they are imperfect, though the Devil is quick to seize his opportunity to lead the sinner on.

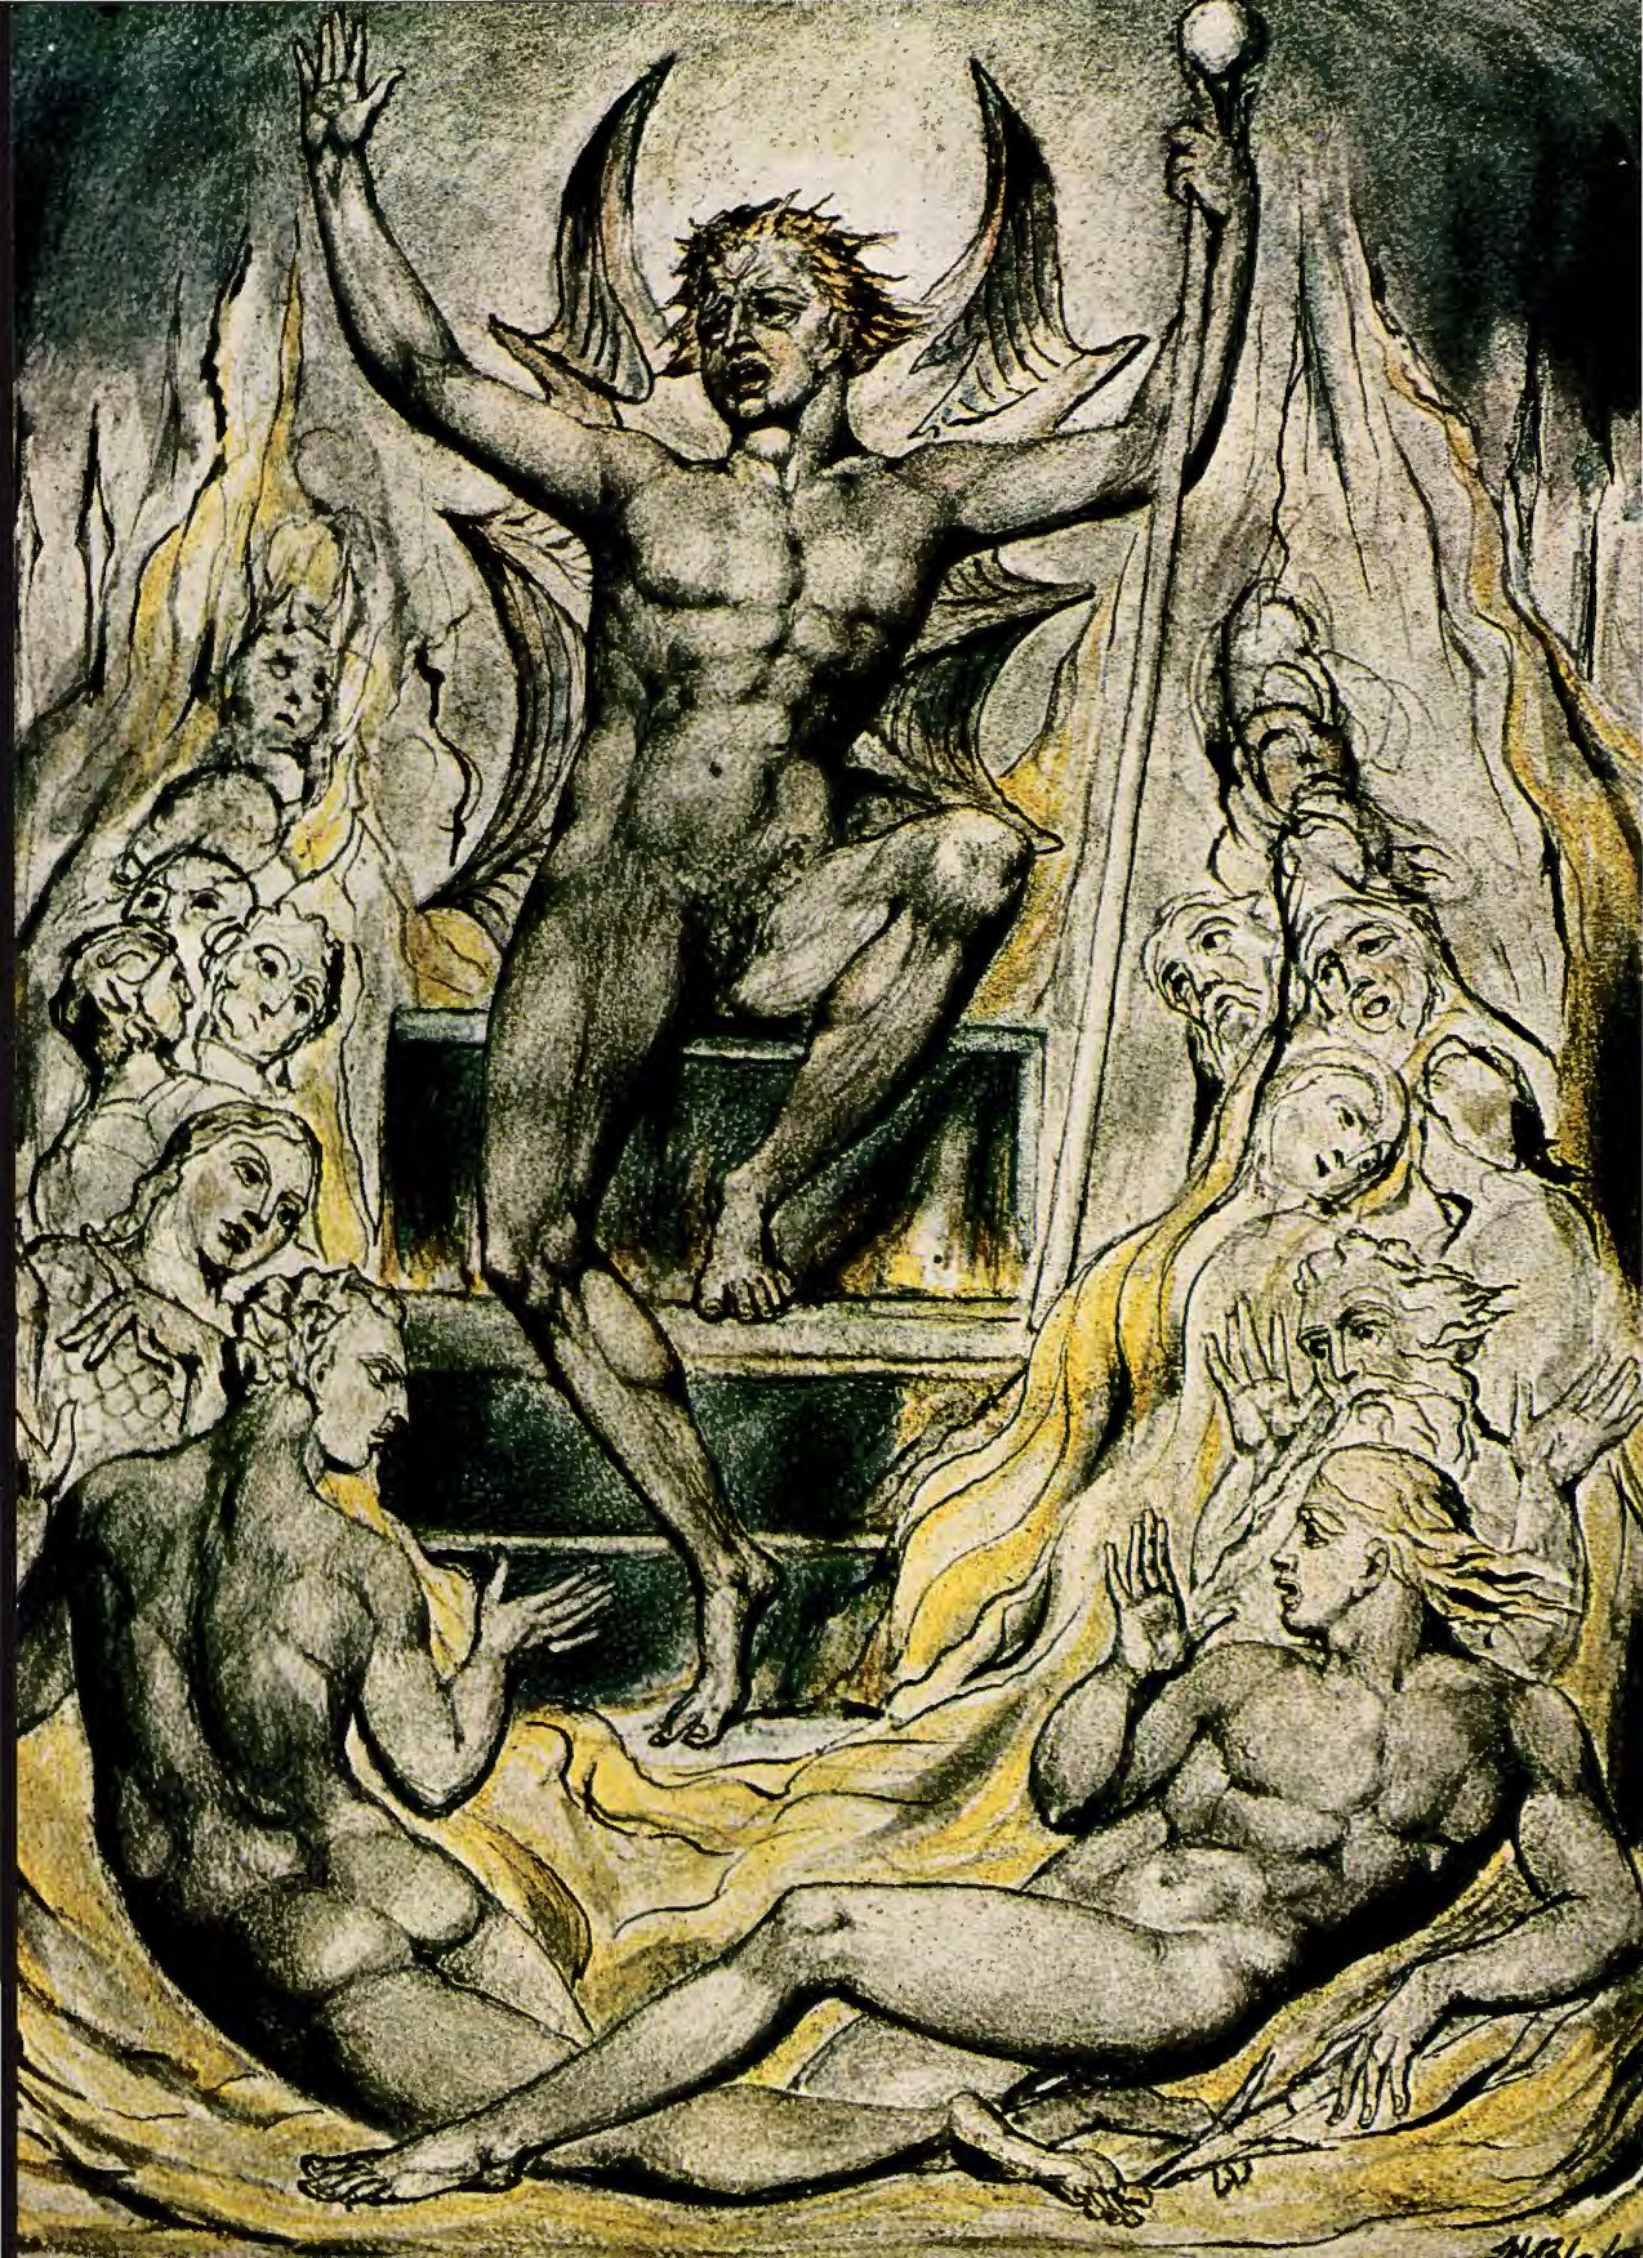
One of the most difficult tasks of Christian teachers all through the centuries has been to combat the persistent tendency of their flock to shift the whole blame for evil and sin onto the Devil, which necessarily leads to shifting it onto God himself. If God is all-powerful and the Devil causes evil, so the obvious argument runs, then God must allow the Devil to cause evil and so must ultimately bear the responsibility for it. As the *Manual of Discipline* was forced to conclude, it is by God's inscrutable design that the angel of darkness provokes guilt and transgression.

In pagan and primitive societies the gods are, in fact, usually held responsible for the existence of evil. The great powers which rule the universe are the ultimate authors of all things, good and evil, life and death, pleasure and pain alike. The Greek gods and goddesses could not be classified as either good or evil, but were either by turns, as the mood took them. The Devil of Europe is the product of belief in a God who is entirely good. He has his roots in Jewish tradition and his flowering in Christianity.

God and Evil

The god of the Jews was at first only one of numerous gods. After the miraculous crossing of the Red Sea, Moses and the Israelites sang his praises: 'Who is like thee, O Lord, among the gods?' (Exodus, chapter 15). David complained that Saul's henchmen had tried to drive him out of the Lord's following telling him to go away and serve other gods (1 Samuel, chapter 26). These other gods belonged to the neighbours of the Jews, like the Baals and Ashtaroths of the Canaanites, and the prophets condemned them as evil powers. The early Christians also attacked the pagan gods as evil demons but did not question their reality.

The picture of Yahweh as one god among many gradually gave way to the belief that he was the only God, who had created the universe and everything in it. If he had created everything, then on the face of it he must have created evil, a conclusion from



The satan who had begun his career as a useful official of the heavenly court later became the master of evil and the enemy of God

John Webb

which some of the Old Testament writers did not shrink. The prophet Amos said, 'Does evil befall a city unless the Lord has done it?' (chapter 3).

In the Old Testament God inflicts death, pain and disaster on men with alarming frequency. He punishes the sin of Adam and Eve with death, toil and the pain of childbirth (Genesis, chapter 3). It was God who hardened Pharaoh's heart to prevent him from listening to Moses, so that he could 'multiply his wonders' by inflicting appalling plagues on the Egyptians (Exodus, chapter 11). Sometimes he sent spirits to afflict people, like the 'evil spirit from the Lord' which tormented Saul and drove him into mad fits of rage (1 Samuel, chapters 16, 18). But in these early traditions there is no hint of the presence of the Devil, for if it is God who sends evil to men no Devil is needed. Belief in the Devil came later and biblical texts which originally had nothing to do with him were taken as scriptural evidence of his existence.

The Coming of Satan

The Devil has several different personal names, the most common of which are Satan and Lucifer. The name Satan means 'adversary' in Hebrew and originally meant merely an opponent, and not necessarily a supernatural one. The Philistines, for instance, were afraid that David might become their satan, or adversary (1 Samuel, chapter 29).

But in later passages an angel who is called 'the satan' appears. He is a member of God's heavenly court and his duty is to act as prosecutor, to state the case against men before God. In the book of Zechariah (chapter 3), when the high priest is being judged by God, the satan is there to accuse him, and is already regarded as unduly merciless.

Left **William Blake's *Satan in Council*: the story of the Devil's rebellion against God and his expulsion from heaven with the angels who followed his banner was adopted by Christian theologians, who believed that his titanic pride had made Satan unwilling to accept second place, even to God *Above* 'The Devil', one of the trumps from an early 19th century Italian Tarot pack, showing him with the serpent: by at least the 1st century AD the serpent which tempted Eve had been identified as either the Devil or the Devil's emissary**

The Syndics of the Fitzwilliam Museum, Cambridge

By the time the book of Job was written (after 700 BC) the satan is still the accuser of men but he is now shown in a strongly unfavourable light. In the early chapters of the book, he objects to God's praise of Job's righteousness, on the ground that it is easy for Job to behave well: he is prosperous and enjoys God's favour, why shouldn't he be righteous? But give him a strong dose of misfortune, the satan says to God in effect, and he will denounce you to your face. Intrigued, and still behaving in a way whose morality seems distinctly pagan, God has Job's children, servants and cattle killed. When Job refuses to curse God for these calamities, the satan is allowed to afflict him with a painful and hideous skin disease, but Job still remains faithful to God.

In Job the satan is performing what is felt to be a necessary function. He tests how far a man's actions match his professions, he looks for wickedness under the surface, and it is for this purpose, apparently, that he 'goes to and fro on the earth and walks up and down on it' (with a possible pun intended on the words *satan* and *sut* 'to roam about'). But he is not an attractive figure and later, with the growth of a nobler conception of God, it was felt that the satan's zeal for a conviction must make him as unwelcome to God as he is to man. When the Old Testament was translated into Greek 'the satan' became *diabolos*, 'the accuser', with the implication of false accusation, slander, and this is the word from which our 'devil' is derived.

The development of the satan, the malicious accuser, into the supreme enemy of God and man may have been influenced by Persian Zoroastrianism, for Palestine was part of the Persian Empire for some 200 years after 538 BC. Zoroastrians believed in two rival gods of good and evil. The world was created by the good god but was promptly invaded by the evil god Ahriman and his legions of fiends (see AHRIMAN).

Although in Jewish and Christian theory the Devil never attained the status of an independent god but was always subject to God's control, Jewish writers increasingly revised the older picture of Yahweh, separating out the good and evil elements in his earlier character and attributing actions which they felt to be evil, not to God but to other supernatural powers. A striking example is the story of David's census. When first told (in 2 Samuel, chapter 24) Yahweh puts the idea of numbering the people into David's mind and then punishes the crime with a plague that kills 70,000 men. But when the story is retold (in 1 Chronicles, chapter 21) it is Satan who suggests the census. This is the first and only use of Satan as a proper name in the Old Testament.

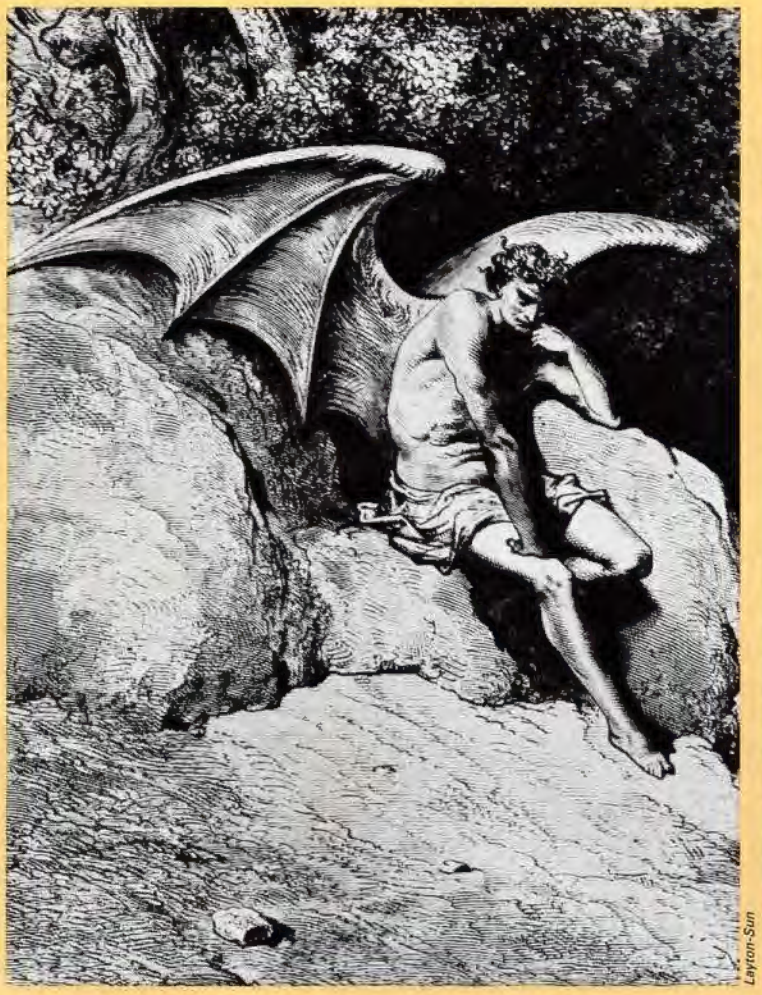
The Jewish *Book of Jubilees* ascribes several of Yahweh's sinister actions in the Old Testament to an angel called Mastema, who is the chief of evil spirits and whose name ('hatred') reveals his character. It was Mastema who tried to kill Moses on his return from Midian to Egypt (whereas in Exodus, chapter 4, it was Yahweh). It was Mastema who hardened Pharaoh's heart, in place of Yahweh, and Mastema who slaughtered the Egyptians' children, again in place of Yahweh (Exodus, chapter 12).

In other apocryphal books called the *Testaments of the Twelve Patriarchs* the evil angel is named Beliar or Satan or the Prince of Deceit. He is now clearly the opponent of God as well as the adversary of man. He is entirely evil, without any redeeming feature, the incarnation of utter 'worthlessness', as the name Beliar (or Belial) implies. God is good, Beliar is evil, and man must choose 'either the light or the darkness, either the law of the Lord or the works of Beliar.' Satan rules his own kingdom, 'the kingdom of the enemy', and those who sin fall into his clutches. (See BELIAL.)

The satan who had begun his career as a useful official of the heavenly court had now become the master of evil and the enemy of God. Two stories were told to explain how this had happened, those of the fall of Lucifer and the fall of the Watchers.

Lucifer and the Watchers

'How art thou fallen from heaven, O Lucifer, son of the morning! How art thou cut down to the ground which didst weaken the nations!' These are the opening words (in the Authorised Version) of the famous passage in Isaiah (chapter 14) which predicted the coming doom of the king of Babylon, and which St Augustine and other Christian theologians took to refer to the fall of a great archangel who had rebelled against God and had been hurled down from heaven in punishment. The archangel's name in heaven had been Lucifer (light-bearer), on earth it was Satan. The angels



Layton-Sun

Radio Times Hulton Picture Library

Satan as brooding romantic hero, an illustration by Gustave Doré to Milton's *Paradise Lost*: though he has the bat's wings of the evil archangel, his humanity contrasts with earlier ideas of the Devil in half-human and half-animal form, as in this illustration *(right)* of Satan teaching Martin Luther. The Devil's animal forms reflect his lordship of sensuality, physical passion and brutishness

who joined his rebellion were also expelled from heaven and became the demons of whom he is the lord on earth and in hell (see also LUCIFER).

The sin which caused the Devil's fall was pride. A Roman Catholic author, writing in the *Encyclopedia Americana*, explains that:

> Lucifer saw the splendour of his own augelic nature, together with its supernatural gifts, and rightly prized it. However, he wished to be sufficient unto himself and refused to admit that he depended on God and could find happiness only in God. His sin of rebellious pride was an act of complete egoism and pure malice: he loved himself to the exclusion of all else and without the excuse of ignorance, error, passion, or weakness of will. The sin of the other rebel angels was likewise one of pride in themselves and perhaps in their leader.
>
> Because of the perfection of the angelic will, Satan's choice, once made, was irrevocable. His rejection of God was eternal, as is his subsequent punishment. His essential and greatest torment is the pain of loss, namely the loss of God by whom and for whom he was created. He is in utter despair and is filled with hatred for God, the good angels, mankind, and his fellow demons.

The first trace of the other story appears in Genesis (chapter 6), which describes how 'the sons of God saw that the daughters of men were fair; and they took to wife such of them as they chose.' Their wives bore them children which were 'the mighty men of old, the men of renown.'

The first full version of this story is given in *1 Enoch*, a Jewish book which was not included in the Old Testament. Two hundred angels of the order of Watchers, the sleepless ones, lusted after the beautiful daughters of men. They came down to earth and took themselves wives, to whom they taught forbidden arts, including magic, botany, the manufacture of weapons, astronomy and astrology, and the use of cosmetics. The offspring of this monstrous union of the angelic and the mortal, the heavenly and the earthly, were monsters – giants who devoured mankind and even killed and ate each other. God slaughtered the giants and the archangel Michael imprisoned the fallen angels in the valleys of the earth until the time when they would be hurled into everlasting fire.

Both these stories are about angels driven to sin by pride or lust, and sentenced to hell in punishment. They were naturally combined, with the Watchers becoming the rebel angels who followed Lucifer's banner. By at least the 1st century AD the serpent which tempted Eve had been identified as either the Devil or the Devil's emissary, so that Satan was partly responsible for human death, the punishment for the sin of Eden.

Christian writers accepted that the Devil's successful temptation of Adam and Eve had brought death into the world. The crime in Eden put all subsequent generations of men into the Devil's power, from which God sent Christ to rescue them (see ATONEMENT; FIRST MAN). Various passages in the New Testament itself describe the Devil as the ruler of this world. He says that he has power over all the kingdoms of the world, when he tempts Jesus in the wilderness (Luke, chapter 4). Elsewhere, he is called 'the prince of this world' or even 'the god of this world', references which some of the gnostic sects used to support their contention that the Devil rules this world because he created it.

War in Heaven

The ferocious vision of the twelfth chapter of Revelation knits together the principal threads in the later Christian concept of the Devil. 'Now war arose in heaven, Michael and his angels fighting against the dragon; and the dragon and his angels fought, but they were defeated and there was no longer any place for them in heaven. And the great dragon was thrown down, that ancient serpent, who is called the Devil and Satan, the deceiver of the whole world – he was thrown down to the earth, and his angels were thrown down with him. And I heard a loud voice in heaven saying, ". . . the accuser of our brethren has been thrown down, who accuses them day and night before our God . . . But

British Museum

The Devil tips the scales against the souls of the just; detail from a manuscript in the British Museum

woe to you, O earth and sea, for the devil has come down to you in great wrath, because he knows that his time is short!" '

Here are combined the themes of the accuser, the war in heaven, the fall of Lucifer and his angels, the Devil's power on earth, and the dragon, who is Leviathan, a primeval monster with which Yahweh does battle in the Old Testament. And 'that ancient serpent' is presumably the deceiver of Paradise.

The story of Satan is told in very much the form familiar to us today in a poem which had considerable influence in the Middle Ages, written by Avitus, a bishop in Gaul in the early 6th century. The Devil rebelled through pride. When he and his angels had been expelled from heaven and he saw Adam and Eve happy in Eden, the Devil was passionately jealous. He feared that mankind, a thing of clay, would succeed to his own lost state and he decided to bring men death. Taking the form of the serpent, he deliberately encouraged in Adam and Eve the same arrogance which had caused his own downfall. He told Eve that the forbidden fruit would reveal to her all the things which God had kept secret, and so would enable her to mingle her mind with the godhead. The poison of ambition entered Eve and she ate the fatal apple.

The Devil's time on earth was not as short as the author of Revelation had suggested. On the contrary, his 'great wrath' lasted for centuries. Lusting for human souls, Satan and his host of demons lurked everywhere in ambush to trap the unwary, to tempt men to sin, to drag their prey to the torments of hell. With the aid of God, men could resist the lures of the Enemy but the Christian emphasis on the entire goodness of God threw into sharper, blacker contrast the figure of the Prince of Darkness.

Attitudes to the Devil ranged from terror to contempt to worship. In folk plays and dances he usually appeared in a humorous role, there were many stories of how easy it was to outwit him, and in German folklore he is often condescendingly labelled *gute dumme Teufel*, 'the good stupid Devil'. But just as in the case of the Kaiser or Hitler in this century, there was a real fear of the enemy beneath the jokes and surface condescension of his opponents.

The opening sentences of Richard Bovet's *Pandaemonium* (1684) provide a typical description of Satan's power and purpose. 'Since the defection of the Fallen Angels from the first rectitude, or state of sublime Happiness and Glory . . . the indefatigable Enemy of Souls hath been restless in his Attempts 'to advance his own Infernal Dominion, and for the withdrawing Human Souls from that glorious Felicity, from whence himself and his Confederate Angels are for ever excluded. And to carry on this Diabolical design, no Fraud nor Artifice hath been omitted, no Delusions nor Suggestions neglected, no Temptations nor Allurements spared, that might entrap and enslave the ever-existing Souls of men . . . For though he changed the highest Heaven for the lowest Hell, a Palace of Eternal Happiness for a Dungeon of Eternal Horror, yet he changed not his Dire and Diabolical Resolutions; but still fights against the Thunder of the Almighty, and though vanquished, still retains his Traitorous Principle and inclination to Rebel.'

The Cloven Hoof

Pictures of the Devil and the horrors of hell on the walls of churches, sermons which preached his malign watchfulness, his shadowy sinister presence everywhere, seem to have created what we would now call a 'backlash' effect. Some, though probably very few at any given time, were positively attracted to the ruler of evil, the lord of sensual pleasure, perversity and outrage.

To what extent the god the witches worshipped was a pagan deity has been hotly disputed (see MODERN WITCHCRAFT). The evidence is hard to interpret, because so much of it was obtained by torture, but it suggests that the witches' god was essentially the Christian Devil, though certainly many pagan elements and ideas were connected with him. For one thing, he frequently appeared (he was presumably a man dressed up) in animal forms, sometimes of a grotesque nature recalling the mixed animal shapes of Babylonian and Assyrian demons. For example, the Devil of the Bamberg witches was sometimes green, with an owl's head, horns, a black face, and talons on his hands and feet.

The creature half-man and half-goat who quite often appeared to witches recalls the classical god Pan and the satyrs who revelled in the rout of Dionysus. The Devil frequently had the bat's wings appropriate to his status as a fallen archangel, he very often had horns, and his favourite animal incarnation on the continent of Europe was as a goat, though he did not take this form in England or Scotland. As a goat, he was usually black, sometimes with a reddish beard, he had a tail and cloven hooves, and he might walk with a limp (see GOAT).

Behind these animal forms there was probably not the survival of any particular pagan god but the survival of an idea. Christianity's tendency to regard the body and its passions as evil, corrupt and dirty, contrasts with both paganism and magic which generally value the whole man, not the man who tries to excise part of his nature. As the arch-opponent of the Christian God, the Devil was naturally the apostle of the belief that man's physical nature is as vital an ingredient of his being as any other, and the Devil's animal shapes were probably an expression of the witches' desire to release the animal in man.

In many cases the Devil appeared as a man, often a dark man, befitting his role as leader of the powers of darkness. But whether in human or animal form, the climax of his worship was sexual union with him.

Some modern magicians deny Satan's existence altogether, some believe in him as a reality to be detested, a few are his worshippers. Another view, stated by Dion Fortune for example (in *Psychic Self-Defence*), sees him as a personification of 'negative evil', as a 'cosmic thrust-block'. Negative evil is the firm surface that we must have to push against in order to walk, and the Devil is 'the principle of resistance, of inertia, that enables Good to "get a purchase" '. For the majority of us probably, the most familiar concept of a being no longer believed in is the great rebel of Milton's *Paradise Lost*, the romantic titan whose pride would not allow him to accept second place, even to God: 'better to reign in hell than serve in heaven.'

RICHARD CAVENDISH

FURTHER READING: R. Cavendish, *The Black Arts* (Routledge, 1967) with full bibliography.

The lithe and leggy goddess Diana, mistress of herself and protector of women, slaves and animals, is a curiously modern figure. The study of her cult at Nemi in Italy was the starting point for Frazer's Golden Bough

DIANA

OF ALL THE GREAT goddesses of the classical pantheon, the Latin Diana (and even more her Greek counterpart Artemis) is the most trnly female. Compared, for instance, with Aphrodite (the vamp), Athene (the bluestocking) or Hestia (the trapped housewife), Diana or Artemis is woman as woman, not woman the mate of man nor woman the personification of an intellectual or social ideal. She has the basic feminine characteristics of directness, aloofness and cruelty, in contrast to the masculine characteristics of romanticism, gregariousness and brutality.

Indeed, to modern eyes, in an age when woman is gradually winning (or maybe regaining) her independence, many of the traits of this ancient goddess, however trapped out they may be in the apparatus of antiquity, appear oddly contemporary. Lithe and leggy, in tall boots and short skirt, a huntress, scornful of men, she holds her own in the wilds of the earth. A comforter of mortal women, she brings them the techniques of painless childbirth. Filling the night with brilliance, she rides the clouds, mistress of the moon, mutable, cool, untouched. Hid in reeking fumes of incense, baring her huge and multiple breasts, hung about with symbols of fertility, she exists in a darkness shot through with oriental richness and wizardry. One feels that James Bond, intrigued and very wary, would have known what he was up against.

It is already clear that there is perhaps even more confusion attaching to Diana (Artemis) than to the other divinities of European antiquity. One reason for this is that while she was a comparative latecomer to the pantheon and had less 'mythology' than many of her peers, she became a favourite character, in her various aspects, in poetry and folklore. But the fact that she is the prime representative of the female (a subject on which everyone has personal opinions) made her capable of many varying interpretations and particularly susceptible to identification with foreign aspects of the feminine principle, as these were encountered by the ancients on their geographical borders, or on the frontiers of their own 'rational' minds.

The Grove of Diana

The Latin Diana might almost be thought of as the patron saint of this encyclopedia, since it was an urge to explain the strange nature of her cult and priesthood at Nemi that led Frazer, some 80 years ago, to begin *The Golden Bough*, the book that lies behind all later comparative studies of 'man, myth and magic'. The cult of Diana was popular in ancient Italy but her oldest and most famous place of worship was at Aricia, near the modern Nemi. Here is a volcanic lake known as the 'Mirror of Diana', surrounded on all sides but one by precipitous, densely wooded slopes, vividly described in the first chapter of *The Golden Bough*. In a grove (*nemus*) on the only accessible shore was the sanctuary of Diana, said to have been founded around 500 BC, although the cult itself had undoubtedly far older origins.

Diana was worshipped in this mysterious place (as elsewhere) as goddess of fertility and childbirth, of hunting and of wild and domestic animals. Associated with her was a shadowy male divinity called Virbius, later identified with Hippolytus, the favourite of Artemis, who was said to have been restored to life by Aesculapius (the healing god) and brought by the goddess to Aricia, where he would be hidden from the wrath of Aphrodite.

In historical times, the priesthood of Diana at Nemi was without parallel. The priest was known as the 'King of the Grove' (*Rex Nemorensis*); he was always a runaway slave who, coming to Nemi, had to pluck a bough from a certain tree and engage the incumbent priest in single, and mortal, combat; having fought (and killed) his way to office, he then lived in perpetual expectancy of challengers, one of whom in due time would overcome him and succeed him in his priestly duties and terrors. (Frazer's conclusion – in a nutshell – was that this barbaric ordination, this ghastly laying on of hands, was an echo of ancient human sacrifices to Diana).

Aricia had a political importance, too, as a religious centre of the Latin League. The foundation in Rome of the temple of Diana on the Aventine Hill was probably an attempt to transfer the most important cult centre of the League, and hence its political leadership, to Rome. It is noteworthy that the Aventine was the headquarters of the Roman plebeians and that Diana was regarded as the protectress of the lower social orders in general and of slaves in particular – a clear connection with the 'King of the Grove'. Slaves had a holiday on Diana's principal festival in mid-August, a date transformed by the Christian Church into the feast of the Assumption of the Virgin Mary, who also, in certain places, was venerated as patroness of outlaws and thieves. Moreover, Diana (Artemis) was, at least in historical times, thought of as a virgin, and no man could enter the temple on the Aventine.

Mistress of Wild Beasts

The classical mythology of Artemis tells that she was the daughter of Zeus and Leto and the sister of Apollo. In some of the stories Artemis was born first, with no pain, and immediately acted as midwife to her mother for the birth of Apollo, thus prefiguring her later care for mortal women. The evolution of her character is a good example of the transition from the pre-Hellenic to the Hellenic world in Greek mythology and of the resulting confusion. Artemis's name is apparently not Greek. In Homer she is a rather ineffective partisan of the Trojans and is called *agrotera* (she of the wild) and *potnia theron* (mistress of wild beasts). She is the huntress, leading the life (as remarked by Charles Seltman in *The Twelve Olympians*) of an unmarried daughter of Homer's 'gay and brilliant feudal families', the goddess of 'energetic women' such as Atalanta, the better of men in hunting and wrestling yet 'unwilling to wed any of them'. The analogy with the huntin', shootin' and fishin' young ladies of the English shires is not too far-fetched, given the change in space, temperament and time.

Although the later Greeks and the Romans certainly regarded Artemis as a virgin, this was not the view of the earlier Greeks. To them, she was celibate but above all independent – if she wanted a man, she would have one but she would not be bound to him. However, as the comparatively uncomplicated, guilt-free Homeric past slid away, Artemis changed from the attractively open-air girl, perhaps sometimes accompanied by an attendant lover, to the more forbidding character of the austerely chaste huntress. It is in this role that she is most familiar. This is the Artemis of Hippolytus, her virgin and, to most contemporary minds, priggish acolyte who repulsed the advances of his stepmother Phaedra and was destroyed (as was she) by Aphrodite; of Actaeon who, having by no fault of his own seen the goddess bathing naked in a spring, was by her changed into a stag and done to death by his own hounds; and of the later European imagination.

In the oldest, pre-Hellenic, stage and particularly in Asia, Artemis, though concerned with the wild, was one of the many manifestations of the mother-goddess, the source of life and fertility. In the mainstream of the purely Greek tradition, this maternal aspect was transmuted into a role almost that of the maiden aunt, the busy attendant at births, a companion of the young. On the periphery, and especially in the cult at Ephesus, the more overtly female, life-generating aspect remains to the fore.

Tomboy Goddess

But this concern and love for young things may also be connected with the boisterous side of Artemis's character. In the famous hymn by the Greek poet Callimachus (c 305–240 BC) the goddess asks Zeus her father to give her only nine-year-old girls as her companions: she appears as a kind of tomboy goddess. At Athens, for instance, girls of this age were dressed in bearskins to take part in a festival of Artemis.

The image of the bear (like that of the stag) runs through several of the Artemis legends. One of the best known concerns Kallisto (the name means 'loveliest'), originally a Minoan forerunner of Artemis but in classical mythology a nymph in her train. There are many versions of the story. In one, Zeus seduced her in the form of a bear; in another, Hera, enraged (yet again), turned Kallisto into a bear and tricked Artemis into killing her; in a third, Artemis discovered Kallisto to be pregnant and herself turned her into a bear and shot her. The victim was transported to the skies as the constellation of the Great Bear (the Plough) and her son was Arkas, the ancestor of the Arcadians. Some say Arkas had a twin brother, none other than Pan.

Scala

Above Artemis baring her multiple breasts, hung about with symbols of fertility; Selçuk Museum *Right* The more forbidding side of Artemis's character is illustrated in the unhappy legend of the young huntsman Actaeon, who, by no fault of his own, saw the goddess bathing naked in a spring. Incensed by this she transformed him into a stag and he was torn to pieces by his own hounds: Titian's *Diana and Actaeon* in the National Gallery of Scotland *Below* Cool and virginal, Lady of the Beasts, the huntress Diana holds her own in the wilds of the earth; by the 16th century German painter Cranach the Elder

Giraudon

In one of the stranger versions of the Kallisto story, Zeus had his way with her after assuming the form of Artemis herself. This is an example of the strand of what we would call lesbianism in the legends of Artemis. It would be a mistake to put too much emphasis on this; but her liking for exclusively female society, her savagery towards certain men and towards her female attendants if they involved themselves with men, all point in this direction. Some of her folk cults, indeed, were decidedly ambivalent, with male dancers impersonating women and girls sporting phalluses.

The link between Artemis and the moon, so evocative to later generations, did not emerge until the 5th century BC. It probably sprang from her concern with woman and from her brother Apollo's identification with the sun; but the connection is nowhere recognized in any cult, as far as we know. Much the same goes for her frequent confusion with the witch-goddess Hecate who, like her cousin Artemis, was also connected with the guardianship of women and the young (see HECATE). Nonetheless, these identifications gave rise to the eerily romantic image of the triple goddess, potent in the night sky, in the wilds of the earth and at accursed crossroads, where Hecate was worshipped and grim happenings occurred. On this darker side, Artemis was also credited with the power (and inclination) to send plagues and sudden death.

Diana of the Ephesians

Although essentially a goddess of hill and heath, Artemis was revered as the chief divinity in three famous Greek maritime cities – Syracuse, Marseilles and Ephesus. It was in the last of these that her cult became particularly renowned. Tradition has it that the city of Ephesus was founded about 900 BC by Ionian Greeks who brought with them the worship of Artemis. These Ionians mingled freely with the local inhabitants and assimilated many Asiatic customs. Tradition also relates that the Amazons built a temple at Ephesus to house a primitive image of a goddess (later identified with Artemis), probably made of a palm trunk. This temple was destroyed by barbarians around the middle of the 7th century. About 100 years later the great king Croesus erected a magnificent temple which in time became one of the Seven Wonders of the World. The chief object of veneration, mentioned in the Acts of the Apostles, was a wooden statue of Artemis.

The temple was the recipient, over a very long period, of rich gifts, which often took the strange form of gold and silver panoplies and garments for the statue. These would be changed at intervals, rather as a child dresses a doll. The most curious of these accoutrements were vestments to which were attached large golden representations of dates, giving the appearance of clusters of ample breasts. But oddest of all, on the head of the goddess was set a small shrine which probably contained the *diopet*, the most ancient and sacred thing in the temple. This was a small stone (possibly, in fact, a neolithic implement) which had been venerated in Ephesus since long before the Ionians came and which was believed to have fallen from Zeus in heaven. (This belief enabled the Ephesians to retort to their tiresome Christian critics that they did not worship an idol but something fashioned by the hand of God himself.)

The temple continued in fame and splendour for many centuries and did not go into a decline until the second half of the 3rd century AD. Finally, about the year 400, the statue was smashed by a Christian who boasted on an inscription that he had torn down 'the demon Artemis'. But it is said that the diopet was saved and hidden; and it is quite possible that an object now in the Liverpool City Museum is the very 'Zeus-fallen thing'.

It is curious that the Diana of the Ephesians, the exuberantly rich symbol of fertility and splendour, surrounded by oriental pomp, yet bearing on her head a relic of neolithic man, should be the longest surviving historical manifestation of the goddess Artemis. For she has lived on in the European imagination as something very different; the pure huntress goddess of the moon invoked by Ben Jonson in the words 'Queen and huntress, chaste and fair . . . Goddess, excellently bright.'

Sonia Halliday/Selçuk Museum

Statue of Diana: as a pagan deity, goddess of the moon and patroness of witches, she was regarded as a demon by the early Christians

Lady of Light

When the hounds of spring are on winter's traces,
The mother of months in meadow or plain
Fills the shadows and windy places
With lisp of leaves and ripple of rain;
And the brown bright nightingale amorous
Is half assuaged for Itylus,
For the Thracian ships and the foreign faces,
The tongueless vigil, and all the pain.

Come with bows bent and with emptying of quivers,
Maiden most perfect, lady of light,
With a noise of winds and many rivers,
With a clamour of waters, and with might;
Bind on thy sandals, O thou most fleet,
Over the splendour and speed of thy feet;
For the faint east quickens, the wan west shivers,
Round the feet of the day and the feet of the night.

Where shall we find her, how shall we sing to her,
Fold our hands round her knees, and cling?
O that man's heart were as fire and could spring to her,
Fire, or the strength of the streams that spring!
For the stars and the winds are unto her
As raiment, as songs of the harp-player;
For the risen stars and the fallen cling to her,
And the southwest-wind and the west-wind sing.

Swinburne
Atalanta in Calydon

Witch Goddess

Greek and Roman authors connected witches with darkness and night, and so with Diana as goddess of the moon. In a poem by the Roman writer Horace (1st century BC), the witch Canidia appeals to 'Night and Diana, you faithful witnesses of all my enterprises.' As a pagan goddess and patroness of witches, to the early Christians Diana was a demon, and traces of her in this capacity survived into the Middle Ages. In 1318 Pope John XXII accused some of his court at Avignon of copulating with demonesses called 'Dianas'.

The most famous survival, however, was the belief that witches flew through the night with Diana. An ecclesiastical regulation called the Canon Episcopi, which has been traced back to the 9th century, says that some deluded women falsely believe that during the night they 'ride upon certain beasts with Diana, the goddess of pagans, and an innumerable multitude of women.' In other versions of this belief different pagan goddesses are named but it was natural to connect Diana, the moon and the huntress, with night-flying. Margaret Murray (in *The Witch-Cult in Western Europe*) called the witch religion of Europe 'The Dianic cult', a hint that has been taken up by those modern witches who worship a Queen of Heaven. But although there are occasional references to a goddess in the history of witchcraft – among the Basques and some of the Scottish witches, for example – traces of her are rare, and witches were mainly concerned with a male god, the Devil.

DIONYSIUS THE AREOPAGITE

ALL WE KNOW of the original Dionysius (or Denis) the Areopagite is what is mentioned in the Acts of the Apostles (chapter 17). 'But some men joined him (Paul) and believed, among them Dionysius the Areopagite . . .' Areopagite means a member of the judicial court which sat on the hill called Areopagus in Athens. The man converted by Paul at Athens was said to have become the first bishop of that city, on the sole evidence of the word of another Dionysius, writing a century later. The once popular identification of the Areopagite with St Denis of France is obviously wrong, for in fact the latter was martyred in c 250 AD.

The Areopagite's importance in the history of mysticism is not due to anything he did himself but to the works which were wrongly attributed to him from the 6th century to the 16th. The real name of the author of these works is unknown, and he is now usually referred to as 'Pseudo-Dionysius'.

The works are first heard of in Constantinople in 533 AD. At a council held

Dionysius the Areopagite was at one time identified, incorrectly, with St Denis the apostle of France, who was tortured and beheaded by the Romans in the 3rd century: detail from a late 14th century French painting depicting the martyrdom of St Denis

Giraudon

there in that year one party appealed to the writings of Dionysius the Areopagite to support its views, but their opponents denied the authenticity of these writings. At the Council of the Lateran in Rome, a century or so later, no one called the attribution in doubt and it continued to be accepted down to the 16th century and even beyond.

These writings on the nature of mysticism formed the groundwork of mystical theology as it developed in the Middle Ages; the fact that they could not have been written by Dionysius the Areopagite does not detract from their value. The literary device which caused the erroneous attribution was a common one in those days, and indeed appears to have been used at an earlier date for some of the books of the Old Testament (the Wisdom 'of Solomon' in the Apocrypha for example). The writer wanted to be taken for the convert Dionysius mentioned in Acts and took some pains to authenticate this; he says that he was much disturbed by an unexpected eclipse of the sun which, he subsequently discovered, took place at the death of Christ (Luke 23. 44). He claimed that he was converted by St Paul and became bishop of Athens. He made out that he addressed his works to Timothy, Paul's companion, and sent his letters to various people, among others to John the Evangelist exiled on Patmos.

Yet everything in these writings combines to make us reject so early a date for them. Thus it is quite obvious that the writer made use of the Greek Neoplatonist philosopher Proclus (411–485 AD). It is more probable, therefore, that 'Pseudo-Dionysius' wrote in or about the year 500. In addition, the liturgical rites which he mentions were obviously in a far more developed stage than they could have been had he been describing what took place in the church of Athens during the time of persecution in the last years of the 1st century and the beginning of the 2nd.

The extant works of Pseudo-Dionysius, all in Greek, are the *Celestial Hierarchy*, the *Ecclesiastical Hierarchy*, *The Divine Names* and the *Mystical Theology*. There are also the letters which still survive.

Charter of Christian Mystics

Of special interest is the influence of these works on the 14th century mystical movements – those of the Rhineland (Eckhart, Tauler and Suso), of Flanders (Ruysbroek especially) and England (the *Cloud of Unknowing*, Walter Hilton, Richard Rolle and Julian of Norwich) all of which seem to have absorbed and reproduced in varying degrees the Pseudo-Areopagite's synthesis between Christianity and Neoplatonist positions. In a sense, his writings have come to form the charter of Christian mysticism. They deal specifically with the intimate union between God and the soul and the progressive deification of man. This is said to be achieved by a process of 'unknowing' by which the soul abandons all perceptions of the senses together with the reasoning of the intellect. This leads it to a state of obscurity and darkness which is increasingly illuminated by the 'ray of divine light' culminating in the knowledge of the ineffable Being, going right beyond both affirmation and negation.

The celestial hierarchy is formed by the nine choirs of angels in their three orders. Firstly, the Seraphim, Cherubim and Thrones; secondly the Dominations, Virtues and Powers; and thirdly the Principalities, Archangels and Angels. These correspond on earth to the threefold hierarchy of bishops, priests and deacons. These, with the sacraments, lead man to deification.

The spiritual life is divided into the three stages of the purgative, illuminative and unitive ways. This division is to be found, though sometimes with slightly different terminology, from the early Middle Ages onwards. The importance of Pseudo-Dionysius lies in his introduction of the idea of 'unknowing' into Christian mysticism, that God is best known by negation: we can know more about what God is not than about what he is. This is not, of course, an approach confined to Christian mysticism; the points of similarity with Zen Buddhism, as well as the differences, are obvious. (See also CLOUD OF UNKNOWING; ECKHART; JULIAN OF NORWICH; HILTON; and RUYSBROEK.)

LANCELOT SHEPPARD

FURTHER READING: *The Divine Names* and *Mystical Theology*, translated by C. E. Rolt, published by the S.P.C.K. in 1920.

Beneath the wild, savage rites of Dionysus lies the recognition of man's need for occasional release from the bonds of law and order. To resist Dionysus is to reject joy – and to incur terrible consequences

DIONYSUS

THE THIRTEENTH GOD of the Greeks, Dionysus was a son of Zeus, according to Hesiod, although his paternity has been disputed. He was a stranger in Hellas, coming from wild uplands, mystic, the object of both frenzied devotion and hostility. After many wanderings and much trouble, he sat at the High Table of Olympus, as one of the great gods, taking the place surrendered to him by Hestia, the goddess of hearth and housework. This bare account contains nearly all the clues we need for as much understanding as we are ever likely to achieve, rationally, of the mythology and cult of Dionysus, the god of far more than wine.

The difficulty in writing about Dionysus is not that he is distant but that he is so close: indeed, he is always with us. But he is often denied and, when this happens, he wreaks a terrible vengeance. He is the god

of the wilds – not the wilds of visible nature where Artemis reigns, but the wilds that extend so far and smile so deep in the secret regions of the human personality. He is the god of the irresistible but often resisted urge to 'let oneself go', to throw off the trammels of custom and respectability, to abandon, indeed, the Greek ideal of moderation in all things. He represents a permanent human force and yet a force that every age and culture seeks, if not to suppress, to channel and contain. Every age will reinterpret him according to its own attitudes and beliefs, its own restraints and permitted releases. This is no bad thing, so long as we are aware of it: it makes us (because he is so strange and fascinating, so known and yet so unknown) think about him more deeply than about Ares or Hera, or perhaps even Zeus or Athene. We can learn more about ourselves from Dionysus and how his cult revealed him than we can from any other Greek deity – except Apollo, the god of order and reason, with whom Dionysus is curiously and significantly linked.

Born from the Thigh

The mythological stories told of Dionysus's birth and his adventurous progresses through the lands of men will of themselves lead us on to the nature of his cult and the historical background of its introduction and acceptance in classical Greece. In origin, Dionysus is no Greek. He plays, for instance, no partisan role in Homer's account of the Trojan War – not even on the side of the Asiatic Trojans. He figures only occasionally, in passing. Homer had heard of his wild rites but clearly knew little about him. Dionysus hails, in fact, from Phrygia and later moves to Thrace, the wild tracts on either side of the Hellespont. His mother, Semele, is associated with the Phrygian earth goddess Zemelo. The Greek mythologists, however, make Semele a mortal, the daughter of Cadmus, King of Thebes – that doom-laden site of so many products of Greek imagination. Semele, needless to say, was beautiful and attracted the attention of the ever-amorous Zeus, the father of the gods. Hera's jealousy, ever fertile of new ways to thwart Zeus, caused her to visit Semele in the guise of an old woman and suggest to the naïve girl that she ask her divine lover to appear to her in his full immortal splendour – not least to impress her sisters Agave, Ino and Antonoe. Zeus, who had promised Semele any favour she might ask, reluctantly consented – whereupon Semele was annihilated by his lightning and thunderbolts. Her unborn son was rescued by Zeus and shut away by him in his own thigh, whence in due time he was born.

But Hera was not to be deceived and on her orders Dionysus was seized by the Titans, who tore him limb from limb and began to cook him up for a meal. Having been restored to life by Rhea (his earth goddess grandmother), he was finally hidden, disguised as a girl, in the household of Athamas, King of Orchomenus in Greece. But Hera made the king demented and he killed his son Learchus, thinking he was hunting a stag. Dionysus was next fostered by nymphs on Mt Nysa where, some say, he

Sonia Halliday

Although drinking wine was in fact only one of the means through which the worshippers of Dionysus attempted to achieve union with him, he is traditionally depicted in art as the god of wine and revelry: Drunken Dionysus, a mosaic from Antioch, Turkey

invented wine. Grown to manhood, he was himself driven mad by Hera and went wandering about the world, accompanied by Silenus, his tutor, and a rout of satyrs and wild women – the maenads or bacchantes – his former nymph nurses and others. Strange tales are told of these followers and of their extraordinary powers. They caused fountains of milk and wine to spring from the ground; fire could do them no harm – they often carried it in their hands or on their heads; weapons left them unscathed; they had the strength to tear apart live bulls and other fierce beasts, the women no less than the men – yet the women showed great tenderness to young animals and suckled them at their own breasts. Armed with the *thyrsos*, an ivy-twined staff tipped with a pine cone, brandishing swords and enwreathed with serpents, they followed the god as far as India and then retraced their steps to Greece.

As he went, the god founded cities, so it is said, taught laws and the culture of the vine and engaged in battles. But if he was victorious in the latter, he frequently met with opposition from stubborn folk who denied his divinity. These paid dearly for their blindness. Lycurgus, for instance, King of Thrace, was driven mad, killed his son Dryas with an axe thinking he was cutting down a vine, and mutilated his corpse. Thrace was smitten with a great drought. Dionysus, who had taken refuge from Lycurgus's persecution at the bottom of the sea, reappeared and said relief would come only with the death of the king. Whereupon his subjects tied Lycurgus to wild horses and tore him apart. In Argos and Boeotia, both provinces of Greece, there was similar hostility to the god with similar results: the women went berserk and rent their children in pieces.

The most famous story of the denial of the godhead of Dionysus and the frightful consequences was set in Thebes. The story is told in one of the most memorable of Greek tragedies, *The Bacchae* of Euripides (c 487–407 BC). Dionysus, accompanied by his followers, came to the city, the place of his birth, and was angered to find that Agave and his mother's other sisters denied his divinity and that he was the son of Zeus; but old Cadmus and the blind seer Tiresias recognized him. Dionysus therefore sent a madness upon his aunts and the rest of the Theban women, who abandoned their household chores and went raving upon Mt Cithaeron. Pentheus, son of Agave and now King of Thebes, a pillar of unimaginative authority and male supremacy, was outraged and tried to arrest Dionysus and his maenads, but they walked out of prison completely unharmed.

Meanwhile the women are out on a high mountain, at this stage in a comely trance, like flower-children of antiquity. But set

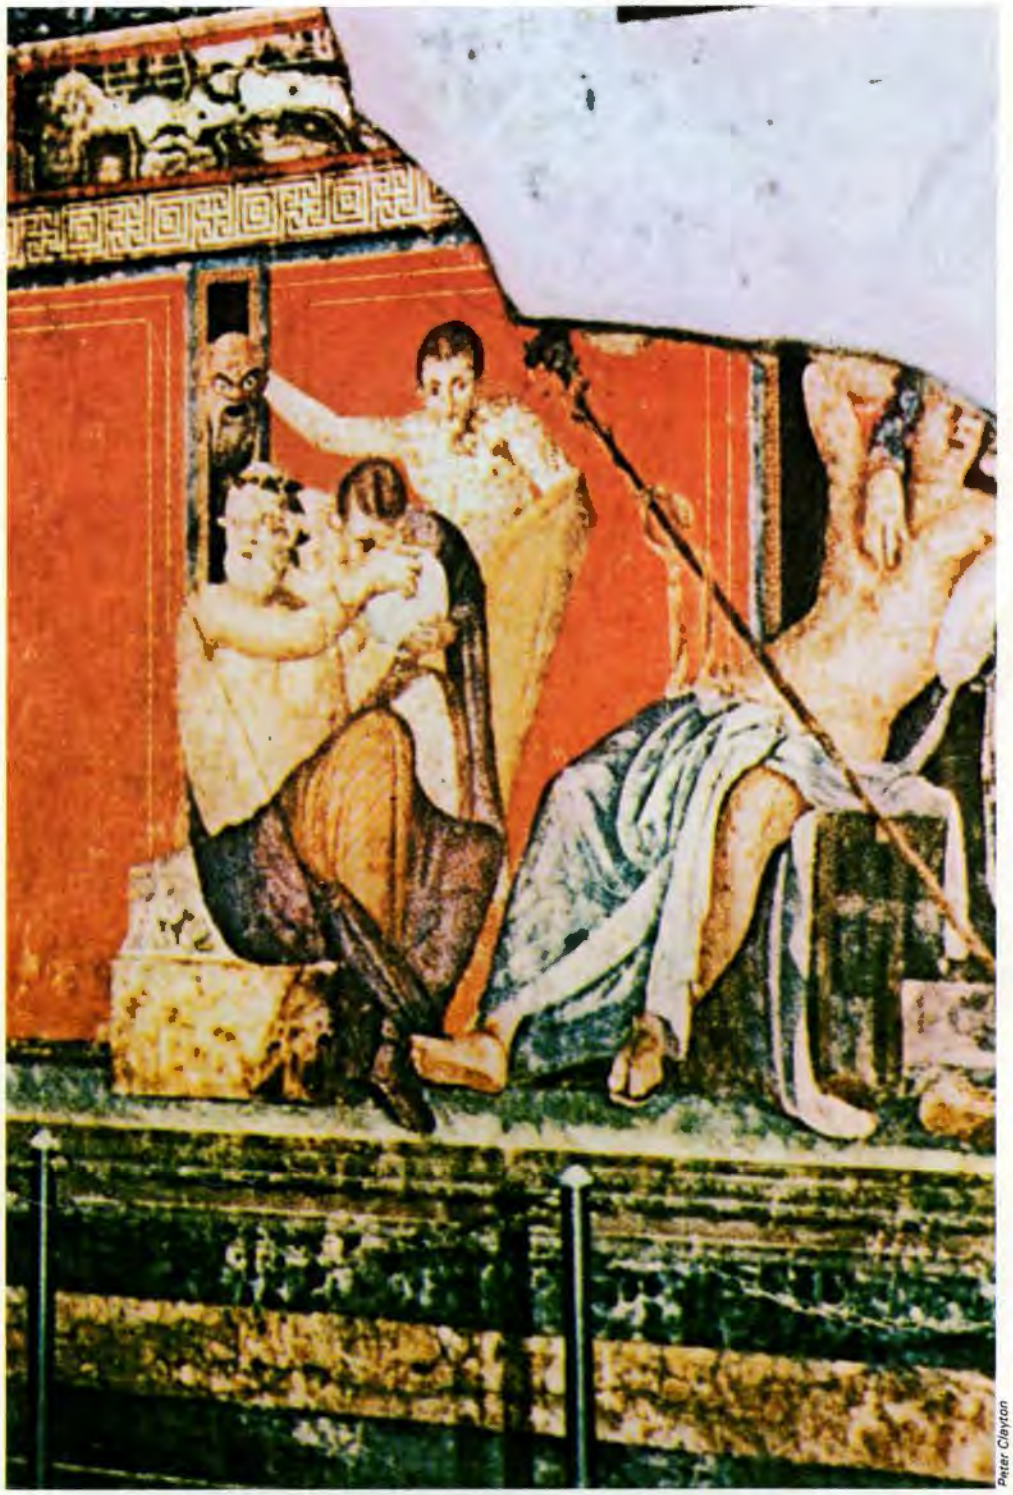
Scala

upon by herdsmen, they go into a frenzy, tear the Theban cattle limb from limb, eat the flesh raw, plunder the neighbouring villages and steal the children. Nothing can avail against them. Then Pentheus begins himself to fall under the spell of Dionysus, who so far in the play has appeared as a mortal. He is persuaded to go and watch the women, hidden in a pine tree and disguised as a woman. But the possessed women discover him, uproot the tree and dismember him alive. Agave, his mother, wrenches off his head, believing she has slaughtered a lion cub with her bare hands. The women return in ecstasy to the city but Cadmus manages to bring them back to their senses. As Agave and the others realise the full horror of what they have done and stumble off into hopeless exile, Dionysus reveals himself as the god.

By the account so far, Dionysus might well seem a bestial character and his deeds even more horrific than most of the cruel doings of the ancient Greek divinities. But the point is this: horrors occur when Dionysus is denied. If you surrender to him you will have joy – a wild and frenzied joy but not a joy destructive in itself; but if you resist, the joy becomes a foul and frenzied horror, a punishment for the refusal of joy. The stories illustrate this point, particularly the *Bacchae*, in which one of the most striking elements is the contrast between the accounts of the women on Cithaeron. In the first, when they are left alone in communion with the god, all is peaceful and idyllic; in the second, after they have been startled by the herdsmen and think they are being hunted, they erupt into bloody madness; and in the third, when they discover Pentheus in their midst, there is a climax of unspeakable fearfulness.

The stories also reflect something unique in Greek religion and mythology: the historical fact of the introduction, by groups of foreign missionaries, of what was to all intents and purposes a new religion and a new ethos – and of the inevitable resistance they met. The Dionysiac cult is totally different from the mainstream of Greek, Olympian religion. The latter was founded upon the immortality of the gods and the mortality of men and upon the gulf between the two. It was man's duty to reverence the

Dionysus was the god of the whole of 'moist nature' – sap and blood and sperm: murals in the Villa of the Mysteries, Pompeii, apparently a centre for the worship of Dionysus *Left* The whipping of a young girl, an initiate into the Dionysian mysteries *Right* An initiate is given wine to drink while a horrific mask is held up behind him: possibly the mask was reflected in the surface of the wine



Peter Clayton

gods, from a distance, and to avoid their anger by decent and orderly behaviour – self-knowledge and no extremes. Dionysus offered the complete opposite. Within a ritual frame, his cult allowed, indeed encouraged, the release of irrational impulses which gave freedom, identification with the god and thereby happiness. He is known as 'Lusios' – the liberator. Moreover, his cult is open to all: to young and old, men and women, slaves and freedmen.

It is this which makes Dionysus the god of far more than wine. He is the god, says Plutarch, of the whole of 'moist nature' – sap and blood and sperm; or, in the words of Professor E. R. Dodds, of 'all the mysterious and uncontrollable tides that ebb and flow in the life of nature.' It was the later Greeks and the stolid Romans who looked to a degenerate Dionysus, the tipsy, merry Bacchus and his Saturday-night-out boys and girls: and modern Europe followed them until anthropology and psychology suggested different ideas. For the real devotees of Dionysus, wine was merely one means of union with the god. There were others more potent – above all, the dance.

Dancing Madness

In many societies throughout the world dancing has had a profound religious significance. Everyone knows of savage dances and the states of 'ecstasy' – standing outside oneself – that they induce. Jalaluddin Rumi, the founder of the Mevlevi sect of dervishes, noted for their dancing, taught that 'he who knows the power of the dance dwells in God'. There have, throughout the Christian era, been outbreaks of 'dancing madness' in Europe; and their characteristics as described in the records are strikingly similar to those that we read of in Euripides. Even in our own time, the dance has become more of a cult. On the wilder shores of pop, events may be observed that are strongly reminiscent of a Dionysiac 'orgy'. And be it noted that the word 'orgy' is *not* used here in its debased common sense. For a Dionysiac, and for many alive today, the 'orgy' is not a drunken revel but a means of seeking, by dance and music, a communion with something beyond the ordinary, in company with a band of like-minded people.

Apart from dance and music, there is evidence that the behaviour of the *bacchae*, the women inspired to ecstatic frenzy by Dionysus, are not figments of the possibly warped imagination of an old and disappointed Athenian playwright. In many countries and in any number of modern clinical descriptions, the same elements recur. The tossing back and around of the head and hair, the handling of snakes, insensitivity to pain, the tearing apart and

God of Many Joys

He, the nurturer and the god of rapture; he the god who is forever praised as the giver of wine which removes all sorrow and care; he, the deliverer and healer, "the delight of mortals", "the god of many joys", the dancer and ecstatic lover, "the bestower of riches", the "benefactor" – this god who is the most delightful of all the gods is at the same time the most frightful. No single Greek god even approaches Dionysus in the horror of his epithets, which bear witness to a savagery that is absolutely without mercy. In fact, one must evoke the memory of the monstrous horror of eternal darkness to find anything at all comparable. He is called the "render of men", "the eater of raw flesh", "who delights in the sword and bloodshed". Correspondingly we hear not only of human sacrifice in his cult but also of the ghastly ritual in which a man is torn to pieces.

W. F. Otto, *Dionysus: Myth and Cult*
(trans. Robert B. Palmer)

eating raw of animals – all these are characteristic of hysteria and, very often, of hysteria channelled into the practice of religion.

In the Dionysiac cult, the rending and devouring of raw flesh is probably based on straightforward magic: you may become god by devouring god in one of his manifestations. This concept is not so far removed from that of the Christian who receives the consecrated bread during Holy Communion, not to mention that of Scandinavian tribes in the Dark Ages who, it is said, devoured their kings when times were bad in order to spread their royal strength throughout all the members of the band. Maybe the fate of Pentheus reflects this kind of human sacrament, behind the ostensible motive of revenge – an echo of ritual symbolism.

It seems probable that the actual cult of Dionysus was introduced into northern Greece about the beginning of the 7th century BC. Its coming, and its gradual penetration southwards, are likely to have had the twin results of disturbing the settled routine of domestic and religious life, and of provoking violent opposition from the Pentheus figures of the time. About the start of the 6th century the problem may have reached crisis point and it appears to have been resolved in a thoroughly Greek, pragmatic way by incorporating the Dionysiac cult into the existing state cults – rather, to take a tame parallel, as British would-be revolutionaries are sometimes elevated to the House of Lords.

Bacchanalian revel in honour of the god of the wilds of the human personality: painting by Nicholas Poussin in the National Gallery

Night on a Bare Mountain

This unlikely marriage took place notably at Delphi, the seat of Apollo, the god of law and order. Commenting on this remarkable outcome, Charles Seltman writes (in *The Twelve Olympians*): 'Law could be redeemed from mechanistic rote by the natural human contact of the anarchic god, while licence could be put under control by complying with the god of self-knowledge and moderation. Order could learn about disorder, and disorder about order.' When one compares this solution with the earlier troubles and the sorry Christian history of persecution and sectarianism, one may yet think the Greeks worthy of study and admiration.

Of particular interest is the establishment of Dionysiac religion at Athens. Peisistratus, ruler of Athens in the mid-6th century, founded both the Panathenaic Games and the Great Dionysia. He invited the priest of Dionysus at Eleutherae – a village on the borders of Attica which claimed to be the god's birthplace – to set up his statue at the foot of the Acropolis. The priest was accompanied by a troupe of country players called *tragodoi* (literally, 'goat-singers') who gave performances before the statue in honour of the god. Many people believe that this is the origin of Greek tragedy and thus of Western theatre (see DRAMA). It is interesting that this may at least partly explain why Greek actors wore masks: Dionysus had long been the god of masquerade – the Master of Illusions, as Professor Dodds calls him – capable of transforming himself into many shapes to avoid his enemies. In the Attic countryside, the Dionysia were less subtle and included, we may be sure, a good deal of rural jollification and drunkenness.

But the most extraordinary manifestation of the Dionysiac cult, which lasted until the age of Plutarch in the 2nd century AD, was the joint mountain dancing festival of the women of Athens and Delphi. This was held in midwinter every two years. A group of well-born Athenian women and girls were chosen to walk the 100 miles, barefoot, across the mountains to the shrine of Apollo, where they joined their Delphic sisters. After prayers and sacrifices to the god of licence in the precincts of the god of reason, they set off at night to scale Mt Parnassus, more than 8,000 feet high. There, on the bitter heights, they held the *oreibasia*, the mountain dancing of Dionysus.

Nobody knows exactly what they did. The remarkable fact is that they did it at all – these cloistered women from upper-class homes upon the serene Attic coast, abandoning themselves in midwinter to the harsh night on the bare mountain. Other parts of Greece held similar rites but nowhere in such dramatic surroundings. Wild they may have been but their timing in midwinter and the exclusion of men point to something very different from the popular idea of an 'orgy'. For these women, the *orgia* were acts of devotion and communion,

of release into the unknown, terrifying yet fulfilling.

Other Dionysiac festivals may well have been more 'orgiastic'. In some, men were allowed to take part and these may have been characterized by sexual freedom. But it is well to remember a passage from the *Bacchae*: 'Dionysus compels no woman to be chaste. Chastity is a matter of character and she who is naturally chaste will partake of Bacchic rites without being touched.' As Seltman says, 'Their state of *ecstasis* left the Bacchae free to follow either the instincts or the restraints of nature. No inhibitions stopped the satisfaction of desire; no exhibitionist urge drove them towards promiscuous folly.'

The Dionysiac cult recognizes the universal human need to fling off the fetters of habit, if only – willingly – to take them up again and soldier on to cope with the demands of an ordered social life. Dionysus allows us this release, this necessary respite from regime. And in spite of the frenzy, this does not free us from ultimate responsibility. As Professor Dodds observes, 'Dionysus is beyond good and evil . . . he is what we make of him.' The god, in fact, is already within us: we have to seek him and allow him to escape, if we do not wish him to break out – as he did from Pentheus's prison – and drive us mad. In this sense, we are indeed one with Dionysus; and that is why he fascinates us.

DIRECTIONS

'I ADJURE THEE, furthermore, by the crown of thorns which was set upon His head, by the blood which flowed from His feet and hands, by the nails with which He was nailed to the Tree of the Cross, by the holy tears which He shed, by all which He suffered willingly through great love for us: by the lungs, the heart, the hair, the inward parts, and all the members of our Saviour Jesus Christ. I conjure thee by the judgement of the living and the dead, by the Gospel words of our Saviour Jesus Christ, by His Saying, by His miracles . . .'

This apparently pious prayer is in fact part of a long incantation in the 16th century *Grimoire of Honorius*, intended to summon up to visible appearance one of the most powerful of all demons, Amaymon, King of the North. The grimoire also provides incantations for summoning the demonic rulers of the other three directions: Egym (south), Baymon (west) and Magoa (east).

The belief that each direction has its ruling demon has a long history in Europe. An early list of them is Oriens (east), Amemon (south), Eltzen (north) and Boul (west). Cecco D'Ascoli, the 14th century astrologer and magician, said that four spirits 'of great virtue' rule the cardinal points. Each of them has 25 legions of spirits under his command. If they are summoned up and given human blood to drink and the flesh of a dead man or a cat to gnaw, they will give trustworthy answers to the magician's questions. Their names are Oriens (east), Amaymon (west), Paymon (north) and Egim (south).

Another magical textbook, the *Lemegeton*, says that the kings of the four quarters 'are not to be called forth except it be upon great occasion, but invoked and commanded to send such, or such a spirit as is under their power and rule'. Several centuries later, the modern magician Macgregor Mathers, commenting on the importance of a properly constructed magic circle, said that without one, to summon up 'such fearful potencies as Amaymon, Egym or Beelzebub' would probably result in the death of the magician on the spot.

In white magic the four directions also have their rulers, the archangels Raphael (east), Michael (south), Gabriel (west) and Uriel (north). The magician appeals to each angel to protect him against evil coming from each direction (see CIRCLE).

Many North American Indian tribes – especially those of the south-west – also link spirits and deities with the directions and with colours. The Pueblos see six main directions: north, yellow; west, blue; east, white; south, red; upwards, usually multicoloured; downwards, black. Animal gods and Nature spirits come into the system, so that Mountain Lion and Oriole (both more or less yellow) are associated with the north. Similarly, the major Aztec god Tezcatlipoca was yellow as ruler of sunrise in the east, blue as lord of the south, red as master of sunset in the west, and black as ruler of evil magic in the north (see AZTECS).

The east, being the direction of sunrise, is symbolically the direction of life and light, and to turn to the east is to turn towards the light, towards spiritual illumination, towards God. This is why the altar in a Christian church is almost always at the east end. Some early churches were built the other way round, following the precedent of Greek and Roman temples which usually faced east so that when the doors were opened the rays of the sun shone on the statue of the god.

By contrast, the west is the direction of death because the sun 'dies' there each evening. In many prehistoric burials the dead face towards the west and in modern Europe people are usually buried with their heads to the west. In Homer the principal entrance to the underworld, where the dead live, is in the far west.

The north, on the whole, has an evil reputation. In the northern hemisphere the sun moves through the sky from east to south to west, and the north is the one sector of the sky through which the life-giving sun does not pass. And if you face eastwards, the sacred direction, the side on which shadows fall is both the north and the left. But alternatively, instead of taking the east as the point of reference, some peoples have looked to the North Star or Pole Star as the fixed point of the heavens, 'the unmoved mover', the First Cause. The Etruscans placed the home of the gods in the north, and when one of their seers was about to speak he would face south, identifying himself with the gods. The Old Old God of the Aztecs lived at the Pole Star, the point on which the whole universe turned.

Robert Estall

Each of the four directions indicated on a church weathervane traditionally has its guardian angel: Raphael (east), Michael (south), Gabriel (west) and Uriel (north)

Evil on the Left

In Europe the left is traditionally the side of evil and the right of good. Black magic is 'the left-hand path' and to move to the left in magic is to attract evil influences. This is probably because the left hand is normally the weaker and the right the stronger, so that right is the side of God and good: hence the word 'right' means not only a direction but also justice, virtue, truth straightness. The left or 'sinister' side belongs to abnormality, evil and the Devil.

Medieval writers found great difficulty in explaining why the gospel is read in church from the left side of the altar and the epistle from the right (from the point of view of the congregation). This seemed extremely peculiar, since the gospel would be expected to take precedence. The real reason was that the gospel had originally been given the place of honour, the right, as seen from the bishop's chair, but this had been forgotten and ingenious explanations were produced. The epistles, it was said, were the apostles' preaching to the Jews, the chosen people of God (the right side of the altar) but they rejected it. So the words of Christ (the gospels) were offered instead to the pagans (the left side).

DISEASE

Magic and medicine have been inextricably mixed since men first tried to cure disease. Magical methods range from the 'shark repellent' of the Second World War to the Renaissance use of 'mumia', the use of holy relics or the moss from a human skull

MANY ANTHROPOLOGISTS make a sharp distinction between religion and magic. They point out that if a sick man seeks a religious cure he implores or badgers some god, demon or other spiritual creature to restore his health. The outcome then depends on the goodwill of the supernatural being. To achieve a magical cure he only needs to know the ritual formula or possess the appropriate charm. If he applies it correctly the desired result will follow.

Other scholars see religion and magic merely as variants, often interwoven, by which people try to gain their desires in an indifferent or hostile world, and seek to allay their fears or soothe their insecurities. It is certain that insecurity promotes recourse to magic. In our own society actors, sailors and bomber pilots (all members of insecure or dangerous professions) are notoriously addicted to the carrying of 'lucky charms'. This is a practice little fancied by bank clerks, civil servants and others in safe, humdrum jobs although that insecure and neurotic civil servant Samuel Pepys mentions in his *Diary* that he carried a hare's foot against the colic. Natives of some Polynesian atolls have elaborate fishing magic to avert the dangers of the open Pacific but none when they fish the quiet waters of the lagoon.

In primitive societies it is often believed that objects that are similar in shape, colour or smell to the cause or symptoms of an illness will have a curative effect; prehistoric burials have been found in which the body has been sprinkled with red ochre, probably because it was thought to have the life-giving powers of blood. Skeleton, between 30,000 and 40,000 years old, found in Samarkand, Russia

Illness, especially among primitive peoples, produces great insecurity. Hence, there are many magical cures available for treating even quite trivial diseases.

As well as being magically cured, illness may be magically caused and it is illogical to

The Wellcome Trustees

consider the one while ignoring the other. Indeed, magic cures are often inseparable from magic causes. On the Melanesian island of Dobu almost all diseases are believed to be due to spells which are the private property of individuals. Anyone who develops yaws, a horrible tropical infection, believes that he knows who owns the magic to inflict it and that only the possessor of this spell will also own the magic to remove it.

There is a distinction between treatments which can properly be described as magical and those which are rational or empirical but are based on wrong beliefs and misunderstood physiology. Is it magical rite or inefficient pharmacology when the Anglo-Saxon leeches prescribed marsh mallow pounded with lard for gout? Many of our modern cures may seem superstitious magic a hundred years from now. During the 1918 influenza epidemic millions of people were convinced of the near-magical efficacy of a proprietary medicine named *Yadil* in preventing and curing the disease. Its manufacturers were eventually convicted of swindling the public. *Yadil* contained no active drugs and was little more than water dosed with garlic, yet vast numbers of people who took it were as sure of its potency as any Dobuan islander is convinced of the magical power of his neighbour's paralysis spell. In the Second World War servicemen likely to be torpedoed or shot down in the sea were given a product referred to as 'shark repellent'. It now seems certain that it was useless except as a magic morale booster under conditions of desperate insecurity.

Throughout the world, man's ingenuity has concocted an astonishing number and diversity of cures and preventives when faced with disease. Yet many are basically similar. In *The Golden Bough* Frazer used the term 'Sympathetic Magic' to include what he called 'Homoeopathic Magic' and 'Contagious Magic'. He based this classification on two general principles.

The first is often called the Law of Similarity. Formerly, and even today among people with no scientific training, it was believed that objects or circumstances which bear some similarity in colour, shape, smell or sequence of events must be related to each other. If this is assumed, it becomes reasonable to treat jaundice by bringing the patient into contact with yellow things. The Anglo-Saxons prescribed yellow flowers, in Germany gold rings were used, and the ancient *Atharvaveda* of India (composed in the second millennium BC) contains a charm to take the disease from the patient and transfer it into a yellow wagtail. The Cherokees of America used burr, a plant which sticks to anything, to strengthen the memory. The Hindus filled a silver basin with water, looked at the reflection of the moon in it and then drank the water to cure neuroses – on the theory that such forms of 'lunacy' were influenced by the moon.

This Law of Similarity came to be known in medieval times as the Doctrine of Signatures. Its essential feature, the proposition that objects are related even by their least significant attributes, led to the belief that 'like cures like', which is the foundation

Jim Bamber

of homoeopathic medicine (see HOMOEOPATHY). Its roots are very ancient. Neanderthal burials, perhaps 100,000 years old, have been found in which the body was sprinkled with red ochre. This, in homoeopathic magic, was probably thought to embody the life-giving potency of blood. Innumerable variants of this principle could be quoted. In Asia Minor and the Aegean, for example, it was customary to cut off some hair and skin from a dog which had bitten you. The dog licked its own wound, thereby curing yours.

Healing by Proxy

The second of Frazer's principles is the Law of Contagion: cures based on it are called Contagious Magic. It states that things which have once been in contact continue to act on each other even when far apart. Thus, hair or nail parings removed from the body can still be used to influence it for good or ill. When a child of the Thompson Indians of British Columbia lost his teeth, his father would feed them, in raw venison, to a dog. This ensured that the child's new teeth would be as strong as those of the dog. In 1902 a Norwich woman named Matilda Henry trod on a wire nail which pierced her foot. She at once greased and polished the nail, remarking that the wound would then stay clean, like it. Although this practice – clean the weapon that wounds you – can be found in every continent, Matilda Henry was unlucky: she died of tetanus.

An extension of the doctrine that 'like cures like' is the 'cure by proxy'. A typical example occurs in an Indian legend where the leg of a valuable camel is cured by setting fire to that of a stray ass. The treatment of a doll or effigy instead of the patient is another version of the same idea. The converse is practised by some African tribes who magically transfer mumps from a patient to a rat, and in Kashmir bulls are driven through villages to absorb the pestilence of cholera.

Extensions of this kind are common and what began as sound empiricism may end as magical flummery. *Mumia*, from which we get the word 'mummy', is derived from Persian and originally meant 'wax'. Later it was applied to natural bitumen and resin, which were used as salves or wound dressings, and were no doubt often beneficial. Because some of these resins were used in embalming, the word 'mummy' was transferred to the preserved corpse, which then acquired the therapeutic reputation of the wax. *Mumia* had become almost a panacea by Renaissance times. In 1564 Guy de la Fontaine, physician to the King of Navarre, found that the leading Alexandrian purveyor of mumia was faking it from the bodies of slaves, even those who had died of the plague. In the same century, a German physician not only made it out of executed felons but even recommended carefully spiced and prepared flesh cut from the buttocks of a living man . . . a long haul from the original wax ointment!

Magical cures often involve vital essences such as blood or flesh. In 1880 the *Daily Telegraph* reported cases of tomb robbing in Germany to obtain the heart or liver of recently dead maidens or children. They were brewed with herbs and eaten to cure various diseases and to make the cannibal bullet-proof.

The eating of mice to cure whooping cough has survived in England until recent years. This remedy goes back to ancient Egypt where mice were believed to arise by spontaneous generation from the mud of the Nile. Hence they were imbued with the life-giving properties of its flood. The earliest written record of mouse as a child's medicine, dating back to 1500 BC, occurs in the *Berlin Papyrus:* 'Make this child or his mother eat a cooked mouse. Tie the bones round his neck with a seven-knotted string'. In the predynastic cemetery of Naga ed Der in Upper Egypt (c 4000 BC) the remains of mice have been found in children's bodies.

Perhaps the earliest form of this custom is recognizable in Stone Age burials. Many Neolithic skulls have been found in which the operation of trephination has removed a piece of bone from the living skull, perhaps to allow the escape of some demon or evil spirit, perhaps to treat epilepsy. Sometimes *rondelles*, circular discs of bone, were cut out and these have been found pierced with a hole as if to be worn as a magical, life-giving or healing amulet.

In the Egyptian mouse cure we met the use of a seven-knotted string. This illustrates a common element in traditional cures: the use of number magic. Certain numbers, such as 3, 7, 9 and 13, have long been credited with a magical or mystical potency

A Spanish mathematician used certain types of numbers to cure impotence. He wrote them down, ate one himself and plied his girl friend with the other

which can be drawn upon for good or ill by persons cunning in this lore. In the New World 4 was the principal magic number.

Many examples of number magic could be given. Spells often have to be repeated thrice, incantations nine times. In Scotland, as in Sicily, a seventh son (or better still the seventh son of a seventh son) had power to heal ulcers. This, as well as involving number magic, is an example of the hereditary transmission of magical potency. It resembles the power claimed by the French and English monarchs to cure scrofula, a form of tuberculosis which was very common in the past. At this ceremony 'touch pieces', originally of gold, later of silver or copper, were given to prevent the return of the disease.

From the time of Pythagoras, the 6th century Greek mathematician, the mystique of numbers has teased the imagination of philosophers (see also NUMEROLOGY). Medieval Arab mathematicians fell greatly under their spell and numbers were used in many aspects of healing. The Spanish mathematician Al Madshritti used certain types of numbers to cure impotence. He wrote down the numbers, ate one himself and plied his girl friend with the other – a strange aphrodisiac but typical of the mystic and cabalistic attitude towards mathematics. Perhaps the most famous mystic group of numbers is that found in Dürer's engraving *Melancolia* (1514).

16	3	2	13
5	10	11	8
9	6	7	12
4	15	14	1

In this square each horizontal and vertical line adds up to 34, as do the long diagonals, the four figures in each quarter, and other combinations. Moreover, the sums of the squared or cubed figures in many combinations equal each other. This curious discovery was believed to have curative properties and was used to treat many diseases.

British Museum

Prescribing by the Stars

Inevitably, ideas about the cure of disease reflect the philosophical or scientific opinions of their time. This is well seen with astrological theories. When, in the ancient world, it came to be accepted that human affairs were closely influenced or controlled by celestial bodies, it was inevitable that this was reflected in the treatment of disease.

An example occurs in the *Anglo-Saxon Herbal*; a prescription for the *fylle-seocniss* (falling-sickness, or epilepsy) is to eat berries of 'asterion' (an unknown plant) at the time of the waning moon, when the sun is in Virgo. Crinas of Massilia (1st century AD) used astrology with enthusiasm: he made his patients pay punctilious regard to times, seasons and celestial bodies. For tuberculous ulcers Pliny, the Roman writer of the 1st century AD, recommends 'damasonium, which is also called alisma, gathered at the solstice and applied in rainwater to the sore, the leaf being crushed or the root pounded with axle-grease . . .' But caution is needed in assessing calendrical instructions. Some, at least, are rational rather than astrological and indicate the season when the root, flower or berry was botanically most ripe for therapeutic use.

Greek physicians were often negative in their approach to patients: they advise against treating such and such a disease. This becomes intelligible if the physician presupposes that his untreated patients will go to the temple for magic cures by incantation, amulets, prayer and purification. The healing temples of Asclepius were open to all (see HEALING GODS). It was up to the physician and the patient to decide between them whether to seek a medical or a magical

Right **Magical charms to cure or prevent disease or injury are common in societies that exist in an insecure and hostile environment: the inhabitants of Trecastagni on the slopes of Mount Etna in Sicily consecrate models of legs, arms and other parts of the body injured during volcanic eruptions to the saints of the local shrine, in order to ensure protection against future lava flows** ***Left*** **In the Middle Ages a sick person would anxiously watch for supernatural signs or omens indicating his recovery or death: if the mythical caladrius looked at a patient he would recover, but if the bird turned away he was sure to die: illustration from a medieval bestiary**

Invalids at Lourdes, a centre of pilgrimage for the sick and dying for more than 100 years: a spring with miraculous healing powers appeared there in 1858, the year in which St Bernadette claimed to have seen the Virgin Mary on 18 occasions. Since then, millions of pilgrims have journeyed to Lourdes in the faith that they would be cured of their ailments

Camera Press London

cure. The philosopher and physician Galen (131–201 AD) says that incantations are useless and outside the activity of physicians. Even Pliny, who from his encyclopedic gatherings is often ridiculed as unduly credulous, has a strong vein of sceptism. He derides the use of an owl's toe to treat fever, and asks, 'Why, of all things in the world was the toe of a horned owl thought of?' For ear complaints he prescribes 'a cricket dug out with its earth and applied. Great efficacy is attributed to this creature . . . because it walks backwards, bores into the earth, and chirrups at night. They hunt it with an ant tied to a hair and put it into the cricket's holde . . . and when the ant has embraced it the cricket is pulled out.' But of some insect remedies he writes: 'Even to hear of these cures makes me feel sick: heaven help us!'

Astrological influences were, of course, potent in causing, as well as curing illness. The Anglo-Saxon chronicles record the arrival of comets which were thought to bring pestilence.

The dominant doctrine of health and disease throughout the Middle Ages was the Humoral Theory, or Doctrine of the Four Elements. Its first complete enunciation, apparently, was by Pythagoras and through Aristotle (384–322 BC) it exerted an immense influence on later thought. It stated that everything was composed of four simple elements: earth, air, fire and water. These were the basis of the four 'qualities' moist, dry, hot and cold, and the four 'temperaments', melancholic, sanguine, bilious and phlegmatic. It was a sterile doctrine, overdue for replacement when the Renaissance dawned. It held, broadly speaking, that diseases were due to a *dyscrasia* or imbalance of these elements, and cure lay in redressing the balance. Thus 'hot' diseases need 'cold' remedies. Theoretically this can be described as no more than mistaken physiology. In practice it led to some outlandishly fanciful treatments, which at least verge on the magical.

The Worm in the Bud

Over vast areas of the world we meet the concept that disease is caused by a magical creature invading the body or implanting noxious missiles in it. It may be the 'worm' of Anglo-Saxon leechcraft, the gnawing snake of Bantu belief, or a wide range of indwelling spirits or devils.

Healing by Invocation

Magical healing in Ancient Egypt:
The sorcerer whose task it was to drive out or to keep away a spirit from the body of a man through the magic power of the word had various means of doing it. The simplest was the command. Addressing himself to the spirit he ordered it to get out: 'Get thee hence, thou female breaker of bones, thou crusher of stones, who enters into the vessels.' Or the disease was adressed: 'Spit, vomit, perish as thou arosest.' . . .

It was important for the magician to know who his opponent was. Knowing his name gave him particular power with which he could threaten the spirit. 'I know thy name . . . do I not know thy name? . . .' was said repeatedly in an incantation for the eye. Or if he was not sure he considered various alternatives:

> Art thou a servant? Come in the vomit.
> Art thou a noble? Come in his urine
> Come in the sneeze of his nose
> Come in the sweat of his limbs.

Threatening and scaring the ghost was a good method employed very frequently. The worst that could happen to a spirit was to be forced to eat excrements . . .

Or the conjurer simply said as a protection against the pest of the year: 'I am the abomination that came forth out of Buto, O Meskhenet, that came forth out of Heliopolis; O men, O gods, O dead, be ye far from me. I am the abomination.' How could a spirit care to take possession of an abomination? . . .

Cajoling the demon by pretending to be healthy, to be 'immunized', was another method and it was said at the time of pest: 'I am the healthy one in the way of the passer by. Shall I be smitten while I am healthy? I have seen the great disaster. O this fever, do not assail me, for I am the one who has come forth out of the disaster. Be thou far from me.'

H. E. Sigerist
A History of Medicine

In these cases cure may be sought by charms and incantations to lure forth the intruder or its missile, or by imbibing nauseating concoctions, often of human and animal excreta, to offend and drive out the demon of disease. The Nootka Indians of British Columbia withheld food from sick people so that the invading spirit should be driven off by starvation.

Doctrines of this kind are often elaborated into complex systems. The neighbourhood of Guinhangdan, a small fishing village in the Philippine Islands, may serve as an example. There witches, sorcerers and spirit gods are the chief agents of disease. The last, called *encantos*, comprise three types: *tuanon* or earth spirits; *tubignon*, river and ocean spirits; and *cohoynon*, who inhabit trees. These beings are very common and although people try to avoid their haunts, this is not always practicable. When a disease has been diagnosed as due to an encanto, incantations (often to Christian deities) and the application of ritual anointment, massage, herbs and poultices are used. A curer called a *parahaplas* wraps the patient in large leaves to sweat for about an hour. He is then uncovered and the leaves examined for the missiles which the encantos have shot into him. Any bits of grit, sand, hair or parts of insects are proof that the disease was in fact caused by one of these spirits.

In Europe mental disease was traditionally attributed to possession by evil spirits. According to Christian legend, a nun failed to make the sign of the cross over a lettuce she was eating and swallowed a devil who was sitting on it. When a priest exorcized him the devil protested that it was not his fault if a negligent nun had swallowed him.

Often the treatment of disease is partly rational or empirical, partly magical. The Romans treated abscesses by poultices, a practice which is still medically approved. But they also recommended that the poultice should preferably be laid on the fasting patient by a maiden, herself fasting and naked. This is no longer standard practice though it is not impossible that some psychological benefit might ensue.

In Bantu Africa, disease is seldom thought of as basically physical in origin. An African often understands the cause and treatment of a disease from the Western standpoint but he will ask why *he* has been afflicted and not another. He demands antibiotics but feels they will not work unless he supplements them by magically appeasing an offended ancestral spirit, atoning for a broken taboo, or placating an irate chief or sorcerer. In Ghana, during the 1918 influenza epidemic, accusations of witchcraft flourished and magical cures correspondingly proliferated.

The Wandering Soul

Many primitive tribes believe that disease is due, not to the intrusion of some evil spirit but to the absence of the patient's soul. This is often thought to wander in dreams and may be unable to re-enter the body if a sleeper is suddenly awakened. When this happens, the errant soul must be enticed back by charms or other allurements. Among the Kenyah of Sarawak a native healer will recall the stray soul and fasten it to the patient's body by string and the sticky blood of a fowl. The Koryaks of Siberia have a similar cure. An Ottawa medicine man has been known to trap an escaped soul in a small box and put it back into the mouth of its owner.

Belief in wandering souls is not confined to primitive and exotic tribes. It is common in Europe. In Germany, Czechoslovakia, Scotland and elsewhere the soul may escape in the form of a white bird, from the open mouth of a sleeper. It may leave the body in a sneeze. If this happens it must be magically returned on the instant by calling out 'Bless you' or, in Spain, 'Jesus', or by making the sign of the cross.

Because in much of the world disease is thought to be a supernatural visitation, supernatural means are naturally used to avert and cure it. One of the most important of these is the power of the gods and saints. In Hindu religious tradition Krishna cures the hunchback woman Kubja by touching her. The Bible claims that Christ similarly cured a blind man. Innumerable examples could be quoted. Healing was a major function of Christian saints, some of whom were specialists. St Lucy was associated with eye disorders, St Apollonia with toothache and St Agatha with diseases of the breast. In medieval times the chief purpose of pilgrimage was to seek a cure at shrines, such as that of St James of Compostela. Recently the body of a medieval man, with a grossly diseased hip joint, was excavated at Thetford in Norfolk. Beside him lay a pilgrim's badge showing that he had journeyed to the healing shrine of Our Lady of Rocamadour in central France. Thousands of believers still seek such cures at Lourdes and elsewhere.

In Christian countries supernatural treatments often contain religious elements. Tudor England was several times ravaged by an epidemic called the Sweating Sickness – perhaps a form of influenzal encephalitis. A cure for it was to recite seven Paternosters and seven Hail Marys – thus combining Christian prayer with pre-Christian number magic.

Christian curative magic takes many forms. In Sussex, shoes put crosswise every night were a cure for rheumatism. Good Friday buns were eaten later in the year as panaceas for illness.

Bede (672–735 AD) in his *Ecclesiastical History* records the earliest healing miracle in England as having been performed by St Germanus. The saint applied a 'bugget' or reliquary, which hung round his neck, to the eyes of a blind girl, 'which done she straight received her sight.'

Curing by Noah's Beard

The fusion of originally separate items of magic into one composite charm has already been noted. Occasionally the result was extremely complex and might combine Christian and pagan elements. The *cimaruta* is a good example. This was a charm, usually of silver or some other metal and commonly worn on a necklace, which was very popular in and around Naples. It often contained little figures of the moon, a hand, a sprig of rue, a key, a horn of fish, a cock or an eagle, a heart, a serpent and a cherub. All these might blend in a single *cimaruta*. They averted evil and cured many ills. The origin and significance of the separate items are complicated and ambiguous. The fish in Christian lore symbolizes Christ. The hand and the horn can both be traced back to a phallic origin. The moon and plants associated with it were consecrated to the goddess Lucina: both Hippocrates (5th century BC) and the Dutch physician Hermann Boerhaave (1668–1738) used moondaisy for disorders of menstruation – and rue was used against plague in Italy.

With healing as the primary object of medieval pilgrimages, it was to be expected

Wellcome Trustees

Among primitive peoples disease is often attributed to supernatural causes, the invasion of the body by a magical creature or evil spirit, or, in other cases, the absence of the soul from the body: the tribal medicine-man attempts either to drive the invader out with charms and incantations, or to lure the soul back into the body *Above* Medicine-man in Brazil treating a patient *Right* Wooden effigy of a shaman of the Haida tribe in British Columbia

that spurious holy relics would abound. Hundreds of shrines throughout Christendom claimed to effect magic cures by these relics. Enough pieces of the alleged True Cross existed to build a house. According to various legends, hairs from Noah's beard were preserved at Corbie in north-east France, parts of Christ's manger at Wimborne in Dorset, drops of the Virgin's milk at Walsingham in Norfolk and her wedding ring at Perugia in Italy.

Corpses and their trappings have always been dreaded and avoided as progenitors of magic ills. They also have healing powers. In Lincolnshire moss found growing on a skull was powdered and used as snuff to cure headaches. A ring made from a coffin hinge relieved cramps, and a piece of gallows rope cured ague. Elsewhere, barren women walked beneath corpses on gibbets, and the Greek traveller Pausanias (2nd century AD) refers to the model of a corpse being used as a votive offering.

Disk

Or disc, a symbol of the sun, or sometimes of the heavens as a whole: the 'sacred disc' of China stood for heavenly perfection: the winged disc, which belonged to the Assyrian god Ashur and other deities of the ancient world, stands for flight and is now used by organizations connected with air-travel and space-flight.

See SUN.

Dismemberment

A symbol of the destruction of old life to create new life: the initiation of shamans, in Siberia and Australia for example, may include a dream of being torn apart by spirits and put together again: in Egyptian mythology Seth tore the body of Osiris to pieces, which Isis gathered and restored: in Greek mythology Zagreus was dismembered and from his heart Zeus created Dionysus: in alchemy the material of the work, and spiritually the alchemist himself, was torn apart to be purified and re-created.

National Portrait Gallery London

DISPENSATION

THE LATIN WORD *dispensare*, 'to weigh out' or 'distribute', was used particularly to refer to the orderly arrangement of a household. It was taken over into Christian theology to mean the orderly arrangement of a religious system or of God's dealings with his human family: the Jewish or Christian dispensations.

In a narrower sense, the word means the relaxation of a law, in the interests of good 'household management' as it were, in cases where the law bears too hardly on an individual. In the Roman Catholic Church, with the growing power of the papacy, the right of dispensing with a law in an individual case was ultimately vested in the Pope.

The Popes came to use the dispensing power with such frequency that many of the faithful were scandalized. People who had made vows were allowed to break them, clergymen were allowed to hold more than one benefice, dispensations were given to marry within the prohibited degrees, or to dissolve marriages, for fees which were an important source of income to the papacy.

Protestant reformers disapproved of this traffic. In England the Pope's refusal to give Henry VIII a dispensation from his marriage to Catherine of Aragon was partly responsible for the breach with Rome.

Henry VIII conferring the succession on his son by Jane Seymour, despite the Pope's refusal to annul his first marriage

Displacement

Technical term in psychical research: when a subject is trying to forecast what card, drawing or other 'target' comes next in a series, he may score a hit on the target before or behind it: in S. G. Soal's experiments, for instance, two subjects scored significantly high on targets coming before or after the one they were aiming at.

J. B. Rhine

Distillation

One of the principal processes in alchemy, in which a substance was heated and gave off vapour, which then condensed; the vapour was regarded as the 'spirit' of the substance, driven out of it to be purified and later recombined with it; the process was often symbolized by birds flying up to heaven and down again.

British Museum

Michael Holford

The wailing cry of the diver bird is uncannily human. This is one of several links between man and diver which make the folklore surrounding this bird especially significant

DIVER

THE DIVER BIRD is best known in the United States as the loon – but in the realms of folklore and mythology, where its diving abilities play an important part in many Indian tales about the beginnings of the earth, its other name comes more frequently into use. The great northern diver, whose distribution is mainly North American, is sometimes seen around the coast of the British Isles, and breeds also in Norway; while two other species, the red-throated and the black-throated, nest in Scotland and the neighbouring islands such as the Shetlands. So the folklore of the diver is far from exclusively American.

Where the red-throated diver breeds in Shetland, it is known as the rain-goose because its call is said to forecast wet weather. In fact the diver calls during courtship, aggression and other such situations and its cries have little or nothing to do with rain. Shetland weather lore is sometimes self-contradictory; divers flying inland – said to be a sign of good weather – may also be noisy, a portent of bad weather. Nevertheless, when contradictions in folklore occur, they may be, as in this case, indications that the lore has interesting antecedents which have been obscured or forgotten. We would be at a loss to understand the Shetland traditions were it not that there are more detailed diver traditions elsewhere which throw light on them. In the Faroes, in addition to belief in the diver as weather prophet, there is a saying that when one calls as it flies over it is accompanying a soul to heaven. Norwegians, too, not only associate the bird with the weather but also with death for they say that its weird calls predict that someone will be drowned.

Skull with Artificial Eyes

There are indications that the Faroese belief in the diver as the companion of the soul is a shred from a fabric of belief which once extended throughout much of northern Europe, Asia and America. The diver has a highly important place in the traditions of Siberian tribespeople. At the four corners of the coffin of a Tungus shaman, where it is deposited on the tundra, are set posts surmounted by wooden models of diver-like birds. Small replicas of divers are sewn on the costumes of Yakut, Vogul and other shamans. Amongst these tribes it is considered reprehensible to disturb or kill a diver. Moreover in Siberia and North America alike, traditions relate that during the Creation or after the Flood the diver helped to bring the world into being by bringing up mud from below the surface of the water. There are clear indications that diver traditions were carried from Asia across the Bering Strait to be disseminated in North America a long time ago.

At Ipiutak in Alaska archeologists have found that graves belonging to an extinct Eskimo culture have yielded skulls not only of human beings but also of divers, suggesting that the birds were regarded as companions or guides for the soul and that the destinies of divers and men were regarded as linked. The eye-sockets of both the human skulls and of a diver skull were found to be fitted with artificial eyes, suggesting the belief in a mysterious affinity between men and these birds. A folktale which seems to shed light on this discovery relates how a diver restored sight to a blind boy by taking him to a mysterious underwater realm. They both plunged in and the boy emerged able to see. The various fragments of tradition from different parts of the world together suggest that the diver was regarded as a magical bird, able to enlighten and lead the human spirit in life and death. Thus the vestiges of diver lore which survive in Shetland and elsewhere in Europe are seen to be the lingering remnants of a magical or magico-religious cult which at one time extended over a great deal of the inhabited region around the North Pole.

Cry Like a Woman's Scream

One of the great northern diver's outstanding characteristics has had an important influence. The bird's loud wailing cry, sounding eerily over the still northern lakes, is remarkably like the screams of an anguished woman. Undoubtedly it reinforced the belief that the bird has mysterious human affinities. Probably it played a part in suggesting that the diver could act as man's guide not merely on earth but to the 'undiscovered country from whose bourn no traveller returns'.

The diver's wailing cry sounds like a woman's screams, and reinforced the belief that the bird has a mysterious affinity with human beings: during seances a shaman would aim to change himself magically into a bird in order to fly to the spirit world. Shaman's rattle in the form of a diver, in the British Museum

Support for the inference that the bird's calls were responsible for its being regarded as in some respects human or quasi-human is furnished by folktales. Thus according to one story the loon is really a fisherman who was knocked on the head and had his tongue cut out so that he could not reveal the name of the criminal, and was then turned into a bird. According to another, loons which had once been men circled around Kuloskap, the culture-hero of the Algonquin Indians, and were taught their strange cry so that, recognizing it, he could come to their rescue if they needed help. Long afterwards, when they had become men again, he visited them and appointed them his huntsmen and messengers. In such stories the distinction between birds and men is vague. This is understandable because during the seances of a shaman he aims to transform himself magically into a bird, imitating its calls and movements, and so flying away to visit the spirit world.

Other diver folklore attempts to account for the bird's peculiarities in appearance and behaviour. As the great northern diver does not breed in Norway but appears off the coasts accompanied by its well-grown young, a story was concocted to explain why nobody had ever found a nest in that area. It was said that under each wing was a recess in which the eggs were incubated. Another story purported to explain why its legs are set so far back on its streamlined body that when the bird comes on land to nest it can only shuffle with difficulty. It was said that during the Creation, by an oversight, its legs were omitted and were thrown after it only just in time to become attached.

DIVINATION

'It is all a question of moving the self into a deeper consciousness, a totality of awareness . . .' The stars in their courses, numbers and letters, the flight of birds, the chance words of children, these and many other events have been seen as portents of the future, and may in fact stimulate some mysterious faculty in the diviner which enables him to know things that are hidden to the normal senses

MAN IS CONSIDERED REMARKABLE for his reasoning faculty which is said to distinguish him from other animals, yet this faculty has never sufficed him. Simple human wishes or apprehensions about the future, as well as momentous decisions in the present, are felt to call for supernatural guidance. Hence the 'science' or art of divination. To divine by seemingly irrational means what action to take in the face of the unknown, what is to be hoped for, what is certain to come to pass, was once the prerogative of the soothsayer or medicine-man. Later it became that of the priest, the prophet or the augur and, since the Renaissance, of the astrologer, the gypsy and the village wise-woman. Today, clairvoyants have brought this once highly honoured practice from its more or less underground existence into bourgeois living-rooms in all the big cities of the world.

Divination is the prediction of future events or the discovery of secret matters by a great variety of means, signs and occult techniques. It is primarily concerned with the future but it sometimes necessitates a turning backward of the vision in order to learn from the forgotten past. Divination is a gift from the divine: from God or from the gods. This is an intuitive gift, the psychologists say; a magical gift, according to the witch; an occult one with its own rationale, according to those who have been initiated into the mysteries.

The huntsman, the herdsman and the husbandman in the distant past wanted to know about seasonal changes, about fertility, about droughts and the water supply, upon which human survival depended. Such men would scan the heavens at night, watch the flight of birds by day, look deep into the embers of the camp fire or into the depths of a still pool – and so, somehow or other, come to 'see' and to 'know'.

Omens were sometimes gleaned by throwing down arrows or bundles of sticks, or by inspecting the entrails of an animal that had just been killed; both haruspicy (the latter method) and augury by observation of the behaviour of birds is known to have been practised as long ago as the 1st millennium BC by the Etruscans (see ETRUSCANS). Other methods employed by men in ancient times probably included the pouring of sand through the fingers or the study of the lines and mounds on the palms of the hands. Playing with knucklebones, men came to cast lots. Centuries later, such methods gave way to the 'hexagrams' of the Chinese I Ching or Book of Changes, to the Tarot cards, to palmistry and to the forked rod of the water-diviner. Divination by gazing into a crystal globe or a bowl of water, by inspecting tea leaves, coffee grounds or ink blots, gradually came to seem more appropriate to a civilized society than dissecting the quivering liver of a newly slain beast or causing a tortoise-shell to crackle meaningfully over the embers on the hearth. From watching stars and recording eclipses, there evolved the highly complicated mathematical readings of the astrologers, while the belief that the earth and her precious stones were endowed with magical power led man to develop the art of alchemy.

An Overwhelming Success

The most remarkable thing about divination is its success. Some methods may have proved more efficient than others and, more to the point, some diviners have a greater power of visionary sight than others, or a greater gift for understanding human character and the way in which an individual is likely to act. But even from the most materialist point of view, judged by its age-old popularity and bearing in mind that divination has had to survive ecclesiastical condemnation and the gibes of rationalists and sceptics, the art was and is an overwhelming success. The financial gains of those who ply it for cash at the present time, and the number of 'professionals' whose consulting rooms are filled and whose waiting lists are replete, are impressive.

The motives for consulting a diviner are fear, desire and hope: fear of hunger, of enemies, of illness and accident, of natural disasters, of what may happen after death; desire for gain, love, children, conquest, happiness, immortality. In the East the question of past and future incarnations has its place. And hope embraces both fear and desire, for there is hope that the worst will not happen and that the best will.

Long ago the person who had the 'gift' of divination might be an experienced grandmother or matriarch, as is the case with many gypsy tribes today, or a revered old man who might also be the chief or 'king', as with other gypsy tribes. Then there was the child who, from birth, was unusual – the strange one, the dreamer, the introvert, the one set apart. Or the tribe might set someone apart, someone who was 'possessed', who had the touch of a god upon him, because he was an epileptic, or insane, or in some cases a homosexual, having the virtues and powers of both sexes in one.

As Above, So Below

The role of the seer was to read and interpret the signs and portents, to awaken in himself an intuition as to what course should be followed, and reveal it to the people concerned, whether individuals or a group. In his hands lies the fate of his people. Will there be famine or war should the present dynastic house fall? What must be done to arrest the plague that is taking its toll of so many worthy citizens? Or again, will the love and possible union of two young people of rival families bring peace, stability and well-being to the kingdom? Such a task was a highly serious matter, and the seer one of the most respected and revered members of the community. And not only did he have to be certain in his intuitions, but he had to find and train neophytes for initiation who would succeed him when he died. Training would include not only divination but the arts of music, of reciting epics, of memorizing genealogies as well as knowledge relating to planning cities, building temples, the laying out of fields and the rotation of crops, the

In ancient times the person with the gift of looking into the future was often an old and respected man, possibly the chief or king of his tribe, or, in the case of a woman, an experienced grandmother or matriarch; this tradition is still alive even today among gypsy tribes, and in some parts of Europe: in an Italian village an old woman studies the strange patterns that are formed when lead is dropped into water, and foretells what the future holds for a young bride-to-be

Above **Phrenology, the art of reading character from the shape of a person's head, developed during the late 18th century: the size and location of bumps on the skull, and the shape of the head itself, are thought to reflect the development of the brain centres associated with various mental processes. Phrenologist examining a young client *Right* Divination by moles on the face or body is based on the belief that marks on the skin are the stars of the body, and that, like the stars in the firmament, they can reveal profound mysteries: in this engraving from a 17th century treatise on the subject a woman's face is made up entirely of circles, possibly implying that the circular movement of the stars in the heavens is reflected in man**

breeding of cattle and, of course, the practice of herbal and surgical medicine. In such a master the vocations of priest, scientist and philosopher were combined.

Augury is a matter of identity, of identifying the things of the earth with those of the heavens, of the palpitating life of creatures with the vibrations of the cosmos, all of which wisdom is embodied in the alchemist's concept 'as above, so below'. Man is a hot-blooded animal with the life-blood flowing through his body as the warm bodies of birds fly through the air, approaching the sun, the divine source of life. Concentrating on the flight of the birds causes flights of thought to wing their way through the mind. Catch these thoughts that are stimulated by the birds and there you have a premonition, a 'hunch', a hint of things to come. Give tongue to such knowledge and there you have a prediction: the oracle, the imprint of outward signs and awakening inward intimations, has spoken through you. It is all a question of moving the self into a deeper consciousness, a totality of awareness, that is wider by far in its range than that of the limited consciousness of the ego or the reasoning faculty.

This consciousness, for example, can be the state of trance or ecstatic enthusiasm as experienced by the Pythian priestess of the Delphic Oracle, or the delirium of a dying man who utters prophetic words. Interpretations put upon the oracular utterance afterwards may be false, and a misunderstanding of that which has been declared might lead to disaster. Again, bribery or wishful thinking may distort an interpretation, but never – say the true prophets – can the oracle in itself prove false.

Training in occult theories was given to chosen pupils in special schools or by individual teachers; even today, such schools exist for the educated and spiritually advanced. Pupils are taught to see relationships between outer happenings – such as the behaviour of birds or the formation of tea leaves, which appear somehow meaningful – and that part of consciousness which is felt to be outside time and space in some way. Cultivating this gift, and transmitting the garnered wisdom of the ages under glyph, sign or symbol, requires instruction from a master and a long period of study and self-discipline for the pupil on probation. The master aids the disciple to pass into the right receptive state of consciousness or trance, and also communicates to him the techniques or keys of interpretation that will objectify his intimations and link these with those events about which those who consult him wish to be informed.

To the seer and occultist, a formation of birds, circling in a certain quarter of the sky, appears as a kind of telegraphic message passing between the mind of the Great Architect of The Universe and the mind of man. The ordered journey of the planets at night, the sudden appearance of a comet, a shower of falling stars, a fearsome eclipse of the sun – if the significance of these phenomena could be grasped, it must have a bearing on the day-to-day events on the

Radio Times Hulton Picture Library

Augury is a matter of identity, of identifying the things of the earth with those of the heavens, of the palpitating life of creatures with the vibrations of the cosmos

earth below. This belief led to the charting of the 12 divisions of the zodiac with their powers, influences and attributes.

So much for the heavens; but if one turned from the celestial to the study of things on earth, such as the intestines of warm-blooded beasts, for instance, could one not find there a correspondence with the pulsating life of mankind? If an eclipse seemed ominous, so did the malformed liver of a young bull that to outward appearance seemed unblemished before slaughter.

Numbers, letters, words and sounds were also believed to have a supernatural meaning and to have a magical and prophetic value besides their utilitarian one. At first it was the priests and priestly scribes who alone knew the meaning of these signs and how to work with them. The Jewish Cabalists used them to construct a magical and mystical religious philosophy and spiritual exercise (see ALPHABET; CABALA). Idols and images of the gods were also looked on in the same way – not just as carved and painted representations but as being highly charged with power and with a numinous quality; as transmitting instruments for the archetypal powers that radiate throughout the cosmos and whose forces can be 'tapped' by the seer.

The Path of the Seer

In dealing with individual or collective problems, there often seems to be no other way than by resorting to some kind of magic – whether this is called psychology, business acumen, political astuteness, or just a 'hunch'. Or again, meditation, clairvoyance, prayer or faith. Human reason is frequently baffled by the apparent lack of meaning or order in life, from birth to death. This is not to say that reason does not have its place in the composition of a human being; every faculty has its rightful place, for man is a composite entity and within this grouping of parts and forces are both the imaginal and the rational faculties, as well as that which is generally referred to as the soul or spirit. This is the starting point from which the diviner and the occultist work when developing their so-called supernatural powers, powers which are better called supernormal, as being latent but not always manifest in everyone. The diviner tries to understand how each faculty or principle in

Mansell Collection

Popperfoto

himself corresponds with a like structure in others, and indeed in the whole universe: and he comes to see in what direction the future must unfold, and in what manner the individual or the group should face it.

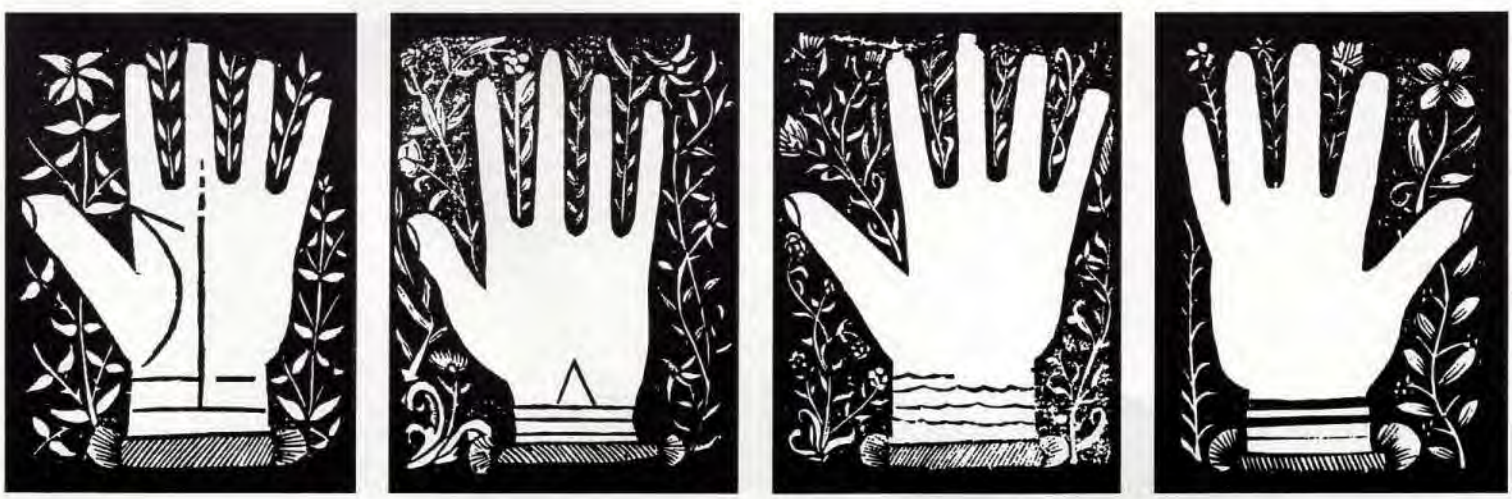
Many diviners have practised the path of austerity, of asceticism or of self-torture as an aid to liberating their gift. Among these are certain Indian and Tibetan yogis and Moslem fakirs. Others have considered that a healthy and beautiful body is the best vehicle through which to allow the other 'bodies' to operate – we might call this the Apollonian Way, and the orgiastic frenzy or licentious method the Dionysian Way. Extremes of ritual licence or of asceticism seem to act equally well as liberation techniques, whatever the morality of the methods.

Palmistry was practised in ancient Greece and China, and still flourishes today: 16th century Italian painting by Peruzzi of a fortune teller reading a woman's hand *Right* An American palmist at work *Below* Illustrations from a late 15th century treatise on palmistry showing *(from left to right)* the hands of 'an Avaricious and Thoughtless Man; a Stubborn and Iniquitous Man; an Irascible and Evil Man'; and the wrist of 'a Woman Unsuited for Motherhood'

But in almost every case periods of retreat from the world, hours or days of meditation and trance, certain restrictions in food and drink, and a number of prohibitions, indulgences or deviations concerning sexuality, are typical. Nor have the uses of drugs or intoxicants been neglected. The Pythoness or priestess-seer of Delphi was said to chew hallucinatory herbs and it has been argued (though without much evidence) that she sat on her tripod above stupefying fumes that rose from a crevice in the rock below her; in a trance-like state she uttered oracular words which were recorded by her male priests in perfect hexameters.

To open the inward eye, to liberate trance states, the drinking of wine or mead, beating of tom-toms, dancing and twirling and, of course, taking drugs such as marijuana, mescaline and now LSD, have been or are being used; though it is clear that addiction to some of these drugs involves extremely grave dangers.

Studying the theories and practices of the



Sieve and Shears

A form of divination much used from the earliest years of the Middle Ages down to our own day, in some French provinces, is coscinomancy, or divination by a balanced sieve. The early phrase was 'spinning the *sas*' – an old word which means sieve or strainer. It is notable that all peoples have ascribed divinatory potentialities to objects in rotation. A mere knife spinning on its collar upon a table is supposed by many people to be capable of bringing bad luck to a house. The gyratory movement is of a character essentially mysterious or even diabolic, as some hold, and divination by the sieve is certainly one of the most perplexing methods in existence. The *Opera omnia* of Cornelius Agrippa . . . contains an invaluable figure indicating the manner of suspending the sieve in order to make it vaticinate. The author says that 'the sieve is suspended by tongs or pincers (*forcipes*), which are supported by the middle fingers of two assistants. So may be discovered by the help of the demon (*daemone urgente*), those who have committed a crime or theft or inflicted some wound. The conjuration consists of six words – understood neither by those who speak them nor by others – which are DIES, MIES, JESCHET, BENEDOEFET, DOWIMA and ENITEMAUS; once these are uttered they compel the demon to cause the sieve, suspended by its pincers, to turn the moment the name of the guilty person is pronounced (for all the suspected persons must be named) and thus the culprit is instantly known . . . More than thirty years since I made use of this manner of divination three times: the first time was on the occasion of a theft which had been committed; the second on account of certain nets or snares of mine used for catching birds being destroyed by some envious one; and the third in order to find a lost dog which belonged to me and by which I set great store. In every said attempt my fortune was to succeed; yet I stopped notwithstanding after the last time for fear lest the demon should entangle me in his snares.'

E. Grillot de Givry
Picture Museum of Sorcery, Magic and Alchemy

diviner raises a question that has never been satisfactorily answered. This concerns the problem of the inevitability of destiny and that of choice. If 'that which is sure to come to pass', as the fortune teller says, is a certainty, then where does choice or free will come in? And if there be no choice, what is the function of the oracle? It would seem that one can encourage the goddess Fortune, and that is why the Romans made offerings at her shrine before any important undertaking. The existentialist maxim, 'We choose that to which we are destined', is a clever play with words but in no way throws light on the subject.

Perhaps the explanation lies in seeking to reconcile oneself with the immutable sweep of the cosmic tides of destiny, while knowing that it is how one reacts to them that is one's own choice. That is, one can react in a positive or creative way, or in a negative or destructive way. The evolution and devolution of life is predetermined and can be named Fate, while there is yet freedom of individual choice, which we name Free Will, within the overall pattern.

Two Kinds of Prophecy

Lest the Christian should join the materialist in deriding divination, it should be remembered that it has its place in the Bible. One needs only to recall the story of the Witch of Endor who, for Saul, practised necromancy – and evoked the shade of the dead Samuel to advise him about the future (I Samuel, chapter 28). Joseph practised divination by water (hydromancy). There are the prophetic dreams of Jacob, and the dreams that Joseph interpreted for Pharaoh. The prophets of Israel not only admonished their people, but warned them of disasters to follow if they did not mend their ways, and the advent of the Messiah was foretold. The New Testament contains many references to such prophecies and shows how these were fulfilled in Jesus. Jesus himself foresaw his own death and resurrection; and finally there is the book of Revelation with its poetic and dramatic previsioning of that which is to come about at the end of this world cycle.

It may seem strange to us that the ancient Greeks placed such a high value upon the pronouncements of their oracles, that a people whom we tend to think of as eminently noble, scientific and reasonable should so wholeheartedly have given credence to them. We tend to forget that the consultation of the oracles was a key-point in the works of the great Greek dramatists like Sophocles who, in *Oedipus Rex*, tells how King Oedipus sent his faithful Creon to the world-famous Delphic oracle to enquire how his city of Thebes was to be rid of the plague which was exterminating so many of its citizens. The oracle declared that he who had killed King Laius must be found and punished. Learning this, Oedipus asked the blind seer Tiresias to use all the resources of his art to search the past and discover the murderer who, of course, was the unknowing Oedipus himself. Not only had Oedipus murdered Laius, his own father, but he learnt that he had married his own mother. To exorcize the impurity within him Oedipus struck out his own eyes and by this terrible act appeased the gods and removed the curse from his people. Such ritual ideas came to be the foundation of Greek medicine and hence the words 'purgatives' for medicaments and 'catharsis' for psychological treatment.

Inspired by such human predicaments expressed in dramatic form, Freud was able to lay the foundations of his psychoanalytic theories concerning guilt, his famous Oedipus complex. His therapy, like that of the ancient oracular pronouncements, lies in gaining awareness by recovering the unknown or repressed guilty experiences of the individual so that, by reliving these and discharging the emotions that went with them, he may be healed of his neurosis and attain maturity.

The Latin orator and philosopher Cicero (1st century BC) explains that divination is a truly religious matter because it necessitates the belief in a divine Providence that has designed a destiny for every man, and would come to his aid if properly approached; and that it would be very unwise to forget about or to neglect this Providence. There are two kinds of prophecy, according to Cicero and Plato; one of art and the other of Nature. And following Plato, Cicero speaks of inductive divination, *entechnos*, that which can be taught, a technique; the other is a natural intuitive kind, *atechnos* or *adidactos*, that which is not taught.

The former is based upon the observation of phenomena as perceived by the diviner, and is explained by Plato as the search for the future by means of the flight of birds and other signs, which he considered healthy and rational as it was founded upon a proper methodology. The latter he saw as a form of madness or mania because it pre-supposes that a god or familiar, a daemon, has entered into the diviner and has thrown him into an ecstasy or trance – *mania* (Greek) or *furor* (Latin). In this state the diviner can foretell what is to come to pass, what Fate or Providence has in store for us. Of this type of seer are the Sibyls and the Pythia. Cicero points out that the Greek word for divination, *mantike*, is derived from mania or frenzy, whereas the Latin word, *divinatio*, is from *divus* meaning divine or of the gods.

The 'grammar' of the diviners in everyday use, when no great portent such as an eclipse was likely to take place, consisted of relatively simple signs through which the will of Providence could be interpreted. Coming upon any of those animals sacred to a god, such as the owl of Athene, the wolf of Apollo, the eagle of Zeus, the bear of Artemis, the serpent of Asclepius, would be significant. Observing the messages of earth tremors or reading those of a scattered handful of dirt was the practice of land dwellers, while understanding the portents given by the seas, lakes and rivers and observing the behaviour of fishes was practised by lake-dwellers or seafaring folk; these signs, well understood, formed part of the diviner's grammar. Plutarch (c 46–120 AD) believed that fishes, because they were said to be mute, are aware of a prophetic illumination because, being so far from the heavens, they have had to develop reason and intelligence so that they could know in advance what was going to happen. But he thought more highly of birds, for he quotes the dramatist Euripides as saying that they are the messengers of the gods.

Messages from the Birds

The Romans especially practised divination from the flight and song of birds. Birds flying to the east, towards the sunrise, were considered propitious, while those flying towards the west and the sunset, in the direction of the underworld, were a bad omen. If they flew low and hither and thither, it was unpropitious for it indicated that they were agitated or troubled. It was necessary to distinguish between much activity, or *energeia*, and a steady horizontal formation, or *hedra*, the former telling of

Methods of Divination

The following are the technical terms for some of the many methods of divination:

Aeromancy	by atmospheric phenomena; weather predicting
Alectromancy	by a cock picking up grain
Amniomancy	by a caul
Anthroposcopy	by facial features
Arithmancy	by numbers
Astrology	by planets and stars
Augury	from the behaviour of birds
Austromancy	by the winds
Axinomancy	by a balanced axe, or by a stone on a red-hot axe
Belomancy	by arrows
Bibliomancy	by random passages in books
Bletonism	by currents of water
Botanomancy	by herbs
Capnomancy	by smoke
Cartomancy	by cards
Catoptromancy	by mirrors
Ceromancy	by molten wax dropped in water
Cheiromancy	by the hands
Clairaudience	by hearing things inaudible to normal hearing
Clairvoyance	by seeing things invisible to normal sight; second sight
Cledonomancy	from chance remarks or events
Cleromancy	by dice or lots
Coscinomancy	by sieve and shears
Crystallomancy	by a crystal
Dactyliomancy	by a finger-ring
Dowsing	by means of a divining-rod
Geloscopy	by a person's way of laughing
Genethlialogy	from the stars at birth
Geomancy	by dots on paper, marks on the earth, or particles of earth
Gyromancy	by whirling round until dizziness causes a fall
Halomancy	by salt
Haruspicy	from the entrails of animals
Hepatoscopy	from the liver of an animal
Hieromancy	by observation of sacrificed things
Horoscopy	by planets and stars
Hydromancy	by water
Ichthyomancy	by fishes
Lampadomancy	from the flame of a candle or torch
Leconomancy	from the shape taken by oil poured on water
Lithomancy	by stones
Margaritomancy	by pearls
Moleosnphy	by moles on the body
Myomancy	from the movements of mice
Necromancy	through communication with the spirits of the dead
Numerology	by numbers and names
Oenomancy	from the appearance of wine poured in libation
Oneiromancy	by dreams
Onomancy	by the letters of a name
Onychomancy	by the finger-nails
Ophiomancy	from the behaviour of snakes
Ornithomancy	by the flight of birds
Palmistry	by the hands
Pegomancy	by fountains
Pessomancy	by pebbles
Phrenology	by the head
Physiognomy	by the face
Psychometry	by handling an object
Pyromancy	by looking into a fire
Rhabdomancy	by a wand or divining-rod
Scapulomancy	by the shoulder-blades of animals
Scatoscopy	by inspection of excrement
Sciomancy	by shadows, or ghosts
Scrying	by a crystal
Sideromancy	by the movements of straws placed on red-hot iron
Sortilege	by drawing lots
Spodomancy	from ashes
Stichomancy	from random passages in books
Tephromancy	from sacrificial ashes
Theomancy	by oracles, and by persons inspired by a god
Uromancy	by urine
Xylomancy	by dry sticks
Zoomancy	from the behaviour of animals

strong action while the latter suggested a steady purposefulness. These instructions were applied to the behaviour of separate birds, or to just two or three together, as well as to larger formations.

The songs, cries or calls of birds were also considered to have prophetic meaning. Such beliefs survive among country people, fishermen and sailors even today. If swallows do not return yearly to the eaves of your house, it foretells that ruin will come to it. If they dart so low as nearly to touch the ground, storms will spoil the crops, but if they are soaring high it predicts drought. Seagulls inland mean a tempest at sea; a lone seabird is bad news. It is generally unlucky to see one magpie alone, but birds in pairs herald love and friendship. The cooing of doves in a forest in the evening is a warning against thieves, but in the dove-cote it foretells happiness and prosperity. The crowing of the cock reminds man of the Resurrection, but if it occurs during the night it means that there will be treason among friends. Flights of wild swans or wild ducks mean travel and news, but if the birds are flying towards the moon the meaning is loneliness or news of a death.

Cats and Rats

Much of this homely wisdom is founded upon fact, of course, but much also seems arbitrary or fanciful. The hooting of an owl and the caw of a raven tell of death or illness, but the songs of blackbirds bring joyful news. Many peasants think that it is dangerous to the health to listen to the nightingale. The hum of bees brings good tidings unless it is a disturbed buzzing which means trouble, but that of wasps spells visits from unwelcome strangers or evil tongues.

Good news should always be told to the bees, whispered into their hives, if you wish for future blessings. A black cat brings good luck if she comes to you but she must not walk away or disdainfully cross your path. Generally, white cats bring bad luck but if they purr at your feet it is a good omen. (It should be remembered that many of these country beliefs vary from place to place.)

Clay model of an animal's liver, with instructions in cuneiform, used by Babylonian priests in haruspicy, the art of divination through inspecting the entrails of freshly killed beasts

British Museum

The howl of a dog at night means that phantoms are abroad, and a death is indicated. Tiny spiders bring money, while large ones must never be killed, for they are sacred to Athene and encourage industry. A lizard foretells a miscarriage but frogs are harbingers of a life-long passion. Cattle lying down when they should be grazing means bad weather, but when they rush about madly a thunderstorm is near. Rats seen leaving a ship in dock mean that it will founder on its next voyage.

At first glance piebald ponies bring good luck and must be wished upon, but you must not look at them twice in succession or the wish will not come true. Hares in a graveyard are the shades of the dead, while snakes are for fertility unless seen disappearing into the ground, when they are taking messages to the dead. Indeed there is no end to such signs given by Nature that may be read by one who has grown up on the land or lived by the sea.

Homely divination was also practised by taking note of accidental happenings: the chance words of a child, of a stranger passing in the street, of an idiot or an old person. This art, known as cledonomancy, also included studying the significance of names. Thus Herodotus (5th century BC) records that the King of Sparta, Leotychides, when about to go to war against the Persians asked a herald his name. It was Hegesistrate which means 'guide of the army', and the king accepted this as an augury of his

coming victory. To use words blasphemously brings down curses for the future so that it is better, the ancients said, to refer to holy personages or objects euphemistically – the real name of a god, for example, always being kept secret and never being pronounced aloud.

Pausanias (2nd century AD) gives an example of cledonomancy. A man was not sure whether to marry a young woman of his own clan or a rich woman of more exalted rank. While thinking over the problem, he heard a child at play with his fellows shout, 'Take care of yourself' which he at once understood to mean that he should marry the rich one! Was he right? We are not told. But to go about learning by this seemingly hazardous method, one should first go before the statue of the god Hermes when the sacred lamps are burning in the evening. After offering incense and placing money – needless to say – by the altar, your question should be whispered into the god's right ear. Then leave the temple holding your hands over your own ears until, on coming to the market-place, you suddenly take them away. The first words heard will indicate the answer to your question. Such magic do words possess that even now we often make a wish when two of us utter the same word at the same moment.

Dangerous Art

Another method, favoured by the Pythagoreans, who disliked bloodshed and therefore would not practise the inspection of entrails common in antiquity, was called empyromancy. In this the seer concentrated on the smoke which rose from the burning of incense or of laurel leaves or other sacred plants. Divination by inspecting pools, rivers and springs was also practised and led to the present use of a bowl of water and perhaps to the crystal – which in turn led on to mirror-gazing, as used in Japan and elsewhere, to induce trance. Peasant maidens, when they want to behold the features of their future husbands, consult their mirrors when the moon is full. Mirror-magic has also been used for evoking demons and has been considered very efficacious by Cabalists, Rosicrucians and other schools of magicians. But for this a profound knowledge of the names, words of power, occult signs and attributes of a host of devils is necessary, and the art is fraught with great danger.

Divination was also performed by means of sounding, or causing the wind to sound, bronze objects such as shields, bells or musical instruments hung in trees. This may have been a tradition inherited by St Joan of Arc when she heard the voices of saints and angels in the church bells. She was also said to have danced round a fairy oak, which may have induced a trance state if it was true that she could tell certain things about the future, even predicting the day of her own death.

Cleromancy is divination by 'lots', by means of drawing sticks, or throwing knucklebones, dice or coins. The result was by no means thought of as a matter of chance by the Greeks and other peoples of ancient times, but as a sure indication of the answers vouchsafed by the gods; learning the will of the gods by casting lots is mentioned in Homer's *Iliad*. Today we still sometimes decide what action to take by tossing a coin.

Prediction by studying atmospheric effects is called *meteora* and today is transformed into weather prediction. Thunder and lightning either meant that the person struck had offended the gods or that, like Ganymede, he was wanted in heaven. The will of the god was *diosemeia*, a sign from Zeus, for example, when he sent rain or a good harvest. Every star or planet had its divinatory significance; Venus and Lucifer, the evening and morning stars, were beneficent; while Sirius, the Dog Star, was generally malign. As for the moon, both her good and bad influences are well known and the word 'lunatic' was used in the past for those who were once thought to have had their minds turned by her.

Concerning the relationship between reason and prophecy, Plato in *Phaedra* held that this gift is outside the reason, being a kind of intuitive knowing given by divine grace to certain chosen men and women. It is a form of delirium, he taught, in which the unconscious speaks while the conscious mind is in abeyance, and is akin to the state of being in love, and to poetic inspiration (as Robert Graves has also made clear in *The White Goddess*). It is an emotion of being beside oneself or of being taken out of oneself for a while.

Plato gave a physiological explanation of

John Waddington Ltd

Napoleon had his guiding star and 'book of destiny' and was not above looking into the future

the predictions given by the configurations of the entrails of sacrificed beasts, by saying that the emotions operate through the blood, lights and liver, and therefore the gods direct the flow of blood and mark the organs of the body with their designs for the future.

A Surfeit of Black Bile

Aristotle also tried his hand at an explanation; the ecstasy is caused or determined, he taught, by the temperament or chemical make-up of a man. The melancholic, for example, has a surfeit of black bile which can cause blood diseases, fevers and a feeling of drunkenness or 'possession'. Hence the origin of individual clairvoyance is purely natural. But like Plato he makes a distinction between insanity and an ecstasy with prevision. In the latter case the black bile is of a very subtle essence, superior to the other elements composing the body, and similar to the fluids emanating from the stars. This fluid is the ether or the fifth, the divine, element in man.

The Stoic philosophers had a high respect for all aspects of the art of divination. Their two dogmas – sympathy and fatality – served as a basis for their beliefs. They taught that there is a universal or cosmic sympathy between the wholeness of life and each fragment or individual entity. Thus according to them the past, the present and the future remain somehow always inscribed as a cosmic record, which may be read by those with the gift or who have been trained for the task. But, as they pointed out, an astute and subtle intelligence lacking in moral principles might easily distort pure vision with a few profitable untruths, if corrupted with the desire for gain. The growing corruption of the once noble oracles of antiquity allowed the gift of divination to pass out of the hands of the intelligent initiate and fall into those of the wicked witch, the conjurer and the triekster at the village fair.

Centuries of Divination

Divination is still practised seriously in many parts of the world, particularly in Africa, among the American Indians, the Eskimo and the peoples of the Far East. In the West, it reached its highest peak of popularity in Greece and Rome but was already in decline before the advent of Christianity; the overthrow of paganism set the seal on its overt expression. From then on it went underground, since the persecution of witches included diviners as well. However, there were exceptions, such as the French prophet Nostradamus (1503–66). And there was a period during the Renaissance when astrology and divining by the stars was patronized even by the popes themselves.

The 18th century saw a recrudescence of the occult arts. Innumerable cults of a philosophic liberal Christianism or a humanistic Spiritualism became popular in avant-garde salons of Paris and throughout Europe. Illuminati, augurs, mesmerists, mediums, clairvoyants of many different kinds abounded. The famous Tarot cards, by means of which the French Revolution had been predicted at Versailles, passed into the hands of these sophisticated inheritors of the traditions of the Magi. The new leaders of the people, anxious about their personal destinies, resorted more or less secretly to the most renowned seers of the day. Napoleon had his guiding star and his 'book of destiny', and was not above having a peep into the future whenever he got the chance. When the Age of Reason gave way to the Age of Romanticism, the magic arts flourished more strongly than they had done for centuries. In the 19th century, neither atheistic and materialist forces, nor Protestant and Roman Catholic authority, were able to quell the gathering interest in, and need for, an interpretation of life that was neither dominated by theologians nor negated by sceptics.

That there is still a demand for the art of the diviner today is obvious at all levels of society. Gypsies still earn a few coins for a hasty reading of the palm or the cards, and there are large numbers of diviners, clairvoyants, astrologers and others practising in many cities. The clients of these inheritors of the diviner's arts are drawn from all walks of life and include royalty, business executives, film stars and pop singers. And, making due allowance for human fallibility and fraud, who is to say whether the amount of hope given and truth revealed does not far outweigh the falsehoods and failures?

BASIL IVAN RAKOCZI

Believers in this modern millenarian movement see the hand of Satan in anything which hinders their missionary work, from poor health to a car breaking down or a missed appointment: but movements of this sort play an important role in developing countries

DIVINE PRINCIPLES

A YOUNG KOREAN electrical engineer named Sun M. Moon, during the late 1940s and early '50s received a series of what he took to be messages from God which acknowledged him as none other than the returned Christ. Through his divine encounters, he came to believe that a new body of knowledge, The Divine Principles, was being revealed to him. This doctrine unveiled the laws by which God governs man, explained the causes of mankind's problems and God's purposes in human history, and also disclosed the manner in which the perfected and eternal kingdom of God would soon be established on earth.

By the late '50s he had assembled several hundred followers in and around Seoul, Korea. To these believers he announced that the next few years would be the 'Last Days' of the 'world as we know it', a period of 'cosmic tribulation and judgement'. The world was soon to undergo a dramatic, supernaturally caused transformation, through which his faithful followers would become rulers of a restored, eternal and perfect Garden of Eden. Although this imminent transformation was to be effected by 'descending spirit forces', God's Chosen People were obliged to play a role. They were to assemble a large number of converts in order to constitute a 'foundation of the new world'. This foundation was to be the elite which would govern the theocracy of the 'New Age'. And since the restoration of man to God's grace was to involve

Holy Spirit Association

Sun M. Moon *(above)* became convinced that God had chosen him as the second Christ after he had been saved from execution in a Communist prisoner-of-war camp

not just Korea, but the entire world, the foundation had to include persons from a variety of nations. Throughout the 1960s Moon sent missionaries abroad – especially to Japan and the United States – to perform this work. Over the years, the movement gained thousands of converts, claiming membership in some 16 countries. The impact of the cult, popularly called the Moonies (see MOONIES) was considerable.

Spartan Simplicity

Two of the most striking features of the Divine Principles movement are the intensity of the members' efforts to win converts and the degree to which they sacrifice themselves to 'God's newly revealed plan'. If the movement remains a rather minor one, in terms of sheer size, it is not because of any lack of effort on the part of its members. The way of life defined as exemplary by Divine Principles believers is one of spartan simplicity and a virtually total commitment to winning converts. Ideally, the believer is expected to surrender all his material wealth to the movement, retaining only enough to enable him to survive while he carries on his missionary activities. While the members often work at conventional jobs, they keep for themselves only enough funds for the bare necessities of life and for the expenses of individual proselytizing. All the rest of their wages goes into a collective fund, to be spent on the more expensive missionary endeavours, such as printing books and leaflets, and renting communal houses and lecture halls. If a convert's spouse, parent or other relative refuses to convert, it is felt best to sever the relationship altogether rather than risk possible interference with the primary task of witnessing. Occupational career commitments must be dropped unless they increase one's access to potential new and influential converts, for the imminent advent of a perfect world renders all conventional careers meaningless.

Periodically, missionary campaigns are held lasting 40 days, during which thousands of people are sent through the countryside to win new converts. In preparation for, and during, these campaigns, the believers fast and deny themselves even their few normal comforts. A diet of bread and water is defined as proper during such periods. During the campaigns some missionaries live by collecting and selling waste articles. The most devoted missionaries may even become permanent itinerants, especially in South Korea. One such missionary has related:

> My husband and I have been pioneering in different provinces, and to do this we had to send our four children into orphanages. I climb to a mount every day and gather brush and wood to make bundles of fuel to carry down to a village and sell. With the money I buy a few pounds of oats for my living. Supporting myself in this way, I proclaim the truth day after day and month after month.

Suffering, and enduring that suffering, for the Glory of God and the Restored World on Earth is a central theme of everyday life among the believers. Indeed, one *must* experience the suffering of living humbly and of missionizing intensely in the face of rejection, if one is fully to win favour with God or, more immediately, with Moon and fellow believers. On ceremonial occasions, Moon provides special prizes and accords special recognition to those whom he judges to have 'suffered most and for a long time and made a notable achievement' in winning converts.

Associated Press Photo

The Divine Principles movement developed in Korea at a time when that country was ravaged by war, and the example set by Sun M. Moon helped to give many of his confused fellow countrymen a sense of direction

Battle Between God and Satan

A significant part of the movement's appeal lies in the character of what is promised them in return for their sacrifice and endurance. Beginning with their rule over the restored and reformed earth within a few (unspecified number of) years, believers are assured of being virtual demigods for all eternity. Those who convert early, before the truth of the Divine Principles becomes self-evident, and who thus help to bring about the inevitable, will occupy the most favoured positions in the divine theocracy. When the millennium comes, the mass of those who are still unconverted will come before them for judgement. Those who did most to obstruct the movement will be assigned the lowest places in the new world. In the context of such massive and eternal rewards, any present suffering and hardship is viewed by believers as quite minor.

A particularly valued place is promised to Koreans. Not only is Moon the successor to Jesus and the 'Lord of the Second Advent', but Korea is the New Israel and will 'serve as the priest nation for the rest of the world', and as 'God's Chosen People' the Koreans will be favoured in the new order. Seoul will be the world capital and Korean will be the language spoken by all mankind.

The Divine Principles conception of reality also has an appeal of a more immediate and everyday character. The movement believes in extremely active supernatural forces, whose continual presence and acts are constantly manifest in everyday events. This world of supernatural forces is populated by spirit persons – humans who have died, and eternal figures such as God, Satan and the angels, who are themselves divided into two warring camps. God's forces are in constant battle with Satan's forces, contending for control of man in the material world. Since the Fall of Man in Eden, Satan has more or less dominated or controlled man, although the forces of God have continually attempted to throw off this domination.

Now that God has chosen Moon as the second Christ and has revealed his divine plan, this age-old struggle is entering its final and decisive phase. In this last stage, God's forces will win a permanent victory over those of Satan. The fact that these forces are locked in a fight to the finish is constantly manifest in everyday events. All events in the material world are caused by the actions of spirit persons in one or

the other of the two camps. Persons in the spirit world cause events in the material world for a purpose related to this cosmic battle. Satan's spirits hinder and God's spirits help those in the material world who help God (in the form of the Divine Principles movement). Satan's spirits help and God's spirits hinder those who help Satan (which means all who oppose the Divine Principles movement).

This conception provides believers with a simple and powerful scheme for interpreting the 'meaning' of everyday events: anything that hinders or hurts a believer, the movement or those aligned with it, is an attack by Satan's spirits: anything that helps a believer, the movement or those aligned with it, is an act of helping or leading by God's spirits. Through constant application of this scheme in everyday life, members come to have an immediate and close sense of unseen forces operating on the physical order (for example, the weather) and intervening in world affairs, in relations among nations, in the latest national disaster, and in their own daily lives. Missed or caught buses, cars breaking down or running smoothly, poor and good health, missed and kept appointments, chance and arranged meetings, lost and found property – everything and anything – belongs to a world of spirit causality.

Opposition from Parents

As might be expected, the beliefs, dedication and missionizing intensity of Divine Principles followers have indeed generated opposition. In South Korea during the 1950s, the movement experienced an especially difficult time. It was a favourite for 'exposé' magazines, an object of condemnation by more conventional religions and an object of some concern to the government. Apart from the disapproval generated by the heterodox character of their beliefs, various kinds of irregularities (sometimes sexual) were alleged to occur within the movement and it was viewed as having a strong tendency to break up families. It should be noted, however, that matters of this sort have frequently been of concern to conventional citizens when faced with intensely committed 'end of the world' religions.

Perhaps partly as a result of its continual growth, the Divine Principles movement has more recently experienced less condemnation in South Korea. Syncretic religions, combining different religious beliefs, have a sizeable following in that country, making them a political fact of life. Recent regimes have apparently thought it the better part of wisdom to attempt to gain the co-operation of such groups in fostering social reform rather than to suppress them.

Movements like the Divine Principles have an important function in developing countries. They can transform a passive belief in the natural and inevitable character of whatever exists into a faith that things can be changed – by God, man, or both. Though political leaders are apt to put little stock in supernatural forces as catalysts of change, they agree with the fundamental belief that things can be changed, and are disposed to support this belief almost irrespective of the larger creed in which it is embedded. In pre-industrial, developing countries such religions as the Divine Principles can be viewed as cauldrons in which are forged people amenable to the modern mentality.

Outside South Korea the movement only began to 'take hold' in the early '60s. While still only tenuously established in most countries in which it claims membership, it has experienced relatively strong growth in Japan. And, partially paralleling the early difficulties in South Korea, the missionizing intensity and devotion of its members have generated opposition among the Japanese. In the main, this opposition has crystallized around the fears of parents whose offspring have joined the movement. In 1967 a group of deserted parents formed a national organization dedicated to getting their youth to return home and to resume their high school or college studies. Pointing to the Divine Principles' missionary intensity and glorification of suffering, the parents have charged that their children have been 'brainwashed', 'misled', and 'made virtual prisoners' of the movement. And, the parents have charged, as a consequence of the movement's fasting practices, many of their children suffer from malnutrition. The group has held demonstrations outside the Divine Principles' Tokyo headquarters demanding the return of their children and they are said to have undertaken legal action against the movement.

It is in the United States that the Moonies aroused the most bitter controversy outside Asia. As parents became aware of what was happening to their children, they made efforts to rescue them from the organization, and had them 'deprogrammed'.

Middle Class Leadership

While appealing to the poorest and least educated groups, the movement's membership in various countries is also drawn from the middle classes and from the young, relatively educated sectors of the population. In South Korea, in addition to students, the movement draws significantly on young army officers and has some attraction for college teachers. Although the membership with these characteristics is small compared to the total numbers of such persons in South Korean society – and small compared to total Divine Principles' membership – it is very important, for the leadership it provides and for the sophistication it has injected into the movement's policies and strategies. Further, the occupational standing and skills of these members gives them access to the power centres of South Korean society.

In the United States, the believers tend to be of a relatively high educational level, and to be under the age of 30, with the bulk of the membership at least below 40. Many are drawn from what is identified in the United States as the 'lower middle class' or from rural and small town migrants to urban areas.

People who convert to the Divine Principles seem uniformly to be persons who, prior to and at the time of their conversion, are experiencing a sense of meaninglessness both in their own lives and in the larger world. The Divine Principles' view of reality has a strong capacity to overcome this and to give a sense of direction.

Like other millenarian religions, the Divine Principles has, over the years, become increasingly equivocal on the topic of exactly *when* the new world order will be established. In the same way that the early Christians had progressively to attenuate their millenarian expectations as they gained power and respectability, the Divine Principles movement may be entering the early stages of transformation into merely another established religion.

Divine Right

Theory that a king's authority is given him directly by God and that he is therefore independent of the will of his subjects, who owe him unlimited obedience: probably descended from old beliefs about the divinity of kings, by way of the worship of the Roman emperors, the theory was not fully elaborated until the 16th and 17th centuries, when it was asserted by, among others, Louis XIV in France and the Stuarts in England.

See KING.

DOG

The dog's habit of attaching himself to mon and identifying with his moster's interests is no doubt one of the reasons why this animal has been worshipped in many places and held in high esteem. Some would go so far as to say that dog worship is still practised in Britain

FROM THE BONES of dogs discovered in caves, burial grounds and lake dwellings in Europe it is known that a breed existed here in the New Stone Age, and in the Bronze and Iron Ages. The domestic dog is probably descended from the grey common wolf, *Canis Lupus*.

From the earliest recorded times the dog has been intimately associated with man, his home and his family. The first mention of the dog in the Bible may be found in the account of the Israelites in Egypt (Exodus, chapter 11) and an early reference to his being man's companion occurs in the Book of Tobit (in the Apocrypha), when Tobias sets out on his journey, accompanied by an angel, 'and the young man's dog with them'. Both cats and dogs were held in high esteem in ancient Egypt; the city of Cynopolis took its name from *cynos*, a dog. Its citizens were forced by law to provide for all their stray dogs, and they even went to war with a neighbouring city when someone ate one of their dogs. It became customary to name dogs on monuments to the dead: Pharaoh Rameses II (13th century BC) gave his pet dog the name of Anaitis-in-Power, and other dogs which were commemorated by name in this way included Ken, Abu, Akna, Tarn and Temas. Several paintings of King Tutankhamen's dogs have been discovered, elegantly depicted on the furniture of his tomb. One shows the boy king riding in his golden chariot, chasing deer, with two great mastiffs accompanying him, wearing gold collars.

It is believed that the Egyptians worshipped the dog because of their regard for the dog star, Sirius, the brightest star in the skies. Sirius was venerated by all the people of the Nile, who depended on the rise and fall of the great river for their livelihood. The rising of the river marked for them the most important feast day of the year, and when the time for the flood drew near they watched with anxiety for the rise of Sirius, the dog star, over the horizon. This told them that the floods were soon to be expected, and that their New Year was beginning. Falling down on their knees in the light of the star, they worshipped Sirius, faithful as the dog, which never failed them.

Another reason for this dog-worship may have been because the dog-headed god Anubis, or Apu, was said to guide the souls of the dead to the underworld, the abode of Osiris. Thus the god – and the creature whose head he wore – had to be placated and worshipped.

The Smell of an Infidel

The dog was also revered by the early Babylonians, Assyrians and Chaldeans, who were the people living between the two great rivers, the Euphrates and the Tigris. History relates that the Governor of Babylon owned so many dogs that four towns were made exempt from taxes provided the inhabitants fed their dogs properly. Terracotta statuettes of these ancient creatures may be seen in the British Museum, and their names have a familiar ring even today. The last of the great kings of Assyria in the 7th century BC gave such names to his hunting mastiffs as 'He-Ran-and-Barked', 'The Producer-of-Mischief' and 'The Seizer of His Enemies'.

Because the Egyptians worshipped dogs, the Hebrews hated them, and scorned the belief that animals could detect the presence of spirits and ghosts, or were familiar with the world beyond the grave. But the Hebrews, although disliking the dog, were aware of his value. 'Dwell not in a town where no harking dog is heard', they said. According to legend, when the Jews made their silent, secret exodus from Egypt to find the promised land, not a single Egyptian dog stirred: 'they did not move their tongues against man or beast'.

Islam abhors the dog for one of the same reasons as the strict Jew. The animal is

The Hound of Heaven

Behind the image of the watchdog that guards man's possessions, lies that of the personal dog-ghost that protects him on lonely roads; and, deeper still, lies the image of the divine dog that protects man's soul on its way to paradise. Behind the image of the guide dog that leads the blind is that of the personal dog-ghost that guides its master to treasure, and ultimately the divine dog that guides souls through the darkness of the Underworld. (Harnesses moulded on the clay images of dogs found buried with their masters in Chinese tombs are similar to those used by the blind.) Behind the image of the dog that hauls medicine and food to outposts is that of the personal dog-ghost that brings these commodities to the bereaved, and – on the deepest level – that of the divine dog-physician and the suckling bitch-goddess. Dogs on all three levels guard treasure, hound criminals and provide faithful companionship: all three take the initiative in approaching man.

Dog-deities provided the light of the sun, moon and stars, and the waters that fertilized the earth. They were responsible for the potency of man and fertility of women, and they gave protection against all evil influences.

The dog received the souls of dying men. It also judged souls after death, and maintained equilibrium between the light and dark elements. As an incarnation of the Buddha, the dog brought man enlightenment.

Finally, we come to the Hound of Heaven – Christ – the Guide, the Protector, the Healer, the Light of the world, the Judge – who everlastingly pursues man's soul, and operates in the individual psyche as the will towards 'Life more abundant'; as the drive towards greater consciousness.

held to be an unclean eater, a devourer of refuse, and must therefore be classed with the pig. Yet Mohammed allowed dogs to be used for the chase, and the animals captured were eaten, provided the name of Allah was uttered when the hunting dogs were slipped from their leads. The Moslem creed admits two dogs into heaven, Tobit's dog, already mentioned, and the great watchdog Katmir, said to be the Dog of the Seven Sleepers, who appears in the Koran and whose descendants are prized by the Bedouin tribes to this day.

The giant mastiffs of the Knights of St John of Jerusalem, who ruled Rhodes from the 14th to the 16th centuries, were taught to distinguish between the smell of a Turk and a Christian; Spanish bloodhounds helped in the conquest of Mexico and Peru; and in the 16th century there was a spaniel which saved the Dutch republic by awakening the camp of William the Silent just as it was about to be attacked by the enemy.

The Country of the Dogs

A number of strange beliefs concerning dogs are held in the East. In various parts of the Orient it is believed that there are tribes of men whose heads are fashioned in the shape of a dog; Bilad el Kelb, the Country of the Dogs, said by the Sudanese to exist near Uganda, is a land where all the men become dogs at sun-down and run about barking fiercely and hunting in the woods. Arabic superstition maintains that there is a tribe called Beni-Kelb (the Sons of the Dog), in which housewives and daughters look like fair women, but the males have no speech, because they are all white hounds. Some say these hounds 'dwell not in the land of Arabia, but inhabit a country beyond the flood, where they devour their old folk as soon as their beards are hoary'. When they have sight of a guest approaching, says the fable, 'the hospitable men-dogs spring forth to meet him, and holding him by his mantle with their teeth, they draw him gently to their nomad tents, where they give him drink and refreshments.'

The Emperors of ancient China hunted tigers, deer and boar with greyhounds, mastiffs and chows. The chow, the common dog of China, is the village guardian, sleeping in the sun by day, on watch at night. In Tibet, the Lama priests place images of 'dog-lions' in their sacred temples.

It is clear that the ancient Persians venerated dogs because of the many references in their sacred writings. Three kinds of dog are mentioned in the *Zend-Avesta*: the house dog, the shepherd's dog and the vagrant. The stray, prowling around the camps in search of carcases and unwanted food, was a scavenger well provided for, being compared to the begging holy man, and was protected by religious laws. In the *Zend-Avesta* the stray dog is described as being 'self-clothed and self-shud, watchful, wakeful and sharp-toothed, born to watch over man's goods.'

There are only five sins, according to this work, which carry with them the penalty of being cast into outer darkness. Two of

A man's dog has been called his 'best friend' and as such has been shown a devotion which sometimes borders on worship *Above* A cemetery for departed dogs in England; it is an old belief that dogs will accompany their masters to heaven *Far left* The British are particularly renowned for their sometimes eccentric attachment to dogs: this lady is collecting funds to feed her large pack *Far right* Artemis or Diana, the classical goddess of the chase, with her hunting dog: one tragic story tells how a young huntsman, who saw her bathing naked, was transformed into a stag and torn to pieces by his own hounds

The Dog Husband

One of the five daughters of an old woman owned a dog. That girl became pregnant, for the dog changed itself into a young man to become her lover. Her family, ashamed, cast her out. But the girl made fire and survived. Eventually she gave birth to four male pups and one female. They grew quickly. One night months later the girl heard sounds like children playing. She spied on the pups, and saw that they had removed their dog coats and were playing in human form, an ability they had kept secret from her. She quickly took the coats and flung them into the fire. From then on the children walked upright as humans. When the girl's family learned that the children were real people, they were all reconciled.

Abridged from *Folk-Tales of the Coast Salish*, ed. Thelma Adamson

Radio Times Hulton Picture Library

The giant mastiffs of the Knights of St John of Jerusalem were taught to distinguish between the smell of a Turk and a Christian

these concern the dog – giving him food too hot to eat, or refusing him food while humans are eating, The faithful, said the holy law, must 'set aside three mouthfuls of bread and give them to the dog'.

When a man dies, as soon as the soul has left the body, the corpse-demon falls upon the body from hell, and this demon can be expelled ouly by the glance of a dog with four eyes. As the Parsees could never find such a creature, they interpreted the doctrine as meaning a dog with two spots over the eyes.

A yellow-eared, four-eyed dog is believed by many Persians to watch at the head of the Kinvad bridge, the gateway to the next world, and with his fierce barking he is said to drive out the Devil from the souls of the holy ones who walk over the bridge into eternity. This yellow-eared dog, according to the Parsees, was the first creature allowed to guard man's body before God had animated it. 'Arise, O thou yellow-eared dog, arise!' cried God, and the dog immediately barked and shook his ears, so that the Devil, seeing the fierce creature, fled down into hell.

The Watchdogs of Hell

It was considered a serious crime, according to the *Zend-Avesta*, to kill a sacred water dog, the holiest of dogs. This impious act was believed to bring on a terrible drought which would dry up all the pastures, the drought lasting until the dog's killer was discovered and put to death. Then the holy soul of the dog was offered as a sacrifice for three days and three nights, in front of a blazing fire. The slayer had to endure 20,000 lashings on his back, and then to carry 20,000 loads of wood. He must also kill 10,000 snakes, 10,000 tortoises, 20,000 frogs, 10,000 cats, 10,000 earthworms and flies, and after further punishment he was allowed to atone for his fearful crime.

The Hindus believe that the dog is equal to man. 'The wise will look upon a Brahmana possessed of learning and humility, and on a dog'. The dog is therefore a responsible creature, and must pay for his mistakes. Thus, a mad dog that bites without first barking or warning, and wounds a man or sheep, must pay for his crime as if it were wilful murder. In the

Hirmer Verlag

sacred books of the Hindus there are two four-eyed dogs of Yama, the God of Death of early Vedic mythology. These dogs guard the gates of hell, a myth which has a parallel in Egyptian mythology, in which Anubis, the dog-headed (or jackal-headed) god, was given the same task, and also in Greek myth in which Cerberus is the monstrous watchdog of the underworld.

Left **Ceramic dog-lions from China which were often placed in sacred temples: by courtesy of the Victoria and Albert Museum** ***Above*** **In Greek mythology the entrance to the underworld was guarded by a monstrous three-headed dog called Cerberus: Greek vase of the 6th century BC showing the watchdog and Hercules who tamed him**

Superstition in connection with the dog dies hard. In many parts of central Europe today, and in most Slavonic countries, the dog-spirit is believed to live in the fields of ripening corn, so that when the wind rustles the corn like waves, the older folk say, 'Look – the mad dog is in the corn.' This dog is supposed to stay in the cornfield until the last sheaf is left standing. He runs in front of the reapers, seeks sanctuary in the last sheaf, but is finally caught. If a reaper falls ill during the harvest, he is said to have stumbled upon the corn spirit, who has punished him with sickness.

Many legends and superstitions surround the close bond between man and the dog. The Spaniards relate how three dogs, Cubilon, Melampo and Lubina, went with their masters to worship the infant Christ at Bethlehem, so that even today in Spain it is considered lucky to call dogs by these names. In the United States, a yellow dog following you awhile, or a strange dog going home with you, means good luck. A dog rolling over continually means visitors coming; a dog eating grass foretells rain. And as elsewhere, a dog howling at night is a death omen – because of the old belief in the dog's supernatural perceptions, enabling it to see the approach of Death himself.

DOLLS

THE MODERN PLASTIC DOLL which walks, talks and winks its eyes has a lengthy ancestry. Dolls were used as playthings by Egyptian children as long ago as 1900 BC. Many cultures, notably the Chinese, Japanese, Indian, Pakistani and American Indian, have given dolls as playthings to boys as well as girls. Dolls provide far more than mere entertainment to children, whose imagination endows them with personality and even the power of speech. They form a focus for the child's fantasies, are made to act out his desires and fears and are often ritually 'punished' in place of the real object of their owner's anger. Cosseted and buffeted by turns, the doll arouses the maternal instinct and provides a grounding in motherhood.

To an even greater extent in the lives of adults, dolls and figurines of many kinds have a variety of symbolic meaning. In witches' spells, dolls were riddled with thorns or pins and used for malicious purposes (see IMITATIVE MAGIC). They were also used extensively as fertility and love charms in Asia and Northern Europe. In medieval France and England wax dolls were made to lure a lover; held to the breast they melted, and as they dissolved so, figuratively, did the loved one's heart. In Europe the doll was also widely used as a powerful aid to fecundity, and the modern practice of placing miniature figures of the bride and groom on a wedding cake probably originated from this practice.

This same fertility-promoting principle is carried on in the west of England and in other parts of Europe today at harvest time; 'corn dollies', figures or shapes woven from the stems of wheat and barley, are hung in homes, barns and public houses in the hope that the 'harvest daemon' will come and rest in them, thus promoting the growth of the next year's crop (see CORN).

In Catholic countries where miniature statues of the Virgin and the saints are revered, the doll is an honoured artifact. In Japan, during the Girl's Festival, or Hinamatsuri, heirloom dolls are displayed in the *tokonama*, or alcove, of every home which has daughters. The dolls represent a Japanese emperor and empress with their court and, after choice scraps of food have been laid before the tiny figures, the daughters of the household are told exemplary stories of Japanese womanhood.

DOLPHIN

THAT DOLPHINS were especially friendly to man was a widespread popular belief in the ancient world, and there are many stories of boys riding dolphins and of dolphins saving men from drowning. Perhaps the most famous is the story of Arion, the legendary poet and musician of the 7th century BC, who was threatened with death by sailors who coveted his wealth. He persuaded them to let him sing one last song, then leapt into the sea and was carried safely ashore by a dolphin that had been attracted by his singing.

Many similar tales are told of heroes and demigods, and it has been argued that they represent local versions of the myth of the god who dies and is reborn. Sometimes the dolphin conveys the god safely to the underworld, or brings him back in the spring; sometimes the body of the god is carried to his future cult-centre. According to one myth about Dionysus, the god hired some sailors for a voyage and the crew, unaware of their master's identity, plotted to abduct him and sell him as a slave. Discovering this, he manifested himself by filling the ship with wild music and flowing wine, turning the oars into serpents and causing a vine to grow up the mast. Terrified, the sailors leapt into the sea, whereupon Poseidon turned them into dolphins.

The dolphin was associated not only with life and death but with divine wisdom and love. Apollo sometimes appears as a dolphin god, and the foundation of his celebrated oracle at Delphi was attributed to Cretan sailors who had been led there by a dolphin that Apollo had sent to guide them. Aphrodite and Eros are frequently portrayed riding dolphins, and Poseidon found an amorous task for the dolphin when he sent it in pursuit of the nereid Amphitrite, who had spurned his advances. As a reward for bringing her back to him, according to one account, Poseidon placed the dolphin in the sky as a constellation.

The idea of the dolphin as a guide or guardian on a journey, particularly by water

Greek vase showing the legendary poet Arion being carried to safety on the back of a friendly dolphin

Royal Ontario Museum

or to the underworld, was widespread among the Greeks and probably throughout the Mediterranean area. At the Greek settlement of Olbia, on the north-west coast of the Black Sea, tokens in the shape of dolphins have been found in the hands of the dead. Dolphins and deities with dolphin attendants, often in forms that resemble the Greek myths, have also been found at Roman sites from Libya to Britain.

Classical dolphin beliefs survived into the Christian era and were assimilated to at least one Christian legend. The body of Lucian of Antioch, who was martyred in 312 AD, was thrown into the sea but brought ashore by a dolphin, and Symeon Metaphrastes, the biographer of the saints of the Orthodox Church, tells how the saint's corpse was carried upon the dolphin's back 'laid out as if resting upon a bed, and it was a marvel to see how the corpse remained immovable upon such a slippery and round body'.

Dolphins are found not only in the Mediterranean but in temperate waters elsewhere, and they appear in the folklore of various maritime peoples. In Annam, for example, it was believed that dolphins would save shipwrecked sailors from drowning, and to find a dead dolphin at sea was a sign of luck.

That ancient beliefs may not be entirely mythical is suggested by several 20th century reports of drowning people pushed ashore by dolphins, and of dolphins making friends with swimmers and even allowing children to ride them. In recent years, scientists have investigated the reputed intelligence of these creatures and have reported that their dolphins seem to have imitated human speech and to have responded intelligently to certain experiments. However, the possibility that the dolphin is an intelligent species with which man will one day communicate remains a dream. It is a dream in which the dolphin is as benign, and as mysterious, as in the ancient myths.

Houston Rogers

Don Juan

Legendary Spanish profligate, hero of innumerable love affairs, who invited the statue of a man he had killed to dine with him; the statue accepted and dragged him off to hell: Mozart's opera *Don Giovanni* is the most famous treatment of the theme, also used by Shaw in *Man and Superman*.

DOUBLE

It is an old and tenacious belief that the human soul can take visible form, a belief which lies behind the lore of the astral body, the double and the aura, the guardian angel, the doppelgänger and the fetch. That the soul could be projected from the body at will, that the witch could be in two places at once, that a man might see his own phantom shortly before his death, or that others might see it at the moment of his death, are deep-rooted ideas which are still widely accepted today

THE NATURE AND SUBSTANCE of the soul or spirit has long engaged the attention of theologians and philosophers. Certain gifted individuals have claimed to see visible emanations from the human body in the form of astral bodies, etheric doubles, luminous auras, haloes and aureoles; and many of these manifestations have been represented in art, from the ancient Egyptians to the Surrealist painters (such as Magritte) of the 20th century. In primitive art the soul has sometimes been portrayed as 'a sort of gremlin emerging from the mouth', according to one imaginative description of it.

The concept of the human double (or doubles) has remained a constant factor in folklore and tradition, particularly the belief that every human being is accompanied through life by two extensions of his personality, the one good and the other evil; the former luminous and the latter dark and menacing. This curious idea was probably based originally on a primitive rationalization into companion spirits of the reflected image in water and the ever-accompanying shadow.

Constant Companions

A vast wealth of lore, legend and superstition surrounds both the reflection and the shadow the world over. The Zulu, for example, believed it dangerous to look into a dark pool lest he be captured by the in-dwelling spirit, while the shadow – that darker 'other self' which followed man everywhere – might be lost or injured by carelessness. At a Chinese funeral great care is taken to ensure that no mourner's shadow is trapped inside the coffin; while it is the practice of children everywhere to stamp gleefully upon each other's shadow, play-acting the ritual killing of the soul.

It was perhaps inevitable that the dualistic ancient Persians should have considered each human being to be permanently attended by a good and evil spirit, which influenced his thoughts from birth to death. The ancient Greeks numbered these doubles among the daemons. Although the human double could exist apart from its original it would be highly ominous for it to be seen, as this was an omen of death. Significantly, it was extremely unlucky for an ancient Greek to see his reflection in water for this too was a fatal omen, inspiring the tragic legend of Narcissus.

While the Greek daemon later evolved into our more familiar demon, the luminous reflection, transformed into the good genius, became the more familiar guardian angel of Christianity (see also GUARDIAN SPIRITS). In this celestial form the concept of the double survived the extinction of the pagan world, but whether conceived as guardian angel, etheric double or astral body, it persisted in the folk beliefs of the people. With its more primitive aspects unchanged, it survived under a variety of names such as the Jüdel or Doppelgänger of Germany, the *fylgja* of Norway, or the fetch, waft, task or fye of the British Isles.

The most primitive concepts of the soul's function continued to hold sway in popular belief until well into the 17th and 18th centuries. It was believed that the soul could escape from the body, or be stolen, or alternatively be sent out of the body at will. In the days before the development of modern medical science it was generally assumed that the absence of the soul could be the cause of illness, and that death might ensue as the result of the soul leaving the body and wandering abroad. Projection of the soul at will was an extremely ancient feature of folk mythology and is suggested in the book of Daniel (8.2): 'I was in Susa the capital, which is in the province of Elam; and I saw in the vision, and I was at the river Ulai.'

That the soul could wander into the unknown realm of the dream lies behind the primitive belief that it is dangerous to awaken a sleeper, since his soul might be prevented from returning. Even more sinister was the conviction that a soul could be extracted from the body by sorcerers and ghosts. Upon this assumption is based the belief found in Haiti that a soul can be captured and used as an instrument to enslave its owner, leading to the tradition of the zombie (see ZOMBIE).

The myth of soul projection became potentially dangerous during the witch trials of the 16th and 17th centuries, when it was accepted that the witch's double might wander abroad destroying human life and livestock, while its owner was to all appearances elsewhere. Known as 'spectral evidence', the testimony of a witness that the witch had been seen performing evil deeds or attending the sabbath was sufficient in law to bring large numbers of innocent persons to the stake or gallows, despite the evidence of other witnesses that the witch was at another place at the time stated. John Cotta in *The Trial of Witchcraft*, published in 1616, justified this procedure by the following analogy: 'Experience doth show us that the same eye which saw the shape, proportion and figure together with the true substance, doth as perfectly both see and know it, when it is separated from the substance by the art of the painter.'

The Double of Death

The concept of the human double played a prominent part in beliefs about omens of love and death. At Hallowe'en a young girl would light two candles on her dressing table and peer into a mirror while she ate an apple, and it was then that the spectral double of her future husband would materialize in the mirror, looking over her shoulder. A girl with particularly steady nerves might even walk round a churchyard 12 times, after which the double would appear to her.

According to Norse ghost lore every human being had a fylgja, or 'follower', a spirit that was as mortal as the body it reflected and which came into the world in the caul of a newborn babe and was doomed to die when the original passed away. Connected with this macabre theme was the belief that whenever a double materialized.

To see your reflection in a pool or mirror was often taken as a sign of bad luck to follow, for it was thought that you were seeing a visible manifestation of your own spirit. *La réproduction interdite* ('the forbidden double') by the Surrealist painter Magritte: by permission of the Edward James Foundation

Brighton Art Gallery

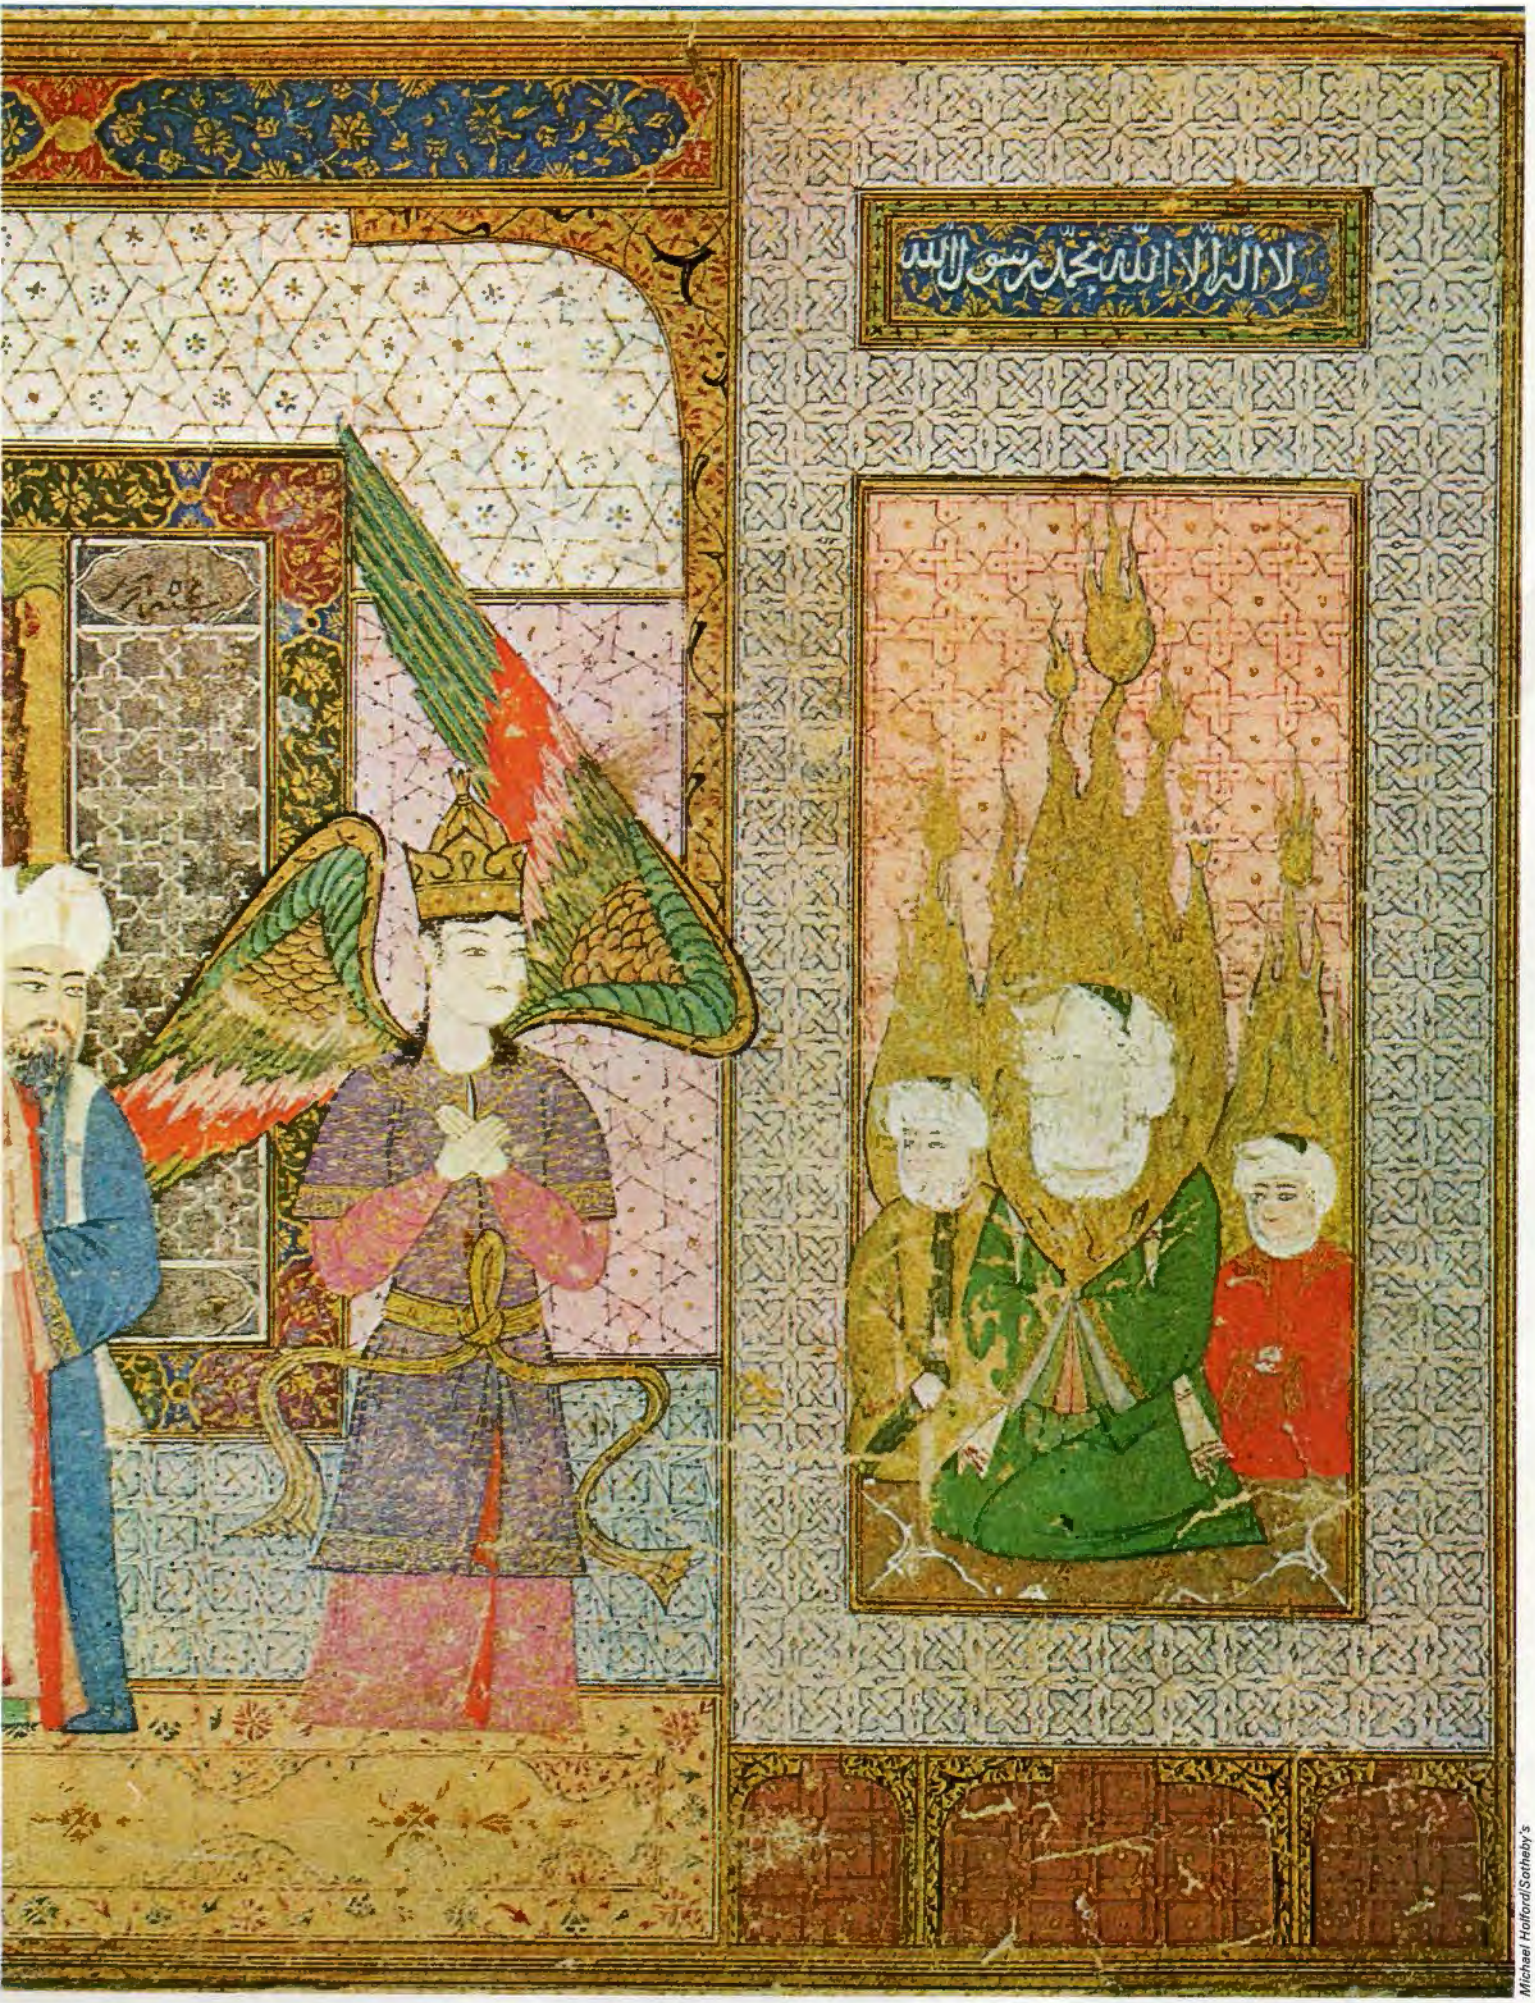
The halo which surrounds the head of the Christian saint has a counterpart in other beliefs: Moslem prophets are often depicted enveloped by flames, a symbol of their spiritual power: 16th century Turkish manuscript showing a prophet visited by an angel and holy men

death was near at hand. An old custom enabled the morbidly inclined, by keeping watch in the church porch on the eve of St Mark, and sometimes on All Soul's Day and Christmas and Midsummer Eves, to witness the shadowy forms of all who were doomed to die in the parish in the succeeding 12 months pass into the church at midnight. It was not unknown for a watcher to see his own double, a far from comforting experience for it was a sign that he too must follow the others.

Far more common, however, are reports of phantoms of the living presenting themselves at the moment of death to an intimate relative or a dear friend. Known as the 'fetch', this type of manifestation is an extremely common feature of the psychic lore of Europe. According to tradition, if the fetch was seen early in the day it was a sign that death would not take place at once: however, should it appear at night, death was likely to occur immediately. In Scotland such wraiths appeared before the shuddering beholder wrapped in their winding sheets. The Irish fetch provides the theme for a number of ghostly anecdotes in which the human being is haunted by his own double. Many modern psychical researchers consider the fetch to be a projection of thought, rather than an actual double, but to our ancestors its genuineness was beyond dispute.

Seeing Your Own Double

Robert Dale Owen, the 19th century Spiritualist, has described how a woman's dying brother appeared to her at the moment of his passing. In the proceedings of the Society for Psychical Research there is an account of the Birkbeck ghost, the apparition of a mother seen by her three children shortly before her death. One of the oldest traditions of this character relates to the 'death fetch' of William Rufus, which was seen at Bodmin in Cornwall flung over the back of a diabolical black goat at the very moment when the king was pierced by an arrow in the New Forest. There is a curious tale in Moreton's *History of Apparitions* in which the double of a young man living in the East Indies, who was about to be disinherited by his father, suddenly materialized in the lawyer's office, terrifying those present with the dramatic command, 'Hold!'.



Michael Halford/Sotheby's

The Empress Catherine the Great responded in a typically autocratic manner when her doom-laden double advanced towards her, for she ordered her guards to open fire on it

Sometimes a fetch would materialize before the eyes of its human original, a horrifying experience because it was an omen of his death. John Aubrey, the 17th century antiquary, relates how Lady Diana Rich saw a vision of herself as clearly as a reflection in a mirror, as she walked in the grounds of Holland House in London: a month later she was dead. Her sister, Lady Isabel Thynne, had a similar experience before her death. In the same century, a Dr William Napier, while staying at an inn, saw his own corpse lying on a bed and did not live long afterwards. Queen Elizabeth I, immediately before her death, was shocked to behold a vision of herself on her death-bed, looking 'pallid, shrivelled and wan.' Goethe and the poet Shelley were also privileged to see their own death fetches. The Empress Catherine the Great responded in a typically autocratic manner when her doom-laden double advanced towards her, for she ordered her guards to open fire on it.

Old ideas about the double became involved in the superstition of the falling picture. The portrait was thought to contain the soul or double of the person portrayed, and should it fall it was regarded as a sign of his impending death. There are households even today where after a death occurs, all mirrors are covered – a custom that originated in the belief that the doubles of the living projected into the looking-glass would be carried away by the ghost of the departed to the land of the dead.

The subject of the human double is still very much an open one, and is an area of considerable study and research. It is interesting in this respect, to note reports of the results of recent investigations carried out with the drug L.S.D. Not only were the subjects apparently able consciously to transform their reflections in a mirror into extraordinary shapes, but to see their own body images projected on the walls of a room or in a crystal; thus reconstructing experimentally some of the most tenaciously held beliefs about the double in European folklore.

ERIC MAPLE

***How They Met Themselves*, by the English painter Rossetti; witches and sorcerers were thought to be able to project their souls at will, but to see your own double materialize was usually a sign that death was imminent**

The Human Aura

The word 'aura' is used by occultists to mean a faint cloud or luminous appearance which has been seen surrounding the human body by certain gifted individuals or clairvoyants. The aura comes from the same layer of occult speculation as the astral body and the etheric double, speculation about the nature of man.

It is clear that besides an objective visible body, each human being has subjective invisible experiences, of which he himself is aware but which he can only make others aware of by means of speech, gestures, writing and other signs. These subjective experiences include sensations, memories, thoughts, urges and decisions; all of which have been classified by psychologists ancient, medieval and modern. In all religions these invisible parts of a man are regarded as more important than his body.

The question is whether those inner, subjective parts of a human being, which undoubtedly exist, ever become observable as outer, objective phenomena – specifically, in the form of an aura. At the lowest level, a materialistic explanation will dismiss the aura as being no more than gaseous substances emitted from the human body; and one sceptic writing on the subject has referred the aura to body odour. But besides odours, many living things also give off radiant heat. Warm-blooded animals can be detected by their heat in the dark, by snakes which prey on them. Some animals are luminous – for example, the glow-worm. Electricity is generated in living processes and can be helpful in the study of them.

In 1858 a well-known industrial chemist, Baron Karl von Reichenbach claimed to have discovered certain radiations coming from magnets, crystals, plants and animals, which could be seen and felt in the dark by sensitive subjects after acclimatization for two or three hours. The north pole of a magnet sent out a blue glow and a cool current of air, the south an orange appearance and a warm feeling. The same was found with the ends of crystals and with parts of animals. The human body showed blue and felt cool on the right side, orange and warm on the left. The radiation was called Od, Odyle or Odic Force. The hypnotist de Rochas in France and William Gregory, Professor of Chemistry at Edinburgh, also believed they had observed it.

In recent years the psychoanalyst Wilhelm Reich has claimed to discover a common functioning principle in living and non-living things, manifesting fully only in the former; in observing it, he finds the same polarity of the blue cool radiation as against the warm orange.

Many other alleged radiations have been suspected of playing a part in the phenomenon of the aura, including the mitogenetic rays discovered by A. Gurwitsch in 1923, which emanate from plant tissue and affect the cell division of yeast. They are ultra-violet radiation of low intensity.

Kilner's Auras

Although it had often been claimed that the human aura had been seen by clairvoyants, it was not until 1911 that W. R. Kilner devised ways of showing it experimentally. He did this by two methods: firstly by looking at the human body through a dilute solution of a dye called *dicyanin*; and secondly by looking at a very bright light through a strong alcoholic solution. The second method must be used for a brief period only, as it is otherwise dangerous. Later, H. Boddington discovered a type of glass manufactured in Czechoslovakia which dispenses with the use of solutions. Kilner also used carmine and since his time a number of other dyes have been found to be more or less satisfactory.

The aura can only be seen against a dead black background. It is not a vapour but appears as a radiation, usually blue-grey in colour. It is also seen in magnets and other objects, and is affected by magnets. It changes with age, but only to any marked degree in females. Kilner distinguished between an outer aura, which was without regular shape, striated (marked with small parallel lines) not visible with the carmine screen, $1\frac{1}{2}$ to $3\frac{1}{2}$ inches in breadth at different places; an inner aura visible through the carmine screen, and inside the inner aura an apparently empty space in which careful investigations showed faint coloured striations, uniformly a quarter of an inch deep when visible. Later the author distinguished an ultra-outer aura, seldom visible.

Kilner's main object in these researches was to aid diagnosis of disease, because he believed that illness caused changes in the appearance of the aura. He identified the

Robert Doisneau/Rapho

innermost of his three subdivisions of the aura with what is called the etheric double. Clairvoyants who have specially trained consider this the most dense vehicle, the 'health aura' or a visible part of it. The etheric double is probably physical matter of a refined character. Highly trained clairvoyants are said to see the astral body, which is so called from its starry appearance. A few privileged seers claim to see the 'mental body' or even the spiritual centre of the being, but this must be rare.

Halo and Aureole

The ancients represented the aura in art. The Egyptians believed in various invisible parts of man, which they sometimes represented in visible form in their inscriptions. Sometimes they showed a sort of halo around the head of an important figure. The gods of the Hindus were often shown with the halo and it was not unknown among the Greeks and Romans. The founders of the Sikh religion were later portrayed with it. Moslem rulers were shown with a flame about the head and as Moslems were forbidden to use human religious images, the prophet himself was sometimes represented in pictures wholly by a flame.

In Christian art from the 5th century to the 16th the aura was almost invariably shown around important figures by a *gloria*, a luminosity around the head or whole body. Later the practice was often revived. A halo which surrounds the head only is termed a *nimbus*, but if it extends around the whole body it is called an *aureole*. The significance of both was spiritual power.

Eugen Kusch

Top **Henri Heraut, a Parisian artist, claims that he is inspired by dreams to create dolls that look like himself. Some might credit him with a macabre sense of humour, for in more superstitious societies effigies of this kind were thought to house the spirit of a person *Above* Black clay urn from an early Peruvian culture, showing a priest with his *alter ego*, or 'other self'**

The nimbus was given to both good and evil beings. The three persons of the Godhead were invariably shown with the nimbus. Christ usually bore a cross inside the nimbus and the cross sometimes appeared in the nimbus of the Father and the Holy Ghost. The Apostles and all later saints were also entitled to a simple nimbus.

The nimbus was also shown on personified figures of the planets and constellations. On powerful rulers the nimbus was often shown, even when they were evil. It is remarkable that the Pharaoh who opposed Moses, Herod who slaughtered the innocents, Judas Iscariot, the Beast of the Apocalypse and Satan himself were shown with the nimbus. The aureole was generally but not exclusively confined to God and the Virgin Mary.

The nimbus was of different colours. God and the saints generally had gold, the patriarchs silver, more ordinary people mostly red, blue, green and violet. Evil beings had a black nimbus. Living persons had a square nimbus, spiritual beings a round one, while the triangular nimbus, when used at all, seems to have been reserved for the Godhead.

DOUKHOBORS

THE NAME DOUKHOBORS was given to a nonconformist Christian sect of Russian peasants who first appeared in the latter half of the 18th century: it was a derogatory term coined by clergy of the Russian Orthodox Church and means 'spirit-wrestler', in the sense that the sect was battling with the Holy Spirit. The Doukhobors themselves claimed that they were fighting alongside rather than against the Holy Spirit, but the nickname, like other religious nicknames such as Quaker and Shaker, persisted in common usage.

Theologically the Doukhobors appear to have had their roots in the beliefs of the Judaizers, a heretical Russian sect which denied the Trinity and the divinity of Christ, the Paulicians – another Russian sect – who protested against religious formalism and rejected the Old Testament, and the Bogomils (see BOGOMILS).

The Doukhobors began by rejecting the authority of the Russian Orthodox Church, claiming that the worship of icons and saints, the doctrine of the Trinity and all forms of ritual – including the Sacraments – were ill-founded. They regarded man as the 'living book' and accepted the gospel only in a figurative sense. Later, they extended their dissent from the Church by including the government in their condemnation, and in particular refused to accept the idea of military service, which was then compulsory in Russia. As the price of their nonconformism the Doukhobors suffered cruel persecution throughout the 19th century, being deported several times to different parts of Russia.

Appalled by reports of their suffering, the writer Leo Tolstoy and a group of sympathizers, which included the Society of Friends (Quakers) in England, petitioned Nicholas II to allow the Doukhobors to emigrate. Representations were made to the Canadian government and in 1899 the first immigrant party arrived on Canadian soil. Land was allocated to them in the Far West and they were cordially received.

The first colony to arrive in Canada numbered about 7500. According to the most recent estimate some 20,000 Doukhobors inhabit Vancouver, Alberta, Saskatchewan, and British Columbia today. The main concession made by the Canadian government was that of exemption from national service on religious grounds; to obtain this exemption the Doukhobors are required to belong to the Union of Doukhobors of Canada, the Union of Spiritual Communities of Christ, the Named Doukhobors of Canada, the Society of Independent Doukhobors or the Christian Community and Brotherhood of Reformed Doukhobors.

In recent times, the sect has made its living mainly by farming, although the

When the Russian Doukhobors find themselves in conflict with the Canadian government, they register their protest by stripping off their clothes *Above* and *right* Members are removed by mounties from a political meeting

original Christian-Communist outlook has largely collapsed. Many Doukhobors refuse to accept government tax levies, as they reject individual land ownership and the registration of birth or marriage. Despite their professed pacifism, the sect has resorted to acts of sabotage, together with mass protest rallies in the nude when their beliefs bring them into open conflict with the government; on occasions, the Royal Canadian Mounted Police have successfully dealt with the latter form of protest by the use of itching powder.

The Doukhobors have little indigenous art or culture; they claim that artistic development leads to competition, and a similar objection to formal education causes a good deal of trouble with the educational authorities. Although they accept a slightly modified version of the Scriptures as a basis of their faith, they generally abhor the written word, and include the Bible in this general aversion, passing on the teachings of Christ by word of mouth.

The 'Sons of Freedom', an extreme wing of the Doukhobors, have used subversive action for years in an attempt to force the Canadian government to deport them back to Russia – blandly disregarding the fact that the assent of two countries is needed for deportation, and that Communist Russia is unlikely to welcome them back to the land of their troublesome fathers.

The Doukhobors, who reject religious formalism, emigrated to Canada at the turn of the century to escape persecution

One of the most important birds in mythology and folklore, the dove has a curiously mixed symbolism. It is the bird of love but also the bird of death and mourning

DOVE

A NUMBER of different strands have contributed to the folklore and symbolism of the dove, and so various themes are involved. This is understandable when we consider that the folklore concerns more than one species and that different aspects of the bird's behaviour have caught the attention of people in various communities. In most ancient writings the bird referred to is commonly the domestic *Columba livia* but species are not always clearly differentiated; when the allusion is to migratory species the turtle dove *Turtur communis* is concerned, or in Asia Minor *Turtur risorius*.

The domestication of the dove (or pigeon) dates from remote times, as early Egyptian tomb paintings testify. There was a 'pigeon post' in Babylon and according to Pausanias, the Greek traveller and geographer of the 2nd century AD, a winner at the Olympic Games sent news of his success to his father by homing pigeon. The Saracens also used pigeons during the Crusades to maintain communications. But in the Middle East as well as in Europe dove cotes were built and the breeding birds were often exploited for food. Such dove cotes dating from the Middle Ages may still be seen in the English countryside.

Although the flesh of doves has been found appetizing by many peoples and pigeon pie was a popular dish in England, there were inhibitions among the Semites against eating it; this was probably because of the birds' associations with divine beings. At Hierapolis in Syria, one of the chief centres of the worship of Atargatis, a deity similar to Astarte and Ishtar, the statue of the goddess was surmounted by a golden dove. The birds were regarded as so holy that a man who was impious enough to touch one was regarded as defiled for a whole day.

British Museum

The Greeks explained in a myth how the dove became associated with Aphrodite, the goddess of love. The goddess and her son Eros were playfully competing in picking flowers and as Aphrodite was winning because she had the help of a nymph named Peristera (Dove), so Eros turned the nymph into a dove and henceforth she remained under the protection of Aphrodite. A Greek writer mentions that as Adonis had been honoured by Aphrodite, the Cyprians cast doves into a pyre to him. The mythology of the goddess, whose names Aphrodite Anadyomene signify Sea Foam, Rising from the Sea, and especially the story that she was born from an egg brooded by a dove and pushed ashore by a fish, suggest that her cult came from across the sea to Greece (see APHRODITE).

Like a number of other birds with religious associations the dove came to be regarded as oracular. According to Virgil, two doves guided Aeneas to the gloomy valley where the Golden Bough grew on a holm oak. There was a tradition at Dodona in Greece that the oracle was founded by a

Left **The modern use of the dove as a symbol of peace derives from the story of Noah and the Ark. When the bird returned with an olive leaf in its beak, Noah knew that the flood waters had subsided *Right* To the Greeks and Romans the amorous dove was a bird of love; the Romans sacrificed doves to Venus, goddess of love, and depicted her riding in a dove-drawn chariot; from the *Roman de la Rose***

British Museum

dove, and the oracle in the oasis of Siwa (Ammon) which Alexander the Great sought out was similarly reputed to have owed its origin to a dove. The Romans sacrificed doves to Venus, goddess of love, whom Ovid and other writers represented as riding in a dove-drawn chariot.

The Roman worship of Venus was to a large extent derived from a Phoenician sanctuary (Eryx), where the dove was revered as the companion of Astarte. Thus European beliefs concerning doves were mainly derived from Asia. It may be that the association in the Middle East between doves and goddesses of fertility arose from the conspicuous courtship and prolific breeding of the birds.

The use of the dove as a symbol of peace, in which role it commonly appears today in cartoons, is derived from the reference in Genesis (chapter 8), describing the return of the dove to the Ark. On being sent out the second time, the bird reappeared with an olive leaf in its beak 'so Noah knew that the waters had subsided from off the earth'. Thus the dove became associated with future prosperity and tranquillity, and hence with peace.

To Christians the dove is a symbol of the Holy Spirit and an emblem of purity. In this 13th century English manuscript the doves eat the fruit of a tree while the dragons below wait to catch them; the tree stands for God, and the dragon, which cannot live in the shadow of the tree, is the Devil

Bodleian Library Colour Filmstrip

Symbol of the Holy Spirit

The importance of the dove in Christian symbolism is derived from the account of the appearance of the bird at Christ's baptism (Matthew, chapter 3; Mark, chapter 1). From the time of the early Church to the present day it has been the symbol of the Holy Spirit, and from the 5th century the dove was shown in pictures of the Annunciation. It also appears in representations of the Creation as the spirit of God 'moving over the face of the waters'. The white dove has long been an emblem of purity and doves were offered in the Jewish rite of purification (Luke, chapter 2). In Malory's *Morte d'Arthur*, as the Holy Spirit appears to Lancelot, a dove carrying a tiny golden censer in its beak enters by the window, impressing the Knights of the Round Table with the purity of the castle of Pellas in which they are assembled. The incident is represented in Wagner's opera *Parsifal*.

Doves feature in the biographies of Saints and Christian personalities down the centuries. In the 3rd century the election of Fabian as Pope was regarded as divinely indicated by a dove alighting on his head, and when Clovis was consecrated on Christmas Day, 496, a pure white dove was said to have brought a vial filled with chrism (anointing oil). Probably because of its association with the Virgin Mary, the dove became an emblem of innocence.

The Mourning Dove

For some North American Indians, though, it was an emblem of improvidence or incompetence. California and Great Basin tribes tell many proverbial fables about Dove's inability to build a sound nest, or to profit by the teaching of the thrush.

The voices of doves have contributed to their folklore – which, in America, seems often to have been transferred from the English cuckoo. In Georgia, a girl hearing the calls of the returning doves in spring performs a ritual derived from an English cuckoo ritual. After taking some steps she looks in her right shoe for a hair which will match the colour of the hair of the man she will marry. Rural lore also says that the dove's call (like the cuckoo's) predicts rain. Unlike the cuckoo, a constant call of a dove is an omen of death.

Doves have been widely associated with death and mourning, probably due to the soul-bird belief – which is shared by many North American Indian tribes. An English folk belief suggests keeping a live pigeon or dove in the bedroom of a dying man, to prolong his life till the family gathers, apparently because the soul, with an affinity for the bird, might thus be made to linger. But in the United States the bird is also a health bringer: turtle doves nesting near a house keep off rheumatism, and a dead dove placed on the chest cures pneumonia.

Even some sceptical scientists have acknowledged that dowsing works. But just how the dowser finds what he is searching for by means of a rod or pendulum is still uncertain

DOWSING

THINK OF A DOWSER and your mind probably calls up the picture of a man with a forked stick in his hands, striding across a field and waiting for some mysterious force to drag the stick's end downwards – like a hunting dog on point – indicating the presence of water underground. And if you believe in reasonable and sensible explanations for things, you probably dismiss this picture and its real-life counterparts as charlatanry or superstition or both.

The picture may be inaccurate but like many popular views it persists in spite of the facts. And certainly the popular idea of dowsing has enough accretions of the overtly supernatural to make it highly dubious in the eyes of 'sensible' folk. Tradition says, for instance, that the forked stick should be hazel – but of course an even older tradition places hazel near the top of the list of 'magical' woods, a vital ingredient in many charms, amulets and folk cures. Folklore offers rowan and ash substitutes for hazel in the dowsing rod, and these are also magical woods. The forked stick, too, has its witch associations, since it was on such an implement that witches were supposed to ride to their sabbaths, as many of the old demonological woodcuts show.

It is the central premise of dowsing, however, that arouses most scepticism: that some unseen power or force exerts itself on the stick, in the presence of unseen water (or other materials); and that this effect takes place only when the stick is held by someone with the dowsing talent, who acts as a kind of transformer or perhaps amplifier of the unseen force.

When people begin talking about special mysterious forces and special mysterious abilities, there is a danger of the whole subject sliding rapidly into what Freud called the 'black mud' of occultism. Many dowsers and a few other interested parties have been anxious in recent years to reject imputations of the supernatural, and have borrowed (from J. B. Rhine and other experimenters in telepathy) the less loaded and more modern term 'paranormal' to describe the dowsing ability. They also reject the familiar term 'water divining' – claiming first that more things than water are sought, and secondly that the seeking has little to do with divination. So 'dowsing', an elderly term with obscure origins, has become their favourite name for themselves. There are many organized Societies of Dowsers in Britain and Europe, none of water diviners. (No such groups exist in the United States.) Dowsers try to make clear what their activity is, at its widest and most factual. They have also set up different kinds of experiments to test dowsing, empirically, to show whether or not it works. They have faltered only when they came to offering some plausible explanation for *why* it works, when it does.

Finding Buried Treasure

What happens in dowsing is fairly straightforward, if also fairly wide in scope. A person uses some implement to find, by a non-physical means, the whereabouts of some material that would otherwise be hidden to his senses. Subterranean water in all its forms (streams, artesian wells, pools and so on) is the most common object of the search. But almost as often the goal is some mineral, like coal, iron or other useful metal. Dowsing was also used for centuries in searches for buried treasure, because of its metal-finding efficacy, until modern technology adapted wartime mine-detectors into metal-detectors for such purposes, so supplanting the dowsing rod.

In archeology, too, dowsers have played a part in determining the position and extent of ancient remains. Yet another use for dowsing is to search for lost objects, usually Granny's precious ring and the like, but it is sometimes employed in more important matters. Dowsers were in demand during the California gold rush and in other mining areas. A British dowser named W. H. Burgoyne claims that he has frequently been requested, often by the police, to help in searches for corpses of the drowned. And medical dowsing uses the implements to locate the whereabouts and nature of an illness within a patient's body.

Just as the object need not always be water, the implement need not be a forked stick, or indeed any kind of stick. It can as easily be a bent metal rod or wire – a long piece with a right-angle bend at one end, where the hands grip it – or a pair of these. One well-known Oregon dowser used a copper rod and radio tube as his personalized

The high degree of success achieved by dowsers in their search for hidden objects continues to baffle scientists. The implements used to indicate the whereabouts of water, for example, may include a pendulum or similar weight attached to a silk nylon thread (*top left*), a long metal rod or wire with a right-angle bend at one end (*top right*), or the more traditional forked hazel stick (*right*). The presence of water underground is somehow transmitted through the dowser to the implement, which begins to tremble

Simon Field

Radio Times Hulton Picture Library

Dowsers believe that they are endowed with a finely tuned faculty which reacts to the presence of certain objects, causing muscular contractions that affect the rod or pendulum *Left* Using an accurate map this dowser practises his art in the comfort of his own home, later visiting the sites to confirm his finds *Right* Sometimes the vibrations are so strong that the dowser has to struggle to hold on

equipment; another Oregonian, the even more famous Clyde C. Hammerley, used a forked bronze bar. But then the implement could also be a pendulum or similar weight on a silk or nylon thread. Often the pendulum is used together with a rule or a protractor-like disc, especially in medical dowsing, when the pendulum's movement along the gradations of rule or disc provides information towards the diagnosis. Many dowsers have their own highly individualized implements, which work for them. In the case of the rods or sticks, they may be held in a variety of ways, lightly with the fingertips, or gripped tightly in front of the chest with the heels of the hands outwards and the palms down.

Dowsing at a Distance

So the dowser chooses his favourite implement and goes in search of whatever is wanted, and at that point we leave the area of hard facts and confront pure mystery. For when the rods tremble and dip above a perfectly unremarkable spot of ground, or when the pendulum alters the direction of its swing, something has caused the phenomenon. It is wholly unsatisfactory to say that dowsers are all frauds, pushing the rods down or adjusting the pendulum when they choose to do so. Yet it is also a trifle unsatisfactory to say that the rods move of their own volition – though anyone who has watched dowsing will agree that it sometimes looks that way, with the rods flailing and waving madly and the dowser apparently struggling to hold on. Dowsers know, of course, that the implement cannot do the work itself: the manipulator must have the dowsing ability. Somehow, in the presence of water or whatever, that ability responds and, dowsers believe, causes *unconscious* muscular contractions that affect the rod or pendulum.

It must be emphasized that the dowser believes himself largely unable (on a conscious level) to detect the object of his search without the implement. Certainly he would agree that he could not pinpoint its location. Nor does he believe that his talent will work unless he has first concentrated his mind on the material for which he is searching. As he sets out across a field with his dowsing rods, he is clearing his mind and thinking only (for instance) about water; this concentration gives his talent space to operate, while the rods reinforce and focus it, as a means of bringing into conscious awareness the dowser's unconscious perception of water.

Apparently the effect can be achieved without the dowser's physical presence on the scene. Many searchers after water or minerals do their dowsing in the comfort of their own homes by moving their rods or pendulums above *maps* of the area in question. Henry Gross of Maine, perhaps the best known dowser in the United States, claimed many successes by map work. The dowser may visit the sites later, to confirm his findings and to pinpoint them more accurately. But such dowsers believe that distance has no effect on their perceptions.

So far at least, it seems there is nothing difficult about dowsing. Anyone can try it to see if they have the talent with a bit of bent wire in the garden, or over a good big map with a homemade pendulum. It is all the more odd, then, that such a simple process with such great potential value should be comparatively young. Ancient myth and legend offer stories of magical rods (those of Hermes and Aaron leap to mind), but these are more akin to the magician's wand than the dowser's rod.

It may be true that the charmed sticks of primitives that trembled and vibrated when a ghost had been conjured up (as in old Melanesian lore) or when in the presence of a thief or his hidden loot (as in old African lore), are in fact early forerunners of the dowsing rod. But dowsing as we know it, with its more practical uses, was born later. Even classical times seem to have been without it: ancient Greek and Roman water finders had an armoury of spells and incantations but were not dowsers. Not until the Middle Ages do references unmistakably concerned with dowsing begin to occur in learned works. It is known that

dowsing was used by prospectors for minerals in the Harz mountains in the 15th century. German miners brought the practice to England in the reign of Elizabeth I. By the following century it had become well established, enough to cause Martin Luther to abjure it, and Georgius Agricola to include in a treatise on mining the first (but hardly extensive) investigation of it.

By the 17th and 18th centuries the dowsing rod stood prominently in lists of essential 'scientific' instruments, and had gathered a considerable documentary background. That background included a sturdy array of scoffers, including Sir Thomas Browne and Jonathan Swift. But in spite of rationalist attacks on dowsing as a superstition, and religious attacks on it as a devil's contrivance, it went on gaining in popularity. Hordes of men in Europe and Britain, by the 19th century, were engaged in the practice; similar hordes were writing accounts of successes. Gradually the dowser's defence was taking shape: it said, don't confuse dowsing with sorcery or superstition, because however it happens it can be *seen* to happen.

In the 19th century there were some people who were prepared to take a more practical view, such as two hard-headed American engineers, who tried dowsing for themselves. They discovered that it not only worked for them but that it found water in places where their hydraulic engineering training and experience would never have led them to look.

Modern scientists on the whole remain sceptical. They are not impressed with the stacks of documented successes from past dowsers: the quantity of the evidence does not necessarily prove (they say) each individual case. Geologists, as would be expected, hold particularly strong views on the subject. They tend to feel, first, that dowsers are too often wrong, and therefore too unreliable, to be taken seriously; and secondly, that when the dowsers are right it is probable that their experience has made them subconsciously aware of land configurations and other physical signs pointing to the presence of water. But certainly not all geologists dismiss the dowsers' claims: some eminent geologists have themselves been dowsers, using it in their work. And a great many others maintain commendably open minds on the subject.

Sensitive Plant

A few scientists have set up experiments to test dowsing. A number of accounts of experiments can be found in Sir William Barrett's book *The Divining Rod* (1926), including a well-documented account of a test in the 1890s, involving the great British dowser John Mullins, who found abundant water on an estate in Sussex where hydraulic engineers had failed. But such old instances seldom convince a hidebound sceptic, mainly because the conditions do not meet the rigour of controlled laboratory experiments. D. J. West, an authority on psychical research and allied matters, acknowledges the number of cases in which dowsers apparently achieved spectacular successes 'in the field'. But he adds that in systematic laboratory tests 'the level of success has always been inferior to the reports of outstandingly accurate performances in natural surroundings'.

From such a statement a sympathetic reader might take the point that dowsing (like telepathy and other 'paranormal' phenomena) is a delicate plant that does not transfer readily from natural surroundings to the clinical world of laboratories. But scientists reject this possibility, and demand that any such phenomenon subject itself to controlled experimentation. In 1968 the British author and broadcaster Brian Inglis investigated dowsing in a television programme, in which his representative sceptic, a university professor and psychologist named John Cohen, asserted that dowsing's reality 'has not been demonstrated yet – not scientifically'. Accordingly, a controlled demonstration was arranged at which a part-time dowser named Robert Leftwich scored considerable success.

Professor Cohen claimed, however, that the experiment was not really scientific and at Mr Inglis's request set up a second experiment entirely under his own control. A patch of ground was chosen and five cans of water, a knife and some dummy containers were buried by the Professor and his assistants at spots unknown to anyone else. The dowser picked up three out of five cans of water but failed to find the knife. Although Robert Leftwich considered the result disappointing, Professor Cohen was impressed – particularly because there was

Engraving showing the different ways of holding a divining rod. Unlike other ESP phenomena, positive proof of success in dowsing can be easily found, by digging

Bettmann Archive

no possibility of visual clues having been picked up from the topography – and handsomely admitted his amazement and his agreement that there seemed something more to dowsing than he had thought. He still refused to accept any supernormal explanation without a good deal more investigation, and he announced his determination to go on experimenting.

All this is taken to reinforce the dowsers' standard reply to accusations that they usually do badly under test conditions. They reply that being surrounded by scientists and other observers, few of whom are sympathetic and many of whom are openly critical, tends to throw off their finely tuned faculty. In the above experiment there was the added pressure from the presence of television cameras and crew, causing natural nervousness which would interfere with Mr Leftwich's concentration. No one should dismiss the dowsers' excuse too swiftly. The ability, if it exists at all, is not a controlled function of the body or the intellect, like running or reading, both of which can be easily tested in laboratories. It is a non-rational, unconscious or subliminal phenomenon; and science has never been favourably enough disposed towards such matters to develop special laboratory techniques for them. There are indications that considerably more individuals may have the ability, in latent form, than we might think – about one in 20, according to a British dowser's estimate.

A Paranormal Awareness

Obviously dowsing involves extra-sensory perception – 'sensing' of the presence of water and the rest, but one that does not operate through the normal five senses, setting aside the possibility that some normal, physical explanation can yet be found. But tacking the name of ESP onto dowsing is merely exchanging one mystery for another: the experts are just as vague about how ESP works. It has been suggested that dowsing is a paranormal awareness of the presence of these material objects, as if the dowsers can 'tune in' to the objects' physical presence in the way that people claim telepathically to 'tune in' to other minds. Some dowsers, but far from all, actually claim to *see* the object of their search, underground, when contact is made. Also, it has been soggested that the ability is more like that of a radar screen: a mental 'probe' is sent out that bounces back to register on the rods.

Most often, however, the dowsers turn to another technological area for their explanations. They claim that the water or the metal itself gives off 'radiations', and the dowsing talent picks them up. From this widely held idea has come dowsing's quasi-technical name, *radiesthesia* – often restricted to mean only the medical form of dowsing, but equally often used to cover the whole field. It is a fairly tangled idea, but at its simplest it implies that everything, every material or object, gives off its own rays or radiations not perceptible to the normal senses, and that the dowser (endowed with his special psychic 'pick-up') need merely tune his mind to the radiations of the substance he is seeking.

Not all radiesthesists are dowsers, however. Some spend their time combating the harmful radiations that apparently can make particular areas uncomfortable, or worse. These can be neutralized, and one's house or person, insulated against such rays, by a variety of contraptions including simple coils of copper wire. Other radiesthesists work with curious machines that are intended to detect and measure the radiational quotients of different objects, persons, diseases or what have you; but none of these instruments have begun to convince neutral observers of their scientific validity. Nor is the nature of these radiations ever made clear in all the thousands of words written about them. It seems, on the whole, that the idea of radiations might make a metaphor of limited usefulness for the relationship between the dowser and the object, but that this attempt to attach a scientific reality and terminology to dowsing has succeeded only in creating an atmosphere of cranky pseudo-science, which can do dowsing no good.

As this early 16th century treatise on mining shows, the divining rod was also used by prospectors to locate coal

It seems much healthier to leave dowsing in the realm of extra-sensory perception, where some small advances in understanding have been made, and from which a good deal of the weird and occult debris has been cleared away. In these terms, a dowser on the television programme referred to earlier offered an interesting possibility for a clearer definition of dowsing as ESP. He thought it might be a variant of the *directional* instinct that pulls homing pigeons back to their starting points, that sends domestic pets hundreds of miles across unfamiliar country unerringly to their original homes. Experiments have shown that this ability in animals must be largely extra-sensory, not relying on landmarks, familiar terrain or the like. Perhaps, then, dowsing is a comparable ability – vestigial in most of us but unconsciously accessible to the talented few. One recalls those marvellous tales of desert animals saving their masters by sensing the presence of water beneath the sand.

Certainly dowsing ought to provide a valuable road to an understanding of ESP in general – perhaps more valuable than the telepathy experiments with cards or the telekinesis experiments with dice, if only because it has in the rod an outward manifestation, and because it is focused on material objects. In telepathy tests the results must always be assessed through statistical probability, which critics seem ready to question. In dowsing the results are ascertained merely by digging. So perhaps we can hope that scientists will look more closely at dowsing, and that eventually they will evolve some specialized new techniques for their experiments.

The greatest mystery of all faced the creator of Sherlock Holmes when he tried to find positive proof of life after death

ARTHUR CONAN DOYLE

A KEEN STUDENT of all psychic and paranormal phenomena for nearly half a century, Sir Arthur Conan Doyle spent the last 12 years of his life as an active and leading exponent of the doctrines of Spiritualism. Born in Edinburgh in 1859, he was brought up in the Roman Catholic faith but while training to be a doctor he was influenced by the works of Darwin, Spencer and Huxley, which caused him to become an agnostic. From 1882 to 1890 he practised as a doctor in Southsea, in conditions of considerable poverty, until growing recognition of his literary ability and particularly of the Sherlock Holmes stories, enabled him to give up medicine (apart from an interlude as an army surgeon in the Boer War) and devote himself entirely to writing and the study of the subjects that interested him.

While living in Southsea in 1887 he conducted a series of experiments in telepathy with an architect friend named Ball, transmitting diagrams from one to the other. 'I showed beyond any doubt that I could convey my thought without words,' he wrote in his memoirs. Having established to his own satisfaction the existence of thought transference between living beings, he became interested in investigating the possibility of messages being transmitted in a similar way from the dead, and attended a number of table-turning seances at the home of General Drayson, an astronomer and pioneer of psychical research.

He became interested in Theosophy, and then in Spiritualist beliefs. Daniel Dunglas Home, the celebrated medium (see HOME), had not long before been practising in London at the height of his fame, and Spiritualism was a topic very much under public discussion. Conan Doyle became a member of the Society for Psychical Research, and his reading at that time included the Swedish philosopher

Psychic News

Emanuel Swedenborg – whom with Mesmer, he later classed as one of the founders of the Spiritualist movement – Sir William Crookes's *Researches in the Phenomena of Spiritualism* and F. H. W. Myers's *Human Personality*. Conan Doyle amassed an extensive library of Spiritualist writings, and his own writings on the subject included – besides numerous articles and letters in the press – *The New Revelation*, *The Vital Message*, *Wanderings of a Spiritualist*, *The Case for Psychic Photography* and *The History of Modern Spiritualism*, a definitive work in two large volumes. *Phineas Speaks* was a collection of reports of seances held in his own home with Lady Doyle acting as medium. Phineas, a disembodied Arab philosopher, was the guide, who transmitted messages from the next world. Conan Doyle's last book on the subject, *The Edge of the Unknown*, came out in 1930, very shortly before his death.

Voice of a Dead Son

In 1902 Conan Doyle met Sir Oliver Lodge at Buckingham Palace, when both men were receiving their knighthoods, and from that time on they were associated in their researches. It was not until after the First World War, however, that Conan Doyle abandoned almost all his other activities and devoted himself entirely to the cause of Spiritualism.

By now he was wealthy, internationally famous, and happily married for the second time; his first wife had died of tuberculosis after a long illness. But the tragedy of the war overshadowed his life; many of his friends had been killed and his younger son Kingsley died shortly after the armistice, of pneumonia aggravated by war wounds. The propagation of a belief in survival after death became, in this sad epoch, Conan Doyle's primary concern. A year after Kingsley's death he attended the seance of a Welsh medium and heard his son speak to him. 'It was in his voice,' Conan Doyle records in *Memories and Adventures*, 'and concerned with what was unknown to the medium.' In the presence of another medium he saw his mother and nephew 'as plainly as ever I saw them in life', and so did two other witnesses.

In order to proclaim his message of hope to the bereaved he began an extensive series of journeys about the world, giving lectures on Spiritualism and life after death, and meeting well-known mediums and leading personalities interested in psychic matters. Wherever he went he drew large audiences, who were probably attracted in the first place by his fame as the creator of Sherlock Holmes, but who remained to be won over by his sincerity and undoubted gift for public speaking. His lectures were illustrated by slides of 'spirit photographs' taken or developed by himself. One, for instance, showed the corridor of a 600-year-old inn at Norwich in which the ghost of a woman was clearly to be seen.

He became president of various related bodies, the London Spiritualist Alliance, the British College of Psychic Science, and the Spiritualist Community. Until shortly before his death he was writing, and involved in correspondence and meetings with the Home Secretary, Clynes, pressing for an amendment to the law as it affected mediums and their clients. Conan Doyle finally died at the age of 71 in July 1930. Not long before his death he became convinced that some fearful cataclysm was to take place in nine or ten years' time.

Conan Doyle's beliefs had called down on him the disapproval of churchmen, not

only because they involved communications with the dead, expressly forbidden by the Bible, but also because they ran counter to the conventional Christian idea that the souls of the dead sleep for many years before resurrection. The Spiritualist belief was that souls do not always realize that they are dead, although there is nearly always an immediate awakening to a new life of the spirit. Doyle felt strongly that the living should do all that was possible to assist the recently dead to surmount this difficult phase and become adjusted to existence on a new plane.

His beliefs were fairly simple and clear-cut. In a lecture given in Edinburgh in 1922, for instance, he described conditions on the 'other side', as reported in messages given through mediums: those who died in old age became younger again, while those who died as children grew up, so that all were at an age of about 25. The new existence had an exceedingly complex social structure, with a hierarchy of different grades, or spheres; depending on its behaviour in previous earthly life, the departed spirit found its appropriate sphere in the next life, but aspiration could carry it upward in a never-ending ascent. Formulating a Darwinian theory of the evolution of the spiritual life of mankind, Conan Doyle concluded that simple logic showed that the scheme of evolution evident in all physical life must also be reflected on the paraphysical level (a theory later to be taken further in the writings of Pierre Teilhard de Chardin).

As well as the disapproval of the clergy, Conan Doyle had to bear scepticism and mockery from scientific writers of the time. He remarked in his memoirs: 'I have abandoned my congenial and lucrative work, left my home for long periods at a time, and subjected myself to all sorts of inconveniences, losses, and even insults, in order to get the facts home to the people.' The criticisms of scientists particularly irritated him. 'The fact that a man is a great zoologist like Lankester, or a great physicist like Tyndall or Faraday,' he said, 'does not give his opinion any weight on a subject which is outside his own speciality.' This argument was not entirely consistent with his statement elsewhere: 'I felt more and more that the case for the phenomena vouched for by such men as Sir William Crookes, Barrett, Russel Wallace, Victor Hugo, and Zöllner was so strong that I could see no answer to their exact record of observations.'

Ghost of a Boisterous Child

Conan Doyle's own standpoint was that of a 'respectful materialist who entirely admitted a great central intelligent cause.' He was also, in the view of many of his readers, an expert sifter of evidence and had in fact successfully solved several real-life mysteries which were laid before him in his capacity as the creator of Sherlock Holmes. He himself recorded many psychic experiences, including the case of a haunted house at Charmouth in Dorset, which as a member of the Society for Psychical Research he was called on to investigate on behalf of the upset tenants. He says that, 'In the middle of the night a fearsome uproar broke out,' in spite of the fact that the threads which the investigators had stretched across doors and windows remained unbroken. There were no other manifestations after this, but subsequently the house burned down and the skeleton of a child of 10 was unearthed in the garden. Conan Doyle suggested that a young life cut short in a sudden and unnatural fashion might have left a store of unused vitality liable to break out in unexpected ways.

In his disputations on the Spiritualist controversy Conan Doyle did not at any time attempt to deny the existence of some fraud among mediums and psychic practitioners, but he asserted that it was far less common than was supposed, and that he himself had only encountered it three or four times. What could complicate the issue, he said, was unconscious fraud. This sometimes occurred when a medium in a semi-conscious condition, possibly suffering from a temporary failure of real psychic power, submitted to the promptings of his earthly nature, or to telepathy messages from those around him.

He adduced numerous examples of true phenomena, as personally experienced by himself. When his own wife was acting as a medium he had received through her whole notebooks of information which was quite outside her range of knowledge; he had developed photographic plates with messages from, and pictures of, the dead; he had witnessed examples of telekinesis, the movement of physical objects through the air, and through closed doors and windows, without human agency; with his own hand he had felt the materialized hands of spirits, and he had had several dreams in which he foresaw events to come. All these phenomena had been scrutinized in a properly Holmesian critical spirit; as he observed himself, he would be unimpressed by a medium who said 'remember the happy days of childhood', but would pay attention if he said 'remember the day we put frogs in the cook's bed.'

An avowed agnostic, Conan Doyle did not immediately reach the conclusion that there was indeed a life after death, even after he had acknowledged the validity of various supernormal phenomena. For 20 years he was moving towards such a belief, and by 1916 he declared that he was in possession of positive knowledge to this effect. Although opposed to all church dogma he retained a deep respect for the principles of Christianity, as for those of Islam and Buddhism; at one point he proposed an eighth principle, to be added to the seven official principles of Spiritualism, which should recognize the person of Jesus Christ and affirm his leadership in the sphere of ethics. The Committee of the National Spiritualists' Union, however, voted against this.

In a recorded talk shortly before his death, Conan Doyle said: 'People ask, "What do you get from Spiritualism?" The first thing you get is that it absolutely removes all fear of death. Secondly, it bridges death for those dear ones whom we may love. We need have no fear that we are calling them back, for all we do is to make such conditions as experience has taught us will enable them to come if they wish, and the initiative lies always with them. They have many times told us that they would not come back if it were not God's will, and that it makes them intensely happy to be able to help and comfort us, to tell us about their happy life in that world to which we are in our turn destined to come.'

DRAGON

The forked tongue and tail of the dragon, his glaring eyes and ominously flared nostrils, his scorching breath and sharp teeth and talons, add up to a formidable array of weapons

'Here be dragons' claimed the early map-makers and indeed there are few parts of the world where this mythological monster has not raised its scaly head. The ambiguous character of the dragon can be seen as a reflection of its hybrid ancestry; to the early Christians it was the malevolent Adversary, while the Chinese believed it was a beneficent being

WHERE THERE ARE MYTHS, there are usually dragons. But although it would be easy to recognize a dragon, and descriptions and artistic representations of dragons abound, it is not so easy to define the beast. Like other fabulous monsters, such as the chimaera and griffin, the dragon is a mixture of several creatures. One of the earliest dragons to leave a permanent mark in the world (he is depicted in white glaze against a blue background on a gate in ancient Babylon) appears to have the head and horns of a ram, the forelegs of a lion, a scaly, reptilian body and tail, and the hind legs of an eagle. Each race has naturally drawn on the part of the animal world with which it is familiar in putting this composite beast together. The dragon of the ancient Egyptians is a close relation of the crocodile, while elephant dragons appear in Indian myths, and stag dragons in Chinese.

The dragon is even more dangerously equipped than any of his mythical rivals. The forked tongue and tail, the glaring eyes and ominously flared nostrils, the scorching breath, the sharp teeth and talons, and the armour-plating of the body add up to a formidable array of weapons. But strangely enough, the dragon is by no means always hostile to man. In the East, particularly, he is often a symbol or a portent of prosperity, and there are many tales of individual acts of kindness performed by dragons for the benefit of men.

Though most people nowadays would associate the dragon with fire, his primeval element is water, whether the sea, rivers, lakes, water-spouts or rain-clouds, and this watery connection is what chiefly distinguishes the dragon from other mythical hybrids. Even desert-dwelling people insist on it, and their dragons spend a lot of time lurking at the bottom of wells. Indeed, the bottom of the well is often identified with the dragon's eye, and this is a link with another distinguishing characteristic of the dragon: its baleful and searching gaze. There is little doubt that the very word 'dragon' is derived ultimately from an ancient Greek word meaning 'to see'. In the Old Testament the dragon is mentioned several times in the same breath as the owl, another creature with large, bleak eyes.

Descended from Serpents

Like other creatures, both mythical and real, the dragon has evolved. The giant saurians – the whale-sized fish-lizards, the fifty-foot tyrannosaurs and the tank-like dinosaurs – disappeared from the face of the earth millions of years before man appeared, but it is possible that their fossils and remains inspired the earliest stories about dragons. Amongst extant creatures, however, the dragon's earliest identifiable progenitor is the serpent, and some authorities believe that they can trace the lineage of dragons all over the world back to one common ancestor, Zu, the monster of watery chaos in Sumerian mythology.

The Sumerians settled in Mesopotamia in the fifth millennium BC, and their struggle to tame the rivers in that country inspired several myths. Their most important god was Enlil, who himself started life as a river god, but was promoted to the dry land and the upper world. The serpent or dragon Zu stole the tablets, worn by Enlil on his breast, on which were set out the laws governing the universe. On Enlil's orders, Zu was slain by the sun god Ninurta, who thus set the precedent for sun gods who battle with dragons in the myths of other ancient peoples.

The Sumerians were superseded, c 1800 BC, by the Babylonians, a Semitic people, who took over many of their myths and religious beliefs. The legend of Zu left traces in the great Babylonian epic of creation *Enuma elish*, in which the sea goddess Tiamat leads the forces of primeval watery chaos against the gods (see CREATION MYTHS). In her army she has sharp-fanged serpents and ferocious dragons, with crowns of flames, made so like gods that all who look at them die of fright. She is defeated nevertheless by Marduk, champion of the gods, and son of Ea-Enki, the god of wisdom. After the battle Marduk cuts Tiamat's body in two, leaving one half to form the sea and lifting up the other to form the sky. Marduk was originally the local god of the unimportant town of Babilu, but his power grew with that of his people, the Babylonians, and he became eventually the god of creation. Every New Year, which the Babylonians celebrated in the spring, his victory over the dragons of chaos was re-enacted through the recital by priests of the creation epic.

It seems likely that Babylonian or Sumerian influence were at work from an early period in Egypt. The dragon myth in particular is thought to have reached there towards the end of the third millennium BC, and to have inspired the legend of the gigantic serpent Apophis (or Apep, or Apop), the enemy of the sun god. Later in Egyptian mythology, the captive Apophis was identified with the ocean which girt the earth and held it together, but at the same time threatened continually to break its fetters and destroy the world. The Egyptians gradually adapted the dragon myth from one of creation to one of the daily combat between light and darkness. The sunset was interpreted as the swallowing of the sun by Apophis, or alternatively the sun was imagined to do battle with the dragon every night as it travelled through the underworld. The dragon rose from a dark river to attack the sun's boat, but by morning had been cut to pieces, or, in other versions of the myth, had been forced to disgorge the sun.

There was a similar story of battle between the sun and storm clouds, which was also represented as a conflict between the god and a dragon or water monster. In a related Asiatic myth, which also derives from the Sumerian and Babylonian stories of battles between the dragons and a god, the dragons survived but were held down on the sea-bed by fetters or by the hands of the gods; their vain struggles to free themselves caused earthquakes and violent storms at sea.

Servant of the Devil

At a later period in Egypt, the dragon was identified with the god Seth, the violent 'Lord of the South', god of earthquakes, hurricanes, thunder and destruction, who shook the very sea itself (see SETH). The belief arose, too, that after death the souls of the wicked would be cast before a fire-breathing dragon or devoured by the 'Swallower of the West', a dragon-like hybrid which was made up from the crocodile, the lion and the hippopotamus.

National Film Archives

In the oldest writings in the Old Testament, Yahweh is represented as a storm god, at whose coming 'the earth trembled, and the heavens dropped, yea, the clouds dropped water, the mountains quaked before the Lord' (Judges 5.4-5). His power over sea, sky, cloud and serpent is celebrated in passages reminiscent of the Babylonian and Egyptian dragon-myths. 'Thou didst break the heads of the dragons on the waters' says the Psalmist (Psalm 74.13), and, according to Isaiah (27.1), 'the Lord . . . shall slay the dragon that is in the sea.' In fact, the battle between Yahweh and the dragons is a familiar theme in the visions of the later Hebrew prophets, for whom, however, the dragon has a purely symbolic meaning as the enemy – Assyrian, Babylonian or Egyptian – of Israel. The prophet Ezekiel speaks of the Lord God's hostility towards Pharaoh, 'the great dragon that lies in the midst of his streams', into whose jaws he will put hooks and whom he will have thrown into the wilderness (Ezekiel, chapter 29). During the Babylonian exile another prophet calls upon the Lord with the cry, 'Was it not thou that didst cut Rahab in pieces, that didst pierce the dragon?' (Isaiah 51.9).

Elsewhere in the Old Testament, and in Jewish writings of the 1st century AD, the dragon is a symbol of mourning and desolation. In early Christian texts the dragon represents the Devil or the Devil's servant, an identification suggested by the leathery webbed feet and forked tail common to both beings, and one which is in line with the general conception of the dragon as the enemy or adversary, especially of God or the gods. In the Book of Revelation (chapter 12), the dragon is described in some detail. He is big and red, and has seven heads and ten horns, and in the war in heaven Michael and his angels fight against the dragon and his angels 'and the great dragon was thrown down, that ancient serpent who is called the Devil and Satan, the deceiver of the whole world; he was thrown down to the earth, and his angels were thrown down with him.' (See also DEVIL.)

The process in which different peoples develop and adapt a vague concept in a way which suits their own needs and experience, can be traced in the treatment of the dragon myth by the ancient Iranians and Indians. In Iran, where a dualistic view of the universe prevailed, there were many forms of the myth of conflict between the god of light and the dragon. In one of these myths the great god of creation Ahura Mazdah struggles with the three-jawed, three-headed, six-eyed dragon Azhi Dahaka, 'an imp of the spirit of deceit'. In a later version of the same story, prevalent in the 4th century AD, it is the fire god Atar, originally a lesser deity in a polytheistic system, but now the son of Ahura Mazdah, who fights the dragon Azhi. The dragon also evolves with the passage of time, and becomes a human monster with two serpents springing from his shoulders, a guise in which he has passed into the folklore of the Armenians and other people of the Middle East.

In the ancient Hindu hymns known collectively as the *Rig Veda* (c1200 BC), the dragon is represented as the demon of drought, and is slain by the god Indra, who thereby releases the waters from the storm clouds. In a parallel development to the Iranian, another version of the myth describes how Trita, god of healing and life, and bringer of fire from heaven, slays the three-headed, six-eyed serpent Visvarupa. In both these myths there are details which recall the Sumerian Ninurta's battle with the dragons. In Vedic mythology, however, the dragon is occasionally depicted as a friend of man, and in later Hindu sacred texts Indra's defeat of the dragon meets with only qualified approval.

The dragon is described as a three-headed creature in the earliest mention of

Facing page In China the dragon was a splendid and generally benevolent beast, associated until 1911 with everything used by the Emperor; but Chinese dragons could cause droughts or an eclipse of the sun when offended, and the Chinese hold special dragon festivals to propitiate them: pillar carved in the shape of a dragon's head, on a floating restaurant at Aberdeen, Hong Kong, where one of the biggest festivals is held each year *Above* An alchemical version of the dragon's legendary guardianship of treasure is illustrated in this 15th century woodcut by Johannes de Cuba of Strasbourg: a dragon is killed to extract a precious gem that the animal has transformed from an ordinary stone

him in ancient Greek literature (in the *Iliad*), where Agamemnon's sword-belt is decorated with a blue enamel dragon and there are three dragons on his cuirass, which was made in Cyprus. The reference to Cyprus may be connected with the fact that the Greeks probably imported the dragon from Palestine, as is reflected in the myth of Perseus and Andromeda. The daughter of the Ethiopian King of Joppa (Jaffa), Andromeda was chained to a cliff on the coast of Philistia (Palestine) when Perseus saw her, fell instantly in love with her, and rescued her from the female sea-dragon. Robert Graves has suggested that Andromeda's story was inspired by a Palestinian or Syrian icon of the Babylonian god Marduk. The Greek myth did introduce a new element into the tradition about dragons, however, and that is the idea that the dragon must be propitiated by human sacrifice, preferably of a royal virgin.

Another peculiarly Greek notion is that of the sowing of dragon's teeth, from which spring the founders of the city. The dragon has survived in modern Greek folklore as the *drakos*, a word usually translated as 'ogre'. These creatures maintain the time-honoured dragon role of the adversary, and in some stories they have more specific dragon traits: they sleep with their eyes open, and see with them shut, a characteristic suggested by fish, which is also attributed to the Dragon King in some Chinese legends. They are also, in some stories, assigned the role of guarding precious treasure.

Guardian of Treasure

The earliest mention of dragons in connection with treasure appears to be by a Greek author, Artemidorus (2nd century AD) an expert on the interpretation of dreams. Dreams about dragons, he says, indicate wealth and riches, 'because dragons make their fixed abode over treasures'. There may well be some remoter, more obscure link between dragons and treasure that has so far not been explained, because in a culture quite unrelated to any of those we have discussed so far, that of the Maori in New Zealand, the dragon's first cousin, the lizard, is also revered as the guardian of funerary caves, and this is said to be because the lizard represents Whiro, the god of sickness and death. The sacred crocodiles of ancient Egypt may also have had a similar function.

The association between dragons, caves and treasure became very popular in the early Christian period and in the Middle Ages. In a Roman legend of the 5th century, St Sylvester conquers a dragon which lies at the bottom of a cave on the Tarpeian rock outside Rome, to which maidens had been sacrificed. The legend incorporates much of the typical symbolism of dragon lore. There are 365 steps leading down to the cave, an allusion to the sun (linked, as we have seen, with dragons in Sumerian and Egyptian mythology) and its annual journey round the earth, according to the cosmology of the time. In this Roman legend the cave is also a symbol of death, as in the Maori lizard cult.

In Teutonic mythology the dragon Fafnir slain by Siegfried lurks in a cave, watching over a treasure hoard which is the source of life and power. Siegfried is made invulnerable by bathing in the dragon's blood, and through drinking it acquires the language of the birds – symbolic of domination over nature. In the myths of many races, heroes obtain boundless courage by eating a dragon's heart or drinking its blood, or acquire its penetrating gaze as a result of killing it.

In early Christian thought the dragon has the allegorical role, already seen in the book of Revelation, of representing the Devil or the Antichrist, or more generally, evil passions, paganism, or the oppressive powers of this world. Whatever the connection between the historical and the legendary St George, the origin of the story of St George and the dragon seems to lie in this general idea, but as worked up in the Middle Ages, particularly under the influence of the Crusades, the story obviously owes much to the Greek myth of Perseus and Andromeda. The hold of the dragon on the medieval mind is also exemplified in heraldry, where the dragon is featured often, both for charges and supporters. The use of the dragon as an emblem in modern times is, of course, suggested by this heraldic tradition.

The Dragon of the East

Whereas in the ancient Middle East and in medieval Europe the dragon remains an essentially sombre and forbidding monster, lurking in the mythical depths, as it were, in the Orient and particularly in China and Japan he has a certain splendour and panache. Indeed, there can be few mythological figures which have so stimulated the oriental imagination. The mere description of the dragon given by the ancient Chinese writer Wang Fu shows an exuberance not to be found in the West: it has a triple-jointed body, the head of a camel, the horns of a stag, the eyes of a demon, the ears of a cow, the neck of a snake, the belly of a clam, the scales of a carp, the claws of an eagle and the soles of a tiger. The Chinese dragon is, however, just as intimately concerned with water, caves and treasure as his cousins in the West. And cousins all these dragons are, sharing common ancestors, though the Chinese dragon has picked up some of the traits of the Burmese lotus-serpent on his journey from Mesopotamia and India, has assimilated a Buddhist adaptation of ancient Asiatic snake cults, and has of course acquired some distinctively Chinese features on his native soil.

The most striking of these is that the dragon in China is not, as in the West, a representative or symbol of the powers of evil. On the contrary, according to the old Chinese *Book of Rites*, the dragon as the chief of all scaly animals is one of the four benevolent spiritual animals, the unicorn, phoenix and tortoise being the others. How this transformation came about can only be guessed. It reflects the general principle stated by Jung that 'every psychological extreme secretly contains its own opposite', which is expressed in Chinese thought through the classical doctrine of Yang and

Camera Press London

Scala

When offended or disturbed, Chinese dragons could cause a drought by gathering up all the water of a district in baskets, or they could eclipse the sun

Yin, the good and bad influences. That this principle underlies the dragon's transformation into a beneficent being is confirmed by Wang Fu's statement that the dragon's scales number 117, of which 81 are imbued with Yang and 36 with Yin, because the dragon is partly a preserver and partly a destroyer. Yang is also the male element and, as its representative, the dragon also became at an early period a symbol of the Emperor, and appeared on the Chinese flag (which may have suggested its use in heraldry later in the West). During the Manchu dynasty (1644-1912) the dragon was held in especial esteem, and everything used by the Emperor was described in terms of it: there was the dragon throne, dragon bed, dragon boat and so on.

This kindly view of the dragon entailed significant changes in the dragon lore which the Chinese adopted from other Asiatic peoples. Whereas the Sumerian Zu stole the tablets of destiny from the god Enlil, Chinese dragons frequently appear as the givers of laws. They are also instructors in magic and givers of swords, while the art of painting was introduced to China by a dragon.

Although Chinese dragons appeared at favourable moments to presage periods of prosperity, and had been known to emit foam which had supernatural powers of fertilization, they could also, when offended or disturbed, cause a drought by gathering up all the water of a district in baskets, or they could eclipse the sun. To

The Terror of Smaug

Bilbo the hobbit ventures into the underground lair of Smaug, the dragon:

As he went forward it grew and grew, till there was no doubt about it. It was a red light steadily getting redder and redder. Also it was now undoubtedly hot in the tunnel. Wisps of vapour floated up and past him and he began to sweat. A sound, too, began to throb in his ears, a sort of bubbling like the noise of a large pot galloping on the fire, mixed with a rumble as of a gigantic tom-cat purring. This grew to the unmistakable gurgling noise of some vast animal snoring in its sleep down there in the red glow in front of him.

It was at this point that Bilbo stopped. Going on from there was the bravest thing he ever did. The tremendous things that happened afterwards were as nothing compared to it. He fought the real battle in the tunnel alone, before he ever saw the vast danger that lay in wait. At any rate after a short halt go on he did; and you can picture him coming to the end of the tunnel, an opening of much the same size and shape as the door above. Through it peeps the hobbit's little head. Before him lies the great bottom-most cellar or dungeon-hole of the ancient dwarves right at the Mountain's root. It is almost dark so that its vastness can only be dimly guessed, but rising from the near side of the rocky floor there is a great glow. The glow of Smaug!

There he lay, a vast red-golden dragon, fast asleep; a thrumming came from his jaws and nostrils, and wisps of smoke, but his fires were low in slumber. Beneath him, under all his limbs and his huge coiled tail, and about him on all sides stretching away across the unseen floors, lay countless piles of precious things, gold wrought and unwrought, gems and jewels, and silver red-stained in the ruddy light.

Smaug lay, with wings folded like an immeasurable bat, turned partly on one side, so that the hobbit could see his underparts and his long pale belly crusted with gems and fragments of gold from his long lying on his costly bed. Behind him where the walls were nearest could dimly be seen coats of mail, helms and axes, swords and spears hanging; and there in rows stood great jars and vessels filled with a wealth that could not be guessed.

J. R. R. Tolkien *The Hobbit*

propitiate them, the Chinese flew dragon kites, especially at the mumming parade in the New Year.

In Japanese legends the dragon is a more ambivalent creature than in Chinese. There are dragons who demand the sacrifice of a young virgin every year, and in one myth the storm god Susa-no-wo rescues the princess Inada by making the dragon drink saki and then chopping it to pieces. In Japan, too, the dragon is associated with water. The Dragon King lives in a mysterious marine realm, with a retinue of serpents, fishes and other sea monsters, and tribes of dragons have power over rain and storms. There are many stories of wise Buddhist priests who can tame these creatures and make them give rain in time of drought, or of holy men on pilgrimages who command the dragons to calm the stormy sea.

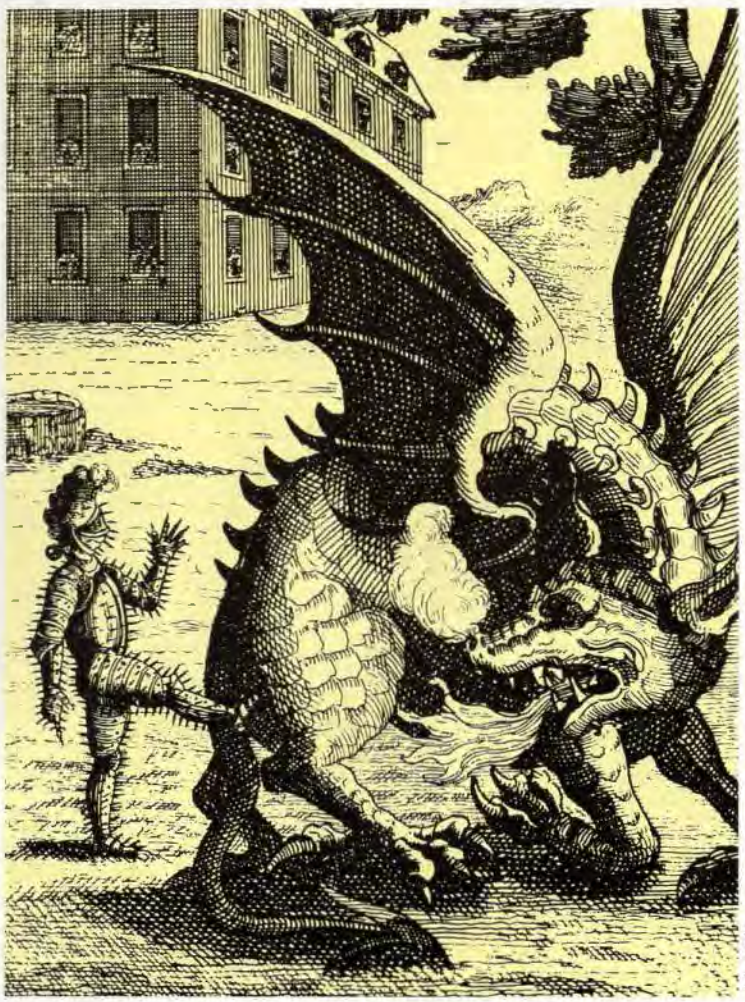
The Beast Within Us

The dragon is known in many other parts of the world: in Hanoi, which was once known as the Dragon City; in Iceland, where the god Loki has associations with a female dragon; in the British Isles, where there are dragon caves and dragon-haunted lochs; and in Hawaii, where all the dragons are descended from the mother goddess Mo-o-inanea, the 'self-reliant dragon'.

According to some modern psychologists, the dragon is still with us, representing, says Jung, the 'negative mother-imago, and thus expressing resistance to incest, or the fear of it'. The dragon's guardianship of treasure represents, according to the same author, the mother's apparent possession of the son's libido: in psychological terms, the treasure which is hard to attain lies hidden in the unconscious. While this theory can be neither proved nor disproved, the consistency with which a number of well-defined traits have adhered to such an indeterminate monster in many countries and climates throughout 50 or 60 centuries, at the very least, poses an interesting problem. One thing is clear: broadly speaking, people get the dragons they deserve, and the same might be true of psychologists and anthropologists, each of whom will give his own solution of the problem.

DAVID PHILLIPS

Staatliche Kunsthalle Karlsruhe



John Webb

'It is natural for all to delight in works of imitation', said Aristotle, speaking of the origin of the dramatic impulse. Yet in the beginning, drama had a more practical purpose, the attempt to encourage the growth of crops by imitative action

DRAMA

MAN IS A NATURAL MIMIC and among the earliest evidences of magical imitation are the representations of animals in the cave art of the Old Stone Age. Our ancestors may have made these drawings to amuse themselves but many anthropologists have concluded that their work had a purpose and was a form of magic for good hunting and bountiful animal life (see CAVE ART). The idea of imitating in order to acquire was continued in the New Stone Age when man had discovered how to grow crops and vary his food supply. The first farmers believed that they could give a hint to the powers of Nature; accordingly when rain was needed they poured water out of a pail, mimicking a downpour in the hope of getting one. One of the origins of drama, therefore, can be said to lie in imitative magic.

Another procedure intended to encourage Nature by imitation was to leap in the air beside the growing grain, with the expectation that it would spring up in fullness and plenty. Here was a game of 'let's pretend', the game which children have never stopped playing. Adults also have continued to delight in pretending to be someone else and have never ceased to enjoy impersonation. In a modern society, we watch 'let's pretend' performances increasingly, because the means of presenting them are so many and so convenient, in cinema and television studios as well as in theatres. There has been continuity of mimicry down the centuries since the relish of pretending is inexhaustible.

R. K. Singh

The Katha Kali danced dramas of India are enactments of sacred myths, tales of Krishna, Shiva and legendary heroes and demons. Before a performance actors meditate on the gods whose parts they will play: the central figure in this scene is the monkey god Hanuman

Born of Fertility Rites

What has changed has been the purpose of imitation. The mimicry which began as magic has expanded into a huge and money-making entertainment industry. The earliest plays were the progeny of fertility rituals. Life and more life were its objectives. It is worth remembering that recreation did not originally mean 'fun and games'; it meant being re-made and born again.

It is a commonplace that conflict is the essence of drama. The first drama, which developed from routines of song and dance, presented a battle of life and death. If a tribal hero or god was shown to be slain he had also to be resurrected. He was not only a human hero. He might symbolize the death of winter and the resurgence of spring and summer; he might be the corn spirit which was hoped to be indestructible. But there were doubts and fears of pestilence attacking man and soil. So Nature had to be helped and encouraged and man, fearful of extinction, had to be comforted. (Comfort, like recreation, is a word which has been softened; it first meant strengthening, as in the Christian description of the Holy Ghost as the Comforter.) Thus performances were arranged in order to exhibit the defeat of winter and death, and the triumph of life renewed.

The first play of which anything is known was enacted at Abydos in ancient Egypt nearly 4000 years ago during the reign of Sesostris III (1887-1849 BC). In it the deity of life, Osiris, was defeated and killed by Seth, the demon of death. Osiris came back to life. He was impersonated in his resurrection with ears of corn springing from his body. When he rose from the dead here were the tokens, for all to see, of unbeaten vitality and fruitfulness.

The Greek historian Herodotus identified the life-giving Osiris with the god-hero of his own people, Dionysus (see DIONYSUS). Dionysus was long associated with the acted drama, which the later Greek poets, especially in Athens, transformed from crude ritual songs and dances in honour of this god into written plays of high artistry and sophistication. They composed tragedies of literary splendour and comedies which mingled buffoonery with wit and topical satire, but the singing and dancing of the chorus remained. In the comedies

there were still the relics of the old lusty revelling and the wearing of the phallic symbol of fertility. The texts have survived as classics to be studied and sometimes revived. When the plays were first written they were part of an annual religious festival, a competitive occasion with prizes awarded, and a ritualistic and traditional one, in so far as the priests of Dionysus were the judges and performances were limited to a holy week. Significantly, the principal time of continual play-going, with a day-long succession of performances, was in the spring.

The drama was still concerned with the gods of traditional mythology although it is probable that these had dwindled to little more than a literary convention by this time. The real faith of the citizens who went to the plays and were not sceptics was in the mysteries of Eleusis about which there had to be silence. The word mystery came from a Greek word for sealing the lips; it described rituals which must remain secret.

'Goat-Song' and 'Revel-Song'

In primitive religions animals, especially the bull and the goat, play a prominent part as the embodiments of physical and sexual energy. Those who now talk of tragedy are rarely conscious that this term meant 'goat-song' to the Greeks, who believed that the origin of tragedy was a tumultuous chant and dance routine in which, as the word implies, the celebrants were seen as half-bestial. When the great dramatic festival was being held in Athens the tragedies in groups of three were followed by the light relief of a satyric play. The satyrs were the semi-human, semi-divine spirits of untamed country, sometimes partly goatish, sometimes partly horse-like. A typical figure was the hairy Silenus, who was shown in pictures seated on a wine-skin (see SATYRS).

The Greek word comedy meant a revel-song. Tragedy developed when one individual, who came to be known as Thespis (hence the name Thespians for actors) stood out from the choric goat-song. He spoke what we call a part, and then was followed by others who thus created the rudiments of a play. Comedy began as a riotous celebration of human fertility and was turned into an art when texts were written. But when the genius of Aristophanes (c 450– c 388 BC), the Athenian master of comic wit, was at its height, the original antics were not forgotten. The players wore the phallus. Perhaps that was a piece of routine which was taken for granted, like the hump-back of Mr Punch. But there remained on public view this reminder of the old caperings. *Caper* is Latin for a goat and so that animal survives today in one of our words for a frolic.

The coming of Christianity to Europe diminished dramatic performances but could not kill the impulse for a ritual release from normal canons of behaviour or the fascination of 'let's pretend'. The coming of the New Year was a natural occasion for rejoicing because the shortest day had passed. The Romans had their midwinter Saturnalia, with its topsyturvy festivities, and so strong was the impulse to celebrate the death of the Old Year and the coming of another season of ploughing, sowing, and eventually reaping, that the Christian Church had to accept a season of wild and even anarchic rejoicing. While the new religion celebrated its Christmas, the feast had to include some of the old pagan rites and liberties (see CHRISTMAS). At the Feast of Fools, first heard of in France in the 12th century AD, an Abbot or Lord of Misrule was appointed to preside over the astonishing proceedings, which were not confined to France and had some English replicas. The Saturnalian spirit could not be suppressed.

The Bessy and the Fool

The junior clergy behaved as though they were seniors. There was drinking and turbulence; there was even sacrilege with a mock Mass and priests playing dice on the altar. There was interchange of garments; men were disguised as women and women

Mansell Collection

The Athenian poets transformed acted dramas from fertility rituals into highly sophisticated written plays which were originally performed as part of an annual festival that was held in honour of the god Dionysus; the masks traditionally worn by the actors in classical dramas gave them a superhuman appearance that was in keeping with their roles as participants in a sacred ritual

as men. There was a curious survival of the goat-song and its mummery since some revellers put on animal skins and paraded with frisking and antics through the streets. The force of tradition in this game of 'let's pretend' is shown even today in the English midwinter pantomime. In it the part of the principal boy was, and often still is, played by a girl, and a horse or cow is represented by two men concealed under an animal's hide. Ritual is continually found to have an extraordinary power of survival in the theatre as elsewhere.

The farmers all over Europe celebrated Plough Monday, the Monday after Twelfth Day early in January, with mummery. It was the day on which, if the weather was favourable, the turning of the soil began. The young men who drove a ceremonial plough painted their faces and had grotesque attendants: the Bessy, a man dressed as a woman, and the Fool, who wore an animal skin, a hairy cap and an animal's tail. An important feature of the Plough Monday rites was the driving out with brooms of supposed ghosts. There is an afterthought of that old magical practice in Shakespeare's *A Midsummer Night's Dream* in which the elfin Puck, endowed with magical powers, ends the play as a sweeper with a broom in his hand. The dramatist was likely to have seen the mummeries of January and June in his native Warwickshire.

Civic Charades

He could also have seen similar performances on May Day when, in the fullness of blossomy spring, there was good reason to implement the fertility ceremonial of the New Year. There was clowning, singing and dancing round the hoisted and decorated Maypole which began either as a tree-symbol of shooting upwards, or a permitted survival of the ancient comedian's phallus. The animal-cult came into the May Day caperings with the riding of the hobby horse.

Out of such seasonal masquerades and miming eventually came the planned and scripted performances of the earliest theatre, such as the pageants and mystery plays of the Middle Ages, in which paganism was replaced by Christian legends and devotion. These were amateur performances and free-for-all spectacles. The members of the craft guilds enacted biblical stories on wagons drawn through the towns, or in or outside churches. They were devised with simple texts and with no inhibitions about introducing comedy into sacred subjects. The title of the mystery plays was taken from the Latin *ministerium* meaning 'a service', and has no connection with the 'sealed lips' mysteries of the classical world. In these civic charades of the English cathedral cities the connection with magic was severed. They were works of faith, not of superstition. The Reformation struck a fatal blow at them, as at all forms of community drama. To the Puritans any kind of 'let's pretend' was an abomination. In their opinion, to impersonate another was to act a lie, and therefore sinful. The theatre was described as Satan's workshop, in which vice and vanity were mingled.

As the professional theatre developed during the 16th century the Puritans did their utmost to kill it but failed because the Queen and the noblemen, as well as many of the common people, enjoyed it. To this the great dramatists of the period owed their careers and English literature some of its finest poetry. The plays and players contributed a magic of their own, that of word-music and the spell of language used at its highest power. There was the magic, too, of the actor's personality and skill in presenting a wide range of characters in tragedy and comedy. The Clowns and Fools in the plays carried on the practice of the old Dionysian revels; they were bawdy celebrants of sex. The Puritans raged and the public were delighted.

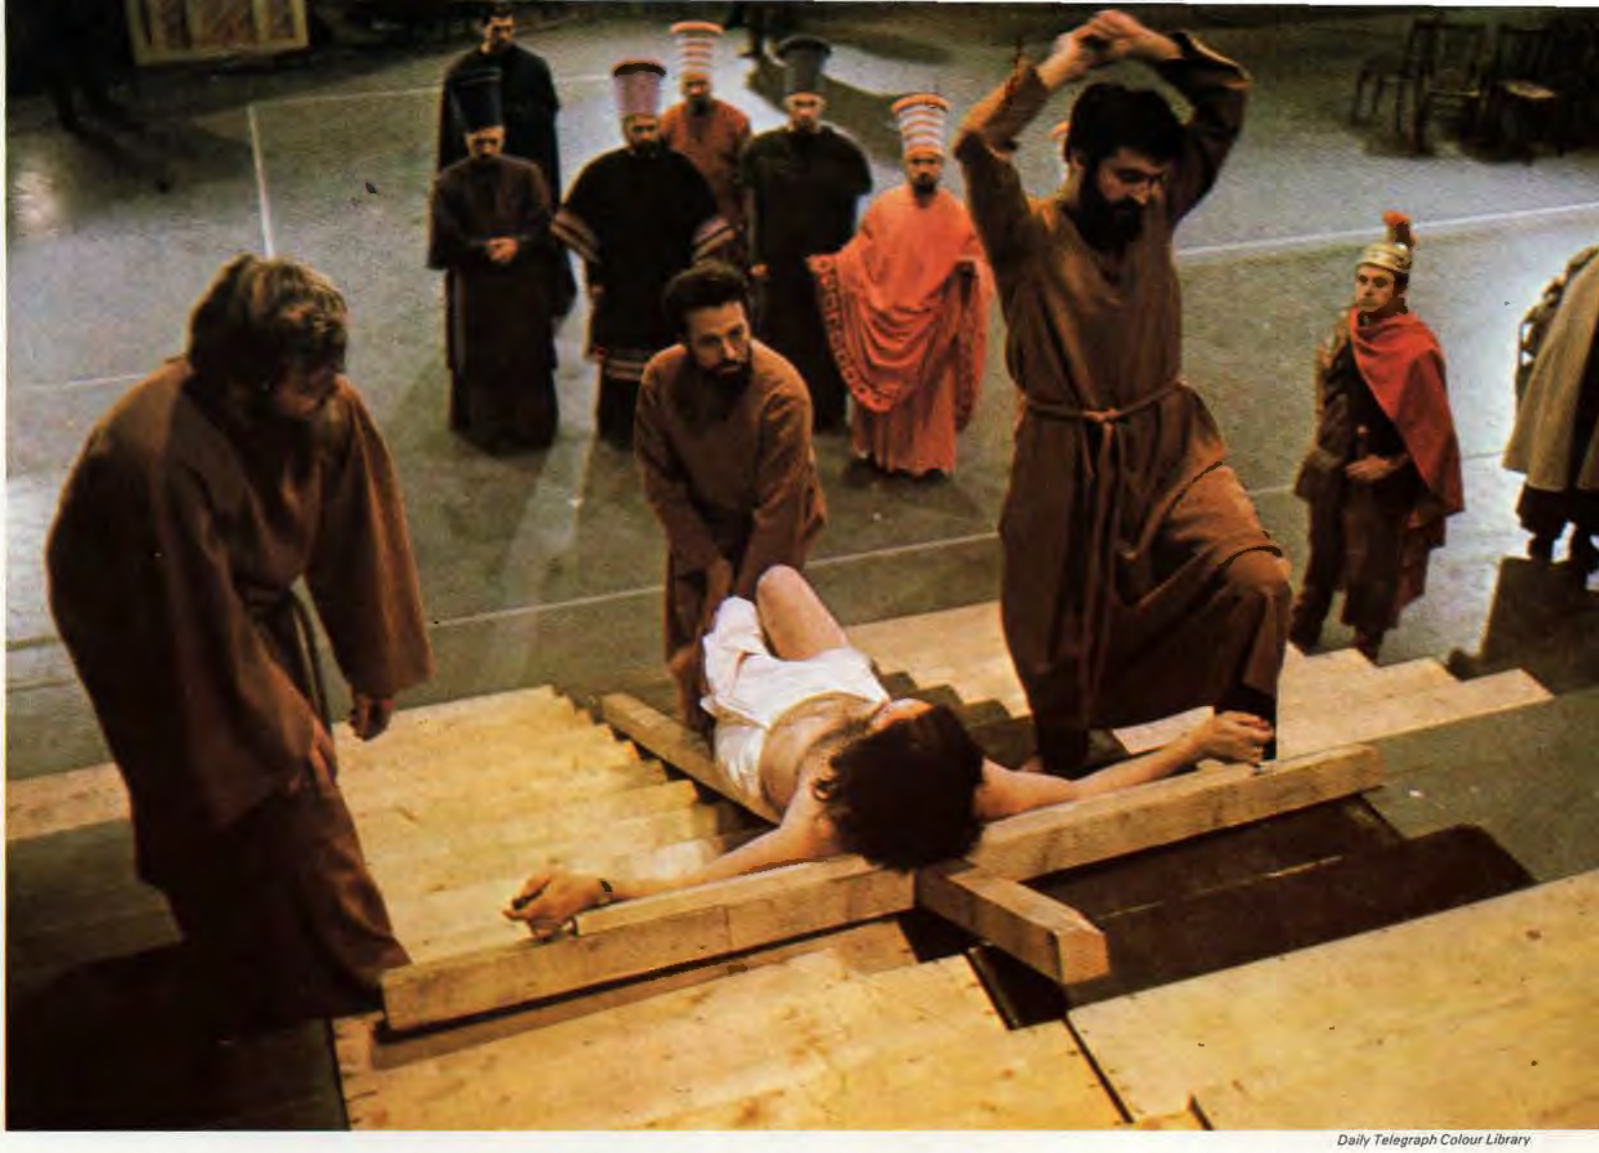
The Folk Plays of Europe

None the less the old spirit of pagan mummery was not crushed. It lived on in the rustic folk plays which were performed, chiefly in midwinter, by the country people and were still to be seen in the 19th century. These maintained the primitive belief that a performance must contain a death and a resurrection. They were thus in direct descent from the drama of the Greeks and even of ancient Egypt. The battle of Seth and Osiris was long continued in the farmhouses of many European countries and there are a number of the simple texts preserved. The characters were given various names in various places but the essential part of the story was much the same. There had to be a contest, a killing, and a life-giving cure.

Sir Edmund Chambers made a careful and most interesting survey of scripts collected from near and far. There were many variations of detail, but the normal performance had permanent characters and episodes. The mummers, sometimes called guisers, arrived and demanded entry at a house where there was a Christmas party with dancing and singing; this sometimes took place at Easter as well. Their leader, known as the Presenter, asked for the room to be cleared and then explained in rhyme that the hero was St George who 'fought the fiery dragon, drove him to the slaughter, and by these means had won the King of Egypt's daughter.' To him entered Slasher, the Turkish knight, challenging St George to combat. They bandied words: 'One shall die and the other shall live.' From words they proceeded to sword-play. Usually the Turk was killed, sometimes St George. In either case the Presenter cried for a doctor and the doctor arrived with his magic bottle containing a herbal medicine. 'The stuff therein is elecampane. It will bring the dead to life again.' The dose had its miraculous effect. Then the clowns came in with songs and capers. Typical drolls were called Big Head, Beelzebub, Little Johnny Jack and Devil Doubt, who carried a broom.

> If you don't give me money, I'll sweep you out.
> Money I want and money I crave.
> If you don't give me money, I'll sweep you to the grave.

The players were labourers with very low wages and were grateful for the smallest tip



Daily Telegraph Colour Library

and a drink of any size. A typical guising was described by Thomas Hardy, doubtless from youthful memories of Dorset, in his novel *The Return of the Native*. The Presenter in that case was disguised as Father Christmas.

Research has shown that all the elements of primitive mummery and fertility rites were brought in. The performers in some places blacked or coloured their faces. Being poor, they had to improvise their costumes and weapons and there was much use of coloured ribbons. There was the ritual broom. There was occasional use of animal skins for the players of comic parts. There was even mention of Egypt since St George had strangely gone to the land of Osiris for his bride. The main event was always the fight between the hero and the villain with its killing and reviving by the wonder-working doctor.

The folk play has been traced from the north of Scotland through Yorkshire to the south of England and across Europe to Bulgaria. There were differences in names and local allusions but all emerged from the universal feeling that midwinter demanded a recognition of light, warmth and growth to come.

Inevitably when the drama went to town and the playwright became a poet instead of a rustic rhymer the celebration of agricultural needs was forgotten. Play-making had begun as a mimetic form of prayer and became an art and a secular entertainment. But the pantomime survives with some of the old ingredients. Its plot is a myth, and its staging asks for magical effects. It draws on the archaic tradition while it reappears with songs and jokes of the present.

DREAMS

'For Jung, dreams were a kind of impartial photography of unconscious life': from the ancient world to the present day, dreams have been regarded as ventures into a mysterious otherworld

THE EXPERIENCE OF DREAMING is one that can still profoundly disturb and puzzle the modern educated person, even though he is disposed to seek a scientific rather than a supernatural explanation of it. Moreover, the theories of Freud and Jung, as well as the practice of psychiatry, attest to the importance of dreams as evidence of the deeper levels of personal existence. It is understandable, therefore, that in earlier ages dreams assumed a far greater significance and played a very important role in human affairs. Dreams gave every person, each night, apparent contact with another world or form of existence, mysteriously different from that experienced when awake. Sir Edward Tylor rightly emphasized the importance of dreams in causing primitive man to conceive of himself as possessing a soul, a non-material self that moved and acted in the dream world.

The variety of dream experience, which can be both pleasant and horrifying, naturally stimulated speculation. Beings of all kinds were encountered in dreams: some were recognized as the dead; some seemed superhuman in appearance and power; some had monstrous forms. Then there was experience of events that had never happened in the waking world, and sometimes the sense of supernormal insight or knowledge. Inevitably the dream acquired an aura of supernatural. It was regarded as a source of information about future events in this world, by way of divine warning or encouragement. Through dreams, the gods might reveal their will, and demons tempt to ill. Dream experience made men aware that they were constantly in contact with a mysterious supernatural world, from which much might be learned about their own destiny in this world and the next.

Egyptian texts record a number of the dreams of kings, in which gods were concerned; their preservation doubtless owed something to the political and religious issues involved. The most notable example has also the most dramatic setting: it is

The Arts Council

recorded on a stele of pink granite placed between the paws of the great Sphinx of Giza. The inscription tells how the future Pharaoh Thothmes IV (1425–1408 BC) once rested, during a hunting expedition, in the shade of the colossal image which represented the sun god Re in his form of Harmakhis, 'Horus of the Horizon'. He fell asleep and dreamed that the god appeared and spoke to him. Harmakhis told the sleeping prince that he would confer the kingdom of Egypt upon him and give him a long and prosperous reign. Then he told Thothmes to observe the sorry situation of his image, the Sphinx, which lay half buried in the drifting desert sand, and charged him to preserve it. When he became king, Thothmes remembered the dream and cleared the Sphinx of the encroaching sand, recording his pious deed on the stele.

The meanings of this and of other royal dreams, in their recorded forms, are clear; they generally attest to the divine providence enjoyed by the kings. But this was not so with most of the dreams which other Egyptians had, and they were evidently much concerned about their interpretation. A science of dream-divination (oneiromancy) was established to meet their need, and something of its technique may be learned from the fragmentary remains of 'keys' to dream-interpretation that have been found.

The following extracts come from the *Papyrus Chester-Beatty* III, which possibly preserves a tradition dating from the Middle Kingdom period (2000-1785 BC). They occur in a long list of dream experiences, presented in a set formula: 'If a man sees himself in a dream looking at a snake – Good, it signifies (abundance of) provisions.' 'If a man sees himself in a dream looking at a dead ox – Good, it signifies (the death) of his enemies.' 'If a man sees in a dream his bed on fire – Bad, it signifies the rape of his wife.' These written 'keys' were for specialist use.

The practice known as incubation, meaning sleeping in a temple to obtain divine advice through a dream, or a cure by dream-contact with a healing god, is attested in Egypt during the Graeco-Roman period; it is not certain whether it had existed there in the earlier period.

The records of ancient Mesopotamia provide ample evidence of a widespread concern about dreams among the Sumerians, Babylonians and Assyrians. The types of dreams and the manner of their interpretation are generally akin to the Egyptian tradition, thereby indicating that human reaction to dreams, like the experience of them, follows a common pattern. On the whole, however, the Mesopotamian evaluation reflects the morose spirit that characterizes Mesopotamian culture. Thus, the Sumerians called dreams Ma-Mou, which meant 'creation of the night'. A dream god, An-Za-Qar, was also recognized, who ranked among the nocturnal demons, suggesting that dreams issued forth from the underworld, the grisly place which the Babylonians called the 'Great Land'.

Mesopotamian literature reveals that warnings of impending doom often came in dreams. For example, in a Sumerian version of the flood legend, the hero Ziusudra learns of the coming catastrophe in a dream 'such as had not been (before)'. The famous *Epic of Gilgamesh* describes the ominous dream which Enkidu reported to his friend Gilgamesh: 'My friend this night I saw a dream. The heavens (groaned) and the earth answered. I found myself alone.' Then he tells how the death god appeared and dragged him off to the underworld. Oneiromancy was an established practice in Mesopotamia.

The cuneiform texts of Ugarit (Ras Shamra), which document the culture of the ancient inhabitants of Canaan before the settlement of the Israelite tribes, show the importance attached to dreams by these people also. Of particular interest is the curious fact that they imagined that gods also dreamed: the great god El learns of an important event through a dream.

Biblical Dreamers

Ancient Hebrew literature abounds with accounts of dreams through which Yahweh communicated his will and purpose to his devotees. To cite a graphic example, the patriarch Jacob, when fleeing from the wrath of his brother Esau, learns of his destiny in a marvellous dream at Bethel, which was probably an ancient Canaanite sanctuary. 'And he dreamed that there was a ladder set up on the earth, and the top of it reached to heaven; and behold, the angels of God were ascending and descending on it!

In ancient Greek and Roman society dreams were regarded as one of the chief means whereby the gods communicated with men, and men might learn the future

Previous page **Divination through dreams was an established science in the ancient world. The Old Testament tells how Joseph was able to forecast seven years of plenty for Egypt followed by seven years of famine, by interpreting Pharaoh's dream in which seven gaunt cows and seven thin ears of corn devoured the same number of plump animals and grain: Florentine mosaic depicting the dream of Pharaoh** ***Left*** **Marc Chagall's** ***The Dream*****: in his paintings Chagall transformed the material world into a dream-country in which men and women behave with the rational illogicality found in dreams**

And behold, the Lord stood above it and said, "I am the Lord, the God of Abraham your father, and the God of Isaac; the land on which you lie I will give to you and to your descendants; and your descendants shall be like the dust of the earth . . ."' (Genesis, chapter 28). The sequel is also significant: 'Then Jacob awoke from his sleep and said, "Surely the Lord is in this place; and I did not know it" And he was afraid, and said, "How awesome is this place. This is none other than the house of God, and this is the gate of heaven."'

What is probably the best known account in the Old Testament of dreams and their interpretation is the episode of which Joseph is the hero, and which is significantly located in Egypt (Genesis, chapters 40 and 41). The Hebrew writer presents his Israelite hero as a highly skilled interpreter of dreams; yet he is careful to represent Joseph as attributing the power to interpret dreams to God: 'Do not interpretations belong to God?' he asks, and he says of Pharaoh's dream: 'The dream of Pharaoh is one; God has revealed to Pharaoh what he is about to do.' However, although the dreams are represented as divine warnings to those who receive them, the recipients cannot themselves understand the meaning of them. Joseph shows his superiority, and his god's favour to him, in being able to interpret Pharaoh's dream which the Egyptian sages have failed to do. The three dreams concerned in the story, those of the butler, the baker and the Pharaoh, all involve a number-factor (three vine-branches, three baskets, seven cows and seven ears of corn). The first two contain warnings of personal fate to be accomplished in three days, the third concerned the fate of Egypt in seven years of plenty and seven of famine.

Oneiromancy appears as an established practice in ancient Israel. It is related of Saul that when 'he enquired of the Lord, the Lord did not answer him, either by dreams, or by lots (Urim) or by prophets' (I Samuel, 28.6). There seems to be a reference to the custom of necromantic incubation in Isaiah 65.4: 'who sit in tombs and spend nights in secret places'. In Hebrew apocalyptic literature, dreams have a major role. The book of Daniel is the classic example of this, with Daniel presented as one who had been divinely endowed with 'understanding of all visions and dreams'.

The Shadowy Gates

In ancient Greek and Roman society dreams were again regarded as one of the chief means whereby the gods communicated with men, and men might learn the future. The dramatist Aeschylus, writing early in the 5th century BC, reckoned the science of oneiromancy among the chief benefits which the 'culture hero' Prometheus had conferred on mankind. Both Greek and Latin literature abound with stories of notable dreams. The poems of Homer provide the earliest and some of the most vividly recounted examples. Zeus is the sender of dreams, and sometimes he deceives men thereby as in the case of Agamemnon (*Iliad*, book 2). Dreams usually take the form of a visit to a sleeping person made by a dream figure (*oneiros*), which could be a god, a ghost or specially created *eidolon* (image) that had the shape of some person known to the sleeper; the oneiros that visited Agamemnon, for example, took the form of the venerable Nestor. The oneiros stood at the head of the sleeper's bed. He saw it and heard its message: the Greeks always spoke of dreaming as 'seeing a dream'. A dramatic example of such a visitation occurs in the *Iliad* (book 23) where the appearance of the ghost of Patroclus to the sleeping Achilles is graphically described.

Dreams were very highly regarded by some philosophers. For instance, Plato in the *Republic*, represents Socrates as maintaining that the dreams of a good man are pure and prophetic, since when he is sleeping his soul is free and is not fettered by bodily concerns.

The problem of interpreting dreams was recognized in a curious distinction that is drawn in the *Odyssey* (book 29). Penelope says to the disguised Odysseus: 'Stranger, verily dreams are hard, and hard to be discerned; nor are all things therein fulfilled for men. Twain are the gates of shadowy dreams, the one is fashioned of horn and one of ivory. Such dreams as pass through the portals of sawn ivory are deceitful, and bear tidings that are unfulfilled. But the dreams that come forth through the gates of polished horn bring a true issue, whosoever of mortals behold them.' The problem naturally produced a class of professional interpreters (*oneirokritai*), who evolved their own esoteric methods of solution. Dream books were written in the Graeco-Roman world, as elsewhere; one of the most notable, the *Oneirokritika* of Artemidorus (2nd century AD) has survived.

Dreams of divine origin were frequently sought by the Greeks and Romans. A favourite means of obtaining them was incubation, a practice already noticed in describing Egyptian oneiromancy. Delphi, the famous shrine of Apollo, was probably once the location of a dream oracle. More notable was the practice of medical incubation, particularly in connection with Asclepius, the god of healing. Patients would sleep in his celebrated temple at Epidauros, in the hope that the god would visit them in a dream and ordain their cure. The many votive-inscriptions found in shrines of Asclepius witness to the faith of those who believed that they had thus been cured (see HEALING GODS).

Dreams figure prominently in the records of early Christianity. Indeed, in the New Testament they are the usual means by which God communicates his will. Joseph is instructed in a dream to marry the pregnant Mary, who was to bear the Saviour (Matthew, 1.20). The Wise Men and Joseph are advised about the evil Herod in dreams, and in a dream Joseph is told to flee with the infant Christ and his mother (Matthew, chapter 2). Pilate's wife is prompted by a dream to warn her husband at the trial of Jesus (Matthew, 27.19). Peter is prepared by a dream to accept the gentile Cornelius as a convert (Acts, 10.9) and Paul is directed in a dream to preach the Gospel in Macedonia (Acts, 26.9).

Dreams in the Modern West

The art of interpreting dreams and, more especially, of using them for divination, was likened to witchcraft by the Christian Church, but dreams played an important role in medieval life. They were, on the one hand, the inspiration of great vocations – as in the case of St Francis of Assisi or St Dominic – and on the other they probably formed the basis of many accounts of witches' sabbaths. During the Renaissance the publication of the first interpretative keys to dreams, inspired by Arab writings, did at least free the subject from the illicit aura which surrounded it during the Middle Ages, although the interest did not go much beyond the level of parlour games.

It was not until the 19th century and the Romantic Revival that dreams became acceptable in the West although they had never lost their significance in ancient societies, in which they were regarded as a cultural phenomenon deserving the attention of the greatest intellects. The subject attracted the attention of scholars, mystics and poets whose approach to dreams was more poetic and metaphysical than experimental and scientific. Several of the Romantics kept dream diaries: the German writer Jean-Paul, for example, did not limit himself to the observation of dreams but also experimented, trying to retain consciousness and to impose his will, in short to control them.

The publication of *Dreams and the Means of Controlling Them* (1867) by Hervey de Saint Denis, a professor of Chinese at the College de France, marked an epoch in the scientific study of dreams. It echoed the work of Alfred Maury, whose book *Sleep and Dreams* (1861) was the culmination of a series of researches into the analogies between dreams and mental illness, and between the images which occur during the intermediate states between waking and sleep (known as hypnagogic images) and the hallucinations of the mentally sick. From all sides valuable observations were being made concerning the association of ideas by which the dream thread was woven, the discovery that even people who deny dreaming do in fact have dreams, and the connection between dream images and external sensory stimuli. But

Hypnos, the Greek god of sleep: without his soothing touch there could be no dreams, believed to be the chief means through which the gods communicated with men

When part of Alfred Maury's bed fell on the nape of his neck, he dreamt that he was being tried by a French Revolutionary tribunal; he was condemned to death and put to the guillotine

without doubt the chief importance of the work of these two scholars was that through them the dream emerged from the medieval secrecy and popular superstition in which it had been held since the Renaissance.

The first approaches to the dream in the 19th century were based on an essentially physiological theory, and Alfred Maury was among those who tried to establish that the fundamental cause of dreams lay in external stimuli. He made many experiments attempting to prove this. On one occasion, he got somebody to tickle his lips and the tip of his nose while he slept; this made him dream that his face was being tortured. When a bottle of eau de cologne was placed under his nostrils, it made him dream that he was in a bazaar in Cairo. Maury's most celebrated dream occurred when part of his bed fell on the nape of his neck, which made him dream that he was being tried by a French Revolutionary tribunal; he was condemned to death and put to the guillotine. One wonders whether the same incident would produce a similar dream sequence in dreamers who had different backgrounds and different memories. Maury seemed to doubt this and his doubts were confirmed by Hildebrandt, another scientist working on the theory that dreams were caused by external stimuli, and author of an important study, *The Dream and Its Value to Life* (1875).

Hildebrandt's experiments showed that the same external stimulus produces different dreams even in the same dreamer, and even more so in different dreamers. Although he was woken up from sleep in the same way three days running, three different dream scenes resulted. The experiments showed without doubt that the external stimulus is never the cause of the dream sequence but, at the very most, its pretext. It remained to be demonstrated that the same was true of internal stimuli. The way was opened to Freud who was to describe dreaming as an autonomous psychic process. Jean-Paul and Hervey de Saint Denis, as a result of their attempts to control dreaming, came to recognize the autonomous character of this process; concentration and will could introduce images and themes of their choice into dreams but they were unable to create the dream sequence in which those images and themes would appear: this sequence remained unexpected and unpredictable. The field of physiological experiments with dreaming is still being explored today.

It was in 1900 that Freud published his celebrated work *The Interpretation of Dreams*. Of all his works this was the one he valued most and which he considered would earn him the gratitude of posterity. Freud reinstated the 'science' of dreams and presented in clear analytical terms observations often scattered among numerous ancient treatises on dreams, as well as those of more recent authors.

The use of dreams for therapeutic purposes, and the sexual interpretation of them, were two characteristics of psychoanalysis in 1900. They had been used for healing in the ancient world but Freud made use of dreams for therapy not for the purpose of tracking down organic illnesses undetected by ordinary examination, nor to cure by healing images, but to reveal through the association of ideas and analysis the conflicting complexes and repressions which hinder the development of the personality. In Freud's time, and especially amongst the rich women who formed the majority of his patients, repression was of a sexual type. This is why at the conclusion of his dream analyses, Freud so often discovered sexual meanings, though he protested very strongly against the accusations of being obsessed with sex which were maliciously levelled against him. He was always aware that dreams can have non-sexual causes, such as hunger or thirst.

Freud's Interpretative Technique

The Freudian technique of interpreting dreams is not very different from that of the ancients: the difference is that instead of appealing to the interpreter's association of ideas, it appeals to those of the dreamer himself. It has above all the merit of being expressed in a new language, which made sense to modern man. In deciphering dreams Freud talked of a 'manifest content' and a 'latent content'. The manifest content is the memory the consciousness retains of a dream on waking. The latent content is something which is disguised but which can be uncovered through analysis. This becomes possible when you put yourself into a receptive state. You have to isolate each dream scene, every detail of the dream, to unleash everything that each of them suggests, even if it is utterly repugnant, grotesque or immoral. The rule of the game, as for the whole process of analysis, is 'the truth and nothing but the truth'. According to Freud, it is only the latent content that can reveal the meaning of dreams.

Why, one may well ask, should there be a latent content and a manifest content? How does the latent content become the manifest content? It is possible, of course, to adopt the attitude that 'it's only a dream': dreams would therefore be absurd and insignificant. Freud took the opposite attitude to this sterile viewpoint. He took the view that all dreams have meaning, even though he was unable to find any meaning in some of them. To explain the existence of a hidden content and a manifest one, he elaborated a theory of resistance and censorship. These ideas were born not so much from the study of dreams, as from that of neurotic phenomena, particularly hysteria. In the course of treating neuroses, Freud was able to establish that hysterics know the 'whole truth' at an unconscious level but refuse, or are unable to admit it. He likened the dream to a neurotic phenomenon. The manifest content he attributed to a resistance which prevents the latent content from revealing itself. This is where the 'censor' exerts itself. The latter imposes from that time onwards a 'dream work' by which the latent disguises itself in the manifest. The dream work operates by means of processes more or less known to the ancients. Firstly, there is a process termed *identification*, often linked to a play on words, a pun, or verbal assonance. Freud himself recounted a patient's dream which he called 'a pretty instance of the verbal bridges crossed by the paths leading to the subconscious' (*The Interpretation of Dreams*). A young woman, apprehensive about her approaching marriage, dreamt of arranging a bunch of flowers, amongst which were violets, as a centre-piece for the table. Freud detected a significant play on words between 'flowers' and 'defloration', between 'violets' and 'violate'.

Displacement is the name for another process in which the emphasis is shifted from

Freud likened the dream to a neurotic phenomenon, a concept that is reflected in this 'dream photograph': in the foreground are the distorted figures of two women, while a sinister masked figure lurks in the background. Photograph by Ira Cohen

'To sleep: perchance to dream:' In his famous soliloquy Hamlet links sleep and death, echoing an age-old association and also the belief that dreams are part of an existence mysteriously different from everyday life. In Greek mythology, Hypnos, god of sleep, and Thanatos, god of death, were brothers: scene from a Greek urn showing the two gods carrying the body of Sarpedon, a son of Zeus

one symbol or figure to another more 'neutral' one in the dream. Say you have an illness which you prefer not to think about; your dream may present this in the form of a woman with cancer of the throat. Yet another process has been termed *projection*; you have done something dishonest and in your dream this action is attributed not to yourself but to one of your rivals or someone whom you dislike.

If the Freudian description of the working of dreams seems satisfactory, indeed obvious in many cases, the interpretative technique lends itself to as much discussion as the theory itself. On the one hand, Freud maintained that all dreaming is the expression of a desire, even if a masochistic one, and on the other, that its primary function is to be the guardian of sleep. The dream was a hallucinatory realization of a desire that reality or prejudiced morality prevented from being satisfied, and this hallucinatory realization allowed it to unfold in sleep without any barriers or difficulties.

Jung's 'Voice of the Other'

C. G. Jung (1875–1961), taking a different viewpoint, showed that dreams upset sleep as often as they protect it. Other authorities have held that a dream is less the realization of a desire than its expression. Drinking in a dream does not quench your thirst; you have to drink when you wake up.

But if dreaming has other functions than those attributed to it by Freud, what are they? What purpose do they serve? Jung, instead of enquiring into the causes of dreaming preferred to look into its purpose. He detected a surprising gap in the Freudian approach: the latter escaped from the need to examine the manifest structure of the dream under the pretext that it was only a 'facade'. But what would a house be without a facade?

For Jung, dreams were a kind of impartial photography of unconscious life, the compensation of our rational vision of things, the voice of the 'other' in us. But this voice uses a language which is strange or lost to us. It is a language which it is important to decipher, not because it deliberately hides something but rather because it is archaic, symbolic, visual. And since the unconscious life is not static, dreams also express a search motive, a delving into the future.

Jung believed that dreams opened up to the individual the paths of the future, hidden to his conscious mind. This is why he attached less importance to the study of a single dream than to a series. These series of dreams revealed the lines of force of the unconscious and, through what he called the 'individuation process' urged the individual to integrate the unknown parts of his personality and thereby achieve the Self, or wholeness. This is why he contrasts the 'reductive' analysis and causal analysis of dreams which he attributes to Freud with an 'amplifying' one, appealing to the creative imagination.

Jung attaches more importance than Freud to what the latter had called fixed or universal symbols and what Jung termed 'archetypes', belonging less to the stratum of the individual's unconscious than to those of the collective unconscious. Freud had already noted that dreams contained fixed elements, not to be detached from the technique of analysis by association of ideas, just as there also exist certain types of dream, such as those of earthquakes, the end of the world, journeys by night across the sea, or more simply, nakedness, loss of teeth, missed trains, or death. Jung sought the meaning of these general symbols, not only in the fields in which Freud had already researched but in the study of comparative mythology and religion. Henceforth these archetypes would help to bring to light the universal dimension of individual problems.

Freud denied that dreams can reveal the future, all their roots being found, according to him, in the past. However, he recognized that 'the dream can lead us into the future since it shows the realization of our desires. But this future which is present for the dreamer, is moulded by indestructible desire to the image of the past.' Jung has been interpreted in slightly different ways, although his theory of the value of dreams in this respect does not differ greatly from Freud's. With regard to telepathic dreams, Freud was less reserved. But it is significant that he did not choose to publish the conclusions he had reached during his lifetime. Jung strongly affirmed the reality of telepathic feats which he called 'synchrones', while at the same time emphasizing the difficulty of finding a satisfactory theory to explain them. Some psychoanalysts have taken note of phenomena of a telepathic or clairvoyant nature which often arise during psychoanalytical treatments.

Chickens Dream Inside Egg

In the '50s the American physiologists Kleitman and Dement attempted to establish an 'objective' method for the study of dreams. Specializing in the physiology of sleep, they rediscovered what the Hindu treatises described 3000 years ago: the existence of two distinct sleeping states. The one, endowed with dreams, the other deprived of them. This distinction between dreaming sleep and deep sleep became evident thanks to the discovery of rapid movements of the eye which occur at the same time as remembered dreams and which are referred to as 'REMs'. American physiologists were also able to show that everybody dreams, including those who claim they never do. They showed that dreams only became evident during certain periodical phases of sleep and that these phases became less with age; with newly-born babies 80% of the total sleeping time is taken up with dreams, falling to 35–40% with children and 20–30% with adults. This seemed to show that dreams, far from being only the relics of the previous day's memories, as Freud had claimed, are found to be predominant at a time when these memories are non-existent. In the case of chickens, physiological signs of dreaming were apparent even before the hatching of the egg and in the case of kittens before their eyes opened. All this suggests that dreams occur before individual memory is able to nourish them.

The experiments conducted by Dement and Kleitman in 1959 seem even more significant. They prevented subjects from dreaming by waking them up when their eyes began to move. These people exhibited such alarming psychotic characteristics that the experiments had to be interrupted. Meanwhile the physiologists thought they had discovered the 'seat' of dreams, or what we prefer to call their 'relay station', at the

level of the pontine reticular formation in the most primitive part of the brain. In France, Dr Jouvet and his colleagues at Lyons also established that the prevention of dreaming in human beings resulted in alarming psychotic symptoms, and produced death 'while in perfect health' in cats and rats. They came to the conclusion that dreams are an essential function of life and that it was less dangerous to undergo hunger and thirst than to be deprived of dreams.

They thus came back through their laboratory experiments to the belief of Jung and others that the dream expresses a self-regulating and compensatory function of the organism. Dreams are indispensable to life. Indeed, physiologists of sleep are incapable of providing us with a guide to the meaning of dreams in general or of particular dream images. In this respect the analytical and symbolic method remains privileged. But apart from the possibility that physiologists may one day achieve this, it is essential to understand that their discoveries strike at the root of all the Freudian views and throw light on the general function of the dream in a remarkable way. This function can in no way be the realization of a particular desire, since it is at its height in infancy, that is to say at a time when the desire has not yet been born and when dreams can be nothing other than the expression of an ancestral desire which diminishes with age. That the 'seat' of dreams may be situated in the most primitive part of the brain and not in the cerebral cortex also confirms the ancestral, hereditary and collective bases of the dream, which Freud found so difficult to admit.

Dress

Clothes seem to have been adopted as much for protection against magic as against sun and weather: priests were very early distinguished from others by their dress, which had, and has retained, strong feminine elements: in religion and magic the absence of dress is often intended to let power flow out freely from the human body or from the image of a god.

See COSTUME; NUDITY.

Drink

Like food, the subject of many beliefs and ceremonies: intoxication by drink or drugs has been widely believed to be an entry to the otherworld or the realm of the divine: the Greek gods drank nectar, the Teutonic gods drank mead, in India the juice of the soma plant was offered to the gods: in Greek religion Dionysus was the lord of wine, drunkenness and ecstasy: in the Christian Eucharist the consecrated wine is the blood of Christ.

See DIONYSUS; DRUGS; ELIXIR OF LIFE; FOOD AND DRINK; MASS.

A gateway to heaven, a release from the prison of self, an opening-up of new vistas of experience: man has found many uses for the drugs which affect the mind and which are being increasingly exploited in modern society. The problem is, as it has always been, to ensure that drugs remain our servants rather than our masters; in primitive societies it has long been recognized that there is a need for a ritual setting to channel these dangerous forces

DRUGS

THE POET BAUDELAIRE described drugs which affect the mind as 'artificial paradises'. The phrase is apt and Lewis Lewin, the German biochemist, repeated it in his pioneering study of these drugs (*Phantastica*, 1924), where he divided paradise into categories: five of them in all, the paradises of narcosis, stimulation, euphoria, intoxication and hallucination. More simply we might say: of dreaming sleep, energetic wakefulness, well-being, drunkenness and the inspired imagination.

In palmistry, a certain small line near the bottom edge of the palm is called the paradise line. Some people, however, call it the poison line, because it indicates the capacity to enjoy a private and rarefied pleasure which in large doses cuts a man off from reality and infects him with an unattainable hope. A substance known as a drug in the pejorative sense of that word also has the characteristic of being paradisiacal and poisonous, as though it were one product of the serpent coiled about the Tree of Life.

One cannot read widely about drugs these days without coming across persistent references to the 'drug problem'. Drugs are indeed a problem in that they are addictive and encourage strange forms of narcissism which, though they may end fatally, are still attempts to regain paradise. The desire to do so is one of the fundamental ambitions of human nature which nearly every religion encourages, and this illuminates the drug problem from another aspect. If drugs can be used to enter paradise, what are the uses of paradise itself?

Drugs are used the world over, sometimes for entertainment, often for therapy or as a religious observation. Thus the soma plant celebrated in the early Vedic hymns of the East gave such bliss to those who took its juices that it was regarded as a divinity, and the visionary worlds of splendour praised by its devotees are certainly descriptions of the images which it induced. Opinions are divided as to what plant soma was originally; at one time it was thought to be a species of either *Asclepias* or of *Sarcostemma*, though it has recently been identified as *Amanita muscaria*, the fly agaric.

The use of this toadstool and of other hallucinogenic (hallucination-producing) mushrooms may have been much more widespread in the past than we realize, and its effects quite possibly helped to give form to a number of traditional descriptions of heaven. Indeed, the most famous mysteries of antiquity, those of Eleusis, may have used the fly agaric in order to initiate the worshippers into a realization of the divine, which could well account for the veneration in which the mysteries were held. In Mexico before and after the Spanish Conquest several plants were held sacred because of their illuminating properties, ranging from the peyote cactus from which mescalin is derived to a species of *ipomea* containing a relative of lysergic acid (LSD); the *psilocybe* mushroom which was called *teonanactl* or 'god's flesh', whose active principle is psilocybine, and *Datura stramonium* or thornapple with its scopolamine and atropine.

Such plants were used to cure illnesses of the soul and of the body, to divine the future and to gain a sense of supernatural knowledge. In South America other plants are used for similar purposes: one Brazilian curer has tracked down some 80 such plants in his own country, including a hallucinatory tree-toadstool. These plants include lianas like *Banisteria caapi*, peppers like *Piptadenia*, cocaine in the Andes, and at least one hallucinogenic animal, a caterpillar found inside bamboo stems.

In Africa, Asia, Siberia and Australia the list of plants which produce psychotropic (mind-changing) effects is long, and where no such plant is available alcohol may be used instead. Modern pharmacology has added to the number of psychotropic substances with highly potent and dangerous

derivatives of opium, with anaesthetics, synthetic narcotics, tranquillizers – the original one being a synthetic based on the active principle of *Rauwolfia*, a plant used for centuries in India to calm the mind – pep pills, hallucinogens and others. However, no modern doctor considers such substances to be sacred, as they would be amongst traditional cultures and as they are, up to a point, among those who use these products for their own enjoyment. This fact in itself has much to do with the existence of a drug problem.

The Religious Use of Drugs

The widespread use of drugs around the world, and especially in our society, makes it plain that man is a discontented animal beset by psychological and physical troubles, by boredom and spiritual ambitions. He uses drugs to relieve pain and illness, and also to change his entire way of looking at things. In religious language, human nature is always wishing to transcend its usual limitations. For waking consciousness is by no means the only kind which it is possible or desirable to experience, and other states can be reached by the use of psychophysical techniques and also by drugs.

Because they change the degree of alertness of the mind in one way or another, it seems probable that drugs interfere with the sleep cycle, either by allowing one to dream while still awake or by using the force of dreams to power action. It seems hardly credible, however, that maté tea, made from the leaf of a South American shrub and containing caffeine, could ever be used to induce trance. Tea, which contains tannin as well as caffeine in quite large quantities, certainly does not have this effect normally, and it was originally celebrated in India and China for its refreshing qualities that allowed the mind to stay awake during meditation. By itself maté could not bring about an oracular state of trance – as it does amongst Indians still living in the Mato Grosso – unless its actions reinforce a process already set in motion by the seer and, by this working together of a psychological technique with a physiological agent, bring about a state of dissociation in which the mind finds a new faculty of expression.

The religious use of drugs, in fact, usually accompanies the practice of shamanism, though shamanism often does without drugs. Shamanism is a technique by which a man, and sometimes a woman, prepares himself by singing, dancing, training and long periods of seclusion during which he meditates, for an influx of untoward inspiration that can carry him into the world of spirits where events on earth are ordained and carried out (see SHAMAN). It is often a hereditary calling, but may equally well be embraced by those who have either a surplus of mental energy or who have suffered from what we would call a nervous complaint of some severity. Such unsatisfied or unbalanced states of mind are continually looking for a resolution of their frustrations and ambitions, and they do so by using traditional methods which articulate their powers coherently.

Drugs can help to do this because their effects are so similar to those produced by other methods of shamanistic training. An instructive case concerns tobacco, which like maté was used for getting into trance. Throughout the Americas this plant was used much as we use it today, for pleasure and to aid concentration, though it was sometimes accounted a fault in an ordinary man if he smoked it in private. But its most significant use was by shamans who smoked large amounts at one sitting to achieve their ecstatic experiences. The combination of tobacco smoke and overbreathing (causing oxygen intoxication) produces that kind of giddiness and nausea which most people experience with their first cigarette. Giddiness is one of the universal symptoms of ecstasy – the word giddy comes from the Old English *gidig*, meaning possessed by a god – and it is by entering into this giddiness and following down the physiological pathways which it opens up that a shaman is able to dissociate himself from his normal waking self and arrive at a place in his mind where all is certain and a quite different conscious process begins.

What such people have done is to use the forces within the paradisiacal experience for definite ends. The lack of such ends in modern society, as has already been implied, is one reason why we have a drug problem: without a ritual support the mind is often not strong enough to resist the effects of a drug, and so loses its sense of direction. When we consider the power of some drugs, this is not surprising. The incredibly small quantity of 100 microgrammes of lysergic

Shamans in parts of Southeast Asia take opium to increase the ecstatic effects of dancing; but the drug is a soporific, and the devotee usually soon reaches a passive state where 'one no longer dreams, one is dreamed': Chinese men smoking opium. As with many drugs, the last stages of addiction to opium are marked by psychic and physical horrors

acid is enough to bring about a psychedelic experience in which the mind is profoundly altered in its normal functioning and of which it previously had but the barest suspicion. Indeed many investigators have been so taken aback by these changes that they prefer to call the drug a psychosomimetic, one which produces a condition resembling madness.

The purpose of a ritual setting for the taking of a drug is to prevent madness, by directing the energies which the drug releases into a number of specific channels, and to put paradise into relation with objects in the outside world by establishing a dogmatic plan within the imagination, through which social events can be seen as psychological ones, psychological as physical ones, and physical ones as spiritual.

By such a method even opium, the grandmother of all narcotics, has occasionally been used not merely to enjoy its sumptuous and pearly visions but to carry out a conscious intention. Such is the habit of shamans in parts of Southeast Asia, who take opium to increase the ecstatic effects of dancing and through them to send their spirits upon a supernatural adventure for the curing of illness or the foretelling of the future. The soporific effect of opium is such, however, that its devotees are much more liable to become physically passive, which must be why it is so seldom used in an active and practical manner. It is true that opium is used in the East for conviviality, but its solitary use is difficult to control. Coleridge, who first took laudanum, a derivative of opium, to dull a particularly ferocious toothache and eventually became addicted to it, did manage to write at least one great poem under its influence: or perhaps we should say that *Kubla Khan* composed itself when his mind, still active in its poetic function, directed the opium into a creative activity. But such feats are rare, for the mind's ability to hold its own against the sweetly insidious effects of opium in large quantities is limited, and the drug soon brings about that passive state in which, as Henri Michaux, the modern French poet, has said, 'One no longer dreams, one is dreamed'.

'O just, subtle and all-conquering opium!' cried de Quincey, author of *Confessions of an English Opium Eater* (1822), who took laudanum as an elixir for his neurasthenia and declared it to be the centre of the true religion of which he was the high priest. But religions have hells as well as heavens, and the last stages of his addiction were marked, as they always are, by psychic and physical horrors from which he at last managed to free himself. What is this paradise, as Baudelaire said of hashish, which one buys at the price of one's eternal damnation? But this progression from paradise to the inferno allows one to draw a most interesting parallel between the possessive effects of a drug and those of a spirit, as in Voodoo (see VOODOO).

In Voodoo ceremonies we might say that a pact has been entered into with any one of the many gods or spirits of the Haitian pantheon, which are called *loa*. The worshipper is possessed by the loa in such a way that he no longer has conscious control of his actions, and has no memory of what passed when he was possessed. The loa who rides him, as the phrase goes, always has a definite way of behaving – a stereotype, we might say, or schema – and this ability to act out the character of a loa is only achieved after training and initiation. Those who feel the influx of divine energy before they are initiated into Voodoo suffer not only from unfortunate accidents but often from manic outbursts ending in madness. It is the business of Voodoo to avoid this outcome and to see that its initiates can become possessed by this energy and still remain sane.

A Pact with the Devil

We might thus call an addict one who has been possessed by a drug after a private initiation which has no aim other than the desire continually to be possessed, unlike a Voodoo ceremony with its definite beginning and end. The addict cannot but wish his experience will continue for ever, even if he realizes that his body will disintegrate under the impact of the drug and that he then can no longer call his soul his own. The narcotic drugs, which slow down physical activity, and the excitants like amphetamine

which speed it up, are particularly apt to bring about this state of living on borrowed time; this is presumably not only because they bring out long-term metabolic changes but also because the will cannot detach itself from the pleasures it seeks.

The question of whether it is ethical to take drugs is a difficult one to answer. They have been and still are being used as an aid to meditation, but the masters of this art are unanimous in condemning them, since they tend to inflame the imagination and give it a wrong idea of its powers. From his own experience, Jean Cocteau has said that no one becomes an opium addict unless he has made a pact with it: a pact in which he dedicates his will to the power of the drug. There is no doubt that the mythology surrounding drug-taking reflects certain basic notions about black magic for this reason. Black magic is rightly regarded as a dangerous pastime because it provides immediate gains without immediate payment: it is a pact with the Devil, who comes later when it suits him and presents a bill on which are written the ominous words, One Soul.

What does it mean, to enter into a pact with the Devil? Freud was much interested in the subject and wrote a study of it at the time when he was still taking cocaine, which he did for ten years. The traditional reasons for such a pact include the obtaining of wealth, of power over men and Nature, and over the hearts of women. But Freud concluded from the case he studied that the central reason was to overcome depression and to find a father-substitute. About cocaine he wrote: 'One senses an increase of self-control and feels more vigorous and more capable of work', and he suggested that its effects were due, not to direct stimulation but to the removal of anxiety symptoms, which produced a return to a state of normal euphoria. Anxiety has to do with the superego in his system (see FREUD), and we can enlarge this description by remarking that by removing the 'censor' cocaine also removes anxiety. Because of this cocaine may have been an indispensable tool for Freud during his self-analysis: it allowed him to follow the lines of his reasoning into the subconscious without his mental censor putting up a resistance. That Freud escaped from addiction while one of his friends, to whom he had recommended it, died from its effects, suggests that he only did so because he had found a method by which the effects of the drug became subservient to the force of his intellectual drive. He had created a special form of ritual.

Separating Mind from Body

Without this drive cocaine is undoubtedly a danger, as we may see from the religious taking of coca amongst the Kogi of Colombia. This tribe uses it ceremonially to learn the lengthy genealogies and liturgies of their worship, and to fill their minds with the proper religious awe and sense of significance. Coca however has the unfortunate effect of making its takers impotent after a while, and the Kogi are suspicious of their womenfolk (who are not allowed to chew it) and so inefficient as farmers that their children are undernourished. Ironically, the atheists of the tribe who have dropped out of the religion altogether are much healthier and happier, though their neighbours scorn them for losing their chance of immortality. This petrifying effect of coca, even with a religious system to direct it, is certainly partly caused by the fact that the Kogi way of life is beset on all sides by the creole population and has withdrawn into a state of apathy.

Coca is used elsewhere in the Andes to ward off hunger and fatigue, and it does so by numbing these sensations and dissociating the mind from anxieties arising in the body. But anxiety may persist even if its symptoms disappear with the use of a drug. These symptoms emerge again after a long time in an even more disagreeable form, as the nightmare effects of addiction show. When at such a time the use of the drug is stopped, this anxiety must be at least one of the constituents of the most unpleasant withdrawal symptoms.

Attacking the Self

The drugs used in other religious rites tend to be hallucinogenic rather than narcotic or stupefying, and these have a quite different effect upon anxiety. Common to plants with such different active principles as *Banisteria*, *Amanita* and *Datura* is the production of a sudden and violent surge of energy with visions in which terror and splendour may be equally present. The Viking berserkers seem to have used *Amanita* to endow themselves with a blind and warlike frenzy no opponent could withstand, a frenzy that might last more than a day and after which they sank into a long torpor of exhaustion.

In South America the Indians who take *Banisteria* and other plants fall victim to a similar frenzy (though they do not use it when on war parties), and European travellers who have tried the drug in their company report experiencing the traditional visions, amongst which are those of beasts of prey about to tear them into pieces. Such drugs seem to work by putting psychological anxieties into touch with the musculature, and what is dissociated is the ego from the imagination rather than, as in narcotics, the imagination from anxiety. There may be a connection between the fact that hallucinogens are not physically addictive and that they do not inhibit anxiety.

All these drugs, however, can be used for delicate purposes as well as frenzied ones. One must remember that all shamanistic traditions speak of an initiatory experience in which the body is felt to be torn apart, after which a crystalline body is given by the spirits. Both the dismemberment and the illumination of the body are commonly felt under hallucinogens, even if in a mild fashion, and one can understand dismemberment as the outcome of a drug-induced dissociation in which the normal persona or expression of the personality, is forced to give up its defensive reactions. What is known as a 'bad trip' is caused by the anxiety which the approach of such a psychological dismemberment evokes, and which generates an increasing feeling of loss and horror when it cannot be properly discharged. From all accounts a really bad trip has certain similarities to a schizophrenic attack, and hospitals report many instances of bad trips which last for days or even months. The taking of tranquillizers is certainly one way of bringing such an episode to an end, but the traditional method is to accept the attack which the drug makes on the self without fear, an acceptance which transforms anxiety into knowledge and makes it give up its energy to a higher faculty.

But no two drugs attack the self in quite the same way, and they activate different parts of the same underlying process and give rise to different types of anxiety. The drug found in *Amanita* seems to be particularly effective in putting the motor system into spasm, and the shamans who use it must go through a long education in this experience and have grappled with the startling visions it produces before they can master its immediate effects and use them according to their will. *Datura* also activates a sense of physical power together with a psychic ambition that may lead a man so far out of his normal range that a spasm of timidity at the wrong moment may leave him stranded upon an ungovernable activity. Different is the effect of the *psilocybe* mushroom which clinically is said to be that of depersonalization. But there are two sides of every coin, and what is depersonalization to one man may be dematerialization to another: tribal practitioners in fact call upon this effect when they wish to penetrate material obstacles, to free consciousness from its bodily entanglements and allow it to inhabit bodies other than its own.

Drug of the Aztecs

Peyote traditionally used has yet other consequences. It was one of the first hallucinogens to be experimented with in Europe, and is famous for its visions of fantastic and grotesque architecture, of prodigious landscapes and giant figures striding about or petrified into ancient statuary, and of jewels shining with abundant colour. All these visions occur without apparent reason, and the Indians phrase this by saying that peyote is a power in itself that works from the outside, a teacher who can show a man the right way to live and answer his questions by giving him an experience to live through.

This quality of the peyote experience allows one to qualify the remark of Michaux that under such drugs one does not dream, one is dreamed. If used correctly peyote has the power of personifying a dream in such a way that it allows the dreamer to keep some part of his self-awareness intact and still questioning. The consequence of searching for a meaning within the visions which inhabit one is that they become increasingly full of meaning themselves.

Peyote is of particular interest because it is the sacrament of the Native American Church, a religion based upon Indian practices and having Christianity for its justification. It was used by the Aztecs for

South American shamans smoked large quantities of tobacco at one sitting to achieve ecstatic experiences, but it was also smoked for pleasure: Brazilian Indian smoking cigar

Eric Cross

divinatory purposes, and by the Tarahumara and Huichot of northern Mexico as the body of divinity on which all their beliefs centred. This religion was picked up by the Plains Indians at the time of their defeat by the whites and used to rally the wisdom of the Indian past to cope with the degrading changes that overcame them. It was in fact a type of cult such as we often find springing into existence when old ways of life are being destroyed by a powerful and technically more advanced culture, and it is also the only surviving one of several such cults which arose in the Plains.

The Search for Power

The drug problem in the West should probably be seen in the same light: the popularity of drugs is at least partly due to the very rapid changes now occurring in our society. Drugs have always been used to search for power, a power which can be used to enlarge the capacity of the imagination and to bring about change in society. When society itself changes, drugs give a certain kind of life to the imagination which is being stripped of its ancient forms, and a confidence in its ability to live in a strange world. Cannabis has certainly been used in this way from time to time: in Jamaica, for instance, the Rastafari smoke it both for religious and political reasons in the hope that they may soon return to their promised land – Abyssinia, where the Lion of Judah still reigns. Half a century ago or more, cannabis was also the motive cause for a new religion being set up by the Baluba of the Congo: they destroyed their fetish houses, and proclaimed the drug to be a power under which they could live in perpetual friendship and protected from calamity. The drinking of alcohol was forbidden, and those who had committed misdeeds were condemned to smoke a number of pipes of cannabis in order to reform their misconceptions.

Wherever a drug is used by a religion to gain a view and foretaste of divinity, it is treated as though it were a god itself. 'We have drunk Soma, we have become immortals, we have arrived at the light, we have reached the gods: what power has malevolence over us now, what can the perfidy of mortals do to us, O Immortal?' So runs one of the hymns of the *Rig Veda*, one of the sacred texts of the East. Opium has been called the hand of God and anchor of salvation, though Cocteau has remarked that it resembles religion as an illusionist resembles Jesus. Tobacco has been called the blessed plant, honour of the earth and gift from Olympus, and both wine and beer have been similarly praised down the centuries. 'Our glass was the full moon, the wine is the sun. If a grave is moistened with such a wine, the dead man will rediscover his soul and the corpse will revive', said Ibn al Farid, the medieval Arabian poet. But the wine he talks of here is that of the Spirit, which also descended upon the Apostles at Pentecost so that they spoke with tongues and were accused of being drunk.

A drug is nothing unless it kindles the spirit in a man, though this spirit may be thought of as divine or demoniacal according to predilection. Whichever it may be, the spirit is not man's possession but a gift made to him, and as a gift it has a nature and a morality of its own which must be both wrestled with and obeyed if it is not to bring harm to its host. Every religion has its own way of experiencing and ordering this power, and their often stringent ritual requirements are the product of a long experience in bringing the spirit in touch with the world of men. The religious taking of drugs is one particular example of this: it says plainly enough that amateurism in these matters does little but create a problem, and that if the mind is to reach beyond itself by the use of a drug it must be placed in the service of an idea and a method that makes for wisdom and communion rather than folly and isolation.

The classical writers were surprised and perplexed by remote woodland shrines rather than civic temples as the cult centres of Gaul, and invested them with romantic attributes of terror

The history of the Druids is closely interwoven with strands of folklore, legend and romantic literature. The first of these two articles traces the history of the mysterious Celtic sages whose religion is said to have involved human sacrifice; the second, by the Chosen Chief of one group of present-day Druids, is written from 'inside' modern Druidry

MEMBERS OF THE PRIESTHOOD of pre-Roman Celtic religion in Gaul and Britain, the Druids are mentioned by name in some 30 references in Greek and Roman writers between the 2nd century BC and the 4th century AD. In addition, functionaries known as Druids are mentioned in the earliest Celtic literature, that of the Irish hero-tales and law tracts, which can be shown to represent a pre-Christian state of affairs older than the 5th century AD. The religion in which Druids functioned was proscribed and exterminated in the Roman provinces of Gaul and Britain during the 1st century AD.

With the rediscovery of classical literature from the Renaissance onwards, the Druids in France and especially in Britain were built up into myth and folklore in accordance with contemporary changes in taste; the Romantic Revival in British art and literature was especially productive of the type of Druid folklore which survives today, but is not much earlier than the late 18th century.

The social and economic background of the Celtic culture to which the Druids belonged can to a fair extent be reconstructed from the evidence of archeology and that of the classical writers who commented on the Celts, with the vernacular sources, as in the case of Ireland, as supporting evidence. In archeological terms Druids belong to the final phases of the La Tene culture of the late Iron Age. References to Druids, however, relate exclusively to Gaul, except for two mentions of them in Britain, found in Caesar and Tacitus.

The classical sources relating to the Druids may usefully be divided into an earlier and a later group, the first being based on first-hand knowledge, the second on an idealizing and romantic conception in which barbarous qualities are minimized or ignored. The two viewpoints represent the contrasted attitudes of 'hard' and 'soft' primitivism in which civilized societies may view barbarians; in the idealizing process concepts of the noble savage, and of a Golden Age at the world's edge, play a large part.

The first group of sources are mainly derived from the comments and observations on the Gauls made by the Greek Posidonius, a Stoic philosopher writing at the end of the 2nd century BC, from first-hand knowledge through travel and contacts with the people of Massilia (Marseilles) in Gaul. His work survives only in quotation, particularly in Strabo, Diodorus Siculus and Julius Caesar. These comments are consistent with those of other writers of the 1st century AD such as Lucan, Tacitus, Pomponius Mela and Pliny, and also Ammianus Marcellinus (b 330 AD). This Posidonian group constitute our most reliable sources.

The second, idealizing, group of sources centres on scholars working in Alexandria from the 1st to the 3rd centuries AD, and may conveniently be named Alexandrian. These are mostly works of compilation, and the philosophical attainments of the Druids are enlarged upon and in general put on an equal footing with those of the other non-Greek philosophers of antiquity, such as those of India or Persia. Stoic philosophy had led to a slight idealizing tendency at times in the Posidonian sources, but in the Alexandrian group we move into a romantic tradition anxious to establish profundity and sublimity in what little was known of the Druids and of Celtic religion.

The Mistletoe and the Oak

The native Irish sources, though of the greatest importance for the light they throw on pre-Christian Irish Celtic society as a whole, are not very informative about pagan religion and the Druids, and since the tales in the form in which they survive are the versions of medieval Christian clerics, this is perhaps not surprising. Furthermore it must be remembered that they relate exclusively to Ireland, and represent the uncritical view of a barbarian society from within. From the foregoing sources, it is possible to piece together the following incomplete information.

The name druid presupposes a Gaulish *druvis*, from *druvids*, and probably related to the Greek *drus*, an oak tree, with the ending cognate with the Indo-European root *-wid*, 'to know'. Pliny makes a direct association between Druids and oaks in his account of the mistletoe ceremony in which the Druid cut mistletoe from an oak with a knife or sickle of gold on the sixth day of the moon (see MISTLETOE). Woodland sanctuaries are characteristically Celtic. The name Druids occurs only in the texts, and is not represented in any pre-Christian inscription. Druids seem to have been a designated branch of the Celtic hierarchy together with bards, and the seers known as *vates*, and as we have seen, are recorded only in Gaul and Britain in antiquity.

The Celtic priesthood as a whole formed an honoured element in society, and Caesar places Druids equal with the warrior-aristocracy, the *equites*, in Gaul, and stresses their exemption from the tribal obligations of war and taxation. The remaining Posidonian sources class them with the poets, the seers and the prophets of the Celtic world, and in the Irish sources they rank among the 'men of art' or of special gifts, immediately below the nobility.

On Caesar's authority alone, there was a chief Druid for all Gaul, who convened annual meetings in a sacred precinct within the territory of the Carnutes tribe. Such sanctuary sites are attested by Gaulish names such as *nemeton*, and seem to have been cleared areas in the forest, in some instances enclosed by a palisade or bank and ditch: there is archeological evidence of such sites. In these sanctuaries wooden images of deities are mentioned by Lucan, and are again corroborated by archeology. The classical writers were surprised and perplexed by remote woodland shrines rather than civic temples as the cult centres of Gaul, and invested them with romantic attributes of terror.

Recruitment to the Druid order seems to have been from the noble classes, and instruction in the oral tradition of memorizing verses for periods of up to 20 years is mentioned by Caesar. Such traditional instruction for bards and poets was characteristically Celtic and, with periods of training of up to at least 12 years, continued in Ireland to the 17th and in Scotland up to the 18th century. Prehistoric Celtic society was non-literate except for an occasional ability to write in Latin (or very rarely Greek), as the only languages of literacy.

Times

The first summer solstice ceremony held by the Order of Bards, Ovates and Druids, which was formed in 1964, took place not at Stonehenge, but at Hunsbury Hill near Northampton

Sacrificed in Fiery Baskets

The functions of Druids in Gaul, at least, seem basically to be those of the acknowledged repositories of traditional lore and wisdom, and particularly of customary law. They are sometimes attributed the prophetic powers of the seers but this may have arisen partly from their practical knowledge of the calendar. They certainly appear as lawgivers, and as being directly concerned with animal and human sacrifices, including those holocausts in huge wicker constructions attested by Strabo and Caesar. It was the practice of human sacrifice under Druid auspices in the Celtic world that was largely the cause of the proscription of the religion by the Romans from the 1st century AD onwards.

What we know of the Druids' corpus of knowledge is scrappy and not very impressive. So far as their speculations on the supernatural are concerned, we have to be on our guard in the classical texts against taking literally the loaded terminology of ancient philosophy, which was all that could be used to describe the situation in an alien and barbarous society. All that really emerges is a belief that the Druids knew the divine will and the actions of the gods, with whom they had communication. Their beliefs about the immortality of the soul struck the classical world as very unfamiliar: an otherworld which was a magical renewal of life exactly as on earth, but in another body and in another place. To accommodate this simple barbarian concept within classical thought, the Pythagorean doctrine of the transmigration of souls was invoked, though in Druid belief this is nowhere implied. The literal re-living of life beyond the grave as a Celtic belief is documented by other references in the texts, unconnected with Druids, and by the evidence of the elaborately furnished princely tombs of the period.

Knowledge of Stars and Time

That a belief in the Druids' prophetic powers may have had some basis in fact is suggested by evidence for their practical knowledge of astronomy and the construction of calendars. The Posidonian sources contain several references to such knowledge, of course not uncommon among the priests of many comparatively barbarian societies of their time, and the references to 'Pythagorean knowledge' believed to be known to the Druids may well refer to some Greek mathematical concepts transmitted to the Gauls via Massilia. The surviving fragments of a monumental calendar-inscription from Coligny in Gaul are an objective testimony to considerable calendrical expertise at this time, and a recognition of the problems of reconciling the solar and lunar years. The other scraps of information about Druidic knowledge imply among other things some knowledge of herbs and their medicinal properties.

Such first-hand references as there are to the later Druids show them as hardly more than magicians and medicine-men on the fringes of Romano-Celtic culture, and even Druidesses who are no more than fortune tellers appear in stories. We saw how human sacrifice was obnoxious to Roman sentiment and while we need not see the Gaulish or British Druids as leaders of a national resistance movement, we can appreciate how, as the tribal repositories of traditional Celtic learning and sentiment, they would embody the incompatible barbarian tradition which the Romans were stamping out from the provinces of their empire. The Elizabethans in Ireland and the anti-Jacobites in Scotland later encountered a similar situation in their forcible assimilation of the final Celtic world.

Romantic View of the Druids

The rediscovery of the Druids came with the rediscovery of the classical texts in which they were mentioned, after their submergence during the Middle Ages. They began to take their place among the respectable ancestors in the new nationalistic feeling in France and England, and in the former country their judicial power was especially commented upon from the 18th century onwards, and in 1585 a code of laws was invented for them. Apart from this strain of idealization, however, they were viewed on both sides of the Channel in terms of a hard primitivism and their human sacrifices in gloomy groves were not glossed over.

Building of Eternal Death

Howling the victims on the Druid Altars yield their souls
To the stern warriors; lovely sport the Daughters round their victims . . .
Terrified at the sight of the Victim, at his distorted sinews,
The tremblings of Vala vibrate thro' the limbs of Albion's Sons.
While they rejoice over Luvah in mockery & bitter scorn,
Sudden they become like what they behold, in howlings & deadly pain.
Spasms smite their features, sinews & limbs; pale they look on one another;
They turn, contorted; their iron necks bend unwillingly towards
Luvah; their lips tremble; their muscular fibres are cramp'd & smitten;
They become like what they behold. Yet immense in strength & power,
In awful pomp & gold, in all the precious unhewn stones of Eden,
They build a stupendous Building on the Plain of Salisbury: with chains
Of rocks, round London Stone, of Reasonings, of unhewn Demonstrations,
In Labyrinthine arches, (Mighty Urizen the Architect,) thro' which
The Heavens might revolve & Eternity be bound in their chain,
Labour unparallell'd, a wondrous rocky World of cruel destiny,
Rocks piled on rocks reaching the stars, stretching from pole to pole.
The Building is Natural Religion, & its Altars Natural Morality;
A building of eternal death, whose proportions are eternal despair. . .

William Blake, *Jerusalem*

But from the early 17th century in England the Druids also appear as Nature's sages and philosophers, and by 1695 the antiquary John Aubrey's suggestion that Stonehenge and other prehistoric stone circles might be Druid temples was modestly put forward, in competition with Phoenician, Roman, Saxon and Danish claimants for the building of the Wiltshire monument. Another antiquary, William Stukeley, in the early 1740s enthusiastically championed the Druids as builders of Stonehenge. Within the framework of contemporary religious controversy he made them priests not only of natural, but of revealed religion, anticipatory Christians in expectation of the Messiah. From then on, a romantic vision of Druids was encouraged by the prevailing temper of taste and sensibility, and by the discovery of the 'noble savage' in the South Sea Islands. The folklore associating Stonehenge and other stone circles with Druids became firmly established at this time, and continues in the present day summer solstice performances on the site.

A Welshman trained in the genuine bardic traditions of Glamorgan, Edward Williams, invented a ritual involving a little circle of stones, the Gorsedd, on Primrose Hill in London in 1792. In 1819 Williams contrived to have this attached to the also genuinely traditional Welsh poetic and musical meeting, the Eisteddfod. He unfortunately forged documents to support his case for a direct Druidic ancestry for his fabrication: the ceremony, with attendant Archdruid and Druids, now forms part of the aunual ceremony. The tradition was further confused from the late 18th century onwards by mistranslations of early Welsh poems, by which they were made to convey a mystical Druidic meaning, and in this climate of thought William Blake turned partly to the mystics and partly to Stukeley to show in his Prophetic Books that 'All things Begin and End in Albion's Ancient Druid Rocky Shore.' In final decline the ancient Indo-European priesthood, almost casually recorded by the classical writers, were a part of English folklore and fantasy; in ornamental landscape-gardening, dressed-up Druids could appear as alternatives to Hermits in decorative grottoes, and even today continue to make their corporate appearances at Stonehenge or Primrose Hill.

STUART PIGGOTT

Survival Down the Ages

Druidry itself has always claimed a high antiquity going back to the New Stone Age. Not only in Stonehenge but in the dozens of orientated stone circles scattered especially along the western shores of the British Isles, Druids recognize the ancient temples in which the sun, moon and stars were held in reverence by their forbears.

There is no need to assume that Druidry is essentially Celtic, although from the Celtic migrations it was doubtless modified substantially. The date given for the legendary Cymry, or brotherhood colony set up in Wales, 2000 BC, seems to correspond with the date of an Iron Age migration. Certain links with the Aryan culture of early India and with the witches led T. C. Lethbridge, in his book *Gogmagog*, to consider that all three traditions have a common origin in South Russia or Asia Minor in perhaps the 4th millennium BC.

The similarities lie in reverence for the sun and moon, circular dancing in a clock-wise direction; the existence of a sacred caste of sages, the burning of the dead, the cult of certain animals and wisdom-teaching by long, memorized poems. 'The young,' says Caesar in his *De Bello Gallico*, 'are taught to repeat a great number of verses by heart and often spend 20 years upon this institution . . . The Druids teach likewise many things related to the stars and their motions, the magnitude of the world and our earth, the nature of things and the power and prerogatives of the immortal Gods.' And it was Britain, not Gaul, that was the training place of this body which held the knowledge of the contemporary sciences and arts and imparted them, acted as political advisers to rulers, were exempt from war and often acted as heralds of peace, as well as being priests of a religion.

Evidence from a Computer

Was it of Stonehenge that the Greek poet Pindar wrote in his 10th Pythian Ode, where he describes a temple sacred to Apollo the sun god, in the land of the Hyperboreans or dwellers beyond the north-west wind? Another writer calls it a round temple of wings where there is dancing and music. Most early writers agreed that Stonehenge should be attributed to the cult of Apollo. 'In the Island of the Hyperboreans,' says Diodorus Siculus (of the 1st century BC), 'is a grove of Apollo, exceedingly beautiful and a temple worthy of notice, of a round form.' The other deity mentioned is Saturn, who slept in the west – 'sleep was the bond forged for him'. Now Stonehenge is precisely a temple of the sun, Apollo, and of time, Saturn. Until recently there was no conception of the antiquity of Stonehenge and it was not until the 18th century that

Imaginative representation of a Druid at Stonehenge, which appeared in *Vanity Fair* in 1911: he holds the cosmic egg and the scythe used in the ceremonial cutting of mistletoe. Scholars working in Alexandria in the early centuries AD were the first to produce an idealized picture of the Druids as profound philosophers

Andy Wier

Danish National Museum

The Druids were the priests and prophets of Celtic paganism; the head of a Celtic god, from the Gundestrup cauldron. The Celts worshipped the head as a symbol of divinity and supernatural powers

it was realized that it was thousands rather than hundreds of years old.

In modern times archeologists, Professor R. J. Atkinson in particular, date the successive Stonehenge structures to the period 1900–1450 BC. An American scholar, Professor Dawkins, fed into a Harvard computer the figures of the sightings across the stones and the positions of the heavenly bodies in 1450 BC and showed that Stonehenge pointed to the rising and setting points of sun and moon at both solstices and equinoxes, 16 orientations in all. Dr Fred Hoyle of Cambridge, followed this up by showing that the partial ring of 'Aubrey holes' or ritual pits inside the circular ditch formed a calculating machine for eclipses.

To this vindication of traditional meanings at Stonehenge, one adds the obvious deductions from its structure: circular dancings, processions, five-fold teachings, a death-and-resurrection cult of the sun, and male and female emblems. These signs give a sketch-outline of a cult, remarkably like the Druidic ideas.

The Chosen Chiefs

How far was Druidry driven out by the Romans? It continued in Wales and developed the deeply poetic traditions of the 5th and later centuries, whence came the Arthurian legends and teachings (see ARTHUR). It also survived in Ireland.

Druid traditions were unwritten until recently and links are widely dispersed in time. It is said that in 1245 a gathering was held with representatives from many parts and the objects of the Order were agreed. A grove or group was founded, the Mount Haemus Grove which still exists. Druids appear, together with Rosicrucians and Freemasons, in the mixture of mystical-occult societies of 18th century London; these were largely influenced by the mystic Jacob Boehme (see BOEHME).

In 1717 John Toland gathered delegates from Bardic and Druid circles in some ten areas, including York, Oxford, Wales, Cornwall, Anglesey, the Isle of Man, parts of Scotland, Ireland and Brittany as well as London, to form the Universal Druid Bond from which the present outward body descends, the Mother Grove An Tich Geata Gairdeachas. The grove no longer professes any specific religion, but forms a deistic philosophy.

The line of Chosen Chiefs includes, besides Toland, Dr Stukeley and Lewis Spence, the antiquarians, and William Blake, the visionary poet and artist. The main English Order was reformed in 1964 as the Order of Bards, Ovates and Druids, conforming to these grades in Brittany, France and Wales. At the same time the public observances were increased to eight – the four solstices and equinoxes, and the four Celtic festivals of Imbolc (1 February), Beltane (31 April), Lugnasad (1 August) and Samhain (1 November).

At solstices and equinoxes the Companions in their grades, Bards in blue, Ovates in green and Druids in white respectively, form into circles wherever they are celebrating; contrary to general belief the more organized ceremonies are now held, not at Stonehenge but at more accessible places, Parliament Hill in London, or Glastonbury Tor in Somerset, although the 'rump' movement left the main body in 1964 and still carries on rites once a year at Stonehenge.

The Lady of Summer

In the old form a trumpet summons to attendance, the Chief with half-drawn sword asks to the four quarters 'Is it peace?', and the Gorsedd or gathering is proclaimed. The reception of honoured visitors follows, often headed by the local mayor. Then, if it is the spring or autumnal equinox, the Lady Ceridwen Cariadwen is received and offers gifts appropriate to the season including the horn of plenty.

The summer solstice has its main ritual at dawn, when the rise of the light and the transformation of all things into good are proclaimed. The second rite, at noon, has, besides the reception of the Lady of Summer, a solemn feast, when the Order as host gives out some of the blessings that are conceived as having been received from the dawn light of this longest day; bread, salt and wine are bestowed upon all those who come.

At the winter solstice, held indoors, the death of the Old Year is mourned with the extinction of all lights. Then the birth of the Mabinog, or little sun, is celebrated by turning to the south-east with the erection of a star-lantern in the darkness. This is the time when mistletoe is distributed, and usually an Eisteddfod of some kind is held; a programme of Celtic music on the old type of harp called the *clarsach*, or a sword-dance symbolizing death and resurrection, have been prominent features of recent occasions.

Of the Celtic fire festivals, two are held in the open air, Beltane with its Earth Mother and May Queen being celebrated upon the summit of Glastonbury Tor, while Lugnasad with its fiery wheel of the descending year is held in a wood. Samhain is a more mystical occasion, being concerned with the links between living and dead; the ritual is Breton and uses the cauldron, ancient symbol of the Mother, and the Four Foods of the Dead. Imbolc is concerned with the washing of the face of the earth and the new furrow.

In the old form a trumpet summons to attendance, the Chief with half-drawn sword asks to the four quarters 'Is it peace?' and the Gorsedd or gathering is proclaimed

The Inner Sun and Moon

From this it will be evident that the observance of seasons and locality and their meanings form a great part of the Druidic public objects. The choice of Parliament Hill instead of Stonehenge for three ceremonies is not merely because the celebration of a national mystique should be near the capital city of the nation, as Stonehenge was the centre of the late Wessex culture. It is because of the extraordinary fact that a series of sites form a line from it, through Gospel Oak and the ancient Pen Ton, ending at the Bryn Gwyn (Tower of London), this line being orientated almost precisely to the midwinter sunrise. Ancient earthwork indications further suggest that Parliament Hill was a great gathering place, similar to the far smaller Tynwald in the Isle of Man. According to legend, here was the Caer Troia, the New Troy, founded by Brutus fleeing from the fall of Troy about 1200 BC.

Yet these observances are also intended to be meaningful at deeper levels. The sign of the Awen, or Three Rays of Light, is that of the divine attributes, Universal Majesty, Verity and Love Infinite. The sun and moon reverenced are not of course the physical ones, but are the inner sun of man and the moon of motherhood. Teaching comes most effectively from pithy wisdom sayings; and there is directed meditation amongst other things within the Order, which together form a safe training of the higher faculties designed for the West through our ancestors, the details of which are only available to those within the Order. This training links with the ancient mystery teachings. The Order of Bards, Ovates and Druids in fact forms an esoteric philosophic body with methods both old and new, as well as being a public body giving its teaching to the public in symbolic forms. In this it is unique amongst esoteric organizations.

The Gorsedd of Bards

Many people would think of modern Druids as Welsh, and certainly the movement is strong in Wales, if nationalistic rather than mystical. On the cultural side, Welsh musical contests go back to an unknown date, before that of King Hwl the Good (c 950 AD) whose Pencerdd or Chief Poet already had a special chair in the court. Some sort of meeting like an Eisteddfod was held in 1176 in Cardigan Castle, patronized by Lord Rhys, but nothing is later recorded until 1450 at Carmarthen. The next held was in the north, at Caerwys in 1523, and another in 1568 where a committee appointed by Queen Elizabeth examined bards and granted licences to wander and earn money by performances. The earlier tradition against written records has prevented our knowing much more until the 18th century almanacs begin to advertise meetings.

With Thomas Jones of Corwen, however, we come to the beginning of the modern Eisteddfoddau when he organized a large meeting at Corwen in 1789. A proliferation of Welsh cultural societies followed, and in 1792 Iolo Morganwg (Edward Williams) started the modern Gorsedd or ceremonial circle ritual. By 1821 the Carnarvon Eisteddfod was a huge affair, much patronized by the nobility and gentry. In 1860 it was decided to hold a national Eisteddfod annually, alternately in north and south Wales.

Nowadays the National Eisteddfod Court organizes the occasion, while the Gorsedd of Bards is responsible for carrying out the full ceremonial. Every Gorsedd must be proclaimed a year and a day beforehand. It is all very distinctly Welsh and concerned with poetry, prose and musical competition and performance. Brittany and Cornwall are regarded as merely 'branch-Gorseddau', not as existing in right of their own traditions and languages, while the French and English Druidic movements are not recognized at all. And yet, when the Gorsedd movement was started under the aegis of Iolo Morganwg, it was proclaimed on Primrose Hill in London, jointly with leading English Druids of the day, that English was to be considered a bardic language, to rank with the 'Ancient British' for all bardic purposes. A few years ago, however, an Archdruid was reported as saying that only Welshmen could be Druids, following which a fraternal delegate from Brittany was refused admittance to the National Eisteddfod.

The mystical-symbolic side is in fact seen only in the ritual. Admission to the three Orders of Ovates, Bards and Druids is by way of examinations or honorary invitations, the Welsh language being compulsory. The Archdruid is elected for three years and has a committee of officers.

The Bards of Cornwall, organized with the help of Wales, form a considerable body which revives the extinct Cornish language so far as is possible; thus the Bards are of two types, language and non-language members. Solely Bardic, their impressive robes are in deep blue. They carry out some of the usual ceremonies at the stone circles of Cornwall or in the great halls of Arthur built at Tintagel in the present century for the Arthurian Order. William Borlase wrote about Druidic remains in Cornwall in the 18th century much as did his contemporary the English Chief, Dr Stukeley; that is, most ancient monuments if not obviously Christian were apt to be ascribed to Druids.

Druids in Brittany

The Bretons have a strong Druid and Arthurian tradition from classical and medieval times; there were the famous prophesying 'Druidesses' on the Île de Seine, and the enchantments of the Forest of Broceliande, near Rennes, where Merlin was imprisoned in a tree by the enchantress Vivien. It was only at the beginning of the present century, however, that Druidry became an organized force in Brittany. For several years now the annual August Eisteddfod has been held beside the beautiful lake at Paimpont, in the midst of the old forest area of Broceliande. The ceremonial follows the Welsh-English pattern.

Druidry is still a hereditary matter as well as one of organized bodies, and James Duncan, the late Father of the Order of Bards, Ovates and Druids, and an independent Druid, used to tell me that to his knowledge there were at least 400 other such Druids. Moreover any senior group has a right to move from an existing Order to make a fresh working. Many of these live unknown to each other. There are also bodies of ancient descent which appear now to have social activities only and to have little inner teaching.

David Hurn-Magnum

The throbbing beat of the drum in many societies forms a bridge to the supernatural. As an aid to the trance state, as a means of frightening away evil spirits, it is part of the equipment of the priest, the magician and the shaman

DRUM

Buckland Abbey, Devon

MAN'S USE OF DRUMS for a wide variety of practical and magical purposes seems universal and of the greatest antiquity. They have been employed to mark the occurrence of special occasions and events; in religious ceremonies of all sorts; as conveyors of messages, often in sophisticated codes; and, of course, as straightforward musical instruments. In many different parts of the world, drums have been beaten to prevent storms or earthquakes and to drive away demons and evil spirits, especially those that cause sickness.

They are sometimes linked with initiation rites. In the Port Moresby region of New Guinea, for instance, the main task which boys are set at their formal entry into manhood is for each to make himself a drum. They go into the forest in groups and are obliged to observe certain strict rules. They must not see or be seen by a female; if they were, their drum would have a poor tone. They must not eat fish, lest the bones tear the skin of the drumhead. They must not drink running water but only water trapped in the great leaves of the jungle foliage; for running water would put out the fire and power of the music of their drums.

Particularly in Africa, where musical skill in drumming is highly varied and developed, drums have been often connected with royal authority. In many western areas, every chief had his own sacred drum, which was played only at important religious ceremonies and offered its own libations of blood. When it was made, a slave would be sacrificed upon it and the spirit of the slave was believed to inhabit the drum thereafter. This recalls the royal drums of certain Malay rulers which were the dwelling-places of mighty spirits.

Above **Drake's Drum in Buckland Abbey near Plymouth, believed to have been taken by Drake on his voyage round the world and to sound of its own accord when war is imminent; some claimed to have heard it just before the First World War** ***Left*** **During a Royal Tour, Nigerians salute the Queen by beating their drums. In some parts of West Africa every chief has a sacred drum as a symbol of his royal authority**

The ancient kings of Buganda, a region especially renowned for the virtuosity of its drummers to this day, had a royal drum which was the object of the greatest veneration and was, indeed, the symbol of their kingship. When it was first made and whenever it was given a new skin, the blood of the ox whose hide was used was poured over the drum, as was also the blood of a human sacrifice. When the drum was beaten, it was believed that the life and strength of this blood flowed into the king, renewing his power and authority. The royal drums of some Buganda tribes also marked places of sanctuary: escaping slaves and straying animals who touched them were regarded as sacred.

The drum is probably most famous, however, for its ability to induce strange states of mind, conditions of trance and ecstasy and weird powers. There are the throbbing drums of magical ceremonies, the drums of Voodoo, of the Maenads of ancient Greece and of our own contemporary music. But in most cases the drum itself is not particularly significant, it is no more than one ingredient in a rich magic brew. In one region, however, the drum itself is of special importance and interest – the far north of Europe and Asia. Here, the drum (in the form of a kind of tambourine) has been used as the chief instrument of divination and has been particularly connected with the shamans of Lapland and Siberia (see LAPLAND; SHAMAN). He would beat on his drum to send himself into a trance. Then, it was believed, he would journey, mounted on the drum, through the world of the spirits. When he returned from the underworld, entranced, he would describe his travels in frenzied song, to the accompaniment of his drumming.

The Siberian shamans' drums were often carved and painted with pictures of men and animals, heaven and hell and hunting scenes. Some had metal images inside them which would rattle when the drum was shaken. (Some believed that thunder was caused by a great shaman beating and shaking his drum in the heavens.) These images were intended to record the visions that the shaman had seen in his trances.

In Lapland, before the coming of Christianity, there was the same veneration for the shaman and his drum. But the Lapp shaman, as well as employing his drum for inducing a state of trance, also used it as a direct tool of divination when he was fully conscious. The head of his drum was painted with many images, done in alder juice or reindeer blood. These images represented the gods of sun and moon, or wind, fertility and thunder, men, women and animals and the underworld. If he wished to foretell the future, the shaman would take his drum from its special skin bag, place little brass rings on the head and tap it with a hammer. As the rings danced on the images, so could the future be seen. This could be done not only by shamans. It seems that in the 18th century nearly every Lapp household had its own magic drum. Whenever an important practical decision had to be made (about, for instance, in which direction to hunt), the father would put on his best clothes, spruce himself up and consult the family drum. But it was always left for the shaman, rapt in his delirious trance, to seek solutions to the questions of greatest moment. He, above all, trusting in his drum, was the only one who could heal the sick by rescuing their souls from the dread world of the spirits.

The Drum in Ashanti Religion

The religion of the Ashanti in Ghana lays great emphasis on drumming during public worship, for drums are versatile instruments capable of performing both musical and non-musical functions, and serving as an aid to worship by creating the appropriate mood for worship, or they can be used as a means of worship and a bridge to the supernatural.

The majority of Ashanti drums are made out of *tweneboa*, a species of cedar formerly also used for building houses, which is believed to be the abode of the spirit, Tweneboa Kodua. It is cut down only after the appropriate ritual has been performed. Before the finished drum leaves the drum carver's workshop, it is first consecrated to Tweneboa Kodua irrespective of what it is to be used for. On any occasion that a master drummer has to perform, he must also begin by pouring a little libation to Tweneboa Kodua.

In organizing the sounds of drums, three functions are considered; the need for alerting or rousing people, the need for verbal communication and the need for movement. Accordingly three modes of drumming are employed: the signal mode, the speech mode and the dance mode. The signal mode consists of single drum beats played intermittently, or a short rhythmic figure played over and over again as a call signal or warning signal.

In the speech mode of drumming the emphasis is not just on selected rhythm patterns but on coherent verbal messages: an attempt is made to reproduce the spoken word as closely as possible on drums. This is facilitated by the nature of the Ashanti language, for Ashanti is a tone language, a language in which the tones of particular words, phrases and sentences tend to be fixed. Because of this it is possible for any drum which gives clear pitch contrasts to reproduce the tones of words, phrases and sentences. The second element of speech which is reproduced is rhythm. The relative durational values of the syllables of the spoken word can be imitated on drums. When these are combined with the appropriate tones, the Ashanti ear is able to re-interpret the sequence of drum sounds in verbal terms.

On ritual occasions the speech mode of drumming is much more frequently exploited than the signal mode. For then the drums can be used for addressing the focus of worship, for invoking his presence,

for praising him, or for communicating the wishes of his worshippers to him. Similarly the drums can be used for addressing the priest who, in Ashanti, also functions as a medium. They may spur him on to dramatic action or give him encouragement in the dancing ring. They can also be used for addressing the community of worshippers or individuals such as elders of a cult group, or ritual officers. The mood for worship can thus be greatly heightened through verbal texts played on drums.

The speech mode of drumming is greatly exploited in rituals devoted to ancestor chiefs. These rituals take place every 43 days and consist of food offerings, blood sacrifice and libations. As a libation is poured for each chief his name and praises are sounded on drums. Ashanti tradition also requires the drummer of the talking drums to play alone at about 4 o'clock on the morning of the *adae* festival, recounting the names of ancestor chiefs in their order of reign, playing a poem for each one of them, and ending with appropriate greetings of the occasion. The drummer usually prefaces this roll-call with a drum prelude called the Awakening, in which he addresses nature spirits, the Supreme Being, the earth and malevolent spirits personified in the witch. At the end of each poem he greets each one and is heard by the entire community as they lie awake in bed or as they start to prepare for the festival. For those who understand the language of the drums, the mood for the events of this day set aside for remembering and revering the memory of ancestor chiefs would have been set by the drummer as he plays in the speech mode.

The dance mode of drumming is equally important in Ashanti religious practice, for the dance is a form of dramatic expression which can be combined with music to express a variety of thoughts and emotions. Hence for the Ashanti it is a vital element of worship and gives an added importance to drum music played in religious contexts. The drums are usually played in small ensembles or in larger groups, each ensemble being associated with social or cult groups who play them on ritual and ceremonial occasions. The ensembles played by cult groups are of several types. The *bommaa* type of ensemble, consisting of five or seven drums, is played on important public occasions of worship for state gods. Stylistic differences are maintained between the music played for the gods and that played for the chief. Another type consists of three small drums augmented by a master drum; in the music played by this type of ensemble the pieces follow each other in a prescribed order and are intended to build up to a climax. If the priest is not already possessed by the god before he comes publicly to the place of worship, he is expected to reach this state in the course of the music and to sustain it in various dramatic forms as the different pieces are played.

Drums used in ritual contexts in Ashanti society have distinctive repertoires which set them apart from those used for other purposes. Those that are dedicated to the gods are regarded as sacred and are kept in the temple or in its vicinity. However it is not only such drums that need care. The Ashanti believe that all drums used in ritual contexts must be protected from chance defilement lest they cease to be an effective bridge to the supernatural.

Drumming is frequently used to induce strange states of mind, conditions of trance and ecstasy. In Africa a slave was sometimes killed on a drum so that his spirit would inhabit it. This Tibetan drum is made of human skulls

Horniman Museum/Michael Holford

Drummer of Tedworth

Poltergeist, probably the earliest well-attested one in England: at Tedworth, Wiltshire, in 1662 an itinerant drummer was arrested by a magistrate, who confiscated his drum; about a month later the magistrate's family heard drumming noises on the roof and pieces of furniture began to move about of their own accord.

A large group of Moslems belong to a sect founded by a ruler who believed himself to be God; after nearly ten centuries, they still await his return.

DRUZES

A MOSLEM SECT, the Druzes differ from other orthodox Moslems most strongly in their practice of an esoteric or secret religion, known fully only to those initiated into it. Their name is derived from that of Darazi, one of the two original apostles of the cult, which was founded in the 11th century.

In Islam there have been from early times a number of schisms (see ISLAM). The main orthodox Moslems are the *Sunnis*, but in the first century of Islam a split began to occur between the Sunnis and the *Shia*, who followed the leadership of the Prophet's son-in-law, Ali. Much later came the *Ismailis*, who split from the Shia in a power struggle for the succession to the Imamate, the headship of Islam. The Druzes were an off-shoot of this important schism. In common with the Ismailis, they believed in emanations of the deity, in supernatural hierarchies, and in the transmigration of souls.

The most extraordinary feature of the Druzes' history is the life-story of the real founder, Hakim, a Caliph of Egypt of the Fatimid dynasty. Hakim was born in Cairo in 996 AD and succeeded to the throne when barely 12 years old. He was closely cared for by a tutor – too closely for his liking, since the tutor rarely let him out of the palace and stopped him from giving his companions lavish presents. He therefore authorized his parasol-bearer to kill the tutor – an act of decisive brutality which his disciple, Hamza, was later to cite among the proofs of his divinity.

Curfew at Sunset

When he was 20 years old, Hakim began to display a marked eccentricity of behaviour, an intolerance not characteristic of the Druzes in more recent centuries, and an excessive prudishness. He persecuted both Christians and Jews. Christians had to wear blue clothes and hang from their necks crosses a foot long. Jews had to wear yellow clothes and hang from their necks blocks of wood, supposed to resemble the head of the calf which they had once worshipped.

He banned the brewing and sale of beer. Town-criers rang bells in the streets and warned men and women not to enter the baths without drawers. Fishmongers were not to sell fish that had no scales. Curfew was at sunset. Once, when a dog frightened Hakim's horse when he was out riding, he had every dog in Cairo shot. Another caprice led to the execution of a number of grooms and valets.

By the time he was 30 years old, Hakim had intensified his oppression of the Christians. Nearly 500 of their churches and

Israel Government Tourist Office

monasteries had been demolished and their lands seized. He himself professed a fervent devotion to the cause of Islam. He wore a coarse black woollen shawl when riding to the mosque on a donkey, and bestowed gifts on the poor sheltering in the mosques. Women had to stay indoors all the time: to enforce this rule, Hakim forbade the shoemakers to make shoes for women.

Women Walled up to Starve

A sacred book of the Druzes describes this period of Hakim's life thus: 'Our Lord before his disappearance wore black garments during seven years; he let his hair grow long for seven years; he kept all the women shut up in their houses for seven years; he rode on a donkey for seven years. This he did out of his great compassion for us, to conform himself . . . to the number Seven, which is so important in the system of the Ismailis. He wore black garments . . . to signify to his faithful friends and servants that for seven years after his disappearance they would be in a state of trial and darkness.'

One day, passing some public baths, he heard the sound of female voices and learned that there were women in one of the baths. He at once had all the doors and windows walled up and left the women inside to starve to death. When his spies reported that some women had managed to evade his ban and leave their homes, he invited them to the palace. A number of them, flattered by the honour, gathered there, whereupon he ordered his guards to sew them up in sacks and throw them into the Nile.

When Hakim was 32, his Islamic piety began to yield to a conviction of his own divinity. His apostle Darazi came to Cairo as Hakim's chief vizier and wrote a book proclaiming this doctrine. Hamza, Hakim's second apostle, attended by 12 disciples, converted many to the new cult. Hakim himself no longer went to the mosque or observed Moslem feasts or the fast of Ramadan; and he suppressed the pilgrimage to the holy city of Mecca.

No doubt his orthodox Moslem subjects were dismayed; but this development brought relief to many of the other religions. Since Hakim now believed himself to be God, he thought that he should not discriminate between various modes of worship. The Christians were allowed to rebuild their churches, their properties were restored to them, and in one week 6000 Christians, who had become Moslems under pressure, returned to their faith.

In order to promote belief in his divinity, Hakim pretended – with the help of a network of spies, many of them old women who could enter the harems – to know everything that was going on in Cairo, and often startled his courtiers by repeating to them things they had said at home the night before.

Again, he issued an order that all shop-doors should be left open at night: the owners would be compensated for any goods stolen. In one night there were 400 thefts. Hakim confronted the owners with a statue; in it was concealed a man who told them where the stolen goods were and who had taken them. The thieves were hanged – but it was Hakim who had employed them for this task, in order to provide further proof of his omniscience and his stern sense of justice.

Terrible as a Lion

Hakim himself used to patrol the streets, often in disguise. Once a paper was handed to him: on it was written an insult to his sister. He gave his army orders to burn and pillage Cairo and kill any who resisted, and went to watch the fire from a nearby height. After one-third of the city had been destroyed, he called his men off, apologized to the townspeople (explaining, however, that he was not responsible for all that had been done), and granted a general amnesty. Such was the terror he inspired that this was received with humble gratitude.

A 19th century student of the history of the Druzes sums up thus the personality of Hakim: 'His aspect was as terrible as a lion; his eyes were full, and of a light brown; no one could stand his look; his voice was strong and sonorous. Inconstancy and caprice, joined to cruelty; impiety united to superstition, formed his general character. It is said that he adored, in a special manner, the planet Saturn.'

His death – or, as the Druzes believe, his disappearance – occurred in 1020 AD. Early one morning before daybreak, he rode on his donkey out of Cairo, first embracing his mother and telling her that, according to his horoscope, he would that day run a great risk. On the mountain top from which he had watched the city burning, he gazed at the stars and said to his attendants: 'We all belong to God, and we shall all return to him'; then, striking his hands together: 'Thou hast appeared then, fatal sign!' No more is known; he never went back to Cairo. The Druzes believe that he was the last incarnation of God and that he is not dead and will one day return in glory.

Oneness of God

With such a founder, it is not surprising that the Druzes have often, down the centuries, been embroiled in violence and civil wars – the last of these having occurred in Lebanon as recently as 1958. A 12th century observer said of them: 'They are subject to no king or prince . . . and are so nimble in climbing hills and mountains that nobody can successfully carry on war against them.' Sometimes they have warred with those of other faiths; but at other times Christians under Druze sovereignty have enjoyed more toleration and security than in any other Moslem land.

It would, indeed, be misleading and unfair to suggest that the Druzes of modern times emulate the savagery of Hakim. In the 1958 war, for example, a leader of their side was a hereditary Druze chieftain, Kemal Jumblatt – a man of intelligence and culture who has held office in successive Lebanese governments. He may be assumed to interpret the traditional teachings of the Druzes in a highly spiritual sense. These teachings, in any case, have always emphasized the oneness of God: they may be compared with the doctrines of the Gnostics in early Christian times.

In 1979 it was estimated that there were around 400,000 Druzes, scattered throughout Lebanon, Syria and Israel. They worship in small, bare shrines, empty but for boxes adorned with shreds of coloured rag. A modern traveller, Robin Fedden, writes of their elegance, their courage, and their 'astonishing beauty'.

Dryads

In Greek mythology, female spirits who guarded oak trees and are shown dancing around them: they were later connected with groves and woods in general; mortal daughters of Zeus, they were long-lived and generally benevolent to men: a hamadryad was the life-spirit which lived in each tree and which died when the tree decayed; tree spirits are also known in many other parts of the world.

See ANIMISM; NYMPHS.

Sotheby's/Michael Holford

The martyrdom of Mani, founder of the Manichean religion; his flayed body lies on the ground, and his skin, stuffed with straw, hangs from a palm tree. The Manicheans were dualists, believing in the eternal opposition of two great principles, the powers of Light and Darkness; from a 14th century Persian manuscript

Where does evil come from? Many answers have been given to this question: one of them is that evil stems from some great god, force or principle which is separate from and opposed to the good

DUALISM

IN THE HISTORY OF RELIGIONS, dualism means the belief that there is a radical opposition between two great principles which underlie the existence of what, in one way or another, is found in the world. In Zoroastrianism, for example, the two opposing principles are Ohrmazd, the creator and champion of the good, and Ahriman, the champion of evil. Ahriman and his army of evil beings harass the good creation of Ohrmazd, into which they have penetrated from outside, until at the end, far in the future, they are expelled and deprived of all their destructive power.

In Zoroastrianism, the theory of opposite principles takes various different forms. In the *Gathas* or 'Songs' of Zoroaster there is the opposition between the beings belonging to the good god's creation and the demonic beings who try to annihilate it. The *daivas* or demons joined the side of evil by their own choice. But an earlier choice had been made by the two 'spirits', the Holy Spirit and the Evil Spirit. They are described as twin brothers, which can be interpreted as indicating the symmetry between them. They are equal and contrary, the inspiring agencies and at the same time the opposite terms of the 'choice' to which all reasonable beings are committed.

Zoroastrianism soon became a clearly dualistic system in which Ohrmazd was opposed directly and from all eternity to Ahriman. Some non-Iranian sources testify to the existence in Iran of a myth recounting how Zurvan (Time or Destiny) gave birth

to the twins Ohrmazd and Ahriman. This seems to have been an attempt to 'bridge' the dualism of Ohrmazd and Ahriman, with Zurvan as the impersonal principle of Time or Time-Fate, the sphere in which the actual agencies of the cosmic drama exist and operate. But the myth was finally rejected by the Zoroastrians themselves. (See AHRIMAN; ZURVAN.)

The Evil Rival

Another example is the 'anticosmic' dualism of Gnostic teachers and sects, like Valentinus, Basilides, the Manicheans and the Mandeans (or much later the Bogomils and Cathars). Here, this world itself is evil, made of a dark and essentially negative substance, and created not by the supreme God but by an inferior supernatural power, the Demiurge. Man's body and the lower level of his soul were created by the Demiurge but contain, imprisoned in them, the divine spark, the spirit which comes from God and which can only be freed from its prison by the *gnosis*, the liberating knowledge of God.

In the doctrine of some Gnostics, including Valentinus (2nd century AD), evil manifests itself only at a late stage in the creation of the universe. There is a succession of emanations from the divine world. The last of these is Sophia (Wisdom) and her 'fall' brings matter into existence. The dualism of the Manicheans and the Iranian Gnostics was more radical, for Light and Darkness were in opposition from all eternity. (See GNOSTICISM; MANICHEANS.)

According to the Bogomils in the Balkans, the evil principle, Satanael, who corresponds to the Demiurge of the Gnostics, derived from God but created an earth and a heaven for himself. He also created the body of man, which he treacherously caused to be animated by a spirit, sent by God (see BOGOMILS).

A dualism partially analogous to that of the Bogomils can be found in a number of legends from eastern Europe; among some sects of western Asia, including the Yezidi of Iraq, the 'worshippers of the Devil' who venerate the Angel Peacock, a demiurge who is a rival of God but is later reconciled with him (see YEZIDI); and among a number of peoples of central and north-western Asia, including the Tartars and eastern Finns. An example is the story of Erlik, a rival who co-operates with the Supreme Being in the work of creation: he digs up for him a particle of earth from the bottom of the primordial sea and tries, with little success, to create a heaven of his own.

These stories imply a feeling of some inadequacy on the part of the Creator. Generally, the adversary is conquered in the end but the nature of his malignant deeds brings them into the fold of dualism proper. He breathes his own bad spirit into man or he soils man's person, and this is not because of any fault on man's part, especially as the intrusion of evil is described as occurring during the creation of man.

Something very similar occurs in a number of primitive mythologies from north-eastern Asia and from North America, where we have the tales of Coyote, a typical trickster-demiurge who is an unhappy but not ineffective competitor of the Creator during the work of creation. Stories detected among

the Dogon in Mali imply that reality has resulted from the opposing actions of a Creator and a competitor, the Pale Fox. The wide diffusion of dualistic myths warns us against always attributing dualism to Iranian or Manichean or Bogomil influence.

The Serpent's Descent

Another strand of dualism appears among the Orphics, in Empedocles and other early Greek philosophers, and in Plato. The world is thought to consist of two principles, which are seen as complementary to each other but usually unequal in value. In Plato there is the dualism of Matter on the one hand and the Ideas (with the supreme one, the Idea of Good) on the other. In Empedocles there is the dualism of the two opposite principles of Love and Discord, which prevail in turn in the universe. In Pythagorean doctrine there is the dualism of the Monad (Unity, perfection, eternity, infinity) and the Dyad (Duality, imperfection, limitation in time and space).

Gnostic dualism has something in common with this type of speculation, especially in the variety of Gnosticism which is called 'ophitism', in which the serpent (*ophis* in Greek) symbolizes the descent of the superior spiritual element (*pneuma*, literally 'breath') into the inferior world of matter, and its subsequent ascent again, or reintegration into the divine, heavenly realm. This concept of descent and ascent is related not only to the theory of the salvation of the human spirit, escaping from its imprisonment in this world, but also to the nature and creation of the universe. The spiritual element is conceived of as animating matter and giving it life, form and movement, even if only precariously and provisionally.

The term dualistic can also be applied to certain Indian doctrines, found in the *Upanishads* and the Vedanta tradition, which are 'monistic' in that they reduce all that exists, in its manifestations in the realm of multiplicity and appearance, to a first principle, the ultimate ground and substance of the universe (*Atman*, *Brahman*, *Purusha*), which is immanent (pervading all things in this world) but also transcendent (surpassing, going beyond them). But these Indian systems are also dualistic, in the sense that they oppose the visible and illusory world with its limited and imperfect gods to the transcendent substance of Atman and Brahman (see also BRAHMAN).

Or there is the Chinese theory of Yin and Yang, the two ultimate principles of the universe, whose opposites – day and night, male and female, celestial and terrestrial, and the rest – underlie all manifestations of being. Again, in Taoist doctrine, these two principles are transcended by one first principle, the Tao itself, which is inexpressible, not reducible to a mere expedient to 'bridge' the Yin-Yang couple (see CHINA; TAOISM).

Fra Angelico's painting of the *Last Judgement*; the souls of the righteous, on God's right, go to heaven and the souls of the wicked, on his left, are subjected to the tortures of hell. Christian concepts of God and Satan, of good and evil, are not truly dualist for God remains the supreme Creator and Lord; Satan is a creature of God and creates nothing

Scala

Ethical Dualism

Sometimes the opposition between the two principles of a dualist system seem to reach into the very interior of Godhead, or whatever is substituted for it, as in some Iranian or heretical Islamic speculations. Peculiar developments of classical dualism, with its tendency to split soul or society or reality into opposing segments, can be detected in some forms of modern existentialism, of Freudian psychoanalysis and of Marxism.

But it is important to distinguish between dualism in the true sense of the term and so-called 'psychological' and 'ethical' dualism. A duality of ethical and psychological possibilities, the good ones and the bad, is to be found in every form of human thinking and behaviour. For example, it would be misleading to assimilate to true dualism the Jewish concept of the two 'spirits' which act in the soul of man, the good inclination and the evil inclination. For these do not detract from the biblical idea of a supreme Creator and Lord of the universe. The Dead Sea Scrolls expressly state that these two spirits were appointed by God to give man a choice (see DEVIL).

Similarly, the Jewish and Christian concepts of Satan are not truly dualist, for Satan is a creature of God and creates nothing himself. Nor are the Jewish and the somewhat different Christian ideas of original sin, which are very different from the dualist Orphic, Platonic and Gnostic notion of a primordial crime, committed in the heavenly world by a divine or semi-divine but invariably non-human and pre-human agency, a sin 'previous' to the world and to man, and producing the very existence of man in the world. This notion did influence some Jewish and Christian thinkers, including Philo of Alexandria in the 1st century AD and Origen in the 3rd, but is foreign to biblical thought. St Augustine formulated the orthodox Christian refutation of dualism, according to which evil is not a principle or a substance but a deficiency of good within created rational beings (either angelic or human).

DWARFS

The small, dark people of Norse mythology, renowned as workers in metal and magic, may have a historical origin

IN FOLK LEGENDS and fairytales, dwarfs were always described as creatures of small stature, ranging from the size of a man's thumb to the height of a two-year-old child. In appearance and feeling, they roughly resembled human beings, but magical powers endowed them with special skills and wisdom far beyond those of any mortal men. Inhabiting the dark and secret places of the earth, dwarfs could appear or disappear with bewildering rapidity.

Although dwarfs were a regular feature of northern folklore, references to such diminutive beings can be found in Greek literature. Crowds of tiny men climbed ladders to reach the top of Hercules's wine cup, when that hero visited their country; and in Greek paintings they were depicted as hewing ears of corn with miniature axes. Such writers as Pliny and Aristotle claimed that tribes of these minute people dwelt in caves on the banks of the River Nile.

Very occasionally, dwarfs were described as incredibly beautiful. Fair Idun, of Norse mythology, was utterly unlike her dark, ugly brothers and father, dwarfs who were skilled smiths. Old Ivaldir sometimes allowed his lovely daughter to walk abroad in the sunlight, which she much preferred to their gloomy underground kingdom of Svartalfheim. Because she was so beautiful the sun's rays did not turn her to stone, a fate which befell other members of the race of dwarfs. Bragi, the handsome god of poetry and eloquence, fell in love with Idun, and married her; and she was given the special task of keeping the golden apples, which gave the gods eternal youth and vigour.

The more usual Scandinavian and Teutonic dwarfs were hump-backed, dark little men with large, wise heads and long beards. Sometimes their feet resembled those of a goat, or a goose. All lived to a great age, and considered unwholesome food to be the cause of the brief span of human life. Their kingdoms and tribes were ruled over by kings and chieftains, and possessed large armies. Dwarf territories were situated deep inside mountains, mines, or under water. In the main, the creatures feared and detested

Radio Times Hulton Picture Library

sunlight, and one named Alviss, who was compelled to remain all day above ground, was turned to stone by exposure to the sun's bright rays. Garbed in black, brown or grey, they found no difficulty in merging into rock clefts and cave mouths, or gaining unseen access to their dark, subterranean abodes.

All That Glitters

Dwarfs were particularly the jealous custodians of gold, precious metals and jewels, and this guardianship also included the glitter of the sun's and moon's rays. Their vast underground halls were reputed to contain the most priceless of treasures. Anyone who stole from these hoards suffered great misfortune, and if a robber did manage to transport some of the gold to his home, he would abruptly discover that the fortune had turned into a pile of dead leaves.

To the mortal men they favoured, dwarfs were the givers of wise counsel, for they were considered to be the repositories of great knowledge. This secret wisdom evidently invested them with the power to foresee the future, make themselves invisible, and assume other forms. They were also adepts at magic songs and runes, and brewed the heady mead of poetry, which was guarded by the gods. Anyone aiding them was treated with the utmost kindness and courtesy, and generously rewarded from the storehouses of treasure. Legend tells of human midwives given gold in grateful return for their special services.

Michael Holford/Prado

Dwarfs and little people in general have always held a fascination for man: the tiny hump-backed men of northern European folklore were often credited with supernatural powers and throughout history people of very small stature were exhibited as curiosities *Left* The wise and kindly dwarfs from Walt Disney's highly popular film version of Snow White and the Seven Dwarfs, whose antics were earlier recorded by the brothers Grimm *Above* Fred Roper's Company of Wonder Midgets, photographed in 1936 at Waterloo Station before leaving for South Africa where they were to appear at the Johannesburg Empire Exhibition *Right* Up to the 18th century dwarfs occupied a favoured position at the courts of Europe, often as playmates of the royal children: painting of the court dwarf, Don Sebastian Morra, by the 17th century Spanish artist Velazquez

These mischievous and sometimes malicious beings teased farm animals, abducted children and beautiful maidens, and stole bread and corn

John Webb

The dwarfs were chiefly renowned for their ability to produce magnificent metalwork. The foremost craftsmen among their numbers were generally the kings. It was these ugly and often ill-tempered little men who could create wondrous works of art and magic. They forged the armour for the gods, and the strong chain called Gleipnir with which the gods bound the terrible Fenris Wolf. Magic swords and golden rings, so highly prized in many legends, were fashioned by the deft fingers of dwarfs. Fair Idun's two brothers made Gungnir, Odin's magical spear. They also produced for the goddess Sif, the beautiful wife of Thor, exquisite, long golden tresses, to replace her own hair after the mischievous god Loki had shorn it all off.

Another dwarf, Sindri, forced to compete against Ivaldir's two sons by the boasting of his brother Brökk, wrought many wonderful things, including Thor's mighty battle hammer, Mjölnir, which no matter how far it was hurled always returned to its thrower's hands. For the god, Freyr, the dwarf made Gollinborsti. This great boar could either be ridden or draw a chariot, and it travelled as easily through water or air as upon land. The lights from Gollinborsti's special golden bristles ensured that Freyr never rode in darkness, not even in the deepest night. For Odin, Sindri fashioned Draupnir, a golden arm ring. Every ninth night, eight rings, all of similar weight, were formed and fell from this magical piece of jewellery, so that by the end of only one year the owner of the dwarf's handiwork would have amassed a great treasure.

Many scholars have produced evidence to justify the theory that the dwarfs of folklore and superstition are descended from a race of small, dark men, skilled in mining and smelting metals, who inhabited the primeval forests of Western Europe. Fearing invasion from the East, they sought refuge in caves, which may have given rise to the belief that dwarfs had been swallowed up by the earth *Above* The survival of the old culture was often thought to be perpetuated by the little people of later centuries: detail of a dwarf from a painting by Domenichino, in the National Gallery *Left* The Elfin Oak, one of the attractions in the children's playground, Kensington Gardens, has been fashioned from an old tree stump

Lords of the Mine

Anyone who forced the dwarfs to give or make one of their exquisite articles was doomed, and their gain brought only misery. An enchanted sword, Trfing, which two dwarfs were compelled to forge, had a curse laid upon it. It could never be drawn from out of its sheath without bringing death.

Those dwarfs who lived in the mines were regarded very warily by men, and considered more vicious and unpredictable than those inhabiting mountains. Miners often heard them moving about far below in the darkness, and now and then glimpsed the little men. Within the mines, all kinds of catastrophes from broken tools to roof falls and sudden fires were attributed to the fury of these dwarfs. This was their method of punishing over-inquisitive humans, who appeared to treat the tiny 'lords' of the mine without proper respect. However, if mollified with presents of food, dwarfs were known to help with the work in hand, and give advance warning of danger by tapping in the mine shafts. The tales of the 'knockers' from Cornwall and Staffordshire belong among those of the rest of Europe relating to mine dwarfs (see CORNWALL).

Generally, it was human beings who had cause to grumble about the dwarfs' behaviour. These mischievous and sometimes malicious beings teased farm animals, abducted children and beautiful maidens, and stole bread and corn. Yet, apparently, they were considered annoying rather than dangerous, except for the Black Dwarfs, which were a type of malignant elf. In the majority of Scandinavian and German folk tales, the dwarf is quite friendly to men, although sometimes complaining bitterly of human dishonesty and untrustworthiness. The *erdleute* (earth people) of Swiss legend were said to help farmers, to find wandering cattle, and collect fire wood and fruit to leave out for the poor children.

Many North American Indian tales concern little folk explicitly comparable to the dwarfs of European tales. The Paiutes saw all dwarfs as mischievous, but the Cherokee believed they could be good or bad – though seeing either kind was a death omen. Many Eskimo tales depict helpful, luck-bestowing dwarfs similar to those of Scandinavia.

The origins of the dwarf are obscure. Norse mythology suggests that the tiny men either came to life as dark maggots crawling from the decaying flesh of the slain primeval giant Ymir, or from the scarlet billows of the seas, which were formed from the same giant's blood. The gods granted them the wits and shape of men, and gave four of the dwarfs, Austri, Vestri, Svori and Norori, the duty of upholding the four corners of the sky. There seems to be little evidence to suggest that any of the dwarfs themselves were ever venerated as gods.

Archeological and anthropological studies have produced evidence to justify the theory that the belief in dwarfs was based on reality rather than on imagination. Some of the first inhabitants of Western Europe were small, dark, shy people, dwelling among the dense forests which covered much of Britain, Brittany, western France and Germany. Like the little Lapps, who inhabited the Scandinavian Peninsula before the invasion of the Gothic-Scandinavian races, they were skilled in mining and smelting the metals which abounded in those regions.

Memory of an Extinct Race

From the East came strong invaders, economically and mechanically better equipped than the small natives. As these new people conquered and settled, the dominant features of their civilization became the much-hated incursions on the little people's original environment. Weaker in strength and numbers, they were forced to retreat into the swamps and islands, driven back by the clearing of their forests for the organized agricultural settlements of their invaders. Later came the passionately loathed church bells, as Christianity overcame the old religions. According to popular belief, the little men hated agriculture, the clearing of forests, and the ringing of church bells – anything, in fact, which disturbed the peace of their underground kingdoms.

Some of these original people intermarried with their conquerors, especially the Celts, who were in their turn forced further westwards by stronger Nordic groups. This mingling of races enshrined many of the very ancient crafts and beliefs of the little people, and determined that pockets of the old culture remained.

As in the case of many minority groups throughout recorded history, the invaders had no need to fear serious attacks from the vanquished, yet the seemingly magical

practices of the defeated race gradually became the fearful superstitions of the more powerful majority. All the mysterious customs appeared to belong in the supernatural realms of some dark fairy world peopled with malevolent spirits who could use their incomprehensible knowledge of magic for the overthrow of the physically stronger overlords. Sir Walter Scott suggested that the little people's probable ability to foretell the weather from observing cloud formations and other meteorological phenomena, would have given them, in the eyes of the conquerors, another magical advantage. Thus, it was the invaders' fears, rather than the dwarf people's actual talents, which gave the relatively smaller and weaker race a curious power. Fairies, with whom dwarfs were popularly associated, were always believed to be capable of travelling quickly, and possessing the power of invisibility. Obviously, their slight stature allowed the little dark men to move swiftly, and no doubt they increased this speed in order to escape the attentions of their enemies, which would be accepted as further proof of great supernatural knowledge.

Caves in many parts of Western Europe show traces of having been inhabited from prehistoric times until as late as the 15th century, and it seems likely that the little people, and the descendants who shared their beliefs and magic, were forced to seek protection in caves. This may well have given rise to the widely held opinion that dwarfs were swallowed up by the earth. Right up until the 17th century, superstitious people claimed to have witnessed dwarfs' nocturnal revels in the vicinity of the so-called 'fairy' mounds. These were probably the barrows where once the little people had ceremonially buried their dead. Such tumuli would be considered to possess mystical and magical significance as meeting places for the secret gatherings of similar believers.

So it may be that dwarfs are really the group memory of a long extinct race. They lived on in the minds of later generations, embellished with incredible powers, and transformed into legendary figures, characterized by the beliefs of various cultural groups. Though dwarfs' fictional habits might differ from country to country, all were probably the distant relatives of the dark, little men who lived thousands of years ago.

The rites of lamentation for Adonis, who was killed by a wild boar while on a hunting expedition, concluded with a joyful looking forward to his return to life, which was also an expression of hope for future crops: Michelangelo's Dying Adonis

The myth of the god of Nature who dies and is reborn recurs in many religions. Modern scholarship has shown that this is not a single strand but a complex web of myths, the meaning of which differs profoundly according to the social and cultural setting

DYING GOD

SEVERAL RELIGIOUS MYTHS of the ancient Near East have in common certain features which link them together despite important individual variations. Historians of religion since James Frazer have labelled these common features as the myth of the 'dying god'. In *The Golden Bough* Frazer complicated the discussion for later researchers by mixing up the analysis of this ancient pattern of myth with his theory of the divine king, who was believed to be the source of vitality for his people and who was ritually killed for the prosperity of his successors (see KING). Frazer's theories on this last subject have suffered severe criticism and are not now thought capable of being sustained. But in the volumes entitled *Adonis, Attis, Osiris* Frazer collected a mass of valuable material that can be detached from the abandoned theories within which he there presented it. The essence of the matter may be briefly summarized as follows.

In ancient Egypt, Mesopotamia and Syria, legends relate how a god is killed, often by a wild boar or by an enemy whose symbol is a boar. The corpse is deposited in a river, or he is drowned. Through his death the vitality of Nature is lost. But his loss is mourned by a goddess who goes out in search of his body. The finding of the corpse is a liberating act for the vegetation, and with this liberation the god returns to life once more. The myth is attached to an annual ritual for the recovery of the vegetation after the heat of summer.

To understand the meaning of this ancient pattern of myth is not easy for a northern European living in a well-watered land, where the contrast between the seasons is marked by relatively small changes. In the Near East, on the other hand, the contrast is extremely perceptible and much more violent in effect. The lovely spring is sadly brief, and rapidly the rich vegetation disappears as it is scorched under the cruel sun. For long months of dry, dusty, burning heat, water comes not from the sky but only from Mother Earth's resources below in wells and rivers. Under the impact of the fierce sun the vitality of Nature, man and beast dwindles to a minimum.

Primitive men watched this annual process with some anxiety. Modern scholars have often supposed that the recurrence of the seasons must have given complete confidence that the cycle would come round again. The ancient evidence shows that this rationalist supposition is false. The seasonal cycle was not an infallible natural law, and the entire prosperity of society depended on a good harvest. A bad year was awkward, a succession of bad years calamitous. Each year the menacing desert threatened destruction. Miraculously, the seed buried in the soil at seed-time sprang up to new life in the harvest but primitive men could not take this for granted.

Weeping for Tammuz

This fundamental experience of man in relation to basic necessities of his physical existence was expressed in many of the ancient Near Eastern myths. One of the oldest attested myths is that of the Sumerian shepherd god Tammuz. In Roman times Tammuz became identified with the Phoenician Adon ('lord'), whom the Greeks appropriated as Adonis. But originally Tammuz and Adonis were independent. The ritual of Tammuz took place at a festival in July when the vegetation had already gone, and consisted of passionate lamentations. The prophet Ezekiel describes with pain and displeasure a vision in which he saw Israelite women at Jerusalem who had so far compromised their loyalty to Yahweh that they were weeping for Tammuz. Mourning for the god's death was certainly the principal feature of the rite. Sumerian hymns tell how Tammuz was drowned and how the mother goddess Inanna (or Ishtar) descended to the underworld to bring him back from his imprisonment there (see also ISHTAR; TAMMUZ).

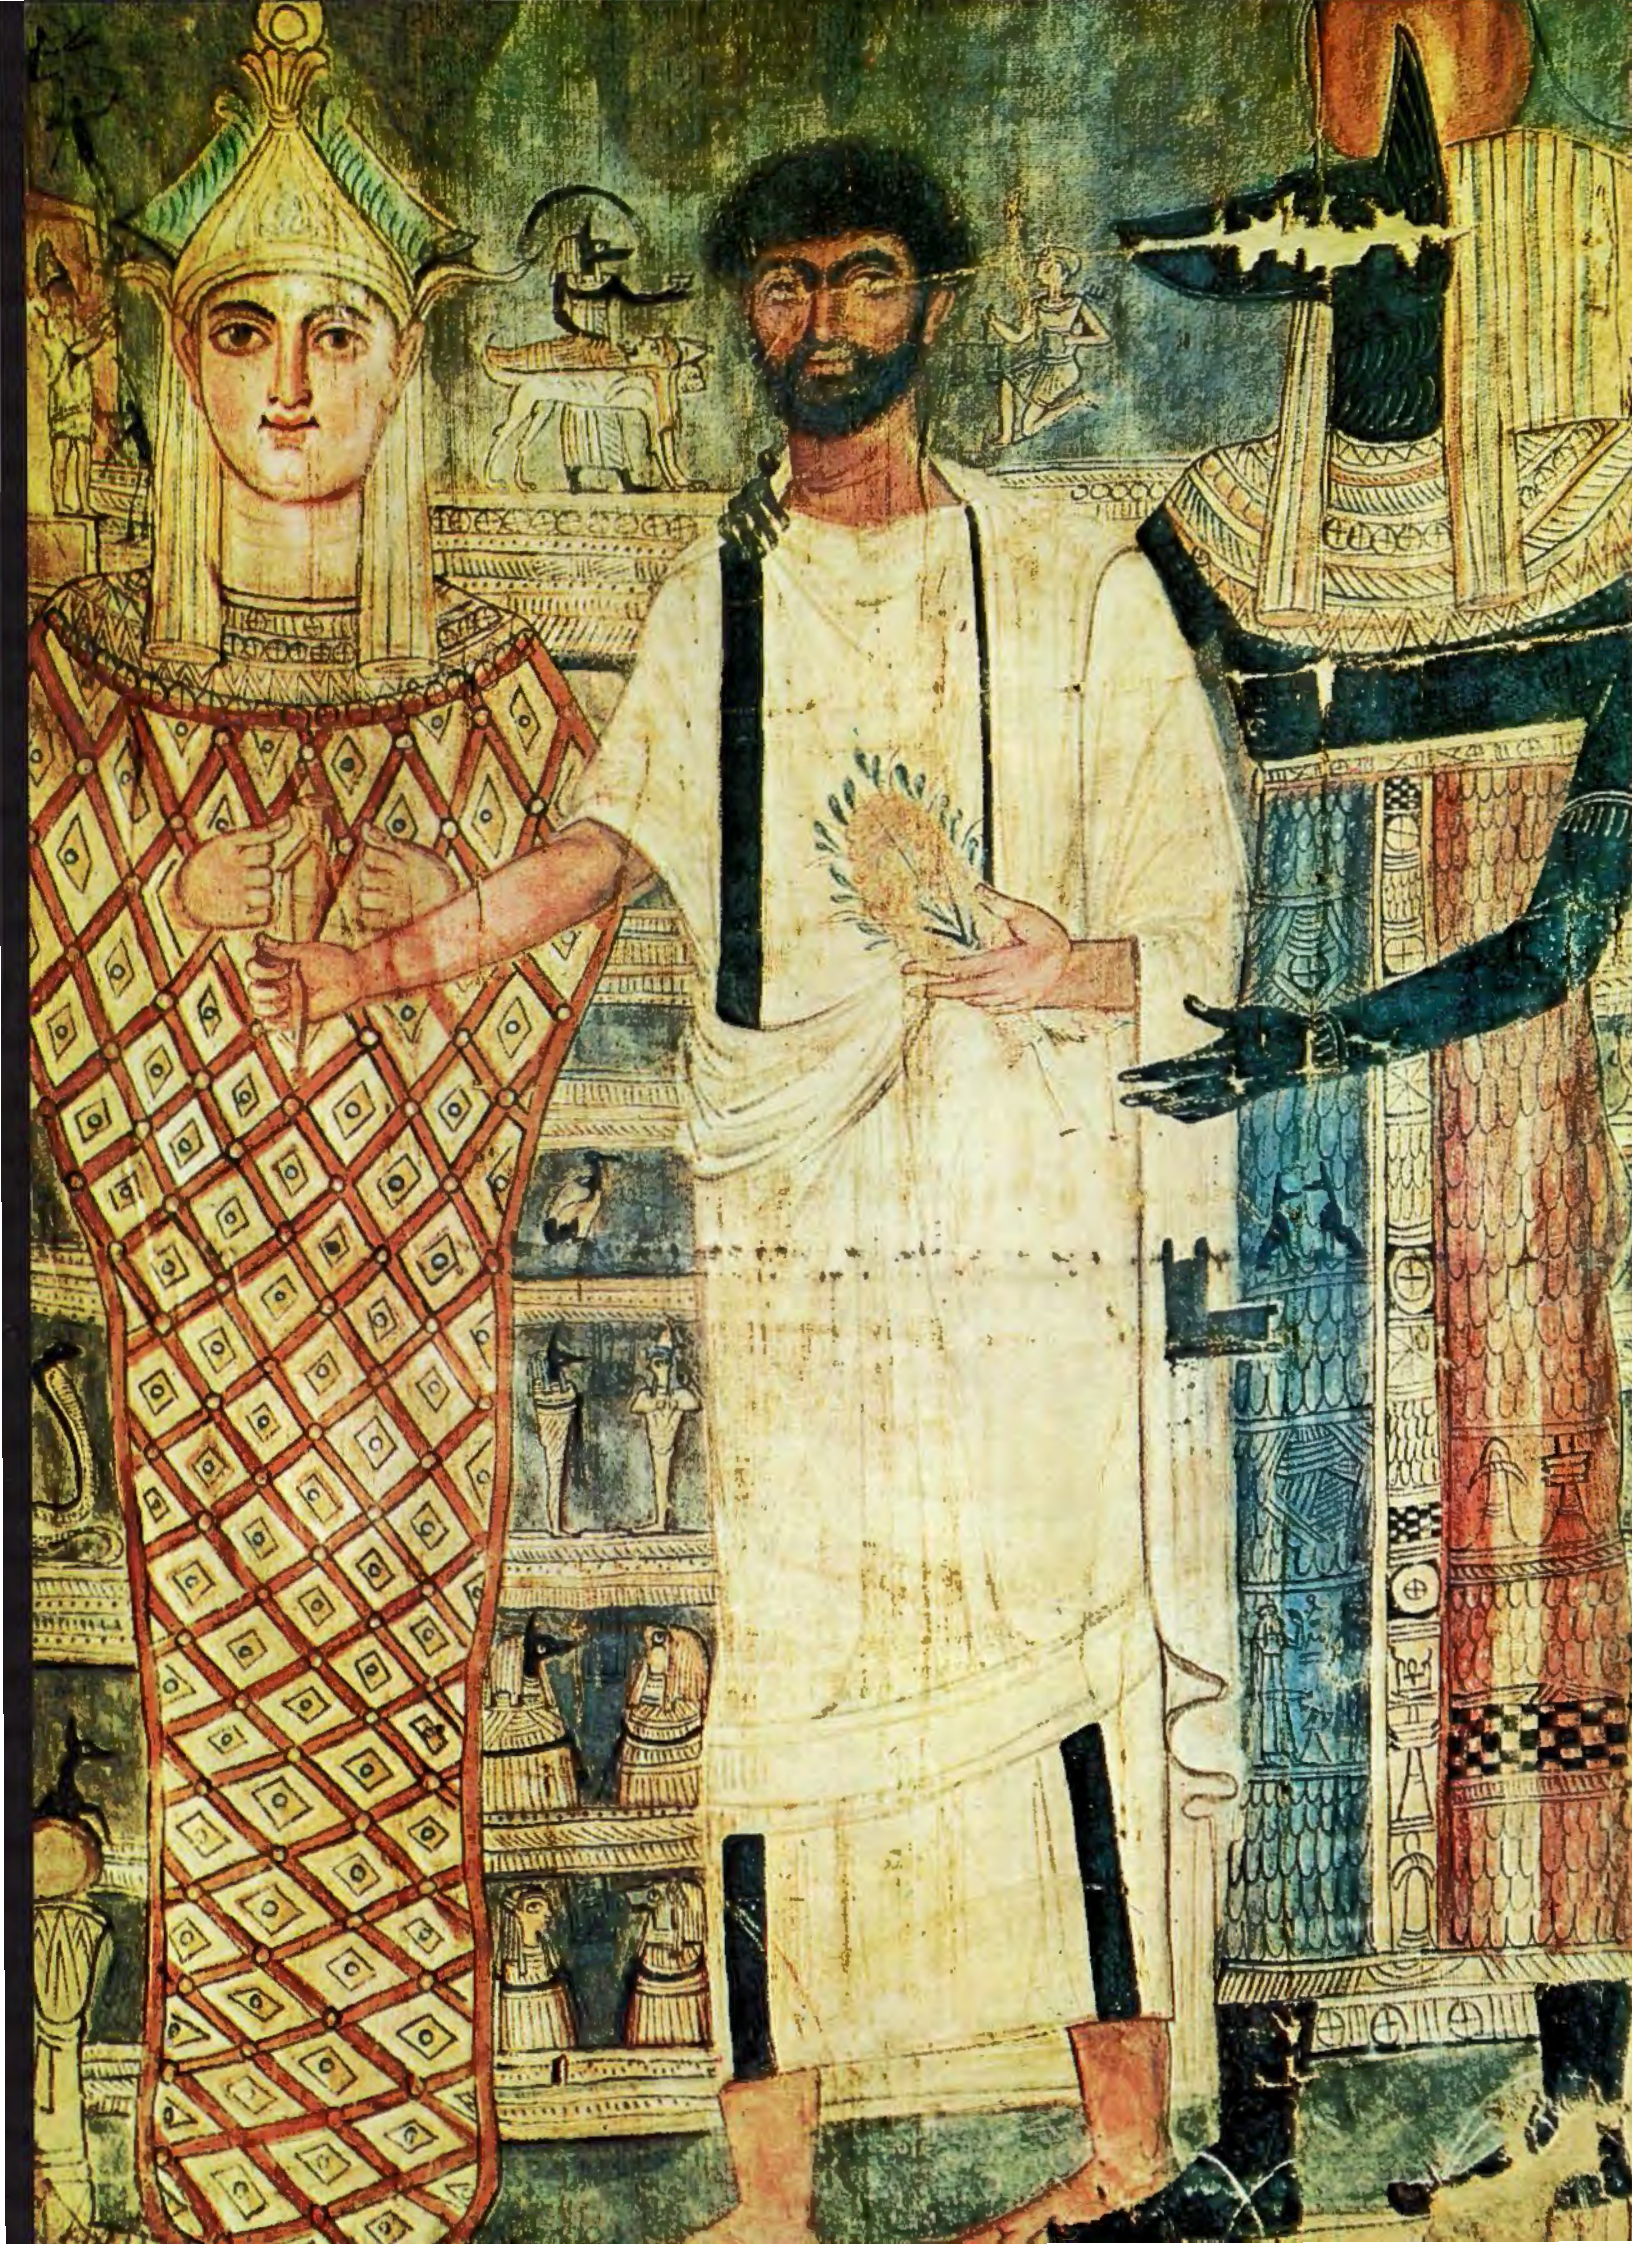
The purpose of the lamentations is not certain. It may have been an expression of sympathy for the tragedy that had befallen Tammuz. Or it may have been an attempt to avert wrath by disclaiming responsibility for the catastrophe.

The ceremonial mourning at a time when the seeds were sown was universally known, and can be seen to have influenced the proverbial saying of the Hebrew psalmist, 'They that sow in tears shall reap in joy.' But the Hebrews did not believe that there was any annual loss and recovery of vitality in Yahweh, and did not lament his demise in the hot summer.

The Mesopotamian rites for Tammuz were for the crops and flocks. The worshippers did not suppose that if they identified themselves with the god through participating in the mourning incantations, they could gain any personal survival of death or privilege hereafter. Like the ancient Hebrews, they expected no immortality other than that of their posterity.

It is a paradox of the history of Adonis that the cult is Semitic and yet that virtually all the extant sources for the study of the cult are not Semitic but Greek. In Greek myth Adonis, young son of the Cypriot king Cinyras, died from a wild boar when he was on a hunting expedition (see also APHRODITE). The boar was proverbial for its ravages in growing crops. In the *Iliad* (book 11) Homer gives a vivid description of the disastrous damage done by a wild boar. So the animal was an appropriate killer for a vegetation god. Adonis, however, represents not the harvest so much as the spring grasses and flowers destroyed by the summer heat. It was natural that in later times (as for Shelley) Adonis stood for the tragedy of noble youth cut off in its prime.

As with Tammuz, the rite for Adonis was one of lamentation, in which the women played the leading part. At Byblos in the 2nd century AD there were impressive ceremonies at Aphrodite's shrine, with an open-air procession and hymns which concluded with a joyful looking forward to Adonis's return to life. Unfortunately no document records, either explicitly or implicitly, the interval between the day on which Adonis was ritually mourned and the day on which his future revival was celebrated. The cheerful ending to the festival was in any event an expression of hope for the future crops rather



than of presumptive confidence in Adonis's present achievement of renewed life. The lamentation for his death was always the principal characteristic of the July festival, and several texts which describe or mention the rites conclude with the funerary mourning without going on to describe the return to life which the lamentations were intended to encourage.

Osiris, God of the Dead

Some of the best known passages in the Old Testament express the moving reflection that man's short and transitory life is like the grass that withers and the flower that fades. But once there is a religious context in which there is expectation or hope of surviving death (as there was not in early Mesopotamia), it is no great step to suggest that man's personal destiny may well have some correspondence with the seasonal cycle of spring, the dying of summer heat, and the renewal of life in the golden harvest. If the vegetation revives, may not man do the same?

This step was explicit in the worship of Osiris in ancient Egypt. The well known Book of the Dead, with its immense collection of formulae and passwords that the soul needs to learn now in order to negotiate its passage hereafter, is a sufficient reminder of the obsessive interest of the Egyptians in their proper destiny after death. Osiris was first and foremost the god of the dead, with a special relationship to Pharaoh. But at the same time Osiris had functions and powers closely akin to those of the Mesopotamian god Tammuz. He was the corn growing up to harvest, and above all the Nile itself, on whose annual flood in the summer months the prosperity and welfare of the country wholly depended (until the Aswan dam was built in 1902). Crops were sown on the mud flats which the receding Nile left as it subsided each October, and this fall in the level of the river was Osiris's death. Yet each June the power of Osiris revived in the waters coming down from the Ethiopian highlands, but which in ancient belief welled up from a subterranean water system bubbling to the surface at the first cataract.

Old Egyptian religion had three focal interests above all others – life after death, the monarchy, and the Nile as the source of agricultural prosperity. All three aspects found expression in the sacred myth of Osiris and his wife Isis. From the marriage of Isis and Osiris, earth and water respectively, sprang the life-giving corn (see also ISIS; OSIRIS). But the myth related how Osiris was killed by his wicked brother Seth, who cut up Osiris's body and threw the pieces in the Nile. The death of Osiris was annually commemorated on the 17th day of the Egyptian month Athyr (13 November). But Isis, together with her son Horus, who was to be his father's avenger, went in a ship in search of the pieces to put them together again. On the night of 19 Athyr (15 November) the mourning worshippers of Cairo used to go down to the Nile to join Isis in her search. At the climax the cry went up, 'We have found him, let us rejoice together.' Ceremonies connected with the Nile flood are prominent in Egyptian religion throughout its history.

Side by side with his lifegiving role in relation to the Nile and the fertility of the crops, Osiris was also of the first importance as king of the underworld which was his permanent home. He did not return from it to revisit the upper world. From his kingdom in the nether regions he caused the annual flood of the Nile and daily sent up the sun on its course. But his 'resurrection' was not a resumption of divine life on earth, for he did not leave his infernal throne.

The influence of this Egyptian cult of Isis and Osiris became considerable in the hellenistic age of the Ptolemies and in the age of the Roman empire. In a drastically reinterpreted form the veneration of Isis as a kindly universal mother spread throughout the Roman empire. A festival of Isis on 19 July marked the official celebration of the rising of the Nile waters and of Horus's revenge upon the wicked Seth. This was still being observed in the city of Rome in the

Staatliche Museen Berlin

William MacQuitty

In Egypt the god Osiris was killed and restored to life but his 'resurrection' was not a resumption of earthly life for he did not leave his throne in the land of the dead. Like each Egyptian king, who became an Osiris after death, he was connected with the Nile flood and the fertility of the earth; with the ascent and descent of the sun, and with life after death *Left* The mummy of Osiris receives the deceased from the jackal-headed Anubis, the underworld guide *Right* Mummified corpse of the Egyptian pharaoh Ramses II

4th century AD. In Egypt the Church came to recognize the need for a liturgical commemoration at this time and put a feast of St Joseph on 20 July, making the Christian dragon-slayer, Michael the archangel, the new patron of the Nile flood.

At the winter solstice, on 25 December, the Egyptians celebrated the birth of the son of Isis, Harpocrates, and led the sacred cow of Isis seven times round the temple of the sun. Twelve days later on the night of 5–6 January, in the late Roman period, there was a festival at Isis's temple in Alexandria to celebrate the birth of her child Aion, the god of eternity. On this night the Egyptians used to fetch water from the Nile, believing that it would be invested with healing properties or even (so some claimed) be turned into wine.

After the 4th century this festival of Isis on 5–6 January became important to the Christian Church in Egypt for whom Christ, not Horus or Aion, was the true sun and light of the world. The earliest evidence for the Christian observance of the feast of the Epiphany on 6 January comes from Egypt, and by the second half of the 4th century Christians throughout the Greek East were celebrating this day as Christ's Nativity, his veneration by the Magi, his baptism, his wine-miracle at Cana, and his feeding of the multitude. The greatly overloaded character of the feast becomes explicable if the original motive behind the institution of the celebration was to provide a rival attraction to the rites of Isis. John Chrysostom (c 390 AD) relates how at the great baptismal ceremonies of the Epiphany, simple Christians used to collect some of the water from the consecrated springs and preserve it for its medicinal properties.

In view of this evident influence of the festival of Isis on popular Christian customs associated with the Epiphany, it is remarkable that Isis's feast on 25 December had no influence on Egyptian Christianity. Only Western Christians observed 25 December as the Nativity of the true sun during the first half of the 4th century, and this festival was first accepted into the Egyptian Church's calendar under Western influence in the 5th century.

Attis and Cybele

The religion of the great mother of the gods had its principal centre in Anatolia. In the hills of Phrygia and Lydia she was worshipped under the names of Cybele or Agdistis, with a great sanctuary at Pessinus, not far from Ankara (see CYBELE). At Comana in Cappadocia there was the temple of another great mother goddess of Anatolia, Ma or Bellona, whom Cybele attracted to herself as part of her attendant train. The religion of these fierce Anatolian deities generated fervent and frantic emotion. Monotonous dirges were sung to the accompaniment of drums and cymbals. Repetitive rhythms induced wild excitement among the priests and worshippers who frenziedly scourged themselves and cut their bodies with knives (much like the priests of Baal encountered by the prophet Elijah), sometimes even castrating themselves in their ecstatic condition.

Cybele had a young male consort, Attis. The myth recounted that Attis met his death either by being killed when out hunting a wild boar, or after being put by Cybele into a state of Bacchic frenzy in which he bloodily castrated himself under a pine tree. Violets were born of Attis's blood as the first flowers of spring. Attis's death was commemorated at a spring festival of mourning and fasting during March, culminating in ecstatic dances on the wild Day of Blood on 22 March and on 25 March, the Day of Joy (*Hilaria*). In the 4th century AD this became the feast of his recall to life by his mother and consort Cybele. The ceremonies were preceded by an all-night vigil with lights. The day following, 26 March, was kept for much needed rest, and on 27 March there was a ceremony of washing Cybele's statue in warm water with a procession at which obscene songs were sung to the accompaniment of indecent gestures, the purpose of which was probably to ward off evil spirits.

Much of the surviving evidence for the cult of Attis and Cybele comes from the late Roman period, at which date the interpretations of the rites, and perhaps some of the rites themselves, had undergone development and modification under external influences. By the 4th century AD the climax of the rite was coming to lie not merely in the lamentations and frenzied acts of self-mutilation but also in the self-identification of the initiate with Attis in the dying and rising process. Here he was assured of salvation both now and hereafter, and in the most solemn act of initiation he went down into a dark pit while the blood of a bull poured over him from above. In virtue of this the initiate was 'reborn for ever', *renatus in aeternum*, as a later 4th century inscription records. Before the 4th century, so far as the evidence goes, the intention in the sacrifice of a bull in honour of Cybele was the benefit of some great cause such as the emperor. In the late Roman period it was rather a private purification for the salvation of the individual soul. The original meaning of the vegetation rite for the welfare of society became secondary to the individual's personal quest, and the rites of Attis and Cybele, like those of Isis, were practised with special tenacity by the wealthy pagan families which required a religion capable of being a viable alternative to Christianity.

In the 5th century AD Augustine of Hippo met a priest of Cybele who assured him that the religion of Attis and the religion of Christ were one and the same. Augustine did not believe him. But the story exemplifies the extent to which late Roman paganism sought to oppose Christianity by taking over some of its more characteristic themes and claiming that the meaning of their myths was identical. Nevertheless the rites of Attis and Cybele never wholly lost their significance as a rite of spring for the crops. The representations of Attis in figurines show him as a shepherd with a flute and pine tree, in one example with a scourge of knuckle-bones, or dying by his pine tree, or dancing in frantic ecstasy. The resurrection theme, however, is never clearly expressed; and the mother goddess Cybele is never portrayed as a Pieta, mourning for her dead son. One custom which survived centuries was that of planting violets on a grave. It may have derived from the cult but this is not certain.

The Dangerous God

Dionysus was a deity of Thracian origin whose cult penetrated Greece in Mycenean times (see DIONYSUS). The character of the Dionysian cult provoked opposition, not least from civic authorities in Greece, who were appalled when their womenfolk went off to dance by night upon the mountains, behaved as if they were drunk and in hysterical ecstasy tore up and ate the raw flesh of an animal. The cities tamed the Dionysiac orgies by giving them official status and by controlling their organization. At Athens the cult was domesticated and rationalized by being given the ritual form of tragedy and comedy (see DRAMA). In Rome also there was consternation when Greek missionaries from south Italy first brought the exciting nocturnal revels. Dionysus was identified with Bacchus, the god of wine, and turned into a jovial Falstaff-like figure rather than the dangerous god of ungoverned animal vitality.

Dionysus's myth had various forms. Poems written in the name of Orpheus, the legendary Thracian seer, magician and poet, relate that as an infant Dionysus was torn to pieces and eaten by the Titans. Zeus struck the Titans with his thunderbolt and out of their smouldering ashes fashioned man who thus remains a mixture of high divinity and low aggressions. Or, it was said, Demeter (Ceres) put the pieces together so that Dionysus was reborn. These and other variations of the myth reflect the different settings in which it was interpreted. Some, including Plato (who provides perhaps the earliest evidence for the existence of the myth), took the story as a theological allegory about human nature. Others saw it as a vegetation myth in association with Demeter and her mysteries at Eleusis near Athens (see DEMETER; ELEUSIS).

Dionysus made a late entry into the myths associated with Eleusis. Originally, as in the Homeric *Hymn to Demeter*, the Eleusinian story simply told how Demeter's daughter Persephone was carried down to the underworld and then returned again to her mourning mother for half of each year. Additions were made as time went on. Rites, which perhaps were once for the propitiation of spirits of the underworld, incorporated agrarian features. Demeter was the corn mother, venerated by workers on the land in

Various ancient myths of a dying and rising god, of a goddess who visits the underworld and whose return to the earth's surface brings the reawakening of life in the spring, grew closer together and influenced one another until in the late Roman empire they were all understood as telling the same basic story of an eternal cycle of death and new life. In Greek mythology, the goddess Persephone was carried off to the underworld by Hades. She spent six months of each year there, returning to the upper world with the coming of spring: the *Rape of Persephone*, by Rubens

Hesiod's time. It was natural that she should welcome Dionysus to Eleusis, at least as an occasional visitor, on account of his association with the vintage. Dionysus and Demeter were identified with Osiris and Isis by Herodotus. The Eleusinian mysteries therefore absorbed influence from agrarian types of cult, and were also associated with individual hopes of a privileged life in Hades for those admitted to initiation. But the death and return pattern of Persephone's myth was not important in relation to these personal hopes.

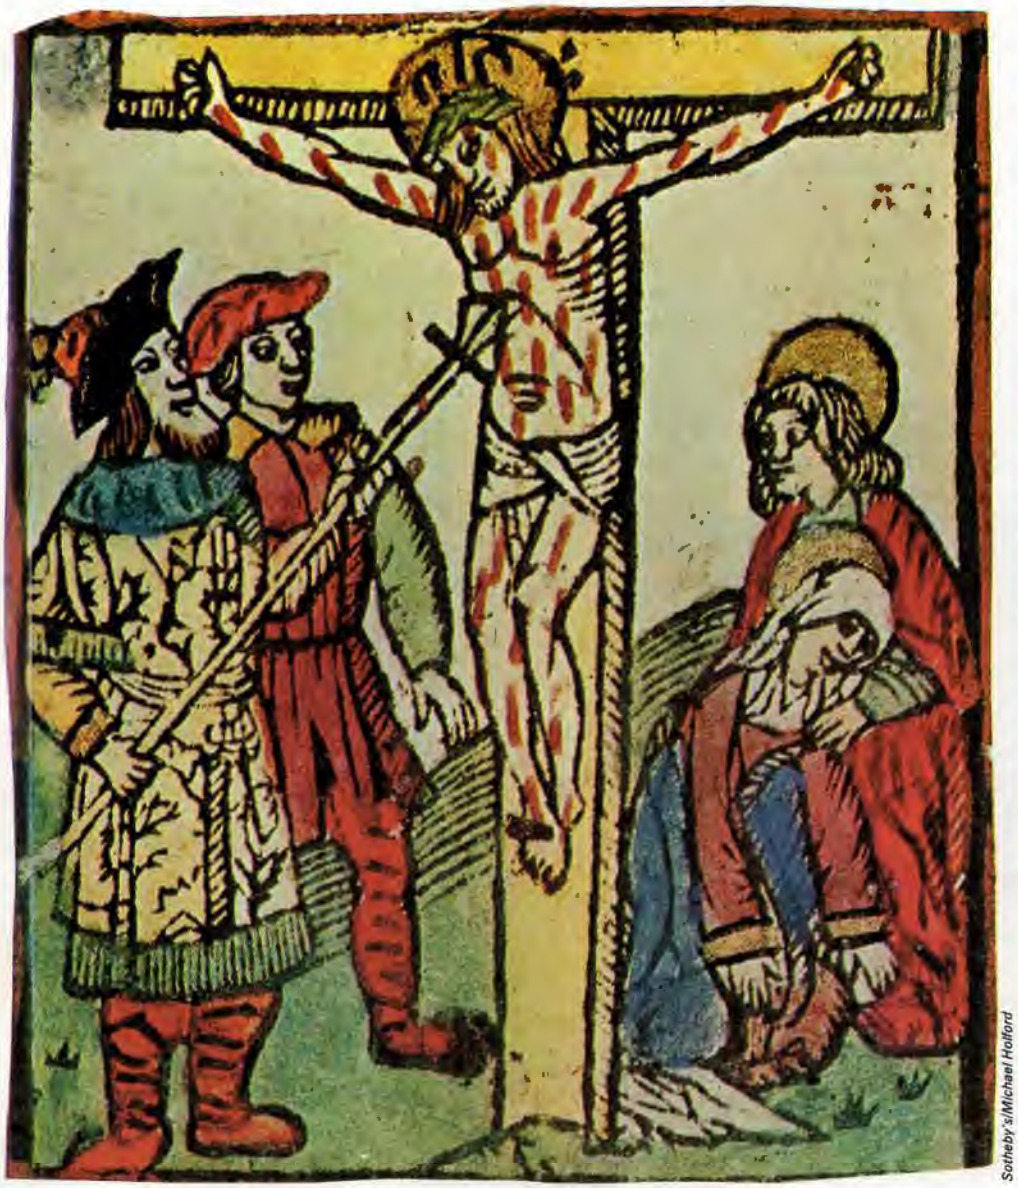
The ancient myths of the 'dying god' of spring and harvest grew closer together as they influenced one another, until in the late Roman empire they were all understood as allegories telling the same basic story – the myth of an eternal cosmic return. The myths themselves incorporated elements from one another, and there was also some ritual borrowing. But the earlier in time the history of each cult is traced, the more individual and dissimilar they come to appear. The crux of the matter is that the meaning of the rites and myths may differ profoundly according to the social and cultural context.

The Dying God and Christianity

The final and perhaps most fascinating question in an inquiry into the ancient myths of the dying god is whether these ancient symbols had either direct or indirect influence upon Christianity. For Christianity has a story of death and resurrection at the centre of the New Testament, a ritual meal of bread and wine, and a spring festival. In its later history it also came to portray the suffering mother and her divine child. The external resemblances are striking. But what of the setting and inner meaning?

The first Christians were Jews. That is to say that Christianity originated within a community that utterly rejected the vegetation cults of the ancient world and would not compromise with them. Ezekiel's condemnation of the women weeping for Tammuz is typical of the Hebrew standpoint taken as a whole. The Judeo-Christian tradition could never accept the notion of a god who suffered periodic loss of power and needed to be revived by propitiatory rites. If the Passover was once the spring

Prado Madrid



Sotheby's/Michael Holford

Although the story of Christ's death and resurrection might seem to reflect the ancient myths of the dying god, Christianity grew in a climate which completely rejected the notion of a god who suffered periodic loss of power and needed to be revived by propitiatory rites: early 16th century woodcut from an illuminated breviary

sacrifice of semi-nomad shepherds, as most Old Testament scholars think (though this view has been warmly contested) nevertheless the Israelites never shared the view of their Canaanite neighbours that the deity's powers required annual revival. Recent investigation of the background of the New Testament, powerfully reinforced by the Dead Sea Scrolls, has seen emergent Christianity as being set almost wholly within a Jewish matrix. The present writer believes that this tendency in recent study has succumbed to the exaggerations which often result from the impact of new material, but could not dispute the broad truth of the position. The first Christians took for granted the traditional Hebraic understanding of the deity as transcendent and as existing independently of themselves and of the world. Such belief stands in the strongest possible contrast to the theology of the vegetation cults for which the god was wholly immanent in the seasonal processes of the physical world.

The Christians simply took over from the Jews the feasts of Passover and Pentecost: why they did not also take the autumn festival of Tabernacles is a puzzle for the solution of which only very tenuous scraps of evidence survive. The origins of Easter as an annual festival lie simply in the continuing observance of the Passover meal among the Christian communities. Nothing could have been more natural. In this traditional form the rite was practised by the Christians before it acquired its full weight of interpretation as the unique annual festival of the resurrection of Christ. But in New Testament times, as can be seen from Paul's first letter to the Corinthians, the resurrection was being celebrated each week on the first day of 'Lord's Day', *dominica* as the Latin Christians soon called it. It was not difficult to hold a special commemoration once a year on the Lord's day which fell nearest to the Jewish Passover. Late in the 2nd century AD after some difficult controversy, the annual Easter festival was transferred from the original date, which always coincided with the synagogue Passover, to the following Sunday – that is, to the Sunday after the first full moon after the spring equinox.

The myths of Attis, Adonis and Osiris were intended to explain the rites of the cult by referring to 'events' of immemorial antiquity; and by the 1st century BC they were generally understood as allegorical myths with a cosmological or psychological meaning. The Christians startled the contemporary world by declaring as sober record that their master who lived recently, and died under Pilate the governor, had risen again and was now living. It is evident from Paul's dry catalogue in 1 Corinthians, chapter 15, that they would not have existed as a community if they had not believed themselves to be reporting a fact.

If, however, the ancient legends of the vegetation gods cannot help us understand how Christianity began, it may nevertheless be possible to see signs of influence on later developments in the Church's history. It has already been suggested above that in relation to Christmas and Epiphany the historian is able to discern fairly clear evidence of either indirect or even direct influence. The Church found it necessary to provide counter-attractions on the traditional dates of great pagan festivals like December 25, January 1 and June 24, when the Midsummer festival became the nativity of John the Baptist. Early Christians had no qualms whatever about putting harvest and vintage scenes or the seasonal cycle on their sarcophagi or their mosaic floors. Yet here again the context of these symbols was significantly modified. The seasonal cycle, if taken as being no more than a poetic illustration and analogy, would naturally suggest the eternal round of transmigration or reincarnation. This the Christians utterly rejected as inconsistent with the unique value and meaning of this life.

The difference brings out a point which emerges with clarity from this comparative survey, namely that it is a mistake to assume that beneath the various forms within which religion finds expression there must be some essential similarity. There is not a universal myth of the 'dying god' which is adopted at a certain stage of human evolution and which appears in different societies and cultures dressed up in clothing of various colours. At least, if we begin from such assumptions, it is certain that we shall miss much of the truth about these ancient religions.

Because of its size, strength and aristocratic bearing, and its ability to outsoar all other birds, the eagle became a recurring emblem of divinity and also of kingship

EAGLE

MANY PLACE NAMES such as 'Eagle Rock' and 'Eagle Mountain' remind us that this magnificent bird was once a familiar sight in the mountainous areas of the British Isles. Even today when the numbers of birds of prey have been greatly reduced in Europe there are localities, as for example in the eastern Mediterranean, where at times of migration considerable numbers may be seen. It is significant, not only for the natural historian but also for the folklorist, that species and individuals decrease northwards, and it is not surprising to find that eagle lore is most deeply rooted in the mountainous regions of Asia. In religion, magic and literature the eagle achieved prominence in that continent and the European folklore of this great bird is in large part derivative. Although eagles of many species are relatively common south of the Sahara the lore connected with them in Africa, with the exception of Egypt, has had so little influence in Europe that we need not take account of it here.

Bird with Two Heads

In antiquity the eagle had a more significant role in Mesopotamia than in Egypt, where Horus, the falcon god, was of considerable importance. This is understandable when we take into consideration the differences in climate and topography between the two regions: such geographical factors had much influence on religion. Ancient Egypt was a land of sunshine dependent on the annual rise of the Nile whereas the Mesopotamian city states came into being in a region fringed by mountains and menaced by storms and floods. As far back as the 3rd millennium BC a double-headed eagle was associated with Ningursu of Lagash, the Babylonian god of fertility, storm and war. These associations are explicable when we remember the eagle's habit of soaring powerfully among the clouds, which were regarded with the greatest concern in such an area as they brought fertility to the fields but might also be responsible for disastrous flooding. The double-headed eagle was adopted by the Hittites and later cultures down the centuries. Evidence of the prolonged continuity of tradition is apparent in its becoming the emblem of Austria.

Another example is provided by the eagle-and-serpent motif. It appeared among the Hittites in the myth of the strife between the weather god and the serpent Illuyankas and has continued throughout many centuries and cultures; it appears today in the lectern of Peterborough cathedral and also in the arms of Mexico. In nature, it is not uncommon to see an eagle carrying a snake in its talons in regions where the snake-eating, short-toed species of this bird are found. In antiquity the conflict between the bird which soars high and the reptile which creeps into holes in the earth impressed people who looked on it as expressing the tension between the forces at war in the universe. Interpretations varied but the motif remained a portrayal of life's warring opposites.

In Indo-Iranian mythology, the eagle had an important role. It was associated with two themes, both of which had wide ramifications; in the Hindu text, the *Rig-Veda* it figures as the bringer of the sacred *soma*, an intoxicating spirit distilled from a plant of this name. In the *Avesta*, the holy book of the Parsees, it is said to dwell on the 'All-healing Tree Light' which in religion and art is related to the Tree of Life. From the cults in which these large symbolic birds were involved emerged beliefs in monstrous mythical winged creatures, such as the Arabian Anka, the Persian Simurgh and the Roc which carried off Sinbad the Sailor, as well as composite part-bird beings like the Indian Garuda. There are reminiscences of these strange creatures in the Book of Daniel where we read of a lion with eagle's wings and in Revelation in which other composite creatures are mentioned. Underlying such concepts is the attempt to symbolize supernatural power.

Asian influence may be detected in the exalted status of the eagle in Greek mythology, as the attribute or associate of Zeus. His eagle-surmounted sceptre at Olympia was in the tradition of Babylonian processional sceptres and such signs of authority continued into the Middle Ages.

In the Old Testament the eagle typifies swift and high flight and is noted as frequenting battlefields, but in most contexts the vulture is not clearly distinguished from the eagle. Through inadequate observation and the misunderstanding or deliberate embroidery of texts, eagle lore became increasingly divorced from natural history.

Myth of Rejuvenation

Eagles which survive to maturity are long lived as Aristotle, Plato and Pliny noted. The references in the Old Testament, such as 'youth renewed like the eagle's' (Psalm 103.5) together with observations of sea eagles plunging into the water to secure prey contributed to the myth of the bird renewing its youth; this became elaborated and embellished as it was transmitted from scholar to scholar down the centuries. Albertus Magnus (1200–1280 AD), quoting earlier authorities, wrote: 'They say that an old eagle, at the period the young ones are fledged, as soon as she has discovered a clear and copious spring, flies directly upwards even to the third region of the air, which we term the region of meteors, and when she feels warm, so as to be almost burning, suddenly dashing down and keeping her wings drawn back, she plunges into the cold water, which by the astringing of the external cold increases the internal heat. She then rises from the water, flies to her nest, and nestling under the wings of her warm young ones melts into perspiration, and thence with her old feathers she puts off her old age, and is clothed afresh; but while she undergoes the renovation she makes prey of her young for food.' Like so many medieval scholars Albertus feels constrained by the weight of authority to quote this account but remarks that as he has known two captive eagles moult in the normal way he must regard this as a miraculous occurrence.

Probably the beliefs that the eagle's feathers are incorruptible and that if placed with other feathers they consume them are extensions of the tradition of longevity. There may be another such extension in the legend current in Inishbofin at the mouth of Killary Bay, Co. Galway, and also in the Shiant Isles in the Hebrides, that Adam and Eve continue to live on in these islands as eagles.

The myth of the eagle stone, a nodule said to be brought to the nest by eagles to assist in ovulation appears to be a variant of a motif in which birds, such as the cock, swallow, hoopoe, raven, crow, jay, crane, adjutant stork and the mythical Roc are associated with stones to which magical properties are frequently attributed.

Companion of the Sun

The eagle, because of its upward soaring flight is a bird of the sun and therefore associated with solar, sky and weather powers, but it also has obscure connections with the stars. The constellation Aquila (Eagle) is opposed to Cancer (Crab) and this was represented on ancient coins by showing a crab on the obverse to the eagle. It was also associated in some circumstances with lightning and the thunderbolt, both on coins and in mythology. The Romans believed that the eagle was never struck by lightning – hence the practice of burying an eagle's right wing in the fields or vineyards to ward off the hailstones which sometimes accompany thunderstorms.

These ancient associations continued in a somewhat disguised form in the legends attached to various Christian saints. St Medard, bishop of Noyon in the 6th century, was protected during a tempest by the outspread wings of an obliging eagle – and when St Servatius of Tongeren in Belgium was in discomfort from the hot sun, as he slept by the wayside, an eagle shaded him under its wings. In the Christian church the eagle has long been the symbol of St John because, as St Jerome wrote, 'he ascends to the very throne of God'. For this reason most lecterns in cathedrals and churches are in the form of an eagle with outspread wings.

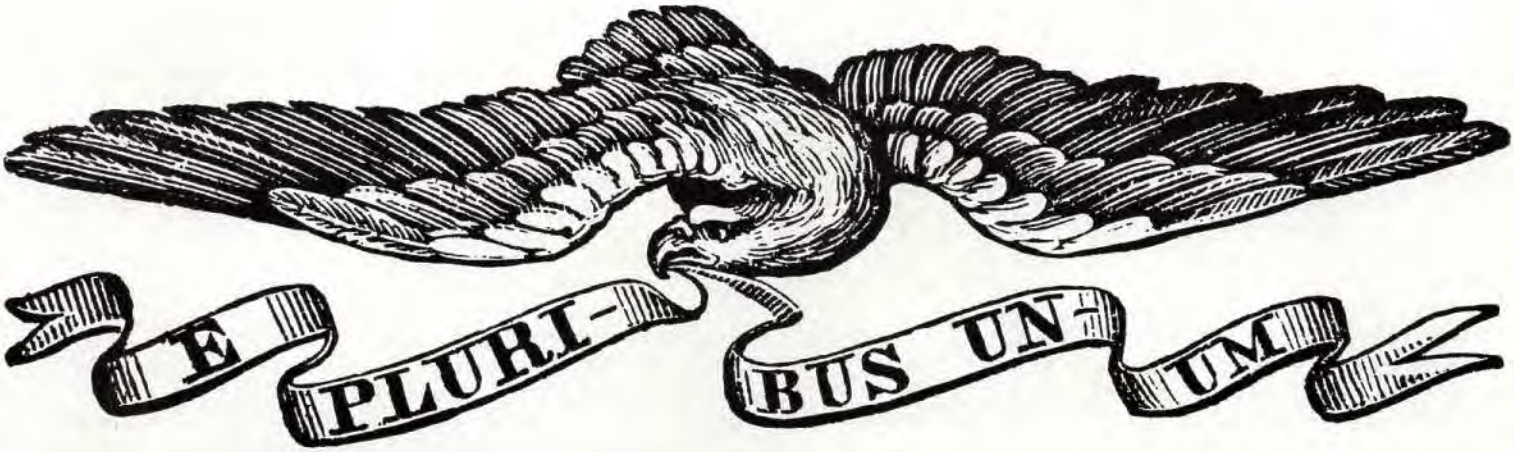
Mansell Collection



In the British Isles eagles occur in the folklore of Wales where it is said that King Arthur lives on in a cavern guarded by these birds. In stormy weather Welsh people used to say: 'The eagles are breeding whirlwinds on Snowdon'; in the neighbourhood of that mountain the cries of eagles were regarded as ominous, foretelling disaster. The Greeks and Romans also drew auguries from the behaviour of eagles. Plutarch mentions an eagle's nest with seven eggs as a portent. At the battle of Arbela in Anatolia (331 BC) a soothsayer rode close to Alexander the Great assuring him that he had divined by an eagle that he would be victorious over Darius. An eagle is said to have lifted the headgear from Tarquinius Priscus and then replaced it, thereby indicating that he would be king of Rome as indeed he became in about 616 BC. Roman legions regarded a site as suitable for winter quarters if there was an eagle's eyrie in the vicinity. Shakespeare, who was well acquainted with the lore of the eagle, referred to a number of classical ideas throughout the plays.

The eagle is no exception to the rule that auspicious birds may occasionally predict evil. The appearance of one of them was a favourable portent at Alexander's birth, but eagles could also foretell death.

Since the eagle was a powerful aerial creature associated with the gods, portions of its body were considered to have medicinal or magical properties. Its feathers, cooked together with a special herb, were said to cure demoniacs, its liver pounded with honey and balsam cured cataract, presumably on the assumption that as the bird's sight is keen a concoction from some organ should be a remedy for poor vision. Its heart served as a love charm but its marrow could be used as a contraceptive – a somewhat ineffective prescription as birds' bones do not contain marrow.

The eagle is prominent in fables and folktales. A number of these stories, such as The Eagle and the Tortoise; and The Eagle Shot with its own Feathers go back to classical sources, and the story of the wren which outwitted the eagle and won the competition as to which bird could fly highest is found in Aesop's Fables.

Putting a newborn baby on the ground or taking an earth-bath are two of the magical ways of exploiting the fertility of the earth, which has been worshipped as the mother of all living things and the ruler of the dead

EARTH

THERE IS AN OLD IRISH STORY about the invasion of Ireland by a people called the Gaedil. The goddess Eriu opposes the Gaedil and makes an army out of sods of peat and the mountain to fight them. She eventually changes her mind and welcomes the invaders but she asks that the island shall bear her name. Which it does, Eriu being the oldest form of both Eire and Erin.

This connection between a goddess and the land, which are identical because both have the same name, is based on the fact that the earth is not merely the stage on which we strut our crowded hour but the foundation of our existence. On it we live, from it our food grows, in it we are buried. And so the earth has been thought of as a great deity, the mother whose tireless fertility nourishes a man in life and to whose dark belly he returns in death. It has been widely believed that man comes from earth to begin with: the first man was made of clay, we are of the earth earthy, we are dust and to dust we shall return. Or the souls of babies are thought to enter their mothers from caves or rocks, and when this is combined with belief in reincarnation the parallel between man and his crops is complete. Both are born of the earth, are buried in it and reborn again.

Among the remains of prehistoric hunting peoples are the 'Venus' figures, naked women carved in bone or stone, some with

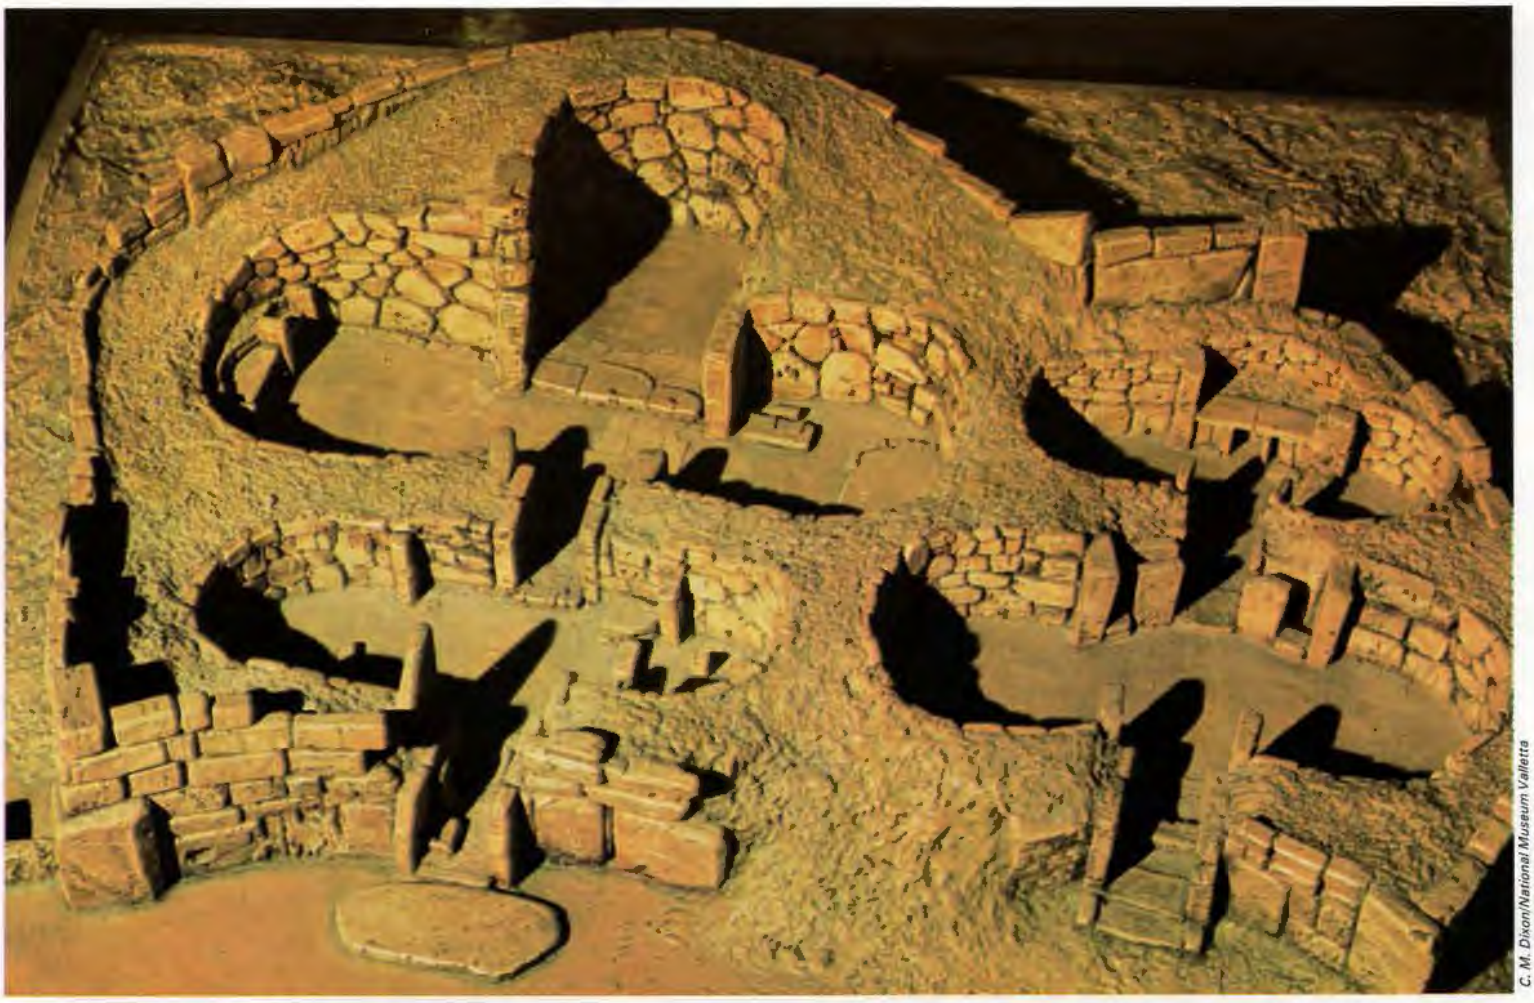
The Underground Gods

The Olympians taught of gods intensely personal, strong, wilful, possibly honest but by no means invariably so. Man entered into contracts with them because it was his only hope. If they broke the contracts he was angry, but could do nothing. Above all things he must remember his humbler station and keep his distance. It taught him too that all his hopes of happiness must lie in this life, since after it was over he would be nothing but a shadow. The chthonian cults brought us from this human, comprehensible and business-like atmosphere of daylight to gods who were surrounded with an air of mystery. They were approached at night, and often in the darkness of an underground cavern or pit. At these entrances to Hades they brought the worlds of the living and the dead together . . .

In the coexistence of these two types of religion lies the explanation of the paradox with which we started out, the presence in contemporaneous Greek literature and thought of the two opposite points of view: the advice to "think mortal thoughts" and "strive not to become a god" on the one hand, and on the other the exhortations to "assimilate yourself to God" and "make yourself immortal as far as you can".

W. K. C. Guthrie, *The Greeks and Their Gods*



C. M. Dixon/National Museum Valletta

huge breasts and buttocks, the sex organs emphasized, and frequently pregnant. Whether these early figures were meant to embody the fertility of the earth as well as the fertility of woman is uncertain. But as farming developed, and in societies which looked to agriculture for survival, similar figures seem to have been connected with the worship of a great mother goddess, who was in one of her aspects the earth, the mother of all living who also ruled the dead buried in her womb. H. J. Rose has said of the Greek earth goddess Ge or Gaia: 'It is unlikely that she was, to begin with, anything so huge as the planet Earth in general; rather was she the particular piece of earth . . . with which the particular worshipper or worshippers were acquainted; or, still more likely, the power residing in that patch of ground which made it produce all manner of plants.' The same thing is probably true of other early earth and mother goddesses.

Clay figurines of c 4000–3000 BC, found in the Zhob valley near Quetta in Pakistan, of a woman with prominent breasts, round eyes, a beaky nose and a grim slit of a mouth, are thought to represent a goddess who ruled the dead and the seed-corn, both buried in the earth, as well as the crops growing in the spring. Huge sanctuaries, constructed on Malta and the nearby island of Gozo c 2000 BC, were used for a cult of both a fertility goddess and the dead. Seen from the air, their ground-plans resemble an immense obese woman and it has been suggested that the resemblance was deliberate. The fact that representations of a goddess are so often found in prehistoric tombs points to a connection between the earth, the mother and the dead. So does the use of caves as both holy places and burying grounds (see CAVES).

An astounding example of prehistoric belief in the earth's fertility was discovered in a Neolithic flint mine at Grimes Graves in Norfolk. At the bottom of one shaft was the figure of a pregnant woman, sitting on a ledge, at her feet a chalk phallus and a pile of picks, made of deer-horn. Apparently the miners who dug this shaft had failed to find a bed of flint, and the shrine to the goddess was meant to neutralize the dearth of flint in this shaft and ensure the fertility of the next.

Heaven and Earth

In south-west Asia and the eastern Mediterranean area, the great goddess had many functions, many disguises, many names – Ishtar, Astarte, Cybele, Hera, Aphrodite, and the rest. As Earth Mother she may once have been regarded as the original source and fount of all things, and the dead were perhaps laid to rest in her womb in the belief that like the seed-corn they would be reborn in due time. But in the earliest cosmogonies of the ancient world that are known to us Earth is not the original creator.

In the beginning, according to Genesis, the earth was *tohu wa-bohu* ('waste and void'), meaning 'non-existent'. It was not until the third day that God created dry land and called it Earth. In Mesopotamia there was an old Sumerian myth that the primeval sea gave birth to a cosmic mountain in which heaven (the god An) and earth (the goddess Ki) were interlocked together. From their mingling the god of air, Enlil, was born. He parted them, and the air has separated sky from earth ever since. There was a similar Egyptian myth, with the variant that the earth is male and the sky female (see CREATION MYTHS).

Heaven and Earth are a divine pair in many other parts of the world, all through the Pacific, in China and Japan, Africa and North America. The Kumana of southern Africa, repeating a very widespread theme, say: 'the Earth is our Mother, the Sky is our Father. The Sky fertilizes the Earth with rain, the Earth produces grains and grass.' Similarly, a fragment of a lost play by Aeschylus, the *Danaids*, describes how rain falling from the male sky impregnates the female earth, and she gives birth to grain and pasture (see APHRODITE).

According to an unfortunately late report, by the philosopher Proclus in the 5th century AD, during the Eleusinian Mysteries the Athenians gazed up at the sky and shouted *Hue* ('Rain') and then at the earth and shouted *Kue* ('Conceive!').

The same idea lies behind poetic imagery which identifies the soil as the womb, and ploughing and sowing as impregnation. In the *Oedipus Rex* Aeschylus says that Oedipus 'dared to sow seed in the sacred furrow where he was himself formed, and plant there a bloody branch.' It is still quite a

Left **Model of temple, in Malta, for the worship of a fertility goddess: the ground plan resembles a huge fat woman** ***Above*** **Gaia who, in Greek mythology, created the sky, mountains and sea: terracotta statuette from Tanagra, Greece** ***Right*** **Coatlicue, the great earth mother of the Aztecs**

common figure of speech that a man 'sows his seed' in a woman.

In Homer the earth is the home of gods as well as men. The three brothers Zeus, Poseidon and Hades cast lots to divide the universe between them. The sky fell to Zeus, the sea to Poseidon, the underworld to Hades. The surface of the earth was their common property (the link connecting sky, sea and underworld together) and they lived there, on Mount Olympus.

But there was a time before the Olympians ruled the universe and they won their mastery by a victory over older gods. This story is told in Hesiod's *Theogony*. First of all Chaos came into existence, and next 'wide-bosomed Earth *(Gai)*' and gloomy Tartarus in the depth of the ground *(chthon)*, and Eros the power of love. Earth gave birth to Uranus, the starry heaven, 'equal to herself, to cover her on every side', to the mountains and to the sea. Then, lying closely locked with Uranus, she bore many offspring, including the wily Cronus, 'youngest and most terrible of her children'. Cronus castrated Uranus and ruled in his stead, a story presumably partly intended to account for the separation of sky and earth (see APHRODITE; CRONUS).

Cronus and his brothers and sisters were called Titans, possibly meaning 'honoured ones'. After a fierce struggle a younger generation of gods, Zeus and the Olympians, defeated the Titans and imprisoned them in Tartarus (which was much later to become a synonym for hell) and there they remained, seldom worshipped but not forgotten. They are referred to with considerable awe. In the *Iliad* (book 14) the goddess Hera is required to swear a solemn oath, 'so that all the gods that are below with Cronus may be our witnesses'.

The Titans are very old gods. They probably belonged to the people who lived in Greece before the Greeks themselves invaded and settled the country, and the myth of their defeat by the Olympians is likely to reflect a reality, the victory of the newcomers. But they were not the only chthonian (underground) powers of Greek belief. There were many others, local spirits which were probably closer to the lives and hearts of ordinary people than the great Olympians. Some of them were spirits of the fertility of the earth, others were semi-divine heroes, worshipped at the tombs where they lay in the earth, for the chthonians continued the old tradition of a connection between the dead and fertility.

Animals sacrificed to chthonian powers were usually slaughtered in a pit or trench dug in the earth, and killed throat downwards so that the blood would fall directly on the ground and soak into it. They were generally black animals (instead of white for the Olympians) and the meat was not eaten by the worshippers but burned. The chthonians were worshipped in dark caves or shrines underground, and at night. Snakes were often sacred to them. Erechtheus, for instance, the guardian spirit of the Acropolis at Athens was a snake and offerings of honey-cakes were given him.

Chthonian spirits not only made the ground fertile but gave oracles and took possession of human beings, inspiring them to divine the future or reveal hidden events. The most famous example is the Pythia, the priestess of the oracle at Delphi, which belonged to the earth goddess herself before the Olympian Apollo killed her sacred snake, Python, and seized the oracle from her. Delphi was believed to be the centre of the earth and there was no more suitable place from which the earth goddess could speak.

The Olympians lived in the light of day. They had human passions, for they were quarrelsome, lustful, reckless, moody, sometimes benign and sometimes cruel, but they were far above the level of men, from whom they demanded humility and obedience. Brimming with vitality themselves, they taught men to look to this life for happiness and for nothing but shadowy oblivion after death. The chthonians were dark, fertile, profound, uneasily mysterious and non-human. Their ability to possess the living, their lordship of the dead and the rebirth of crops, meant that they held out a hope of happiness after death.

Not that the Olympians and the chthonians can always be sharply distinguished, for many of the Olympians had chthonian connections themselves. Hesiod advises farmers to pray for a good harvest to Zeus Chthonios and pure Demeter. It was in the worship of Demeter, in fact, that the chthonian strand in Greek religion reached its fullest and finest expression. She was originally an earth and fertility goddess, and her daughter Persephone was the wife of Hades and the queen of the dead in the underworld. The belief that Demeter could give the initiate into her mysteries a happy immortality was probably based on the analogy between the seed-corn resurrected in the spring and the buried dead finding a new life beyond the grave: the Mysteries of Demeter at Eleusis were originally agricultural ceremonies (see DEMETER: ELEUSIS).

Spirits Underground

The ruling god of the underworld and master of the dead was himself an Olympian. But although in the *Iliad* Hades was said to share the earth's surface and live on Olympus, most Greek writers placed him almost permanently in the halls of the underworld (which was afterwards given his name). One of his titles was Pluton, 'the rich one', because living under the earth he was linked with the earth's fertility, and in Latin he was Pluto or Dis, 'wealthy' (see PLUTO). Another Olympian closely connected with the earth was the god of the sea, Poseidon, in his capacity as the maker of earthquakes, 'earth-shaker' (see POSEIDON).

Earthquakes are widely believed to occur when the god or hero or monster who holds the earth up changes his hold on it or shifts his position. Among some African peoples the movements of an underground god cause the earth to tremble. The Fijians offered the earth god sacrifices to persuade him to turn over gently. On the East Indian island of Timor earth tremors are caused by a giant who eases the strain by shifting the earth from one of his shoulders to the other.

In European popular belief, lesser spirits

of the earth lived on for centuries, uncanny and dangerous beings like the dwarfs hammering away in their underground galleries (see DWARFS) or the knockers and buccas of the Cornish tin mines. Miners, violating the earth with their shafts and tunnels, always seem to have feared supernatural dangers as well as physical ones.

Belief in the magic powers of earth also survived. Many peoples, including the Romans, Germans, Scandinavians, Parsees and Japanese, had the custom of placing a newborn baby on the ground soon after birth, to let the fertile vigour of the soil pass into the child's body. In the 17th century in England Francis Bacon maintained that the smell of soil refreshed the spirits and improved the appetite, especially in the spring, before the earth had 'spent her sweet breath' in growing vegetables. Ladies, he thought, would do themselves much good by weeding. James Graham, a celebrated quack-doctor of the late 18th century, strongly recommended 'earth-baths', in which the pores of the skin would draw in the soil's nourishing juices. He used to lecture on this, with his tame 'goddess of health' at his side, both buried up to their chins in earth, their heads protruding from the soil like a couple of cabbages.

East

The direction of the rising sun and therefore symbolically the direction of life and light: to turn to the east is to turn towards the light, towards spiritual illumination and towards God; hence in Christian churches the altar is usually at the east end: the dead are often buried with their feet facing eastwards in the hope of resurrection: magicians sometimes invoked Oriens the ruling demon of the east and in drawing the magic circle they would turn to the east and move clockwise imitating the passage of the sun. EAST ANGLIAN & ESSEX WITCHES

For more than 200 years East Anglia was renowned for its witches and for the severity of its witch trials. Even today the name of Matthew Hopkins, the Witchfinder General, still evokes terrifying memories

Michael Busselle

THE TRAVELLER THROUGH the eastern counties of England and particularly East Anglia will observe on village greens and in market places certain monuments dedicated to the victims of religious persecutions during the reign of Mary I in the first half of the 16th century, in which no less than 277 Protestants were burnt by the Romanists. After Elizabeth I had succeeded to the throne an implacable hatred for all things popish exploded into a violent demand for radical reform. A primary objective of the Reformers was the elimination of the practitioners of magic and sorcery who had been permitted to function almost unchecked by the Church of Rome, and it was no accident therefore that Essex, heartland of dissent, should have become foremost in the demand for a house-cleaning involving every aspect of superstitious usage. At the same time the voices of the returned Marian exiles from the Continent, where witches were being persecuted in many countries, added still further to the clamour for action against the alleged sorcerers.

In a sermon delivered by Bishop Jewel before Elizabeth in 1560, he stressed the need for legal action against the magicians. 'Witches,' he declared, 'had marvellously increased within your Grace's realm,' and he went on to demand that 'the laws touching such malefactors be put in due execution'. At that time there were laws upon the statute book prohibiting witchcraft, for the first abortive Witchcraft Act of 1542 had been repealed in the reign of Edward VI, while a subsequent attempt to introduce legislation had failed in the reign of Mary. The year 1563 witnessed the Convocation of the Church of England urging stronger penalties upon the practitioners of witchcraft and in that same year the Elizabethan Witchcraft Act passed into law. This imposed the penalty of death for murder by sorcery, and the pillory and imprisonment for witchcraft of a less lethal character.

The first person known to have been executed in England after the new Act had come into force was 63-year-old Agnes Waterhouse of Hatfield Peverel in Essex; she was hanged at Chelmsford in 1566 for the alleged crime of bewitching William Fynee to death. Her principal aid and accomplice was her familiar, a cat named Sathan. It is significant that no less a personage than Sir Gilbert Gerard, the Attorney General, participated in the trial of the accused. The first of the victims, like so many who were to follow her to the gallows, was of peasant stock. The English rich, unlike their Continental counterparts, were secured by their wealth from the wild accusations of witch-hating fanatics, for they retained the power as well as the legal right to sue any detractor for defamation of character. In Sir George Croke's *Reports of Select Cases* at law during the Elizabethan period (published in 1661), there occurs the significant instance of Fortescue v. Hext in 1593, in which the court held it to be 'very heinous and actionable' for a woman to say of a man 'He is a witch and bewitched my husband to death for he made his picture in wax and roasted it every day by the fire until he roasted my husband to death'.

So much for the Witchcraft Act as it affected the well-to-do, and it was no doubt due to this and other circumstances such as the absence of both Inquisition and official torture, that English witchcraft preserved its traditionally peasant characteristics throughout the whole period of the persecutions. The victims were mainly confined to the social outcast or the village scapegoat. The offences with which they were charged

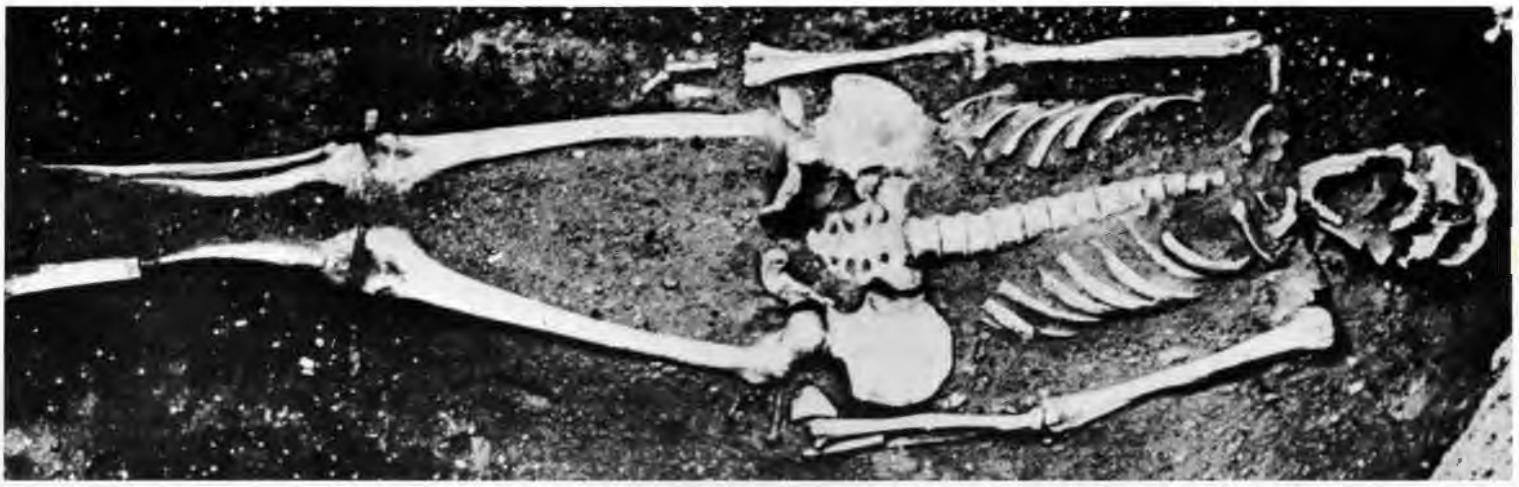
Trigon Films

were mostly acts of simple *maleficia* – baleful acts attributed to the vindictiveness of witches – without any signs of the elaborate sabbaths conjured up by the Inquisitors of France and Germany.

It was the misfortune of the county of Essex to remain the scene of continuing persecutions during the whole of this period, the major 16th century trials occurring in 1566, 1579, 1582 and 1589. The notorious trial of the witches of St Osyth, near Brightlingsea, was held in 1582; 14 women were charged with various acts of witchcraft, including murder, upon the evidence of children of six to nine years of age. The tragedy began as a village quarrel with the exchange of such insults as 'old trot' and 'old whore' and the bewitching of cows and geese. It was the St Osyth trial which in all probability impelled Reginald Scot to publish his famous *Discoverie of Witchcraft* (1584) in which the manifest absurdities involved in the witch-hunts were exposed to the acid test of ridicule. Even the most casual survey of the evidence provided by the old court records reveals that the outbreak of the witch mania in East Anglia bore all the characteristics of mass hysteria, with the whole folklore of witchcraft being hurled at the heads of the accused along with the 'evidence' based upon hearsay, and with the testimony of young children being freely accepted by the courts.

At the very heart of this conspiracy, it appears, were the village soothsayers, known as Cunning Men and Cunning Women. They were in fact witch-doctors and had no hesitation whatsoever in denouncing unpopular individuals as witches. This had been their role from time immemorial when the punishment had been limited to ecclesiastical penances or the ritual drawing of the witch's blood to neutralize the spell. Now, however, with the state as official witch-hunter, their influence in village life spelt misery and death to every suspect.

Although practitioners of magic themselves, the Cunning People only rarely fell foul of the authorities. They were universally respected, for they represented to the peasant mind the anti-witch principle and were therefore regarded as an integral part of the grand alliance of Church and State against black witchcraft. George Gifford, an



The witch-hunting mania in East Anglia had all the characteristics of mass hysteria: one authority declared that any old woman with '. . . a hairy lip, a gobber tooth, a squint eye, a squeaking voice or a scolding tongue' was liable to be pronounced a witch ***Left*** **Still from** ***The Witchfinder General,*** **a film about Matthew Hopkins: he claimed to have the Devil's list of all the witches in England** ***Above*** **Skeleton of a witch, its mouth apparently open in a macabre scream, which was found buried at St Osyth, scene of a notorious witch trial in 1582**

Elizabethan clergyman of Malden in Essex, left a contemporary account of their sinister role in Elizabethan times. Gifford, who regarded Cunning People as agents of the Devil and deluders of the people, observed: 'When the people fear a witch there is much running to the wizards to learn what to do. The Devil teaches these Cunning Men many horrible abominations and foul abuses of the name of God by which they are made believe that they are cured from their harms.' Gifford thus testified to the malevolent power of the practitioners of white witchcraft who were to his mind as guilty of witchcraft as those they so readily denounced, a fact that very few of those in authority were prepared to admit at the time.

It was Gifford's contention that many of the rituals then employed to combat witchcraft were in reality forms of pagan sacrifice, particularly the burning alive of farm animals. He went on to point out that these village witch-doctors were responsible for the arrest of perfectly respectable individuals: 'Within these last few years,' he said, 'the devil has by Cunning Men accused the very religious and godly of having secret marks upon them.'

How to Tell a Witch

The witch fever raged throughout Essex and East Anglia, overflowing into the adjacent counties. In Norfolk, ever-growing numbers found themselves dragged before the magistrates to be executed or confined in prison or the pillory until they were ready to confess their guilt. Suffolk also suffered its spate of denunciations, arrests and hangings.

The death of Elizabeth and the accession of King James I, a witch-fearing fanatic, had little influence upon the general trend of the witch mania in the eastern counties, for wherever the extreme Protestants maintained their militancy witch-hunting was likely to break out at any time and spread like a forest fire. In Catholic areas, needless to say, the magistrates were far less zealous in rooting out evidence of pagan practices and there the witch-hunters were far less certain of their prey.

Handbooks for magistrates, as for example Michael Dalton's *Country Justice* (1618) and Richard Bernard's *Guide to Grand Jurymen* (1627), insisted that the primary evidence of witchcraft was the possession of an animal familiar. Bona fide physicians, as fallible as their unofficial allies, the Cunning People, were generally prepared to diagnose many of the illnesses that they were unable to cure as caused by witchcraft. At the same time the Puritan clergy sought everywhere for the least sign of any religious deviation that could be classed as a 'superstitious practice'.

Tainted Blood

The most primitive types of magic beliefs prevailed among the peasant population all of whom claimed to be staunch Christians. In 1624 John Crushe was presented to the Essex Archdeacon's Court accused of burning a bewitched lamb alive on Hawkwell Common in order to break the spell of witchcraft from which his flock were suffering. It was during this century that the people of East Anglia began to protect themselves against the malice of witches by the use of witch bottles, receptacles containing urine and horseshoe nails which were heated on the fire as a form of counter-magic and which were probably introduced from the Low Countries. Good urine it appears was absolutely essential; bad urine (that of a witch) causing the bottle to blow the cork.

East Anglia underwent its second and infinitely more severe witch-hunt in 1645, led by the self-styled Witchfinder General Matthew Hopkins, a lawyer who had become interested in witchcraft. It was in Manningtree, near the Suffolk border of Essex, that the persecution was revived with considerable intensity. Conditions were ripe, for with the Civil War still raging and its outcome far from certain the Puritan eastern counties had been reduced to a state of tension which only the punishment of a scapegoat could relieve. The population was, if anything, even more fanatically Protestant and therefore witch-fearing than in the times of the Elizabethan witch-hunts and there existed in addition a further factor that has received scant attention from students of witchcraft in the past.

In many of the towns and villages of East Anglia there still lived the children and grandchildren of the victims of the trials of the 1560s and 70s; and since witchcraft was generally assumed to be in the blood and therefore a hereditary taint, these became the automatic first choice, whenever fresh victims were required. In 1645 John Rivet, a tailor of Manningtree, troubled by the illness of his wife, sought advice from a Cunning Woman named Hoyve of Hadleigh in Suffolk, and was told that her sickness was due to witchcraft. Rivet, searching his mind for a likely suspect, remembered that the mother of Elizabeth Clarke, a neighbour, had been hanged as a witch. This information came to the ears of Matthew Hopkins, who seized upon the discovery as an opportunity for publicity and brought Elizabeth Clarke before a magistrate. The prisoner was searched for witch's marks and tormented by being denied sleep, an apparently legitimate form of torture, while Hopkins waited for her imps to visit her. In due course these put in an appearance, taking the form of a kitten, two dogs, a rabbit, a toad, and a polecat.

The unhappy prisoner was finally forced into making a full confession and named as her accomplice Anne West, a poverty-stricken widow who had long been suspected of witchcraft. The latter had the additional disadvantage of being denounced by her own daughter Rebecca, who freely admitted having attended a witch's meeting in company with a number of Manningtree women. What was to become the stock ritual of denunciation followed by prosecution leading to further denunciations then followed. St Osyth village, scene of the terror in Elizabethan times, once again delivered up its quota of suspects into Hopkins's hands, as did many other villages in the vicinity.

Searched for Witch's Marks

Following their trial held at Chelmsford in the summer of 1645 before Robert Rich, Earl of Warwick, 19 countrywomen died on the gallows. Arthur Wilson, the Earl's steward, who was present at the trials, set down as his opinion that the prisoners were

The mere presence of a witch-hunter was usually sufficient to agitate a whole community into a frenzy of denunciations

no more than victims of their own imaginations being 'poor, melancholy, envious, mischievous, ill-disposed and ill-dieted,' confirming once again that it was the miserable poor who had become the victims of the witch-hunts.

Hopkins claimed to possess the Devil's list of all the witches in England and, thus armed, set out to find further victims, accompanied by his own group of professional witchfinders. Amongst these were John Stearne who searched the male prisoners for witch's marks while Mary Phillips searched the women. They began systematically to comb the countryside of East Anglia, moving from town to town and village to village, often at the invitation of the authorities, who were by this time utterly overwhelmed by the witch panic. Among Hopkins's charges for his services were the sums of £23 0s 6d for a visit to Stowmarket and £15 for King's Lynn. Witch-hunting had become an extremely profitable profession.

By a deliberate policy of terrorism in which prisoners were tied up, deprived of sleep, made to sit cross-legged on stools for hours on end, or marched backwards and forwards until they dropped from exhaustion, Hopkins secured the confessions he needed without crossing the official boundary between mere duress and illegal torture. There appears to have been no shortage of suspects; for to Hopkins witchcraft meant the possession of animal familiars, hence any unfortunate outcast possessing a pet cat, dog or mouse became particularly liable to suspicion. In the same way any sudden or inexplicable outbreak of disease among human beings or cattle could indicate witchcraft as most contemporary physicians would have been prepared to testify.

Not only Norfolk and Suffolk but also the counties of Cambridge, Northampton, Huntingdon and Bedford became the stamping grounds of the Hopkins gang who took care never to venture beyond Puritan territory. The mechanism of witchfinding appears to have been in the main self-generating and the mere presence of a witch-hunter in the vicinity usually sufficient to agitate a whole community into a frenzy of denunciations. So great was the terror engendered by the witchfinders that a suspect had even been known to volunteer to be searched for witch's marks in order to vindicate his good name in the eyes of his neighbours, as for example Meggs, a Suffolk baker, who offered himself for examination and, having failed the test, was sent to the gallows.

The witch-hunting industry involved all manner of normally respectable citizens. Great Yarmouth, Norfolk, paid its local team of searchers for Devil's marks '12d per day to be divided among them'.

Ordeal by Swimming

With 200 of his victims packing the jails of East Anglia Hopkins staged a great trial of witches at Bury St Edmunds in 1645. Among the 18 who died by hanging was John Lowes, a 70-year-old clergyman who had been denounced as a witch by his own parishioners at Brandeston in Suffolk. Forced to undergo the walking torture until he fainted from exhaustion, Parson Lowes at last admitted to the ownership of familiars, one of which he had dispatched to sink a ship at sea. None of his accusers ascertained whether or not such a ship had existed, let alone had sunk on that day, and the old man was hanged after reading his own burial service, as no other clergyman could be persuaded to undertake it for him.

Among the best known methods used for the detection of witches at this period was the 'swimming test', an ordeal in which the suspect was trailed on ropes in a pool of water or a stream, the assumption being that if she floated she was guilty and that only if she sank could her innocence be presumed. Long pins were also plunged into the bodies of suspects in the search for Devil's marks. The swimming test was forbidden by a Parliamentary Commission in 1645 but no restraint was imposed by officialdom upon Hopkins's other enormities.

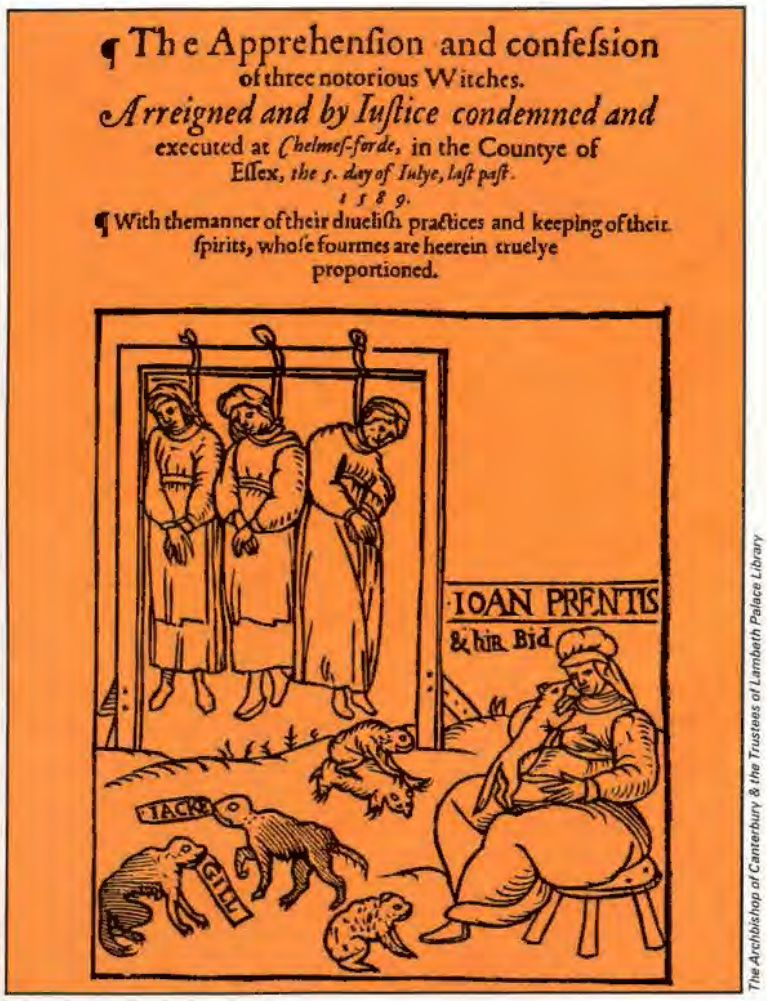
In 1645 Hopkins undertook a number of incursions into the county of Huntingdon. Here he came into conflict with a clergyman, the vicar of Great Staughton, Rev John Gaule, who resented his presence in the county and who openly attacked him from the pulpit. Although compelled to recant Gaule returned to the attack, finally publishing a damning indictment in pamphlet form entitled *Select Cases of Conscience Touching Witches and Witchcraft* in which he exposed the cruel tortures used by the Hopkins gang, making the point that 'every old woman with a wrinkled face, a furrowed brow, a hairy lip, a gobber tooth, a squint eye, a squeaking voice or a scolding tongue . . .' was liable to be pronounced a witch. Hopkins attempted a reply to the charges raised against him in his own pamphlet *The Discovery of Witches* but by this time his star was beginning to wane and there was every sign that the day of the unofficial tribunal was over. In the first place the triumph of Parliament in the Civil War had created more settled conditions and, secondly, the voice of criticism was beginning to be raised against him from all quarters. In 1646 Hopkins retired to his house in Manningtree where he died in the following year.

The type of person selected by fate to fulfil the role of witch is a problem for the psychiatrist. Sir Charles Oman, the historian, divided English witches and wizards into four main groups: the conscious charlatans, the malignant persons who really believed they had the power to harm their enemies, the sheer lunatics, and finally the victims of torture and duress. There is not the least doubt that most of those who suffered in the great East Anglian witch-hunts of the 17th century believed personally in the reality of witchcraft, and some possibly that they were guilty of the crimes with which they were charged, for belief in magic was universal among the peasantry. One Newmarket woman who sincerely believed her pet toad to be a familiar spirit received the scientific attentions of Dr William Harvey, discoverer of the circulation of the blood and physician to King Charles I. The doctor, to the witch's disgust, cut open the unfortunate toad, demonstrating to his own satisfaction at least that there was nothing supernatural in its composition. Harvey was many years in advance of the majority of his profession, who were perfectly prepared to use witchcraft as an alibi for their own medical deficiencies.

Livestock Burned Alive

A Dr Jacob of Yarmouth, in the year 1664, basked in the glory of a reputation for 'helping children that were bewitched'. Jacob was involved in the notorious case of the Bury St Edmunds witches of 1665 when Rose Cullenden and Amy Duny of Lowestoft were found guilty of bewitching a number of children, one of whom died. Given in evidence was the astounding fact that at the instigation of Dr Jacobs a toad which had been discovered in the bedding of

Mansell Collection



The Archbishop of Canterbury & the Trustees of Lambeth Palace Library

one of the children was thrown into the fire where it exploded, and that afterwards Amy Duny was seen to have burns upon her arms, a sure sign of her guilt. During the court proceedings a number of children testified that Amy Duny and Rose Cullenden were attacking them 'spectrally' when it was quite obvious to those present that the women were doing nothing of the kind. This type of 'spectral evidence' was perfectly acceptable to the witch-fearing judge Sir Matthew Hale who, in spite of doubts raised by other members of the court, sentenced the prisoners to death. Contained in the indictment were the usual stock charges against 17th century witches: the conveying of nails and pins into the bodies of victims, the bewitching of farm carts and the magical killing of cows and pigs.

There is a note of grim humour in the curious case of Abre Grinsett, a beggar woman who was charged in 1665 with bewitching Thomas Spatchett, bailiff of Dunwich, so that he suffered attacks of headaches, and fits. The fact that he had broken his skull as a child appeared to have little bearing on the evidence submitted to the court, which included a full confession, by Spatchett, of a compact with the Devil who had assumed the shape of a 'pretty handsome young man'. One of the magistrates observed that if Abre Grinsett chose to bewitch men like Spatchett she was free to do so, and she was discharged and sent home where she was later found dead, to all appearances murdered by her neighbours.

The possession of animal 'familiars' was at one time synonymous with witchcraft, and any outcast with a small animal as a pet was liable to be accused of the crime *Left* Illustration to Matthew Hopkins's *The Discovery of Witches* showing the witchfinder and two witches with their familiars, including a legless spaniel and an ox-headed greyhound *Right* Execution of three witches at Chelmsford in 1589: seated at the base of the gallows is Joan Prentice, who admitted to killing a child by witchcraft, with her familiar, a ferret, on her lap

Throughout the 17th century and well into the 18th, witch-hunting remained a popular sport in East Anglia and Essex. The repeal of the Witchcraft Act in 1736 had little effect upon the superstitious fears of the common people who continued to believe in witchcraft for a further century. Under the terms of the new Act witchcraft ceased to be a legal offence although punishment limited to imprisonment and pillory was reserved for those who claimed to have supernatural powers, as for example the Cunning People. To a considerable extent the situation had reverted to that existing before the Witchcraft Act of 1563 with witch-hunting now a private matter between the bewitched and his adviser, the Cunning Man.

Faith in white witchcraft as prescribed by the Cunning People remained extremely strong in East Anglia until the 1850s when, following the decline in the belief in magic, witchcraft ceased to be a factor in peasant philosophy. Even as late as 1826 a huckster was swum as a witch at Wickham Keith, Suffolk, and at about this time Ipswich was honoured by the presence of its own Cunning Man 'Old Winter', a notorious white wizard. In 1857 *The Times* cited a not untypical case, in which a magistrate at Hockham in Norfolk was requested by a citizen to submit a suspected witch to the swimming test. Behind the scenes as prime instigator had been the inevitable Cunning Man.

Many magical practices belonging properly to the Dark Ages continued to be practised in the remoter parts of the East Anglian marshlands until fairly recently. Livestock was burned alive throughout the first half of the 19th century as an antidote to witchcraft, while as late as 1866 crosses were nailed to barn doors in Norfolk during an epidemic of cattle disease, to protect the herds from devils and witches. Even in the 20th century iron objects like knives and scissors were placed under cottage doormats to keep witches from the premises.

The marshland coastal fringes bordering the North Sea long remained an area of peasants who were dissenters almost to a man, and almost medieval in their acceptance of witchcraft. Until 1860 Essex possessed the most famous Cunning Man of all times, James Murrell of Hadleigh, an expert exorcist whose prowess with the witch bottle was proverbial (see MURRELL). Even as late as the 1870s the witch bottle was not unknown among country labourers, although as often as not the refinements of the art had been forgotten, a jam jar of urine being used instead. Witch's imps in the shape of

The majority of people who suffered during the great East Anglian witch mania were convinced of the reality of witchcraft, and it is even possible that some believed themselves to be witches; in any case, Matthew Hopkins's deliberate policy of terrorism ensured that he obtained the confessions he needed without officially torturing his victims. Scene from *The Witchfinder General*

white mice were still feared in parts of Norfolk, Suffolk and Essex until the close of the century and provided the theme of many macabre legends, some of which are remembered to this day.

The Devil's Harvest

Further north, in the Fenlands, country folk long believed in the satanic compact, considering it possible to secure the granting of material requests from the hands of the Devil by a rite called 'The Gathering of the Devil's Harvest', which was performed on St Mark's Eve. Perhaps the best known survival of witch fear in its most malignant form was the notorious incident of 1863 in which an old fortune-teller, after being accused of witchcraft, was forced to undergo the swimming test at Sible Hedingham in Essex as the result of which he died. For this crime the two principals, a man and a woman, both shopkeepers, were sentenced to terms of hard labour. It transpired from the evidence given in court that the unhappy victim had been submitted to the cruel 17th century ordeal known as the walking torture, in an effort to persuade him to remove a spell he was supposed to have placed upon the woman. It was not far from here, at Dunmow, that one of the last known attempts to impose the swimming test upon a witch was made by two country labourers in 1880. The offenders were brought before the courts and punished.

As a macabre postscript to the East Anglian witch-hunts of the 16th and 17th centuries a St Osyth resident discovered, when digging his garden some 40 years ago, the skeletons of two women buried in a north-south orientation and riveted limb to limb. Whether these were survivals of witch persecution it is not possible to say with absolute certainty, but it is reasonable to assume that the bodies had been so restricted after death to prevent them rising from the grave to haunt the community.

EASTER &

No celebration in the Christian calendar is richer in symbolic ritual than Easter. In dramatic contrast with Holy Week, a time of sadness and mourning, Easter Sunday dawns with universal rejoicing, the rays of the rising sun announcing to all mankind that Christ, too, is risen

THE RESURRECTION OF CHRIST is commemorated at Easter, the most important festival in the Christian calendar. The impact of this feast day on the common people in time past was so great that it was even supposed that the sun itself danced for joy each Easter Day. It was popularly believed that this sight could be seen by anyone getting up early and standing at some suitable vantage point, always provided that the Devil had not blocked the view. Of course it was not everyone who believed this. John Brand, a stern 18th century antiquary observed that: 'It is a common custom among the vulgar and uneducated.'

It may have been this belief that lay behind an ancient custom recorded at Chester, which R. Chambers describes (*The Book of Days*, 1864). The Dean of the cathedral produced a ball during the Easter service, held it and danced, before passing it to choristers and others present, including the Archbishop. Afterwards they all had a meal of bacon and tansy pudding.

At one time the herb tansy was customarily used for flavouring Easter cakes and puddings. It is seldom used nowadays, on account of its bitter flavour, but most probably it was originally intended to symbolize the bitter herbs served at the Jewish Passover table, a festival from which the Christian Easter partially derives. Lambs were sacrificed at the Hebrew feast to commemorate Israel's deliverance from bondage in Egypt, and Christian tradition represents Christ as the Paschal Lamb, clasping the banner of victory over death. (The word 'paschal' comes from the Greek form of the Hebrew 'Pesach', passover.) In Devonshire and Somerset, on Easter morning, people watched for this lamb and flag motif to appear in the centre of the sun's disc. Sometimes the rising sun, symbol of Christ risen from the dead, is welcomed with Easter music. Bands and choirs sing hymns, and in America the Moravians – an old German

religious community living in Pennsylvania – play trombones at three o'clock in the morning to wake sleeping people.

The great climax of Easter in the Eastern or Orthodox Church comes earlier still: at midnight, when the priest announces to the assembled people: 'Christ is Risen', to which the congregation reply: 'He is risen indeed.' Everyone has brought candles and these are now lit, so that the whole church becomes a blaze of light. Before the Revolution Russians would greet one another with a ceremonial kiss – three times repeated in honour of the Trinity. The Lenten fast, which is still strictly observed by Orthodox believers, ends at this moment. Hungry peasants have been known to slip a few coloured eggs in their pockets and to begin eating them the moment the ritual greeting has been given, even though the service is still in progress.

The harsh Lenten diet was most unpopular and in some countries people gave it a very elaborate send-off. In England a red herring, prepared to look like a man riding away on horseback and arranged on a bed of corn, was eaten on Easter Day. In Poland there was a similar custom. Country boys took a pot of *zur* – gruel made from water mixed with fermented rye meal – and a herring, and drummed them out of the village before burying them. People lived on little else during the fast period, and the boys enjoyed giving the food its funeral.

The severity of Lent and its restrictions explains why the Easter festival is a great

occasion for feasting, and in many Christian countries families used to hold open house – sometimes with rather curious food by modern standards. In England radishes were a seasonal speciality, and a Radish Feast was held in Oxford.

The Paschal Lamb

Easter foods in central and eastern Europe are prepared in advance, and blessed by the priest before anyone will consider tasting them. As magnificent a spread as the family can afford is provided, with the best linen cloth in use. The tradition of the Paschal Lamb ensures pride of place for this meat at the Easter table, but in some countries a substitute of pastry or sugar may serve as a centrepiece instead. In Poland the lamb is made of butter and surrounded with numerous dishes containing ham, roast veal, sausage and other delicacies. As a rule the whole ensemble is prettily decorated with flowers and garlands.

Easter pastries are another important part of traditional Easter fare. Russians prepare *paska*, a tall, stiff bread, made with cottage cheese and raisins and iced on top. Italian mothers give their children *ciambella*, a cake made with olive oil; boys are given one in the shape of a horse, while for girls the cake is shaped like a dove, arrayed in real feathers. Austrian children receive a nest-shaped cake filled with eggs. Some scholars see in such ceremonial pastries the remnants of an old magic rite, where ritual offerings of bread assured prosperity to the community and to the tribe.

Sometimes pastries were part of a dole or charitable distribution. At Biddenden in Kent the famous Biddenden cakes are still distributed on Easter Monday, according to the terms of an ancient benefaction. Tradition says that this is in fulfilment of the wishes of Siamese twins, Elizabeth and Mary Chulkhurst, who left 20 acres known as the Bread and Cheese Lands, to provide these cakes and a supply of bread and cheese. The cakes are embossed with the figures of the two women.

The custom of doing public penance for human sinfulness on Good Friday is common in many parts of the world: penitents dressed in sombre black robes follow an effigy of Christ on the Cross as it is borne through the streets of Seville

This food, and other similar forms of charity, of course fulfilled a genuine need in times when poverty meant starvation. Slightly different were Church Ales, held in some parts of Britain at Easter. Churchwardens had to provide malt for brewing ale, which was then sold with bread, meat and other foodstuffs donated to raise funds for the church and for charity. The feast which followed was originally held in the church itself, but resulted in unseemly rowdiness, and so church halls or houses came to be built. The custom aroused the displeasure of the Puritans after the Reformation and was gradually suppressed. In time some of them were closed and others turned into licensed inns.

Easter was also an occasion for paying rent, which could be rendered in kind as well as cash. There are records of various spices – pepper, cumin, cinnamon – and even pairs of gloves being offered. Indeed presenting new gloves to the landlord at Easter was an old method of ensuring land tenure, and young men would give a pair to their sweethearts.

A complete set of new gloves for Easter is nowadays customary in some countries, a relic from the early Christian times, when the festival was a popular occasion for baptizing newcomers to the Church. The candidates wore fresh white robes to signify the new life given to them by the Resurrection. Popular tradition says that anyone who can afford new clothes for Easter, and neglects to buy them, will be unlucky, and in America the annual Easter parade is when the new spring outfits are displayed.

Renewal and rejuvenation, closely linked with the central meaning of Easter, are symbolized in many ways. According to a common and widespread belief, running water becomes blessed on Easter Day because Christ sanctified it. In France women wash their faces in the flowing streams, and in other countries farmers sprinkle their animals. Bottles of Easter water are often carefully preserved as a source of healing. In Ireland they say it provides protection from evil spirits.

Water is important in assisting the crops to grow, and primitive peoples supposed that it possessed a more general fertilizing influence. In some European countries it is customary to sprinkle the girls, and the boys who do it are rewarded with a small gift. In Hungary this took place on Easter Monday – hence its name, *Vizbeveto* or Water Plunge Monday. Today a few drops of eau de cologne replace the old fashioned dousing. The same custom existed in Poland, where it was known as the *Dingus*. In the Middle Ages it was a two-day festival, and after the splashing girls and boys pelted each other with eggs.

Traditionally work was forbidden in Poland during Easter Week, especially on the Thursday, which is dedicated to the memory of the dead. They say that a farmer who insisted on ploughing his fields was swallowed up, together with his team of oxen. Anyone putting an ear to the ground will hear him calling for help. Some people avoided work with linen or yarn, the tradition being that dust from these materials would get into the eyes of dead souls. Probably there is some connection with funeral shrouds.

A popular fertility rite consists of touching a young man or girl with the branch of a tree. This bestowed health and fruitfulness. In Czechoslovakia the Easter Switch is plaited from pussy willow branches and decorated with ribbons. A boy would strike a girl on the legs with this until she paid him a fine of Easter eggs. In eastern Pomerania, more surprisingly, children chased their parents out of bed, a birch twig being used.

Some Easter customs seem to show direct links with crop growth rituals. In Greek Macedonia the girls would get up early on Easter morning, find a cherry tree and rig up a swing. Later, other swings were erected on the village green and the *hora*, an ancient circular dance, was performed while the swinging took place. A similar game was popular in Latvia, the original intention presumably being to encourage the crops to grow as high as the girls were swinging.

A Lift for the King

In England Lifting or Heaving must have served the same purpose, though Christian tradition converted it into a commemoration of the Resurrection. This popular custom was discontinued towards the end of the last century. As a rule Easter Monday was the day when women were 'lifted' by the men, the roles being reversed the following day, but this varied according to local custom. King Edward I was lifted on Easter Monday by the ladies of the court, for which he paid them £14 – a lot of money in those days. A special chair was prepared, with

The Resurrection of Christ

Now on the first day of the week Mary Magdalene came to the tomb early, while it was still dark, and saw that the stone had been taken away from the the tomb. So she ran, and went to Simon Peter and the other disciple, the one whom Jesus loved, and said to them, "They have taken the Lord out of the tomb, and we do not know where they have laid him." Peter then came out with the other disciple, and they went toward the tomb. They both ran but the other disciple outran Peter and reached the tomb first; and stooping to look in, he saw the linen cloths lying there, but he did not go in. Then Simon Peter came, following him, and went into the tomb; he saw the linen cloths lying, and the napkin, which had been on his head, not lying with the linen cloths but rolled up in a place by itself. Then the other disciple, who reached the tomb first, also went in and he saw and believed; for as yet they did not know the scripture, that he must rise from the dead. Then the disciples went back to their homes.

But Mary stood weeping outside the tomb, and as she wept she stooped to look into the tomb; and she saw two angels in white, sitting where the body of Jesus had lain, one at the head and one at the feet. They said to her, "Woman, why are you weeping?" She said to them, "Because they have taken away my Lord, and I do not know where they have laid him." Saying this, she turned round and saw Jesus standing, but she did not know that it was Jesus. Jesus said to her, "Woman, why are you weeping? Whom do you seek?" Supposing him to be the gardener, she said to him, "Sir, if you have carried him away, tell me where you have laid him, and I will take him away." Jesus said to her, "Mary." She turned and said to him in Hebrew, "Rab-boni!" (which means Teacher). Jesus said to her, "Do not hold me, for I have not yet ascended to the Father; but go to my brethren and say to them, I am ascending to my Father, to my God and your God." Mary Magdalene went and said to the disciples, "I have seen the Lord" . . .

John, chapter 20

decorations such as coloured ribbons, and the person to be lifted was invited to take a seat. It was then hoisted in the air three times, those who did the work receiving a reward of money and perhaps a kiss.

The idea of taking flight has obvious echoes of the Resurrection. In parts of Germany models of a bird were usual Easter presents. With gracefully spread wings of paper, they were hung from the living-room rafters. A similar bird flew above a baby's cradle in parts of eastern Europe, generally being left there throughout the year.

In England and other European countries, Easter Day was once celebrated by lighting great bonfires. This marked the renewal of life with the return of spring. Sometimes a doll, symbolizing winter, was burnt or thrown in the water. This was also known as Burning the Judas. Among the Germans, Dutch and Swedes these fires can still be seen. German settlers in Texas also still make Easter bonfires and tell their children that the Easter rabbit is burning flowers: he is making dye for the Easter eggs.

The rabbit is a comparative newcomer to the Easter celebrations, having taken the place of the traditional hare. But at Hallaton in Leicestershire there is still an annual Hare Pie Scramble on Easter Monday. The parish rectors were given the right to a piece of land on condition that they provided plenty of ale, two dozen loaves and two hare pies for the occasion. As it happens, hares are out of season at this time of year, so the pies are made with some other meat instead.

VENETIA NEWALL

The Ceremonies of Holy Week

The week preceding Easter, Holy Week, has been observed by Catholic Christians since the 4th century AD, by the performance of special ceremonies. The dramatic Gospel accounts of Christ's last week in Jerusalem provided a series of events that could be ritually commemorated. These Holy Week ceremonies mostly originated in Jerusalem. They were soon adopted in varying forms throughout the Church, because the official establishment of Christianity by the Emperor Constantine (288–337 AD) encouraged pilgrims to visit Jerusalem in increasing numbers. In Jerusalem, and elsewhere in Palestine, the interest and patronage of the Emperor and his mother, St Helena, caused many churches to be built marking sacred sites of the Gospels. They included, most notably, the Church of the Holy Sepulchre in Jerusalem and the Church of the Nativity at Bethlehem. St Helena is credited with the discovery of the True Cross on which Christ was crucified.

A contemporary account of the Holy Week ceremonies as they took place in the latter part of the 4th century is extant. Known as the *Peregrinatio Etheriae* or 'Pilgrimage of Etheria', it was so called because it was written by an abbess or nun of that name, who was probably of Spanish origin and who made a pilgrimage to the Holy Land at that time. Her record will be used here as the basis of a description of the Holy Week ceremonies. It will be supplemented where necessary with accounts of rites that were later added to the original scheme.

Entry into Jerusalem

Holy Week began on the Sunday before Easter; it is known today as Palm Sunday. According to Etheria, the faithful gathered at the seventh hour that day on the Mount of Olives, on the eastern side of Jerusalem. After an appropriate service, the people, led by the Bishop, followed the traditional route taken by Christ from the Mount of Olives on his triumphal entry into Jerusalem. They were accompanied by children, all bearing branches of palm or olive and crying: 'Blessed is He that cometh in the Name of the Lord.' The procession slowly made its way through Jerusalem to the Church of the Holy Sepulchre. The ceremony ended with prayers before the reliquary of the True Cross. In the Middle Ages, elsewhere, the Palm Sunday procession was usually made from one church to another, where palms were blessed and distributed. Christ was represented in the procession by a Gospel book, or a crucifix, or the Blessed Sacrament. Sometimes a carved figure, seated on a wooden ass, was used. In Byzantine churches icons were carried. The blessing and distribution of palms, together with a procession singing 'All Glory, Laud and Honour', remain the chief features of the modern Palm Sunday rites.

Etheria describes special ceremonies, but of subsidiary importance, on the Monday, Tuesday and Wednesday of Holy Week. They were associated with sacred sites in and about Jerusalem. They were not adopted into the later scheme of Holy Week.

The Washing of Feet

The Thursday of Holy Week was a day of great significance because it recalled the Last Supper of Christ with his disciples, and his Agony and Arrest in Gethsemane. At the time of Etheria's pilgrimage, the chief ceremony was a night vigil on the Mount of Olives. First, the people, led by the Bishop, assembled in a church containing a cave, which Christ had traditionally visited that day with his disciples. From there they proceeded to the place of his Ascension. At first cock-crow, they descended to the Garden of Gethsemane, where 200 candles were lighted. The account of Christ's arrest was read, and evoked great lamentation. The procession then returned to Jerusalem, just as darkness was lifting. The Bishop dismissed the people to rest, before returning for the rites of Good Friday.

Elsewhere the Thursday ceremonies inevitably took a different form from those enacted in Jerusalem. In the Western Church emphasis was laid upon the Last Supper. At the Mass that day there was a solemn ringing of all the bells at the 'Gloria in excelsis', after which they were silent until Easter Even. Because no Host was consecrated on Good Friday, an extra Host was consecrated on Thursday; this was used on Good Friday for the Mass of the Presanctified, a shortened form of Mass. It was carried in solemn procession to an Altar of Repose, before which the faithful kept vigil. In cathedrals the Holy Oils were blessed. It was customary also for the Holy Water stoups to be emptied; and the altars were ceremonially washed, although this was sometimes done on Good Friday. The Kiss or

In pre-Revolution Russia, Easter Day was a time of conviviality and celebration, starting at midnight when candles were lit in churches and three ceremonial kisses exchanged in honour of the Trinity: lithograph of 1862, illustrating Russian Easter customs. Coloured eggs and *paska*, the tall stiff bread that was traditionally baked for Easter, are shown below the central picture

Sign of Peace, the ritual embrace after the Agnus Dei, was omitted at Mass in commemoration of the kiss of Judas. The ceremonies concluded with the *Pedilavium* (washing of feet). It was performed by bishops or abbots on people of inferior rank, in memory of Christ's washing of his disciples' feet at the Last Supper. It was also performed by certain sovereigns. The English royal Maundy service recalls the practice of earlier English kings. The name 'Maundy Thursday' is derived from *mandatus novum* ('a new commandment', John 13.34), the first words of the response of the ceremony of the washing of feet.

Good Friday, the anniversary of the Crucifixion, started in 4th century Jerusalem with prayers before sunrise in the ancient church on Mount Sion, where the alleged Column of Flagellation was preserved: the scourging of Christ by Pilate's soldiers was thus mourned. According to Etheria, the chief ceremony that day took place in the Church of the Holy Sepulchre. The relic of the True Cross was exposed and adored by the faithful. In turn, they bowed and kissed the sacred wood, which was then held by the bishop. They were carefully watched by deacons, since, as Etheria reports, a pilgrim once bit off and stole a portion of the precious relic. This ceremony was followed by a three-hour service at the site of Golgotha, the place where Christ was crucified.

In the Western Church a ceremonial Veneration of the Cross (sometimes called 'Creeping to the Cross') is the characteristic Good Friday rite. Clergy and people kneel and kiss a crucifix placed on the sanctuary steps. After this ceremony, the Host, consecrated on Maundy Thursday, is brought from the Altar of Repose for the Mass of the Presanctified. The liturgical colour is black; and the organ is silent. A Three Hours Service, from noon to three o'clock, originally introduced by the Jesuits, is now customary in many churches.

Holy Saturday, known also as Easter Even, commemorates the resting of Christ's body in the tomb. The Easter vigil is notable for an elaborate ritual, of which the theme is the rekindling of fire as a symbol of Christ's Resurrection. In Jerusalem this Paschal fire is kindled by the Patriarch of Jerusalem within the Shrine of the Holy Sepulchre.

In the modern form of the rite, the fire is kindled in the porch of the darkened church. The procession moves into the church, lighted by a single taper or candle; a second is lighted in the nave; a third at the sanctuary. The focus of attention then becomes the Paschal Candle, a large candle set on the north side of the sanctuary. This candle, referred to as a sacred pillar of light, is duly consecrated. Five grains of incense in pyramidal form are inserted into it, supposedly in memory of the Five Wounds of Christ. The lighting of the Paschal Candle is followed by the lighting of all the lamps and candles of the church and the joyful ringing of its bells. The completion of the Easter Vigil was followed in ancient times by the first Mass of Easter at dawn.

The Paschal Candle is, by implication, a symbol of Christ. It is, significantly, extinguished at the Feast of the Ascension of Christ, which marks his physical withdrawal from the world. The Holy Week ceremonies, as a whole, are basically commemorative of the Passion and Resurrection of Christ; but like the ritual of the ancient mystery-religions, they are calculated to promote in the faithful a sense of identity with Christ in his sufferings and triumph over death.

This Jewish Christian sect, which broke away from the early Gentile Church of the Apostles, is characterized by its recognition of Jesus as the Messiah of Israel, who would one day return to reign on earth

EBIONITES

THE NAME 'EBIONITES' was first used in the 2nd century by the Christian writer Irenaeus to describe a Christian heretical sect. This strange name may go back to the very beginnings of Christianity.

Many scholars cite, in this connection, the Apostle Paul's statement in his Epistle to the Romans (chapter 15) about a financial contribution that had been organized in Greece 'for the poor among the saints at Jerusalem'. The reference here is clearly to members of the original Christian community at Jerusalem who were in need. It has, however, been suggested that the expression 'the poor' may not just denote a state of poverty, but rather be an honorific title assumed by the Jerusalem Christians, who are reported to have 'had all things in common; and they sold their possessions and goods, and distributed them to all, as any had need' (Acts of the Apostles, chapter 2). Moreover, it is recalled that Jesus had said 'Blessed are you poor, for yours is the kingdom of God' (Luke, chapter 6). Consequently, if the Jerusalem Christians were thus known as the 'poor', which in Hebrew speech would be the 'Ebionim', the Greek word 'Ebionites' could be reasonably considered as a translation of Ebionim. This conclusion means that, by the 2nd century, a sect of Christian heretics bore the same name as the original Jewish Christian community at Jerusalem.

The theory that the Jerusalem Christians were called Ebionim has been further strengthened, but at the same time made more complicated, by the fact that the evidence of the Dead Sea Scrolls seems to indicate that the Qumran community may also have called themselves Ebionim (see DEAD SEA SCROLLS). This Qumranic use would, accordingly, suggest that 'Ebionim' was truly an honorific Jewish title current at the time of Christ, and that common usage of it may indicate some connection between the Qumran Covenanters and the original Christian community at Jerusalem. But, however that particular issue may be assessed, what is important here is the fact that, if the Jerusalem Christians were indeed known as Ebionim, the evidence of Irenaeus reveals a surprising situation: namely, that by the 2nd century these original Christians, or their immediate descendants, were regarded as heretics by an orthodox Church Father such as Irenaeus.

That the members of the original Christian community at Jerusalem were known as the Ebionim is indeed probable, but it cannot be regarded as certain from the extant evidence; for there exists no actual statement that they were ever referred to simply as the 'Poor' (Ebionim). However, whether or not the Ebionites did derive from the first Jewish Christians, the latter certainly merit our attention; for they have a basic importance in the study of Christian origins.

Christianity originated in Galilee and Judaea, and the first disciples of Jesus of Nazareth (see JESUS) were Jews. After the Crucifixion, the disciples' faith in Jesus as the Messiah of Israel was re-established by a series of visions, which convinced them that God had raised him from the dead and that he had ascended into heaven. They believed that he would shortly return to earth, with supernatural power, to complete his messianic career, which meant in terms of current Jewish thought, the restoration of political sovereignty to Israel and the consequent overthrow of the Roman government there. The Acts of the Apostles, written towards the end of the 1st century AD, gives a later idealized account of the fortunes of these original Jewish disciples, and the writings of St Paul provide information that is of the greatest importance.

According to these sources, we learn that the disciples of Jesus, including his mother and his brothers, established themselves as a community at Jerusalem, thus forming what was to be the Mother Church of Christianity (Acts, chapter 1). They began to proclaim to their fellow-Jews that God had confirmed the Messiahship of Jesus by raising him from the dead, and they urged them to repent of their sins and prepare themselves for the imminent return of Jesus as the Messiah. In this presentation of Jesus, they clearly conceived of him as exclusively the Messiah of Israel, concerned only with the salvation of the Jews as the Chosen People of Yahweh (see YAHWEH). Their own conduct confirms this view, because they continued to live as zealous orthodox Jews, worshipping regularly in the great temple at Jerusalem and observing the ritual Law. In other words, these original Jewish Christians did not conceive of their faith in Jesus as constituting a new religion; indeed, it made them more devout and zealous members of their ancestral religion of Judaism. Although they encountered the repressive opposition of the Jewish sacerdotal aristocracy who co-operated with the Roman government in Judaea, these Jerusalem Christians won many converts, including Pharisees and members of the lower orders of the temple priesthood, thus attesting that they were regarded by their compatriots as orthodox Jews.

St Stephen, the first Christian martyr: he was charged with blasphemy because, in contrast to the Ebionites who believed that Christianity was a perfected Judaism, he was hostile to the orthodox cult of the Jewish Temple. He was condemned to death and stoned

The Three Pillars

The leadership of this Jerusalem Church raises an interesting and important problem, which can only be indicated here. According to the contemporary evidence of Paul, at Jerusalem there was a triumvirate or party of three, consisting of James, the 'Lord's brother', Cephas (Peter), and John. Of these three 'pillars' as they are called, James was obviously the leader (Galatians, chapters 1 and 2). The testimony of Acts is more problematic. In the earlier chapters Peter appears as the recognized leader. Nothing is said of James until chapter 3, and the statement there seems to imply that Peter then handed over the leadership to James. James thereafter is clearly the leader, although the author of Acts curiously avoids identifying him as the brother of Jesus. That James did become the head of the Mother Church of Jerusalem is confirmed by later Christian writers and implied by the Jewish historian Josephus (1st century AD). James doubtless owed his position to his blood-relationship to Jesus; on his death in 62 AD, he was succeeded by another relative, Symeon, thus indicating that at this early stage leadership was dynastic.

This original Jewish Christianity, with its headquarters at Jerusalem and communities in other parts of the country, was essentially a Jewish Messianic sect within the body of Judaism; its distinction lay in its recognition of Jesus as the Messiah of Israel. It clearly did not contemplate its doctrine and purpose as being applicable to Gentiles, peoples other than Jews. It reluctantly accepted the conversion of a few individual Gentiles, who seem already to have had some connection with Judaism.

There seems, however, to have been a 'splinter' group, led by Stephen, who were hostile to the orthodox cult of the Jerusalem temple and possibly had some connection with the Qumran Covenanters who had a similar attitude. Some members of this group, which was dispersed on the death of Stephen, travelled to Antioch in Syria, where they preached the new faith to Gentiles and made many converts. The leaders of the Mother Church of Jerusalem were,

thereupon, faced with a problem: could these Gentiles be admitted to membership of the Church without becoming Jews, which meant, for male converts, being circumcised? The evidence of the Acts and Paul's Epistles is conflicting on what policy was actually adopted. On the whole, it would seem that the Jerusalem leaders probably accepted Gentile converts into something like proselyte status, without definitively requiring circumcision but strongly commending it. They doubtless viewed such converts as second-class Christians, and never expected their numbers to be large before Christ's second coming.

The conversion of Paul, a Hellenistic Jew, was destined to effect a fundamental transformation of this situation (see ST PAUL). He was inspired to see Jesus not only as the Messiah of Israel but, more importantly, as the divine Saviour of all mankind; consequently he presented Christianity as a universal salvation-religion. Paul and his doctrine were repudiated by the leaders of the Jerusalem Church, and his arrest by the Romans in 59 AD removed him from further part in the movement.

So far as the history of the Mother Church of Jerusalem can be reconstructed from the sparse and fragmentary evidence, it would seem that it strictly controlled the Christian movement outside Palestine, especially in combating the influence of Paul. A strong Jewish Christian church was probably established also in the great city of Alexandria in Egypt, with close ties with the Mother Church. In Palestine itself Jewish Christianity appears to have been sympathetically associated with the Zealot resistance movement against Rome, which was religiously inspired (see ZEALOTS). There is reason for thinking that the execution of James at the instigation of Ananus, the high priest, in 62 AD was due to this association.

St James, the brother of Jesus, was the first leader of the Ebionites: he was executed in 62 AD, probably because of the sect's association with the Zealot resistance movement against Rome: detail from a painting in the Church of St Cecilia in Trastevere, Rome

Scala

In the war against Rome, which started in 66 AD and ended with the destruction of Jerusalem in 70 AD, the Mother Church of Christianity disappeared. A later legend, demonstrably unsound, told of the flight of its members to Pella, a city in Transjordan. What is certain and beyond dispute is that the Mother Church of Jerusalem, which had been the recognized source of faith and authority in the infant Christian movement, ceased to exist after 70 AD.

The obliteration of the Jerusalem Church led to a rehabilitation of Paul's interpretation of the faith, which came to form the basis of Catholic Christianity as a universal salvation-religion. Remnants of Jewish Christianity survived in various places in Palestine, Syria and Egypt until the 5th century. Its members clung to the original tenets of their faith, being characterized by their observance of the Mosaic Law, their belief that Jesus was of human origin, and their hostility to Paul. They are known only through the garbled and prejudiced accounts of orthodox Christian writers, who regarded them as heretics. They are named either as Ebionites or Nazarenes, and various strange beliefs and customs are ascribed to them; it is likely that some groups did adopt Gnostic ideas (see GNOSTICISM) or held beliefs that stemmed from the Qumran Covenanters.

Certain of their writings have survived, in forms of varying authenticity. The most important are the so-called *Pseudo-Clementines*, comprising the *Homilies*, the *Recognitions* and an *Epitome*. Others, including an Ebionite Gospel, and Ebionite *Acts of the Apostles*, a *Gospel of Peter*, and a *Book of Elkesai* are known by surviving fragments or from references by orthodox writers.

ECKHART

THE TRIAL OF Eckhart von Hochheim on charges of heresy opened at Cologne in September 1326. In the following year he travelled to Avignon, to be examined by a papal commission. In March 1329 a papal bull condemned as either heretical or dangerous 28 'articles', propositions drawn from his works. It also says that Eckhart had revoked them and 'at the end of his life professed the Catholic faith'. He must therefore have died late in 1328 or early in 1329.

This great German mystic, generally known as Meister (Master) Eckhart, was born c 1260. He entered the Dominican friary at Erfurt and before 1298 had been elected Prior. He was sent to the University of Paris where he received his master's degree in 1302. After holding various ecclesiastical offices in Germany, and a second stay in Paris, he taught at the friary of Strasbourg and then at the Dominican university in Cologne.

Despite the heresy trial, Eckhart's personal orthodoxy was never in question, and as the papal commission's task had been merely to examine the wording of the condemned articles, without reference to the context or to the author's intention, his immediate followers (notably Johann Tauler and Heinrich Suso in the 14th century, and Nicholas of Cusa in the 15th) could defend and continue his teaching. All the same, it was very often regarded as suspect, the manuscripts of Eckhart's works in German were scattered and the manuscript collections of his Latin works were largely forgotten after the 15th century. Though Eckhart's influence was far-reaching, from the 14th century mystics until the revival of mysticism in the late 18th and early 19th centuries, our knowledge of his works is still incomplete. Many historical problems and difficulties in interpretation remain, and any general survey of Eckhart's thought must be treated cautiously.

Meister Eckhart studied for his master's degree in Paris, leading the kind of life depicted in these illustrations from a 14th century MS: student priests at their devotions (*left*) and (*right*) caring for the poor

Eckhart was steeped in the Vulgate version of the Bible (the Latin translation made in about 385–405 by St Jerome), in the Church Fathers and, as a Dominican, in Thomas Aquinas and Albertus Magnus, and in Aristotle and Aristotelian tradition. He frequently refers to Pseudo-Dionysius and other mystics but his supreme authority was St Augustine. He used his philosophical and theological training, not to build a system of thought but to understand the reality of the Logos (the divine Word) which he felt claimed his and every human life, and to teach the deeply felt need to be *deiformis*, 'God-patterned'.

This comes out in his commentary on Exodus 20.21 – 'Moses went up to the darkness inside which there was God' (Vulgate). The word 'darkness', he says, can be interpreted in four ways: the troubled condition which compels a man to seek God's aid; secondly, the troubled condition of a man when God is with him, citing the prayer of St Bernard of Clairvaux that 'if thou art with us, grant that I may always be in a troubled condition, so that I may always be worthy of having thee with me'; thirdly, the troubled condition that separates the 'imperfect', who only follow God as long as he calls them to honours and wealth, from the 'perfect' who will accept hardships and misfortunes and follow the Lord unconditionally; and finally 'the immensity and the supreme excellence of the divine light'.

It was not that there is any darkness in or around God: on the contrary, it is his very light that dazzles the mind, so that knowledge of God who is above all that can be known is, humanly speaking, perfect ignorance. The same theme appears in Pseudo-Dionysius and in the 14th century English *Cloud of Unknowing*. (See DIONYSIUS THE AREOPAGITE: CLOUD OF UNKNOWING.)

Eckhart stresses the necessity of being completely 'removed and pulled away from . . . all that is subject to change'. To be with God involves overcoming *imperfection* (mundane values like wealth and honour, or mundane knowledge which confines itself to phenomena that change) and reaching *perfection* (poverty, suffering and ignorance regarding self-sufficient mundane knowledge). His mysticism is a way of living and a way of thinking, not speculation or contemplation as ends in themselves, and it stems from the personal need to be with God.

The Light in Man

In one of his sermons Eckhart describes a saint as one who 'has left all things behind him and (now) takes them up at the point where they are eternal'. To refuse to be submerged in mundane life, then to see it as God-given and hence to refuse to manipulate it, but to *let it be* as God shapes it, and then to *let oneself be* God-shaped: this *letting be*, this *surrender*, frequently occurs in Eckhart, and in Boehme and his followers (see BOEHME). Eckhart quotes St Augustine who speaks of the dire poverty of the soul that desires to embrace many different things; as in a circle, where many radii meet in one centre. If you leave this centre, then 'by being scattered in many different directions, everything is lost'. The same fate befalls the spirit who 'pours himself out into the vastness of everything . . . when his own nature forces him to look everywhere for the One and does not allow him to find the many'.

Eckhart saw harmony within God and each creature, and between God and the creatures. This harmony is due to an affinity between the nature of the spirit and that of the One, of God in the fullness of his excellence. But Eckhart goes much further: man actually has within his nature something of the divine light, the divine spark; and he goes on to say, with St Augustine, that this light is inextinguishable. He emphasizes that this applies to the light in so far as it is divine, and that the soul is a mere receptacle of the divine light or wisdom. To say less would have been to put man on an equal footing with God, which Eckhart denied.

But was Eckhart being consistent? Did his search for a rational theory for his experience of God's presence in the soul push him further along a line of argument than he really intended, so that he had to reassert, somewhat artificially, the God who transcends his creatures? For he also used the concept of the *ground* of a being, whether God or creature, by which he means the oneness of a being in its hidden depths as contrasted with the diversity of aspects at the surface. It is from this inmost core of his personality, unmoved by outside agencies, that the Father gives birth to the Son. Man, too, should derive his life from his core, not from outside agencies. And it is here that God imparts himself to man through the *inner* birth of his Son. 'Hence God's ground is my ground and my ground is God's ground. Here I live my life out of my very own nature, as God lives out of his very own nature.'

Eckhart goes even further, when he maintains in his commentary on Exodus 3.14 – 'I am that I am' – that the very inclusiveness and absoluteness of God's being makes all other beings entirely dependent on him, indeed *part* of him. Then how is it possible for any being to have autonomy? Are we all simply extensions of God?

This is excluded by Eckhart's analysis of the traditional terms 'being' and 'essence' (contrasting Latin *esse*, the fact that there is a certain being, with *essentia*, the quality of its existence, what properties or attributes it possesses). In man and in other creatures, being and essence are distinct: in God they coincide. The difference between Creator and creature is thus more than one of degree. Through the very kinship of the artist with his handiwork – a comparison Eckhart often uses – and that of God who *speaks* with man who *responds*, each creature has its own status. God's being does not simply engulf everything that is not himself.

In his *Commentary on St John's Gospel*, discussing John 1.1 – 'the Word was with God and God was the Word' (Vulgate) – Eckhart compares the relationship between the Father and the Son (the Word) with that between justice and one who is just. In so far as the just man *is* just, he is identical with, or subsists in, justice. Yet the two are distinct, in the sense that justice is the exemplar, the originator, and the just one receives his just existence from it. The Father, who is the origin and exemplar, gives birth to the Son: the two are interdependent. And in the *Commentary on Ecclesiasticus* the Holy Spirit is seen as the bond of love between Father and Son. The Trinity may thus be seen as three distinct persons who depend on each other for their existence. But there is no distinction between their being and their essence. The one divine being *is*, and it is the Father giving birth to the Son in their mutual love, the Holy Spirit.

Eckhart develops the use which Thomas Aquinas had made of Aristotle's concept of the 'active intellect', which perceives objects, not as separate items but as patterns or meaningful wholes. Eckhart says that the active intellect considers objects as totalities, with the roots from which they sprang. The uniting force is love, and the active intellect participates in the union achieved by love.

In the Son, God lives in full awareness of his being. But the Son is also the 'reason' (*ratio*) that brings about the Father's intention of coming out of himself and making creatures who share with him the fact of being. They flow from God and because he makes them they share being with him, but their essence is not his. The Son, as *ratio*, engineers the coming about of orderly structure, and as active intellect he conceives the structure itself and envisages the way in which creatures will actually come about and develop within that structure. He is the Word that creates, because God speaks through him.

God is being-and-essence: his creatures have being *with* and *in* him, but essence *from* him. The Son participates fully in the divine essence, and in the essence of all creatures. The creatures also have essence, though they participate less fully in the divine essence than the Son. Their essences constitute a hierarchy, from the lowest creatures, which have being but whose essence has a very low power of participation, up to man, who has reason and intellect and a capacity for love. Man can love the Word which is Truth, and Eckhart quotes Song of Solomon 5.16 – 'This is my beloved and this is my friend' – and follows it with a passage from the 12th century author Hugh of St Victor which describes an actual state of ecstatic illuminating love.

Eckhart is quoting here, not recounting his own experience. He does not look for heights of mystical experience: he is concerned with a God-oriented life, where love prepares the ground for seeing God's creative thought realized in the Logos, the Son. In such a life, unity of being, the loving aspiration of the will and the God-discerning intellect certainly experience ecstatic heights. But these are no more than intense moments in a life spent participating in God's life.

Commenting on John 1.14 – 'And the Word became flesh and dwelt among us' – Eckhart says that we cannot perceive an object unless its image is already impressed on our minds. Seeing the Word incarnate in Jesus is only possible when one is 'God-patterned', and this only happens because out of pure grace the Word was made flesh and dwelt *in* us. By grace the inner birth makes us the Word's adopted sons, so that

we participate in the life that he is. We are the image of the Word, and hence also of the Holy Trinity. And we see God's glory, not only as he dwells in and among us, but as the Word becomes flesh 'universally and in the course of nature, in every work of nature and of art'. For the man who is God-patterned has within himself 'all grace and all truth', as St Paul said (Romans 8.32, Vulgate): 'with himself he has given us everything'.

Eckhart's principal Latin work was probably begun during his second period in Paris, c 1311–1314, but was never finished, and only parts of it have survived. It was intended to consist of three sections: *Opus Propositionum*, basic theological propositions, of which we have only the *Prologue*; *Opus Quaestionum*, of which nothing but the title is known; and the *Opus Expositionum*, commentaries on the Bible, and a collection of sermons (*Opus Sermonum*). The whole work was to have constituted Eckhart's *Opus Tripartitum*.

In Latin, there are also a sermon preached in Paris on St Augustine's day, 1302 or 1303; a *Collatio*, or inaugural lecture, dating from between 1297 and 1300; and a number of *Quaestiones*, or disputations, from Eckhart's two periods in Paris.

In German, there are the *Talks of Instruction* given to religious communities. The *Liber Benedictus* consists of a treatise called *The Book of Divine Consolation*, written for the Queen of Hungary, and of a sermon preached before her, *The Noble Man*. Some 60 other sermons are now regarded as authentic, as well as the treatise *On Detachment*.

ECLIPSE

MAN HAS ALWAYS REGARDED the sun with awe and reverence, not only because it is seen to be the energy source of all life, but also because of its constancy and the inflexible reliability of the cycle of day and night. This diurnal cycle has been built into the evolutionary pattern of all living things so that they respond to sunset and sunrise as if remotely controlled by the sun itself. Sunset and dawn have become the natural regulators of our activities and rest periods. It is not surprising, therefore, that the sun should be treated with respect and even worshipped, because of the security that it inspires. It is because of the unfaltering cycle of the movement of the sun across the sky that we are peculiarly sensitive to any interruption that occurs.

In the days when solar eclipses were not understood, these phenomena were the cause of great alarm and were generally ascribed to supernatural agency. Among the Romans at one time it was even considered blasphemous and held to be a legal offence to speak openly of their being due to natural causes. A total solar eclipse is indeed awe-inspiring even to experienced astronomers. The scene is set by the gradual weakening of the sunlight as the moon moves across the disc of the sun, even though the sky remains clear and blue. Just before the eclipse is total

For thousands of years astrologers have been able to predict eclipses, and usually interpreted them as omens of disaster: illustrations from a 13th century manuscript showing (*left*) an astrologer plotting an eclipse and (*above*) diagrams of the shadows cast by bodies of various sizes

British Museum

Superstitious fear has almost always been man's reaction to an eclipse of the sun or moon; in this illustration from a 15th century French manuscript, the fears of the men in Alexander the Great's army are stilled by the soothsayers, who interpret the lunar eclipse as a good omen, foretelling victory for the Macedonians in their coming battle with the Persians

the shadow can be seen bearing down at a speed of about 2000 miles an hour and the air has become unusually still. As the darkness sweeps down there is an involuntary temptation to crouch and let the shadow pass; a glance at the sun reveals the crimson prominences, like huge angry flames embedded in the pearly light of the corona. One's attention is riveted on the magnificent spectacle until suddenly the sun reappears. Dawn is repeated in the space of a few seconds and the whole world seems to come to life again.

The earliest recorded eclipse seems to have been the one that took place on 22 October 2136 BC, which is referred to in the ancient Chinese classic the *Chou King* or Book of History. Eclipses must have been observed earlier than this for the story has it that the two official astronomers of the time were taken by surprise by this one, with the result that there was insufficient time to prepare the customary rites. The normal procedure was to beat drums and gongs, shoot arrows in the air, and make a general din with the intention of frightening away the monster that threatened to devour the sun. In spite of the fact that the sun recovered from this attack the two astronomers were executed for their negligence. There are many other cases of the use of various rites to ward off the threat to the sun.

One particularly interesting case in modern times is the one recorded in a letter to the *Philadelphia Inquirer* concerning the eclipse of 29 July 1878: 'It was the grandest sight I ever beheld but it frightened the Indians badly. Some of them threw themselves upon their knees and invoked the Divine blessing; others flung themselves flat on the ground, face downwards; others cried, and yelled in frantic excitement and terror. Finally one old fellow stepped from the door of his lodge, pistol in hand, and fixing his eyes on the darkened sun, mumbled a few unintelligible words and raising his arm took direct aim at the luminary, fired off his pistol, and after throwing his arms about his head in a series of extraordinary gesticulations, retreated to his own quarters. As it happened, that very instant was the conclusion of totality.'

Solar eclipses are usually very short and the total phase cannot last longer than eight minutes. It is this transient nature of the event that seems to promote the use of some sort of ritual. No sooner have the demonstrations begun than the monster moves away and the eclipse is over. Such highly 'effective' deterrents will obviously be remembered and used again if the occasion should arise. Nowadays we expect eclipse predictions to be accurate to a fraction of a second because we understand the underlying physical principles and have studied the motions of the earth, the moon and the sun in great detail. In the story of the Chinese eclipse there is an inference that the astronomers should have known about it in advance and there is good reason for believing that crude predictions were possible in those days because of the repetitive cycle of eclipses known as the Saros.

The Babylonians discovered that there was a Saros or cycle of 223 intervals between new moons, after which eclipses of the sun and moon recur. If an eclipse is seen on a particular day, then it is certain that another will happen 18 years, 10 days and $7\frac{3}{4}$ hours later which may be visible from the same place but which will not have the same appearance. On average there are 41 eclipses in the Saros cycle, and each one of these will be followed by another just over 18 years later. The Saros was almost certainly known to the Chinese and they would have used it in predetermining the dates of eclipses. The first well documented example of the use of the Saros was the prediction of the eclipse of 28 May 585 BC by Thales of Miletus, the Greek scientist and statesman, but there can be no doubt that the method was used earlier than this.

Columbus Exploited Eclipse

Obviously the ability to predict was a powerful tool in the hands of the astrologers and their readings of the sky were variously correlated with natural disasters, deaths, wars and the displeasure of the gods.

In more recent times, others have used their knowledge of eclipses to great effect. Sir Arthur Helps, in his *Life of Columbus* (1910) relates the story of how the explorer used the lunar eclipse of 2 April 1493 to obtain provisions from the inhabitants of Jamaica. At first they were reluctant to help him and he threatened them with divine vengeance, 'for that very night the light of the Moon would fail'. The natives were frightened and during the eclipse they approached Columbus and implored his intercession – with the inevitable result that the moon was restored to them and provisioning ceased to be a problem.

The only difference between lunar and solar eclipses as far as prediction and observation are concerned is that a total solar eclipse can be seen only from a narrow strip on the earth's surface across which the moon's shadow sweeps during the time of the eclipse, and which may be only about 150 miles wide. Lunar eclipses can be seen from the entire moonward hemisphere of the earth.

One would expect that some detailed knowledge of the processes causing eclipses would dispel some of the fears accompanying them, but the evidence of modern anthropologists seems to refute this. It seems that the basic reaction to a major natural disturbance like an eclipse still contains a certain amount of fear.

ECSTASY

The Christian mystic in solitary communion with the divine and the Sufi in his frenzied dance both claim an experience of ecstasy

MYSTICS, THEOLOGIANS, psychologists and poets all have their very different interpretations of what is meant by ecstasy. The term implies a mystical experience, and is sometimes used as if it described all kinds of mystical experience in which the ordinary perception of the everyday world is surpassed. Although it need not be a religious experience, as a religious phenomenon ecstasy is often, although not invariably, induced by devotional acts such as prolonged meditation, the contemplation of particular objects, fasting or the repetition of sounds or movements. At least five senses in which the term is used may be distinguished.

The most restricted use of the concept is found within the Roman Catholic faith, most particularly in the exposition of mystical experience elaborated by St Teresa of Avila (1515–82), for whom it denoted a specific stage of the mystic's relation to God (see TERESA OF AVILA). Drawing on her own extensive mystical experience, she distinguished ecstasy as the stage following the mystic's sense of initial union with God. It was signalized by complete surrender to God; he occupied the interior of the soul and the believer became dead to the world. The ecstatic stage was followed by the betrothal of the mystic to the deity.

The state of ecstasy has often been compared to the experience of sexual union. Accompanied by the continuous sound of drumming and singing, this Voodoo worshipper dances herself into an erotic frenzy in which she may feel united with her god

Transworld Feature Syndicate

William Sargent

A man believing himself to be possessed by a god is forcibly restrained during a Voodoo ceremony in Haiti. In such a state the ecstatic feels himself raised above his physical being to a point where he loses contact with the normal world. He may well appear to assume another personality, in which case the onlookers are likely to regard his speech and behaviour as being divinely inspired

Not all Roman Catholic mystics and theologians have followed this restricted usage. More generally, others have described as ecstasy almost any experience of a transcendent reality in which the individual has the impression of being united with the deity, or in which the spirit is uplifted in contemplation of a religious subject. For these writers ecstasy lies in the union of two separate and different entities – man and God – in which God is transcendent but, in rare and special instances and in personified form, is briefly united with the worshipper.

There is a broader conception of ecstasy which is not specifically Christian. Here ecstasy is any mystical experience in which the individual attains a heightened awareness of deity and gains knowledge that he does not normally possess, and in which he has a sense of elevation above his physical being and surroundings to a point where he becomes unresponsive to normal sensory stimuli – insensitive to pain, for instance.

Associated with this last usage, but more extensive, is the use of the word ecstasy to describe the experience of those who are involved in collective behaviour of a frenzied and uncontrollable kind. Epidemics of pathological behaviour have been common in Christian history, beginning perhaps with the talking in unknown tongues in Jerusalem at Pentecost (Acts chapter 2) and in Caesarea (Acts chapter 10). Among many dramatic incidents in medieval times, the dancing epidemics of religiously inspired crowds in Italy in the 14th century (see DANCING MANIA), the convulsions widely experienced in parts of France in the 18th century (see CONVULSIONARIES), and the 'preaching sickness' which affected many people in Scandinavia in the 19th century have all been regarded as manifestations of religious ecstasy. So have the phenomena that attended early revivalist meetings. John Wesley, although himself unsure of the cause, recorded over a hundred cases of people being dramatically affected at his Methodist meetings in the 1740s; some died or went mad.

Poets and others have often described as 'ecstasy' intense moments of heightened vision and a mysterious sense of elevation. The poets William Wordsworth, Alfred Lord Tennyson and Jean Rimbaud are frequently cited in this respect, although none of them attributed his vividly recounted experiences to the agencies invoked by Christian mystics. Others, particularly Aldous Huxley, have suggested that the experience to be gained by the use of drugs (in his case, mescalin) is similar to that undergone by mystics.

It is clear that the word ecstasy may relate to a range of mystical experiences or dramatic social behaviour. This divergence arises in part from the difficulty of comparing essentially personal experiences. Similar subjective experience may be interpreted in highly different ways according to personal temperament, to the religious and mystical traditions of the society of the person involved, and to his acquaintance with those traditions. In this area where religious ideas, subjective experience and social behaviour converge there is little precise terminology and little possibility of accurate measurement.

Rapture and Ravishment

The difficulty of categorizing experience of this kind is illustrated by the extent to which Christian mysticism – and also that of the Cabala in Judaism – is heavily dependent on terms that are drawn from sexual experience and sexual union. 'Lover', 'ravishment', 'rapture', 'marriage' are all terms commonly used to describe what is involved in ecstatic experience. It may be noted that these terms give some grounds for those theories that relate the experience of ecstasy to the sexual frustrations of the fervently religious celibates who, as a class, have been most disposed to mystical experience. The idea of the lovers' union as the prototype of ecstasy itself goes back long before the Christian era.

There is no agreement as to what constitute the essentials of ecstatic experience; however, a cluster of elements recur, though by no means all of these are reported by all

Herbert List

Left Member of the Jamaican obeah cult during a pocomania session: a state of trance is induced by dancing to the sound of chanting and drumming, which sometimes lasts for days at a time. Afterwards experiences in the spirit world are recounted _Right_ A young girl in a huge concert audience screams uncontrollably at a pop group, encouraged by the presence of hundreds of other girls in a similar state of frenzy and intense excitement

who claim to have experienced ecstasy. It is usually said to involve a sense of extraordinary elation, new or mystical knowledge, glory, joy, purification, a sense of union with a higher being and a loss of worldly awareness. Sometimes there is also a sense of peace, ineffability and release. There are, however, accounts of Christian mystical experience that are sometimes classed as ecstasy in which feelings of darkness prevail – for example in the accounts of the 4th century bishop Gregory of Nyssa and of St John of the Cross (1542–91). In general ecstasy is of short duration, and the traditions of Catholic mysticism suggest that it usually lasts for no more than half an hour. If, however, we take into account ecstasy as the public expression of frenzied religious experience and trance state and spirit possession, as distinct from private and silent reverie, then there are cases of ecstasy that have lasted several hours.

Indian Visionaries

There is no reason to suppose that particular psychic states are confined to any one culture, although the explanations given for such states will vary according to cultural concepts. A range of mystical experience, trance states and behaviour associated with these is found in many societies. Among American Plains Indians a young man seeks a vision as a personal experience which will provide him with direction in his life. The vision quest requires fasting, purification and the physical tortures of the Sun Dance (see GREAT PLAINS INDIANS).

Claims of personal access to religious truth are always potentially disruptive for any established orthodoxy. Although in an unorganized religion like Hinduism, in which widely divergent traditions co-exist, they cannot be regarded as heretical, even in that tradition mysticism has given rise to disputing schools. In more organized religious systems, such as Islam and more especially Christianity, mystics have usually been treated with suspicion and their experience of ecstasy regarded with caution. The mystic's experience of ecstasy had to be interpreted in terms acceptable to the Church in medieval Catholicism. The tendency of the ecstatic – found in Sufic teachings in Islam as well as in Christianity – was to claim not only temporary union with God, but essential identity with him. For his statements to this effect, Meister Eckhart stood condemned in the 14th century (see ECKHART).

Perhaps because mystical experience was described and rationalized by those already committed to the dogmas of the Church, in Christianity ecstasy has become a highly intellectualized concept, experienced most typically by the believer in isolated contemplation and not so readily seen in expressive behaviour. Perhaps because the Church was so closely identified with the civic agencies of social control, religious behaviour of a frenzied type that might claim to be ecstatic was always suspect and usually interdicted. The private mystic, whose writings might edify others, might be tolerated within the framework of Church order, but the demonstrative ecstatic who might claim authority higher than that of priests and officials was an obvious threat to public and religious authority.

In the last three centuries mystical ecstasy has been a less common phenomenon in Christian history. For long virtually confined to the enclosed life of convent or monastery, handled intellectually and recounted principally in literary form, ecstasy and mysticism generally have suffered the impress of rational patterns of thought and of social organization.

Release from the World

Roman Catholic writers, who have, understandably, had most to say about ecstasy in the Western world, have sometimes denied that such a phenomenon can properly occur in Hinduism, which is indisputably the most mystically disposed of all the great religions. Ecstasy, they argue, occurs only in the union of a believer with a transcendent personified deity. Hinduism tends to pantheism and to monism (crudely described as a belief in a single reality), rather than to

Barnaby's

monotheism; unity, therefore, rather than temporary union, is the dominant concept in ecstatic experience.

The Catholic view ignores the extraordinary diversity in Hindu thought and is, of course, to insist on dogmatic prescriptions of psychic states. The dominant emphasis of Hindu mysticism has been on the attainment of a state of consciousness in which the believer merges with the one universal spirit, Brahman, and realizes that the sensory world is illusory. Despite divergent traditions, the dominant goal of Hindu mysticism is release from the human condition, the attainment of spiritual illumination in an ineffable experience. Intense joy, detachment from the world and self-surrender are common themes throughout Hindu mysticism, and these may likewise be called ecstasy.

Ecstasy in the narrow sense of the term was also less likely to be found in Judaism and Islam, with their more severely monotheistic and transcendental conceptions of God. Mystical experience is, however, recounted in the Old Testament, and the vision of the divine charioteer with the four mysterious living creatures recorded in Ezekiel (1. 4-28) became a prototype for ecstatic contact with the unseen world. The traditional lore of Judaism and the books of the Cabala contained a demonology, angelology and cosmology which were guides to the wise in their search for mystical and ecstatic access to God (see CABALA). The Cabalists rejected the rationalistic trend

of Judaic thought in medieval Europe and used sexual symbolism to describe the soul's relation to God.

Compared with the Christian view, the Moslem conception of God is much more as a being 'wholly other'. However, in the tradition of Sufism (a mystical doctrine within Islam) both the ideals of temporary union with God, as found in Christian ecstasy, and the more pantheistic theory of continuing union of God and man, are to be found (see SUFIS). When Abu Yazid could affirm, 'I am He,' in the 9th century, he gave expression to an extreme sense of ecstasy, contrary as such ideas were to Islamic orthodoxy.

Dancing and Whirling

Visions were an integral part of this type of mysticism, and although Sufic teachings contained many discrepant ideas and some contradictions, there is a frequent return to the idea of union with God. Although not part of the original Sufic teachings, ecstasy was induced by singing and dancing in some Sufic orders, and at the popular level whirling and dancing became identified with the ecstatic state. The dance corresponds to the concentration on the cross or on relics by which ecstasy was sometimes induced in Christianity, or with the repetition of chosen *mantras*, or prayers, in Indian religious practice.

Allowing for cultural differences in behaviour some states of spirit-possession and trance might also appropriately be regarded as conditions of ecstasy. Outside the orthodox expression of Christianity there is to be found a wide incidence of such phenomena, but it is also found in movements that have been considerably affected by Christianity, of which some would be recognized as distinctly Christian. The experience of the 'baptism of the Holy Ghost' among Pentecostalists (see PENTECOSTAL MOVEMENTS) might be held to be an experience of ecstasy, in which the believer speaks in unknown tongues by the power of the Holy Spirit which momentarily overwhelms him. Pentecostalists speak of the 'infilling of the Spirit', which is a near-sexual symbol of the union achieved. In conformity to general Protestant tradition, however, those who have undergone this experience do not claim to have had visions. In the new independent Christian Churches in West Africa, of which the Church of the Cherubim and Seraphim and the Church of the Lord, Aladura, are among the largest, there are institutionalized occasions at many services when revelations are pronounced and, more spectacularly, dramatic and ecstatic outbursts occur in which the individual may speak with the voice of God and give commandments to the congregation.

Even more compelling are the ecstasies that are to be witnessed in the Afro-Brazilian cults of the coastal cities of Brazil. In their temples there are usually a group of priestesses who are regularly 'possessed' by one of the various African deities who have been worshipped by the Negro population since their arrival as slaves in Brazil (see BRAZIL). Frequently these deities are also identified with particular saints of the Roman Catholic Church, and most temples possess a Catholic altar as well as idols for the various deities. The priestesses, during their trances, act out the role of the deity and are thought to be entirely impervious to normal sense perceptions. Drumming, singing and dancing are the usual procedures by which the ecstatic state is induced. In ecstasy the priestesses may administer advice, attempt cures and sometimes behave wilfully and outrageously, particularly so when a group of peasant gods, known as *caboclos*, possess their votaries. This type of ecstatic performance is, of course, of much greater immediate social impact and significance than the solitary ecstasy that is the prototype of orthodox Christian mysticism.

Ecstatic behaviour sometimes carries an element of exhibitionism, as in the case of this Indian fakir, who is suspended by hooks while his assistant daubs the admiring crowd with ashes. Fakirs practise an extreme asceticism, often involving self-mutilation, in an attempt to acquire spiritual and magical powers

Camera Press London

Ectoplasm

A whitish substance exuding from the body of a medium in trance which gradually materializes, taking on the shape of a face or a body: it has been variously likened to muslin and liquid or paste jelly and has been observed to issue from the mouth and breast, and in the case of the famous medium Eva C., from the thumb: this kind of phenomenon has lent itself to fraudulent practice, one medium admitting that he had drawn his faces on gauze rolled in goose-fat.

See MEDIUMS.

Scandals and law suits marked the spectacular career of the woman known to her many thousands of followers as 'Mother'

MARY BAKER EDDY

THE DISCOVERER and founder of Christian Science, Mary Baker Eddy, was born Mary Baker at Bow, New' Hampshire in 1821, the youngest of six children. The facts of her early life are, despite her own autobiographical recollections and many official biographies produced by the Christian Science movement, very much disputed. Her education appears to have been slight, despite her claim to have been taught Hebrew, Greek, Latin, natural philosophy and moral science by an elder brother who graduated at Dartmouth College. In later years Mrs Eddy, perhaps excusing her somewhat faulty use of language, declared that what she had learned from schoolbooks 'vanished like a dream' when she discovered Christian Science, and that 'learning was so illumined that grammar was eclipsed'.

Despite the limitations of her education, Mrs Eddy became one of the really remarkable women of the latter part of the 19th century, producing several books, of which one sold many more than a million copies, founding a Church and an international daily newspaper and influencing, through her teachings, the lives of many thousands of people.

During the course of her life she married three times, first at the age of 22 to George Washington Glover, variously described as a building contractor and as a bricklayer, by whom she had her only son; she was widowed within the year. In 1853 she married a dentist, Dr Daniel S. Patterson, whom she divorced in 1873 after he had deserted her. Her third husband, Asa G. Eddy, was a student of the then Mrs Patterson when she began to teach her mental healing system; she married him in 1877.

In the years of her first widowhood and as the wife of Dr Patterson, the founder of Christian Science lived the life of a semi-invalid; the precise nature of her complaint has remained obscure. Before her remarriage to Dr Patterson she became preoccupied with various methods of healing, and the authorized biographers suggest that her 'experiments' in these years, particularly with homoeopathy, were steps by which she became increasingly aware of the powerlessness of drugs and the power of the mind in the process of healing.

In 1862, four years before the date given by the authorities of the Christian Science movement for the discovery of Christian Science, Mrs Patterson (as she then was) went as a patient to Phineas P. Quimby in Portland, Maine. Until his death in 1866 she was a regular patient of his, once staying for some months under his care. Quimby's system of healing was without doubt the most important influence on Christian Science as Mrs Eddy later developed it. Quimby got his ideas from Charles Poyen, a French mesmerist who had travelled in New England. The doctor had originally practised with the aid of a medium, but subsequently came to believe that what cured his patients was the process of changing their thought. Quimby began a practice of mental healing, manipulating the heads of his patients but trusting to the mental rather than the manipulative elements in his system. The notes he wrote on his practice were published many years later by one of his students. Quimby wrote of a Christ Science of healing; he believed his methods to he those employed by Jesus; and he held that good thoughts would drive out bad. From this Mary Patterson acquired her first ideas about Christian Science, although she was subsequently equivocal about her relationship with P. P. Quimby and her indebtedness to him.

Despite the many similarities between the ideas expressed in *Science and Health*, the Christian Science textbook which she first published in 1875, and the ideas of P. P. Quimby, there are also distinct differences. In particular, Christian Science embraces a much more distinct and consistent philosophical ideal. The source of Mrs Eddy's idealism has been disputed, but it seems likely that she was introduced to popularized versions of the work of Berkeley, Kant and Hegel by one of her students. She was not above plagiarism, as is apparent from her borrowings from Carlyle, Ruskin and other authors. But whatever notions she acquired from the idealists, Mrs Eddy appears to have feared the identification of her healing system with that of Quimby more than anything else. She tried to disown the association, then reinterpreted it. She always made the strongest attacks on spiritualism and animal magnetism (associated with mesmerism: see CHRISTIAN SCIENCE), which had given rise to Quimby's original ideas. If the diaries of Calvin Frye, her secretary for the last years of her life, may be relied upon, Mrs Eddy was in those years 'haunted by the suggestion that she must confess that she "got it" from Quimby or she would be damned'. Certainly Mrs Eddy was almost obsessed with fears of plagiarism: she copyrighted her works; brought those who plagiarized her writings to court; and forbade her students to take notes during instruction.

Claimed Divine Revelation

The official Christian Science version of the discovery of her system, as given in the various biographies of Mrs Eddy authorized by the Directors of the Mother Church, is that in early 1866, after a fall on ice which she later claimed had been thought to be fatal, she prayed and after three days was able to walk again. Mrs Eddy subsequently claimed this as the occasion of her discovery of Christian Science, but at the time she was much less certain, and within two weeks of the accident she wrote to another of P. P. Quimby's students pleading for his mental help in her affliction. In retrospect this incident, so nearly coincident with the death of Quimby in the previous month, which marked the beginnings of her work as an independent healer, became interpreted as the occasion of her revelation. It was, however, some years before this version of the facts was published and her relationship with Quimby relegated in importance. Her subsequent success was undoubtedly related to her own growing claims to be the sole discoverer of her system and, indeed, the recipient of a divine revelation: she regarded God as the author of the textbook of Christian Science and her teachings as 'uncontaminated and unfettered by human hypotheses'.

The early students of Mrs Eddy were largely recruited from people with a strong predisposition towards the occult. She lodged with spiritualists and advertised her method of healing as a new and rewarding profession. Few of her early pupils remained loyal, however, and the stormy relationships

described in the various biographies suggest that Mrs Eddy either had a tendency to attract unstable people to herself and her system, or that she was herself a woman of difficult temperament. Students left her, charging her with love of money and bad temper, and sometimes these episodes prompted her to litigation or, more often, accusing the apostate of 'mental malpractice' – the deliberate misuse for evil ends of the mental suggestion to which Christian Science attributes so much power.

Only when she moved to Boston, and to some extent ceased to have day-to-day relations with her followers, did Christian Science begin to thrive and acquire respectability. Scandals still persisted, some of them of a kind which might have been thought to bring irredeemable discredit on the movement. Mrs Josephine Woodbury, for instance, taking to heart Mrs Eddy's spiritual teaching and emphasis on chastity, gave birth to a son whom she declared to be immaculately conceived, and whom she christened the Prince of Peace. This was too direct a challenge to Mrs Eddy's authority. She, despite her idealist teaching, remained throughout her life a practical woman with a strong sense of reality. She disbelieved Mrs Woodbury's claim, said so, and had to fight a libel action about the language which she used to describe the episode. Another follower, Mary Plunkett, induced her husband to join her in announcing the dissolution of their marriage in one of the Christian Science periodicals. Her subsequent, and highly dramatic, proclamation of spiritual marriage to another Christian Scientist brought her expulsion from the movement. Mrs Eddy's austere views on sex received less emphasis in later years, although some who claimed to be loyal followers continued, although married, to lead nun-like lives for years after Mrs Eddy's death.

The Movement Grows

Neither these unconventional ideas, nor a remarkable sequence of disorders in the ranks of Christian Scientists, prevented the movement from growing and thriving in the last two decades of the 19th century. In the late 1880s Mrs Eddy gradually inaugurated a complete change in its government, withdrawing from active participation in it but retaining the right to intervene on any point in its affairs when she felt guided to do so. She wrote, and frequently revised, a *Manual* for the government of the Church which, in addition to preserving certain prerogatives of hers (which 60 years after her death still technically remain in force), established a Board of Directors to control the Mother Church, the First Church of Christ, Scientist, Boston, Massachusetts, and established all other churches as branches of it. She took steps to control the church pastors and independent teachers of Christian Science who had become active, and subjected all to the Board of Directors.

Her own removal from the scene of operations undoubtedly encouraged the growth of innumerable stories about Mrs Eddy which circulated among her adherents. To be called to attend her became a very rare and

Radio Times Hulton Picture Library

The personality of Mary Baker Eddy, a woman of limited education but strong character, still dominates the Christian Science movement. A legend in her lifetime, she claimed miraculous powers of healing and direct revelation from God

distinguished privilege in the movement, and to serve in her household, even in a menial capacity, the equivalent of an education in Christian Science by the more formal method of courses which she had instituted.

She took an active part in the complicated legal decisions which arose in connection with the building of her church in Boston, where the room in which she stayed for one night has been kept as a type of shrine for Christian Scientists, known as 'Mother's Room'. Only a few years after this church was built, and perhaps to eclipse the immense success of one of her students, Mrs Augusta Stetson, the moving genius in building a large new church on New York's fashionable Riverside Drive, Mrs Eddy authorized a two million dollar extension of the Mother Church. Most impressively of all, only two years before she died, she ordered the Christian Science Publishing Society to produce an international daily paper, *The Christian Science Monitor*, which has perhaps done more to establish and sustain the prestige of the movement than any other of Mrs Eddy's amazing accomplishments.

By the turn of the century, Mrs Eddy and her movement had become a modern wonder, even in the United States with its capacity for novelty in a vigorous, expansionist age. Wildly exaggerated claims in the daily press about the size of the movement sustained public interest. (Mrs Eddy was commonly said to have probably a million adherents in 1906, when, in fact, the Mother Church had only 40,000 members, and when the United States census counted only 65,000 Christian Scientists in the whole country.) Publicity was not, however, always favourable.

Mrs Eddy found criticism as difficult to bear as the rivalry to her own leadership that she discerned in the considerable achievements of her own students, such as Mrs Woodbury and Mrs Stetson. Hostile critics were not to be tolerated, and Mrs Eddy forbade her followers to patronize bookshops or publishers who sold 'obnoxious books', by which she meant books critical of herself and Christian Science. The rule has remained in the Church *Manual*.

Accounts of Mrs Eddy as an individual have varied widely. The evidence of her own uncorrected prose suggests untutored vigour, ambition and half-digested ideas. She did not espouse a particularly austere code in her private life, though she eschewed coffee, tea, alcohol and tobacco. She was very much a patriot, and saw no objection to dealing in stocks and shares, which she did extensively with the fortune she accumulated. She had no particular interest in the theatre or in culture, which is perhaps understandable given the circumstances in which she lived all her early life, but she did not forbid cultural interests to her followers.

Despite the emphasis of her teachings, and the absolute denial of the efficacy of drugs or medical practice, Mrs Eddy wore glasses in later life, visited the dentist and certainly used drugs. Her own reputation as a mental healer is largely based on a number of dramatic, and mainly self-recounted, occasions of healing. The healings are largely unauthenticated by medical testimony – a circumstance which Christian Scientists attribute to the hostility of medical practitioners to mental healing. Certainly there were widely reported healings on the dramatic occasion of Mrs Eddy's speech in Chicago in 1888.

Personality Still Dominant

Speculation about Mrs Eddy's successor inevitably arose towards the end of her life. She herself had said that she would be succeeded by a man, and had subsequently said that she referred to no man then living. Some of her followers looked for her resurrection after her death, but this prospect was not encouraged by the Board of Directors of the Mother Church who, in fact, inherited Mrs Eddy's authority. The movement withstood her death in 1910 without immediate disruption, despite the difficulty of adjusting to the fact of its leader's death by a Church officially believing that man should demonstrate that death had no claims on him. The bitter divisions and protracted litigation which followed in the next decade arose largely from the very inadequate instruments of government which Mrs Eddy bequeathed to her movement. Despite these troubles, which may have much affected the growth of Christian Science and which certainly made clear its authoritarian character, there is no doubt that the personality of Mrs Eddy is still dominant within the Christian Science movement.

Michael Holford/Horniman Museum

According to one tradition from Central Europe, the Virgin Mary dyed eggs in various pretty shades to amuse the infant Jesus; since then eggs have been decorated at Easter with elaborate and colourful designs

Few people who follow the ancient custom of giving eggs at Easter remember that the egg is a symbol of new life and fertility, appropriate to a spring festival celebrating the Resurrection of Christ

EGG

THE SIGHT of a young bird suddenly breaking out from what seemed a lifeless object encouraged ancient peoples to speculate about the nature of creation. The egg became a symbol of life. Early man was unable to grasp an abstract idea like the creation of the world but he could watch a parallel process in the hatching of an egg. The idea of a 'world egg' which produced the first creator followed from this, and it appears in many early creation myths (see BIRDS). Ancient Egyptian writings describe how the sun god Re was born from an egg. In Hindu mythology the golden world egg is called *hiranyagarbha*; it hatches Brahma, the sun, and he forms the universe from its component parts. The Chinese have a legend that the first being, P'an Ku, appeared from the cosmic egg, and in Oceania various legends ascribe the origin of man to birds' eggs.

The emblem of life became a popular fertility symbol. In some countries peasants carry eggs into the fields as a magic charm to increase the crop and double the yield of grain. The Scots used to put a nail and an egg in the bottom of the sowing basket and pile seed corn on top. The egg represented the corn 'as full of substance as an egg is full of meat'. Slavs and Germans smeared the plough with egg on Green (Maundy) Thursday, a festival of spring and renewal, hoping to ensure a good crop.

Eggs are seen as such powerful fertility charms that they are used to correct various types of impotence and sterility. In Péc, a town in Serbia, pain in the testicles is relieved by an application of fried eggs

sprinkled with sal ammoniac. The same treatment is said to restore lost virility. In Morocco, a man wishing to increase his sexual capacity eats an egg yolk every morning for 40 days. A childless Hungarian woman mixes a little of her husband's blood with the white of an egg and the white speck from the yolk. This mixture is stuffed inside a dead man's bone and buried in a spot where the husband will urinate; then the woman will conceive. According to a traditional Hungarian saying, a man with a big family has 'mixed his blood with eggs'.

Because they contain new life, the seeds of the future, eggs are often used in divination. A popular method of discovering one's future husband was to pierce the shell at Hallowe'en, New Year, or some other significant occasion, and catch the white in a glass of water. The shapes which formed were studied carefully and interpreted; in France the egg was broken on someone's head. Girls in Scotland and Ireland removed the yolk from a hardboiled egg and filled the cavity with salt. If the charm was to work effectively it all had to be eaten, including the shell. This was done at midnight and no water might be drunk before the morning. If the girl dreamed that her lover was bringing some, it meant she was going to be jilted.

To Sea in an Egg-Shell

Many people in the United States invert the shell of a boiled egg after they have eaten it, and smash the other end. This is a relic of the idea that witches used unbroken shells as a means of transport – to fly through the air or sail over the sea. Reginald Scot in *The Discoverie of Witchcraft* (1584) says: 'They (witches) can go in and out at auger-holes, and sail in an egg-shell . . . through and under the tempestuous seas.'

Ceremonial burial of an egg is quite common in the Middle East. Moroccans who wish to drive someone insane empty an egg and write the name of a jinn, or spirit, around the shell with a mixture of saffron, fig juice and egg white. The contents of the egg are then mixed with gunpowder and put back. If the egg is buried where the victim habitually walks, the charm will drive him out of his mind. Should the parents of a newborn Moroccan baby omit the customary gift of money to

Scala

the local schoolmaster so that his pupils can have a holiday, the boys take their revenge. They secretly dig a hole outside the parents' door and steal an egg from their chickens. The egg is interred and a chapter of the Koran recited over it, as is the custom at a funeral. When the mother walks over this her child is doomed to die and she herself will be permanently afflicted with an issue of blood.

In parts of the United States, folk medicine gives a way to erase a birthmark: rub it with a fresh egg each morning for seven days, burying the eggs under the doorstep.

Eggs are also used in protective magic as a guard against the Evil Eye. In north Albania, when a child is born the neighbouring women call and bring eggs to the mother as a gift. If the new arrival is a boy they take an even number: two, four, six or eight. If it is a girl the number will be odd: one, three, five or seven. One of the eggs is smashed and thrown across the infant's face to guard it from the Evil Eye. In southern Macedonia (Greece), 40 days after a birth the mother takes her baby to be 'churched'. On her way back she calls at the homes of the sponsor and closest relations. If the child is a boy the woman of the house takes an egg and, passing it over the infant's face, blesses it, saying, 'Mayest thou live, my little one. Mayest thou grow old, with hoary hair and eyebrows, with a hoary beard and moustache.' The ancient Mayans used eggs to cure, or counteract, the Evil Eye in a simple ritual where the priest would break the egg and the victim would gaze at it as if it were an eye, burying the egg afterwards.

The Easter Egg

A great number of traditions have grown up around the custom of giving Easter eggs, but we do not know precisely when or where this custom originated. A grave excavated at Worms, Germany, and dated about 320 AD, contained two goose eggs painted with stripes and dots, but local archaeologists were unable to say whether the burial was Christian. As early as the time of Pope Gregory the Great (590–604 AD) eggs were forbidden during Lent: hence they became a special treat when the long fasting period was over. Decoration of eggs for Easter existed in Poland before the 11th century and, in England, the household accounts of King Edward I contain an entry for 18 pence spent on the purchase of 450 eggs, to be coloured or covered with gold leaf and given to members of the royal household.

In England before the Reformation eggs were used in church ceremonies, the appearance of the new bird from its shell being compared to Christ arising from his tomb at the Resurrection. In Old Russia we find similar ideas. The tradition of giving Easter eggs was immensely important and one legend traces the custom to St Mary Magdalene who, it is said, was arrested by a centurion in Alexandria; she gave him an egg and he let her pass. Another version describes how she presented one to the Roman emperor as a token of Christ's Resurrection.

In France and certain other Catholic countries, during the silence of the church bells from Maundy Thursday until Easter, children are told that the bells have gone to the Pope in Rome to fetch the Easter eggs. Paschalia, the Easter spirit, is supposed to bring them in Greek Macedonian homes. In fact the parents slip red eggs under the younger children's pillows after attending midnight Easter Mass. In Westphalia, Germany, an Easter fox brings the eggs. Often, and more logically, it is a bird: Swiss children watch for the arrival of the Easter cuckoo. Elsewhere in Europe the Easter hare lays eggs in one's house or garden; in America it has become the Easter rabbit. Said to be sacred to Eastre, an obscure Germanic spring goddess, the hare – a prolific breeder – was a symbol of fertility.

Sometimes the Easter eggs would be kept throughout the year to bring good luck, and in the Balkans people supposed that Easter eggs had power to repel evil spirits. They were buried in the fields to protect the crops. The Poles hung the shells in their fruit trees to increase the yield or scattered them in corners of their rooms to keep out insects and toads. Even the water in which they were boiled was carefully saved and poured across the entrance to the cowshed. This would prevent a witch from coming in and stealing the milk.

Decorating the Eggs

In Central and Eastern Europe colouring Easter eggs is especially important and there are many legends seeking to explain how the custom arose. Ukrainians often use blue dots in their designs, which they call the tears of the Virgin Mary. They say that she took a basket of coloured eggs as a gift for Pontius Pilate, in the hope of persuading him to show mercy towards Jesus. But in her grief as she prepared them she wept, and her tears fell upon the shells, forming brilliant dots of colour. Poles tell their children that she dyed eggs in various pretty shades, red, green and yellow, to amuse the infant Jesus; since then Polish women have dyed them, but at Easter, not Christmas, for the Resurrection theme is the underlying reason for the custom.

Humpty Dumpty had a great fall from which he never recovered. It was natural that a character unable to survive a fall should be given the form of a fragile egg

Mary Evans Picture Library

In countries of the Orthodox faith, the most popular colour for dying eggs is plain red. The Rumanians explain this with a story of the Virgin Mary leaving a basket of plain eggs at the foot of the cross on the original Good Friday. They were a gift for the soldiers there, so that they might be a little kinder to her son. But the basket was ignored and after a time the blood of Christ flowed down and stained the eggs red. Even today Balkan peasants say that the red colour represents the blood of Christ.

Apart from these plain eggs, peasants of Central and Eastern Europe produce very elaborate patterns with the wax-resist technique. The artist uses a crude wooden pen filled with melted wax to trace patterns on the shell. Areas covered by the wax remain undyed when the egg is dipped in colouring. Designs utilizing as many as seven colours can be created by this method. Other types of decoration involve appliqué work.

The Poles glue paper shapes to the surface of the shell, and in Serbia they use little circles of coiled metal or tufts of brightly coloured wool. These elaborate eggs were sometimes presented as tokens of love by a young girl to her sweetheart. As many as a hundred might be given and, if a girl felt that the work was beyond her, she employed a local woman to do it. Factory-made chocolate eggs are a comparatively recent innovation, first popular in the time of our grandparents.

A traditional English technique for colouring eggs was to tint them with dyes made from plants or to press flowers against the shell. The Wordsworth Museum in Grasmere contains a few eggs decorated for the poet's grandchildren in the 1860s by the family gardener. It is unusual to see such historic specimens, since they generally became casualties of the Easter games. Egg rolling is the best-known game, still practised in America and in scattered parts of northern England and Scotland.

Many superstitions concerning eggs prevail in the United States. Farmers advise against setting a hen in May, or placing an even number of eggs under a hen. Eggs set by a woman will be pullets, but those taken to the nest in a man's hat will be cocks. An egg marked with a black cross will keep weasels away. Eggs laid on Friday are said to cure stomach-ache. It is said to be unlucky to take hen's eggs in or out of a house after sunset, or to bring birds' eggs inside at any time. Dreaming of eggs foretells good luck, or a wedding; a dream of broken eggs portends a lovers' quarrel; a dream of a lapful of eggs, not surprisingly, is an omen of riches to come. An old belief from the South says that placing eggs under your parents' bed will make them quarrel.

EGYPT

The sun's disc was to be worshipped before all the animal-headed gods of Egypt. So declared the Pharaoh Akhenaten, in one of the most remarkable episodes in the 3000 year history of Egyptian religion

TWO FACTORS have conspired to give ancient Egypt its unique appeal: its religion and the fact that its climate has so wonderfully preserved the relics of this religion for us. Religion permeated the whole life both of the individual Egyptian and of Egyptian society. It found expression in such a rich variety of forms that Egyptian religion provides the best introduction to the historical and comparative study of religion. Almost every aspect of religious faith and practice is found in this ancient religion: polytheism, henotheism (the worship of a single god), monotheism (belief that there is only one God), mythology, magic, ritual, divine kingship, mighty temples and mysterious tombs, a professional priesthood, illustrated religious texts, a wisdom literature and religious scepticism. It also embraced the most elaborate funerary cult, magical resurrection and a complex afterlife, and the earliest conception of a judgement after death. Although now extinct, Egyptian religion was the longest-lived religion yet recorded; it was already in being in 3000 BC and it survived until the forcible suppression of pagan cults by the Christian emperor Theodosius in 384.

Egyptian religion is well documented. There is an abundance of texts inscribed on the walls of tombs, temples, obelisks, statues and stelae (stone memorial slabs), or painted on coffins or written on papyrus scrolls. They range in date from the Pyramid Texts of c 2400 BC (see BOOK OF THE DEAD) to texts of the 4th century AD.

Above **Three *ankhs* or looped crosses, worn by the living as charms to prolong life and buried with the dead to ensure their resurrection, are carried by the goddess of happiness in a procession of gift-bearing gods. Bas relief of about 2700 BC *Following page* The goddess Isis spreads out her winged arms in a protective gesture, at the foot of a gold coffin enclosing the mummy of Tutankhamen. Isis was often depicted as a guardian of the dead**

As Re-Harakhti he was associated with an ancient sky god and was depicted as a falcon or falcon-headed man crowned with the sun's disc. Detail from the Papyrus of Anhai in the British Museum** ***Far right*** **On the same papyrus the sun god is shown in another form, as the beetle Khepri with the solar disc; the scarab beetle was thought to be born spontaneously and therefore became an apt symbol for the rising sun**

Monuments such as pyramids, temples and tombs have often been so well preserved that their ritual use can be easily traced. Temples and tombs were adorned with ritual scenes, and tombs with depictions of the underworld, all of which provide a vivid picture of Egyptian deities, worship and belief about the next world.

The immense duration of Egyptian religion makes it necessary to know something of the course of Egyptian history, especially since Egyptologists use their own chronological scheme in making reference to various periods. This scheme is founded on a dynastic framework; the dynasties concerned are royal, but it is not certain why the various groups of monarchs are so related to each other. The dates given here are approximate, since only rarely can an Egyptian date be definitively established. The Thinite Period (3200–2780 BC), comprising Dynasties 1–2, marks the beginning of the united kingdom of Upper and Lower Egypt under pharaonic rule. The Old Kingdom (2780–2280 BC), comprising Dynasties 3–6, was the pioneering period of Egyptian civilization, known as the Pyramid Age. The First Intermediate Period (2280–2052 BC), comprising Dynasties 7–10, was a time of social revolution when royal power was seriously weakened. At the time of the Middle Kingdom (2052–1778 BC), comprising Dynasties 11–12, the political centre had moved to Thebes in Upper Egypt; this was a period of great literary activity. The Second Intermediate Period (1778–1567 BC), Dynasties 13–17, was a time of national eclipse, when Egypt was subjugated by Asiatic invaders. The New Kingdom (1567–1085 BC), Dynasties 18–20, was the period of Egypt's greatest imperial expansion; Tutankhamen was a minor king of the 18th Dynasty. The Late Period (1085–330 BC), Dynasties 21–30, was a period of national decline, when Egypt suffered from Assyrian and Persian invasions; the last native Egyptian pharaoh was Nectanebo (359–341 BC). During the Ptolemaic or Hellenistic Period (330–30 BC), Egypt was ruled by Greek (Macedonian) monarchs, the last of whom was the famous Cleopatra. After her death, Egypt was incorporated into the Roman Empire; this was the Roman Period (30 BC–641 AD). The main pattern of its religion continued, with the Roman emperors taking the place of the pharaohs, until it was finally suppressed in favour of Christianity in 384 AD. Certain elements of the ancient faith passed into Coptic Christianity, which survived the Islamic conquest of Egypt in 641 AD and the subsequent conversion of the Egyptian people to Islam.

Two natural features have always dominated life in Egypt, namely, the River Nile and the sun; from them stemmed two of the basic themes of ancient Egyptian religion. Egypt has been aptly described as a land having length but no breadth. The description is not quite accurate, because the Delta area is certainly extensive; but south of Cairo, Egypt really consists of two strips of irrigable land on either bank of the Nile, with the desert stretching away on each side. The land consequently divides into two distinctive parts: Lower Egypt, comprising the Delta area, and Upper Egypt, formed of the long narrow Nile valley. The fertility of the land depends absolutely upon the annual flooding of the Nile and the careful control and conservation of its life-giving waters. This entails the construction and maintenance of elaborate irrigation works. Consequently a strong centralized government, uniting Upper and Lower Egypt under one rule and able to direct the country's labour resources, has always been essential to the economic and social well-being of the people. Such a government was first established about 3000 BC by princes of This, in Upper Egypt, and the achievement was so important that the Egyptians looked back to this union of Upper and Lower Egypt as the starting point of their national life.

Pharaoh, the God on Earth

Because the pharaoh (a title derived from *per* meaning 'house' and *aa* meaning 'great') was so essential to the well-being of the land, he came to be regarded as divine. According to a tradition that arose in the Old Kingdom, he was believed to be son of the sun god, and therefore the deity's representative upon earth. The pharaoh was accordingly regarded as the owner of Egypt (in Egyptian *Kemi*, the 'black land'), and the mediator between the people and the sun god. A royal insignia and ritual proclaimed his unique status. When he died,

Two natural features have always dominated life in Egypt, the River Nile and the sun; from them stemmed two of the basic themes of ancient Egyptian religion

or rather ascended to the sky to join his divine father, his body had to be enshrined in a great tomb, served by a mortuary temple. The pyramids were the distinctive tombs of the pharaohs of the Old Kingdom.

Because the sun so insistently dominates the daily scene in Egypt, it was venerated under the name of Re (Egyptian-Coptic for 'sun') as the supreme state deity, intimately associated with the monarchy. Known as the 'Great God', Re was conceived under various highly imaginative forms. As Re-Horakhti, an ancient falcon or falcon-headed sky god called 'Horus of the horizon' was associated with the sun god. Re-Horakhti was represented in art as a falcon-headed man, crowned with the solar disc; sometimes this form of the deity was depicted as the solar disc, encircled by two serpents, between the outstretched wings of a falcon. As the sun at dawn, Re was represented as a beetle (*Khepri*) or a beetle-headed man. This strange concept had a subtle significance. 'Khepri' derived from the word *kheper*, meaning 'to become or exist', so that Re-Khepri indicated both the rising sun and the sun as the self-existent creator of the universe. The declining sun was Re-Atum, shown as an aged man of wise counsel; the word 'Atum' conveyed some idea of 'completion'. Atum was the god of Heliopolis, the old centre of sun worship.

Since Re, as the state god, was essentially connected with the kingship of the pharaohs, it was inevitable that his cult should be affected by political changes in Egypt. During the Old Kingdom period, he was worshipped as Re-Atum in his ancient home at Heliopolis, where his temple was supposed to mark the primeval hill where he began the work of creation. When the political capital was moved to Thebes in Upper Egypt, during the Middle Kingdom, Re was associated with the local god of Thebes, Amun. Amun-Re was represented in art as a man wearing a cap, surmounted by two plumes and the solar disc. The great pharaohs of the New Kingdom were zealously devoted to Amun, building at Thebes for his worship huge temples, richly endowed, so that Amun became in effect the sole state god. This exaltation of Amun eventually produced one of the most interesting, though obscure, episodes in the whole of Egyptian history.

The Heretic King

It would seem that the priests of Heliopolis, the ancient cult centre of Re-Atum, attempted to combat the exaltation of Amun by promoting the worship of Re untrammelled by association with another god. Accordingly they proclaimed the Aten, the sun's disc, as the symbol of supreme deity. Meanwhile at Thebes the enormous power acquired by the priesthood of Amun had begun to challenge the royal power. When Amenhotep IV (1372–1354 BC) ascended the throne, he gradually set about supplanting Amun as the supreme deity by the Aten. This king, who soon changed his name to Akhenaten ('Pleasing to the Aten'), was a strange genius whose devotion to the Aten bordered on fanaticism. He moved his capital from Thebes, the stronghold of Amun, to a new city named Akhetaten ('Horizon of the Aten'), where he built a magnificent temple to his god, similar in plan to that at Heliopolis. He expressed his devotion in hymns to the Aten and he had himself frequently portrayed, together with his beautiful wife Nefertiti and their children, worshipping the Aten, whose descending rays, ending in hands, bless the pious family. He took measures to repress the cult of Amun, even to the point of causing the deity's name to be removed from monuments. However, the attempt to reform Egyptian religion did not survive the heretic king, and his successor Tutankhamen (1354–1345 BC) was obliged to submit to Amun's supremacy and bring the court back to Thebes. The memory of Akhenaten was execrated and his monuments destroyed. The ascendancy of the Amun priesthood reached its inevitable conclusion in about 1080 BC when Herihor, the 'First Prophet of Amun', took over the royal power at Thebes. (See also IKHNATON.)

The third main theme of Egyptian religion was constituted by the funerary cult which centred on the god Osiris. This was essentially concerned with the spiritual needs of individuals, which were not served by the state religion. Osiris, the divine hero who died and rose again, had an intimate personal appeal and, since it was believed that resurrection to eternal life could be achieved through ritual assimilation to him, he came increasingly to dominate Egyptian religion; his cult was the longest lived of all those of the Egyptian deities.

The earliest texts record a multiplicity of gods and goddesses. The majority were local deities but some achieved a nation-wide recognition. Amun is a case in point: the political supremacy of Thebes made him the supreme state god. Most local deities, like Bast, the cat goddess of Bubastis, and Sebek, the crocodile god of the Faiyum, had their chief sanctuary in their place of origin, with which they remained essentially associated; sometimes their cult might be accorded a limited observance in one or two other places. The origin of these local deities is unknown. The fact that many of them had animal forms or animal heads has suggested the theory of their derivation from ancient totems; but there is no certain evidence that totemism existed as an institution in early Egypt, and many other local deities cannot be explained in this way.

Of the major deities after Re, Osiris and Amun, whose worship was generally observed throughout the land, Horus and Isis enjoyed the widest recognition. Horus was a complicated deity who, under certain forms, achieved the status of a state god. His solar aspect as Re-Horakhti, under which he was associated with Re the sun god, was paralleled by another of equal importance but of confusing significance, especially since the two aspects became combined in one single deity. In the Osirian mythology Horus is the posthumous son of Osiris; who avenges his father's death and inherits his kingdom. Since the Egyptians identified a deceased king with Osiris, and his son and successor with Horus, the latter came to be regarded as the divine prototype of the reigning pharaoh.

In the Osirian mythology the god Seth figures as the murderer of Osiris and the opponent of Horus, who finally overthrows him. This god, who seems originally to have been associated with storms and the desert, and so regarded as a strong and fierce being, gradually became the Egyptian god of evil. Seth is generally depicted as an animal-headed man. The animal has never been certainly identified; it has a long curved muzzle, almond eyes and sharp pointed ears. The Greeks later identified Seth with the monster Typhon.

The other chief deity of the Osirian mythology who can claim to have become, with Osiris, one of the two most popular deities of Egyptian religion, and later of Graeco-Roman society, was the goddess Isis, the wife of Osiris and mother of Horus, the daughter of Geb and Nut.

Ptah, the god of Memphis, always enjoyed a position of dignity in the Egyptian pantheon, because Memphis had been the ancient capital of the land and continued an important city. He is represented in art invariably in human form, tightly wrapped in a robe like a mummy; he wears a skull cap and holds a curiously shaped staff or sceptre. The priests of Memphis attributed to him the creation of all things, including the other gods. Memphis was also the cult centre of the Apis bull, a primitive symbol of procreative vitality, which was associated with Ptah as the manifestation of 'his blessed soul'; later the Apis was also associated with Osiris.

Hathor was a widely popular goddess, who manifested herself in various forms. As a beautiful woman, she was the divine patron of music and dancing, symbolizing the joy of life. In a bas relief at Karnak, recording the divine birth of the pharaoh Amenhotep III, Hathor is represented as animating the infant king and his *ka*, or other self, with the *ankh*, the symbol of life. The goddess was also thought of as a cow and was sometimes depicted suckling the king. She personified the sky and is often represented as a cow receiving the setting sun, an office which caused her also to be regarded as a guardian of the dead, whom she transported to the next world. But Hathor had another side to her nature: she was identified with the destructive 'Eye of Re', and as the 'Lady of Punt' she was a divine lioness. She was closely associated with Horus: her name Hathor *(Het Hor)* means 'House of Horus'. Hathor's ambivalence of character is similar to that of the Mesopotamian goddess Ishtar.

The Divine Scribe

The Egyptians deified the earth as a male deity, Geb; but often he was represented as a goose. In the Heliopolitan story of the creation, Geb originally lay in close embrace with Nut, the sky goddess, until separated by Shu, the god of the atmosphere (see CREATION MYTHS). The Pyramid Texts indicate that Geb was once venerated as the oldest of the gods, and the pharaohs were regarded as his successors, sitting on the 'throne of Geb'. A very

Michael Holford/British Museum

The abundance of funerary texts inscribed and painted on papyri and on the walls of tombs and coffins show the Egyptian's concern with his well-being in the afterlife. It was believed that the dead could be resurrected to eternal life through ritual assimilation to Osiris, the god of the dead, who had himself died and risen again. The Papyrus of Hunefer shows Osiris on the far left, swathed in white mummy wrappings and holding the crook and flail, emblems of supreme power. In the centre the mummy lies on its catafalque and on either side Hunefer, the royal scribe, offers worship to various divinities

different deity was Thoth, who was associated with the city of Hermopolis but acquired attributes that made him significant to all Egyptians. His appearance is one of the strangest among the many strange Egyptian deities, for on a human body he has the head of an ibis bird. Thoth was regarded as the god of wisdom and the divine scribe; he is generally represented holding the reed pen and colour palette of the Egyptian scribe. He assumed an important role in the judgement of the dead, where he recorded the verdict when the heart of the deceased was weighed. The Greeks identified Thoth with Hermes and, as Hermes Trismegistus ('Thrice-great Hermes'), he was the source of the mystic revelation incorporated into the so-called Hermetic literature of the Graeco-Roman period (see HERMETICA).

A god who deserves special mention, though he was not numbered among the greater gods of Egypt, is Bes. He was represented as a squat, dwarf-like figure with a large grinning face. He may justly be called 'the poor man's god' because of his great popularity, despite his having no cult centre. Bes was the patron of fun and music, and helped women in childbirth. In many ways he could be regarded as the god of good luck; numerous amulets shaped in his image have been found.

The Egyptians were most obviously polytheists; but there is also evidence of a tendency to henotheism, if not monotheism, among them. Most notable is the use of the expression 'the Great God' in their wisdom literature and certain inscriptions. The use of this expression, without further qualification, is significant; it shows that the Egyptians recognized one supreme deity who needed no distinguishing name. It seems certain that in the earlier period the title 'Great God' referred to Re, the sun god; later Osiris may sometimes have been so designated. Akhenaten's concept of the Aten certainly merits the description 'monotheistic'. But it seems likely that the worship of any specific Egyptian deity in its local sanctuary was a kind of henotheism; during the service, the deity concerned was conceived of as the 'one' god, there and at that moment.

Egyptian religion does not appear to have been so rich in mythology as was the religion of the contemporary civilization of Mesopotamia. It had indeed its creation myths and the fundamentally important Osirian myth. Three other myths are known which concerned Re and certain goddesses. One told how Re grew old and mankind rebelled against him. To punish them, Re sent forth his eye in the form of his daughter Hathor. So destructive was the goddess that the sun god had to make her drunk in order to stop her work of slaughter, for otherwise mankind would have been wholly exterminated. A variant version of this myth concerned the fierce goddess Tefnut, who lived as a lioness in the Nubian desert. Re, whose daughter she was, wanted her to return to him and he sent Shu and Thoth, in disguise, to persuade her to come back. On the return journey she transformed herself into a beautiful goddess at Philae, and revealed herself as Hathor at Dendera, which was her chief cult centre. The third myth told how the goddess Isis acquired her magical power. She made a serpent and caused it to bite Re. No god could cure Re in his agony; then Isis appeared and offered to relieve him on condition that he revealed his secret name to her. The tormented sun god was forced to comply and the knowledge she gained gave Isis her great power. There are a number of tales, such as that of the Two Brothers, which are full of supernatural details, but they are not true myths.

Ka, the Second Self

Religions are concerned not only with the deities who personify and explain the various manifestations of power that men encounter in the world, but also with human nature and destiny. The ancient Egyptians' concern with their personal destiny found expression in their elaborate mortuary cult. This cult presupposed a very complicated view of human nature. The individual person was conceived as a mixture of the physical and spiritual, made up of several constituents. The *ka* was a kind of *alter ego* or double, created at conception together with the person whose ka it was. Egyptian texts give conflicting information about the nature of the ka and where it existed during the lifetime of the individual concerned. In art it was depicted as an exact replica of the individual, from whom it was distinguished by the ka symbol – shown as two arms extended upwards – which was set on its head. Provision had to be made for the ka at death; in fact the tomb was called the *het ka*, the 'house of the ka', and it contained the ka statue in which the ka dwelt. 'To go to one's ka' was a euphemism for death. It is uncertain whether the Egyptians thought of the ka as a non-material entity; it seems to denote some vital force essential to the existence of the individual person.

The ka cannot properly be described as the soul. The *ba*, another constituent of human nature, had more claim to this description, though not in the sense of the 'soul' as the inner essential self according to the Greek idea of the *psyche* or the Hindu *atman*. In their concept of the ba, the Egyptians expressed their belief that at death a free-moving entity separated itself from the body but remained in close proximity to it. They represented the ba as a human-headed bird, giving it a male or female face according to the sex of the deceased. In the funerary papyri the ba is often depicted as perched on the portal of the tomb or flying down the tomb shaft to revisit the embalmed body lying in the sepulchral chamber below. Another important constituent of the person was the *ib* or heart. This was sometimes referred to as the 'god in man', since it was regarded as a kind of witness or censor of the conduct of the individual within whom it resided. The heart had a vital role in the judgement after death. The individual's shadow and name were also important to his being, though of lesser significance compared with the other entities. At death, the Egyptian trusted that the proper performance of the mortuary ritual would transform him into an *akh* or glorified soul.

Important as all these constituents were

The Egyptians continued, century after century, to embalm their dead and to furnish their tombs as though the dead really did live in them

to the whole person, the body was always regarded as essential to life: this was why it was so carefully embalmed to preserve it from the disintegration caused by death. With their elaborate conception of human nature and the care given to ensuring eternal well-being after death, it is remarkable that the Egyptians never seem to have been curious about the purpose of human life in this world. In this lack of concern they contrast notably with the Mesopotamians, in whose mythology the origin and purpose of mankind was a primary topic.

Egyptian ideas of how and where the dead spent their afterlife are fundamentally confused. This confusion is already present in the Pyramid Texts (c 2400 BC). It doubtless went back to predynastic times and stemmed from different local traditions. Three conceptions of the afterlife can be distinguished. What is probably the most primitive envisaged the dead as living on in their tombs, equipped with various everyday necessities and nourished on daily food offerings made by their relatives. In the Pyramid Texts the existence of a celestial realm of the dead is described. The idea takes two forms: that of ascending to heaven to join the sun god Re in his solar boat on his daily journey across the sky; or of ascending to join the 'Imperishable Ones', the circumpolar stars. The idea of accompanying the sun god became the more generally accepted view. The third conception was associated with Osiris and his realm, which was called the *Duat* or *Ament* (the West).

This realm was subterranean and was situated beneath the western horizon, which in Egypt was constituted by the western desert. The dead had to journey there, encountering many hideous monsters and fearsome obstacles on the way. This land of the dead was imagined as an idealized Egypt, where the blessed dead lived happily the same kind of life as in the Nile valley. Special guidebooks to the next world were provided for the dead: the Book of the Two Ways described alternative land and water routes, both equally perilous; the Book of Gates divided the Duat by 12 gates; the Book am Duat told of the 12 time-divisions taken by the sun god on his nightly journey through this underworld. What is particularly significant, in all this complex imagery and practice concerning the dead, is that the Egyptians continued, century after century, to embalm their dead and to furnish their tombs as though the dead really did live in them.

Magicians of the Nile

Magic played an important part in ancient Egyptian life and thought. It was mainly based upon the principle of symbolic imitation – that like will beget like. For instance a model of a wax crocodile, directed by an appropriate spell, might be transformed into a real crocodile to kill a rival; there is actual evidence of such a practice. Most things could be endowed with magical potency, from the pharaoh's crown to amulets such as the *udjat* eye (giving power to see everything, and promoting prosperity and fertility) and the *ankh*, a symbol of life and vitality, which was used by both the living and the dead. A statue of a god had to be animated by a magical ceremony similar to that of the 'Opening of the

Mouth' which was performed on an embalmed corpse. The whole mortuary ritual was based on the magical assimilation of the dead to Osiris, so that they would experience a similar resurrection from death. An indication of the Egyptians' belief in magic is provided by the custom of mutilating hieroglyphic signs representing dangerous animals or insects, or showing them as pierced with knives when they occurred in tomb inscriptions; it was a precaution against these potentially dangerous signs coming to life.

The service of the Egyptian gods was performed in temples by a professional priesthood, assisted by specially appointed laymen. This service had two main forms: a daily toilet and offering ceremony, and periodic festivals. The daily service was performed in the inner sanctuary of a temple by priests only, on the image of the god which was kept in a special shrine. The image was anointed and symbolically clothed and offerings of food and incense were made to it. The festivals commemorated various events in the annual calendar: New Year's Day, sowing and harvest, and the inundation of the Nile.

Some festivals were devoted to certain deities or their temples. A notable example was the annual visit of Hathor of Dendera (or rather her cult statue) to the sanctuary of her spouse Horus at Edfu. The journey was made by boat, with halts at various towns on the banks of the Nile. The occasion was one of prolonged rejoicing and merrymaking among the people. It was only at festivals that ordinary folk saw the image of the god, which was carried out of the temple, mounted on a special boat, on the shoulders of priests; for inner courts of temples were forbidden to the public.

Egyptian temples were of three main types; some of them, like those of Amun at Thebes, were on a colossal scale. Sun temples, such as that of Atum-Re at Heliopolis and of the Aten at Akhetaten, were square in shape, enclosed by a wall and open to the sky. At Heliopolis the chief object of veneration was the *ben-ben* stone, a truncated obelisk which marked the place where Atum-Re had originally emerged from the primeval waters of Nun and commenced the work of creation. Other temples were of rectangular plan, comprising a series of courts. The inner

Lord of Every Land

The great Hymn to the Aten *nobly expresses Akhenaten's concept of the sun as supreme lord*

Beautiful is your shining forth on the horizon,
O living Aten, beginning of life!
When you arise on the eastern horizon,
you fill every land with your beauty.
You are bright and great and gleaming,
and are high above every land.
Your rays envelop the lands,
as far as all you have created.
You are Ra, and you reach unto their end,
and subdue them all for your beloved son . . .

You who bring children into being in women,
and make fluid into mankind,
Who nourishes the son in the womb of his mother,
who soothes him so that he weeps not,
O nurse in the womb!
Who gives breath in order to keep alive
all that he has made;
When he comes forth from the womb on the day of his birth,
you open his mouth in speech, and give all that he needs . . .

You make the Nile in the Other World,
and bring it whither you wish,
In order to sustain the people,
even as you have made them.
For you are lord of them all,
who weary yourself on their behalf,
The lord of every land, who arises for them,
O Aten of the day, great of majesty!

Extract from Joseph Kaster's translation in *The Literature and Mythology of Ancient Egypt*

sanctuary was reached through a pillared hall, and was in complete darkness. The third type of temple was the funerary temple, built for the proper performance of those rites, especially the food offerings, which were regarded as essential to the well-being of the dead man whose tomb they served. The great pharaohs of the New Kingdom erected vast funerary temples on the western bank of the Nile, opposite Thebes. These differed little in size and layout from the temples of the gods.

Since most of the extant evidence on Egyptian religion relates to the king and the upper classes of society, little is known of the religion of ordinary folk. Lesser deities, such as Bes, doubtless seemed to them more approachable than the great state deities, but Osiris had an intimate personal appeal to all classes. There is some evidence that Amun could be addressed as 'one who cometh at the voice of the poor'; however, it is significant that on the stele of Neb-re, where these words occur, the Amun 'who hears the prayers' is depicted seated outside the portals of his temple, as a kind of vizier to the greater Amun who dwelt within the sanctuary.

Michael Holford

The Aten, the sun's disc, was elevated to the status of a god by the Pharaoh Amenhotep, who changed his name to Akhenaten, meaning 'pleasing to the Aten', and built a magnificent temple to his god

The Dawn of Conscience

The 'dawn of conscience' has been located, with reason, in ancient Egypt. Already in the Old Kingdom the concept of *maat*, which denoted the qualities of truth and justice, was associated with the 'Great God' as the basic principle of an ordered universe. From this period, too, emerge the beginnings of the belief so important to the evolution of ethics and morality, that the dead would be judged on their conduct in this life.

The immense duration of Egyptian religion, and the impressive continuity of its traditional pattern of faith and practice, suggest that the Egyptians unthinkingly accepted an ancient priestly tradition, generation after generation. But there is evidence that this was not wholly so, and that there were those who could look critically at their ancestral faith, especially the funerary cult. There exist, inscribed on the walls of certain New Kingdom tombs, versions of what is known as the Song of the Harpist, which takes its name from the figure of a corpulent harpist who is depicted singing it. It was probably sung at memorial feasts held by relatives at the tombs of the deceased. In it the futility of the mortuary faith is frankly expressed: 'None cometh from thence that he may tell us how they (the dead) fare, that he may tell us what they need, that he may set our heart at rest, until we also go to the place whither they have gone.' The obvious conclusion is drawn from this scepticism: 'Be glad, that thou mayest cause thine heart to forget that men will (one day) beatify thee. Follow thy desire, so long as thou livest.'

A Mummy at the Feast

The expression of such sentiments is significant; for it shows that there did exist at least a minority who could doubt the truth of their traditional religion and the effectiveness of its ritual technique for the achievement of a blessed immortality. Yet this faith was able to continue its serene tradition without the suppression of such heretical scepticism. That it did so attests the strength of two things: the spiritual satisfaction which the average Egyptian got from his faith in Osiris, and the practical nature of his philosophy of life. The Greek historian Herodotus, who visited Egypt in the 5th century BC, records an Egyptian custom at banquets of showing the guests a model of a mummy with the admonition: 'Gaze here, and drink and be merry; for when you die, such will you be.' This curious custom was prompted by no spirit of cynicism or levity; it reflected the practical evaluation of life that characterized the Egyptians. They feared death, but they believed that they had the means of reversing its threat of personal extinction and they accordingly made provision to secure this immunity. But such preoccupation with death and the afterlife did not induce pessimism or prompt a this-world-denying attitude. The Egyptians sought to extract the most joy possible from life, while preparing for death and mindful of the judgement that faced them thereafter.

The legacy of Egypt's ancient religion cannot be accurately assessed. The famous American Egyptologist J. H. Breasted believed that Akhenaten's monotheism influenced Moses and found its fruition in the Hebrew concept of one single God, who is the creator and sustainer of the universe. The connection cannot be proved and the assumption that it did exist has not been generally accepted by scholars. More certain is the influence of Egyptian wisdom literature on the Jewish Book of Proverbs. The elements of Egyptian religion which passed into Coptic Christianity were chiefly related to the world after death; such elements included the idea of a judgement immediately after death and of the assessment as being made by weighing the soul on scales. And the Egyptian elements have yet to be fully evaluated in the Hermetic literature, where the god Thoth figures prominently under the name of Hermes.

EIGHT

IN POPULAR NUMEROLOGY, if your name adds up to 8 (see ALPHABET) you will usually be told that you are a driving materialist, ambitious for power, influence, status and money. It is pre-eminently the number of business executives, efficient administrators, men of great organizing ability and dominating character, busy with worldly concerns, clever, realistic, cold and ruthless when necessary but not always unkind at heart, men who get on in the world. They are much interested in money but in their private lives are often curiously impractical about it. They are likely to be too preoccupied with the main chance and too self-sufficient to make ideal partners in love or marriage. So materialist is the number 8 that it has been interpreted to mean an interest in Spiritualism, due to a liking for the materialization of spirit-forms. An American numerologist sums up this view of the number by recommending that in any year which adds to 8, you should 'Go for the money. Make influential contacts.'

But the path of 8 is not at all an easy one. It is the number of great success but also of dramatic failure in worldly matters. It has ominous overtones, expressed by one authority in the statement that those whose number is 8 will like choral and organ music, especially of the gloomy and plaintive variety. Eight-people live lives of constant strain and effort and, no doubt as a result, are liable to suffer from nervous indigestion.

Lying behind all this is the fact that 4 is the number of earth and material things (see FOUR) and since 8 is 4 doubled, 8 must mean an intense involvement in material matters, money-making, industry and commerce, earthly power and 'the things of this world' in general. In addition, the eighth sphere of the cabalistic Tree of Life is taken to correspond to Mercury, who in one of his roles was the god of trade and commerce, and the figure 8 resembles the two interlaced serpents of Mercury's caduceus. The shape of the number, the two circles suggesting dualism – success and failure – and the fact that 8 is twice 4, which is the unluckiest of numbers, account for the ominous undertones.

A New Beginning

The popular interpretation is also partly based on an entirely different line of symbolism, in which 8 means 'a new beginning' and so 'new life'. In Jewish tradition a baby boy is named and begins his life as a real person on the eighth day after his birth. Baptism as a Christian is 'a new beginning' and fonts in churches are often eight-sided. Many Christian baptisteries, buildings constructed when baptisms were performed only three times a year and so a large building was needed, were octagonal.

As the number of a new beginning, 8 also means immortality, resurrection, life after death. The early Christians associated 8 with Sunday. They accepted that God made the world in six days and rested on the seventh but they said that the Sunday on which Christ rose from the dead was God's eighth day, on which he renewed his work and gave men the possibility of eternal life. One of the numbers of Christ was 888 (reached by adding the number values of the name Jesus in Greek). It was also pointed out that eight people survived the flood – Noah, his wife, their three sons and the sons' wives – to start life afresh on the earth (Genesis, chapter 8). As the number of the Christian life after death, 8 also stands for eternity and infinity, and the mathematical symbol for infinity is an 8 lying on its side. The prospect of eternity in heaven or in hell has contributed to the modern numerologist's prediction of great success or dramatic failure with 8.

Occultists have generally followed the Christian track, noting that 8 is the first cube number and so introduces a new dimension, and that the cube is a symbol of earth and so can stand for 'the solidification of matter', and bringing in the shape of the figure 8 and the Eightfold Path of Buddhism, which is the way of liberation from earthly existence (see BUDDHISM). A. E. Abbot's *Encyclopaedia of Numbers* says: 'Esotericism sees the 8 as signifying a resurrection into a higher consciousness, and representing the eternal and spiral motion of cycles. The crossing-point of the figure 8 suggests the crossing-point from earthly life to the spiritual world . . .' Behind all this may lie the fact that a man's body has seven orifices but a woman's has eight, and it is through the eighth that new life comes into the world.

Eisteddfod

A Welsh word meaning a 'session'; the traditional assembly of Welsh bards and musicians, at which competitions were held and a 'chair' was awarded to the chief bard: the modern festival, now held annually, owes its popularity to a revival of interest in Celts and Druids in the 19th century; it consists of competitions in poetry, music, literature, and the arts and crafts, and is intended to preserve and promote the Welsh language and culture.

See DRUIDS.

El

The supreme deity of the Canaanites and Phoenicians, whose wife Asherah, called Astarte by the Greeks, was the great mother goddess: his name means literally 'the god' and his other titles, 'Father of Men', 'Creator of Created Things' and 'the Bull' indicate his benevolence to man and his strength and virility: he is depicted on a stele as a bearded man, wearing a crown adorned with a pair of bull's horns.

See ASTARTE.

ELDER

TWO KINDS OF ELDER have magical and mythological associations: the common elder – 'ever bush and never tree', as an old Scots rhyme has it – and the dwarf elder, a large, rather ill-smelling herbaceous plant dying down in winter. They belong, somewhat unexpectedly, to the honeysuckle family.

Of the two, common elder is more closely connected with magic; as with so many plants, it is associated with witches and the Devil but, if properly used, also provides protection against them. In many lands there are tales of an elder mother, elder spirits or witches who both inhabit the bush and *are* the bush. Consequently if a branch is cut from an elder, blood may spurt from it and, likely as not, some old crone in the village will have her arm in a sling the next day. If elder is taken indoors, death will be in the house within a year; if it is burnt, the Devil will come down the chimney; if you strike a man dead with an elder stick his hand will come up from his grave; beat a child with elder and it will stop growing properly; make a boat of elder and you are sunk; a cradle, and the child will ail and be easy prey to fairies. Yet an old American belief says that burning an elder stick on Christmas Eve will reveal, or unmask, all witches and black magicians in the area.

Scandinavian mythology makes much of Hydle-moer, the elder mother, related to Hulda, the goddess of marriage. It was she rather than witches who was responsible for disasters following injury to an elder, but this was a matter of revenge, and could be averted by asking permission before cutting an elder or making use of it. Forms of this belief have been recorded from Huntingdonshire and Lincolnshire. A Danish legend suggests that if one stands under an elder at midnight on Midsummer Eve, the King of the Elves will be seen passing by. It was, however, widely considered unwise to sleep beneath an elder and to dream of it betokened illness.

Yet at the same time amulets and charms against witches and other evil spirits could be made from elder wood; elder sprigs picked on the last day of

April and fixed on to houses protected their inhabitants likewise; while if a baptized person dabbed the green juice from the elder's inner bark on to his eyes, he could know of the doings of witches anywhere. Elder would protect, too, from lightning, could be made to charm warts away and made the ideal handle for the whips of hearse drivers, who were at risk because of their work with the newly dead.

Gallows and Graves

In Austria, as in northern England, a cross of elder was placed on new graves; if it flowered, this was a sure sign that the soul of the departed had reached heaven. Elder boughs might also be placed in a grave to keep witches from the dead.

Epitomizing all the minor myths and the general distaste for this often crooked, ugly, ill-smelling tree, a major myth grew up about the elder. In Jacobus de Voragine's medieval *Golden Legend* we find the first account of the elder's use for gallows and as an appropriate graveyard plant, and, although the elder does not grow naturally in Palestine, the statement that it was both the tree on which Christ was crucified and that on which Judas killed himself.

Elder has been used in medicine since Egyptian times, not just as a charm but for making curative lotions. American Indians made tea from the bark, which was an emetic if the bark was scraped upwards, a laxative if scraped downwards. Pioneer United States folk medicine used the plant's bark, flowers, and berries to cure such ailments as headache, toothache, burns, swellings and tumours, rheumatism and insect infestation. Elderberry wine is still made today as a general tonic; and it is said if you carry an elderberry in your pocket you will be safe from ivy poisoning.

The dwarf elder was even more valuable than the tree in European folk medicine, being recommended against bites of mad dogs and snakes, to cure dropsy, gout and piles, and as a purge. It could also be used to dye hair black and cloth blue. While it was, in France, one of the herbs dedicated to St John, its main claim in mythology is its reputation of growing only where the blood of a Dane has been spilt.

The way this myth grew up has been demonstrated by Geoffrey Grigson. The plant was anciently called walwort, probably derived from Old English *wealwhyrt* meaning 'foreigner plant', referring to the dwarf elder's introduction to Great Britain. In 1538 the name danewort is given (by William Turner) as an equivalent, and as late as 1640 we find Parkinson repeating older herbalists in explaining that this referred to the plant's purgative qualities in producing 'the danes', namely diarrhoea. 'Danes' may derive from *dain*, an old word meaning 'a stink'. *Historia Regum Angliae*, written by John Rous in the 15th century, contains an account of 'ebulus' (the old Latin name) growing freely where the British people – the Mercians – died when the Danes overran the country. In his *Britannia*, William Camden puts this story together with the name danewort and concludes that the truth must be that the plant thrives where Danes have died.

What is interesting, however, is the widespread and ancient belief that dwarf elder arises where any human blood has fallen. The great botanist Linnaeus quoted the old Swedish name *mannablod* meaning 'man's blood', paralleled by the Welsh *llysan gwaed gwyr* meaning 'man's blood plant' and Norfolk 'blood hilder'. The modern dictionary slips in Old English *wael wyrt* or 'slaughter plant' as a further possibility. Certainly the sap and the juice of the berries, blackish like spilt blood, and the autumnal red of the stems, suggest reasons for this belief.

A. J. HUXLEY

Medieval legend identified the elder as the tree on which Judas Iscariot killed himself. The guilt-stricken Judas is shown first contemplating suicide, then hanging from the tree of ill omen

El Dorado

A mythical king from South America who was said to cover himself with gold dust, thus giving rise to his Spanish title, 'the gilded man': the name was also applied to the fabulous city of Manoa and surrounding country which was believed to contain untold wealth, and its supposed location on the Amazon inspired many luckless expeditions from Spain and England in the 16th century: it has now come to mean any richly endowed area or accumulation of treasure.

Museo del Oro

The belief that God chooses an individual or a people for a particular task or destiny was held as long ago as the third millenium BC. The idea of divine election occurs not only in Hebrew thought but in many other religions

ELECTION

THE IDEA that God specially chooses certain individuals or nations for some peculiar role in the scheme of his providence is known as election; the word is derived from the Greek word *eloge* ('choice'). The idea is basic to the traditional structure of Christian theology, and it finds expression in the German term *Heilsgeschichte*, meaning 'Salvation-History'. This Heilsgeschichte is an elaborate interpretation of the history of the Hebrew people, designed to show that God used both the Hebrew people as a whole and certain individual Hebrews for the furtherance of his plan to save mankind. The idea that God had thus chosen the Hebrews was not, however, only a Christian idea; it was already deeply rooted in Hebrew thought and graphically presented in the Hebrew Bible. But in its original Hebrew form the idea was essentially nationalistic and almost exclusively concerned with the destiny of Israel.

This idea of divine election, in both its Hebrew and Christian versions, has had an enormous influence on human thought and institutions in many parts of the world. In later Christian thought the idea took on a new and distinctive form in connection with belief in the predestination of human beings to either heaven or hell. Similar ideas of divine election have also found expression in other religions, most notably in Islam.

Belief that one has been divinely chosen for some special office or task is very ancient. In Egypt it can be traced back to the third millennium BC in the claim made by the pharaoh that he was the son of the sun god Re, and so represented him on earth. The imperialist pharaohs of the 18th Dynasty claimed that their god Amun-Re had given them world-sovereignty. In a hymn dating about 1470 BC, in which Amun is represented as addressing Thothmes III, the god announces his election of the king as the world conqueror: 'I have come that I may cause thee to tread down the uttermost ends of the lands; what the ocean encircleth is held in thy grasp. I have caused them to behold thy majesty as a lord of the wing, which seizeth on what he seeth according as he desireth.' Similar expressions of divine election are found in ancient Mesopotamian and Babylonian texts. Marduk, the great god of Babylon, is even represented as having chosen the Persian prince Cyrus (died 530 BC) to overthrow the native Babylonian king Nabonidus.

And it was not only kings who claimed such divine election; whole peoples have believed that they have been elected to a status of superiority over others. The Indo-Iranian peoples, who conquered Iran and North-Western India in the second millennium BC, referred to themselves as the *aryas* ('Aryans'), which meant the 'noble', in contradistinction to the despised natives, whom they dispossessed of their lands under the leadership of their own Aryan gods. The ancient Greeks arrogantly divided mankind into two contrasted groups: the 'Hellenes', who were their own superior selves, and the *barbaroi*, the barbarians. The Romans, in their turn, believed that they had been elected to world empire either by Jupiter, their supreme deity, or by a mysterious *fatum* or destiny. The British-Israelite theory of the British having been chosen for a similar role is a 20th century example of the same kind of belief.

Such a predisposition on the part of a people to claim divine authority and aid to justify their conquest and dispossession of other peoples can reasonably be evaluated as a natural human trait, indicative of a deeply rooted unwillingness to accept direct responsibility for their own violent self-aggrandizement. The sense of confidence produced by the conviction that one is serving God and not oneself is also obvious, and it represents an ancient form of 'psychological warfare', even though it was not often consciously used in this manner. But such instances of belief in divine election rarely developed into a carefully articulated tradition, which in turn decisively moulded the national character, as happened in Israel, where it also found literary expression of a most remarkable kind.

Hebrew literature, as embodied in the Old Testament, the Apocrypha and Pseudepigrapha (a collection of literature of an apocalyptic nature), contains a philosophy of history in varying forms, through which

Scala

In Christian theology the idea of election became associated with predestination: the elect could look forward to an eternity in heaven, the rest to eternal damnation: a 14th century Italian painting of the Last Judgement

runs a common theme. It is that Yahweh, the god of Israel (see YAHWEH), had in the remote past chosen the Israelite or Jewish people for a special destiny. This destiny was to take the form of their settlement in the land of Canaan, where they were to devote themselves to his service and enjoy his special favour. This settlement in Canaan meant their conquest of the country and the extermination of its inhabitants, towards whom Yahweh is represented as being hostile, as he is also generally represented to be towards all other nations. The identification of Canaan as the land of Yahweh's promise provides the motif for the continuation of the theme of the Heilsgeschichte. The vicissitudes of fortune that Israel experienced, including periods of foreign domination, after the settlement, are explained in terms of Israel's varying faithfulness and unfaithfulness to Yahweh, with the promise of the ultimate vindication of the nation as Yahweh's Elect People.

The Promise to Abraham

The theme of Israel's election is impressively presented first in the books of Genesis and Exodus. It is set forth in these writings in what appears to be a sequential narrative of dramatic events, in which Yahweh is depicted as choosing Abraham, who originally lived in the Sumerian city of Ur in Mesopotamia, to be the progenitor of the Hebrew people and the first recipient of his promise that Canaan would become their own land. Abraham is represented as a kind of Bedouin chief, living a nomadic life with his family and their flocks after leaving Ur of the Chaldees. The first promise of his election is recorded in Genesis (12, 1–3), when Yahweh commands him to leave Haran, where he had settled with his father, and migrate to Canaan: 'Go from your country and your kindred and your father's house to the land that I will show you. And I will make of you a great nation, and I will bless you, and make your name great, so that you will be a blessing. I will bless those who bless you, and him who curses you I will curse; and by you all the families of the earth will bless themselves.' After Abraham arrives in Canaan, Yahweh appears again to him and declares: 'To your descendants I will give this land' (Genesis 12.7). This promise is repeated to Abraham's son and grandson, Isaac and Jacob.

But although Abraham's election is regarded as the crucial event that initiated Israel's unique destiny, no reason is given why Yahweh did thus originally choose him to be the progenitor of the elect people who were to inhabit the Promised Land. Equally remarkable is the fact that, according to the Genesis narrative, it is not the elder son of Isaac, namely Esau, but the younger son Jacob who is selected by Yahweh to inherit the promise. This unexpected preference is referred in later Jewish tradition to the arbitrary choice of Yahweh; for Yahweh is represented as addressing Israel through the prophet Malachi: '"I have loved you," says the Lord. But you say, "How hast thou loved us?" "Is not Esau Jacob's brother?" says the Lord. "Yet I have loved Jacob but I have hated Esau"' (Malachi 1.2–3).

Despite Yahweh's promises Abraham, Isaac and Jacob do not, as it happens, settle in possession of Canaan but live as nomads, with Jacob himself dying in Egypt. According to Genesis (chapter 46), Jacob and his other sons settled in Egypt through the influence of Joseph, Jacob's son, who had become the chief minister of the pharaoh. This surprising conclusion of the book of Genesis, however, prepares the way for the marvellous events narrated in the succeeding book of Exodus. But this book starts with a very different situation. A long period has elapsed during which Joseph's generation have died out, and his descendants and those of his brothers have become a populous nation. The Egyptians, alarmed at the growth of these foreigners in their land, enslave them and take measures to reduce their numbers. Yahweh is then described as intervening to save the Israelites from their hondage. This he finally accomplishes, having selected Moses as his agent and leader of his people. According to the narrative, after the miraculous exodus from Egypt the Israelites journeyed to Mount Sinai, where Yahweh summoned Moses to bear to the people an invitation to enter into a covenant with him: 'Thus you shall say to the house of Jacob, and tell the people of Israel . . . if you will obey my voice and keep my covenant, you shall be my own possession among all peoples; for all the earth is mine, and you shall be to me a kingdom of priests and a holy nation. These are the words which you shall speak to the children of Israel' (Exodus 19.3–6). Yahweh is then represented as delivering to Israel, through Moses, the sacred Law including the Ten Commandments, the observance of which was Israel's side of the covenant.

Double-Sided Election

This idea of a formal covenant made between a god and a nation is unique in the history of religions. Logically it implies a kind of double-sided election: that Yahweh selected Israel to be his people, and Israel selected Yahweh as its god. However, throughout Hebrew literature it is Yahweh's election of Israel which is exclusively stressed. Israel's side in the transaction is invariably cited by the prophets in condemnation of the nation's failure to keep its obligations to Yahweh. That Yahweh signally fulfilled his commitment in giving Israel possession of Canaan is a reiterated theme of Hebrew prophecy and poetry, and it is graphically described in the book of Joshua. This writing closes significantly with Moses' successor Joshua, under whom the conquest of Canaan is represented as having been accomplished, addressing the Israelite tribes in a farewell speech before his death. He speaks in the name of Yahweh: 'I gave you a land on which you had not laboured, and cities which you had not built, and you dwell therein; you eat the fruit of vineyards and oliveyards which you did not plant.'

And so Yahweh's promise to Abraham, Isaac and Jacob is fulfilled: the descendants of these patriarchs have become a nation and are settled in possession of the Promised Land of Canaan. Thus is the theme of Israel's election and its accomplishment presented in the Hexateuch, or first six books of the Old Testament. But scholars are

generally agreed that this presentation is a later literary creation from earlier and diverse traditions, and that the reality behind it was very different. Research has distinguished a literary tradition, designated the 'Yahwist', which forms the basic scheme of the Hexateuch. It is so called because it is consistently concerned to show that Yahweh is the supreme creator god who chose Israel to be his people. On analysis, this Yahwist tradition appears to date from about 900 BC, and is a cleverly designed composition which has fused into a consequential narrative three different cycles of tradition. Its purpose was to present the various Hebrew tribes which had established themselves in Canaan as a unified people, descended from a common ancestor, to whom the god Yahweh had originally promised the possession of Canaan. The three cycles of tradition are usually described as the Primeval History, which starts with the creation and fall of Adam and ends with the Tower of Babel; the Patriarchal History, which runs from Yahweh's calling of Abraham to the settlement of Jacob and his sons in Egypt; and the Exodus and Conquest of Canaan.

Philosophy of History

From the careful investigation of the relevant evidence, the modern view of the historical reality behind the Yahwist narrative is that a loose confederation of Semite tribes, who had adopted Yahweh as their war god, partially conquered Canaan: some of these tribes had probably escaped from bondage

Sonia Halliday

in Egypt. The devotees of Yahweh were concerned to maintain the exalted position of their god after the settlement in Canaan, but the tendency of the confederate tribes was to revert to the worship of their ancestral gods or adopt the agricultural deities of Canaan. The Yahwists were helped in their task by the fact that the break-up of the confederation made for military weakness and the consequent defeat of the Hebrew settlers by revived Canaanite power and the newly established Philistines. The Yahwist prophets were, accordingly, able to proclaim that when the tribes had been faithful to their covenant with Yahweh, he had done mighty deeds for them – delivered them from Egyptian bondage and given them possession of Canaan. They called upon them, therefore, to repent of their unfaithfulness, repudiate the other gods and return to their allegiance to Yahweh, who would remember his covenant and save them.

This Yahwist appeal to Yahweh's providence for the Israelite tribes in the past was, according to modern scholars, eventually elaborated by a Yahwist writer into the veritable philosophy of history which has been preserved in the Hexateuch. Its theme was Israel's election and Yahweh's providence for his chosen people; its aim was to show that Yahweh had been the ancestral god of the various tribes that had formed the Israelite confederation. To achieve this, the Yahwist writer fashioned the ancestral legends of the various tribes into a consecutive narrative which related various ancestors into generations of one family, whose founder was Abraham. In this Patriarchal History the election theme was carried back beyond the Exodus and Sinai covenant to an original promise made to Abraham. Hence, by fusing this Patriarchal History with the Exodus and Conquest of Canaan tradition, the various Semite tribes that had formed the Israelite confederation were presented as the descendants of the 12 sons of Jacob, the grandson of Abraham. To complete the cycle of this conspectus of Yahweh's providence in the past, the Yahwist writer added to the Patriarchal History and the Exodus and Conquest of Canaan narratives the Primeval History – an account of mankind from the creation of its original parents, Adam and Eve, to the shattering of the original unity of mankind and its scattering abroad as divine punishment for the building of the Tower of Babel.

The Godly Remnant

This Yahwist interpretation of history came to exercise a profound influence upon all subsequent Jewish life and thought. For there was thus enshrined in their sacred Scriptures a graphic record of how Yahweh chose Abraham to be the progenitor of Israel, promising to his descendants the possession of Canaan, and of how he had marvellously fulfilled his promise. And the Torah or Sacred Law, given at Sinai, was the symbol of Israel's covenant with Yahweh to serve him as his Elect People. Through all their long centuries of suffering and tribulation, this sense of divine election has always inspired and sustained the Jewish people, and forged an indissoluble bond between them and the Holy Land of Yahweh's ancient promise.

From about the 8th century BC an important variant version of the Election belief grew up. During the religious and political struggles of this period the majority of the Israelite people often forsook Yahweh for the worship of other gods. This caused the Yahwist prophets to formulate the idea of a 'remnant' of the nation who would always remain faithful to Yahweh, and so inherit the promise of the Election (Amos 3.12; Isaiah 10.20–22). This idea was destined to be utilized in a remarkable manner many centuries later, and to become a formative factor in Christianity of fundamental importance. The transformation of the idea was the work of St Paul (see PAUL). Himself a Jew who accepted Jesus as the Messiah of Israel, Paul was confronted with the problem that the majority of his compatriots rejected Jesus and were thus cut off, as he saw it, from salvation. Hence he was faced with the question: 'has God rejected his people?' (Romans 11.1). For an answer, Paul fell back on the old prophetic idea of a Godly Remnant as the true Israel; and as this Remnant he identified the minority of the Jews who had become Christians and the Gentile converts, justifying the incorporation of the latter by quoting a prophecy of Hosea: 'Those who were not my people I will call "my people"' (Romans 9.25). Thus Paul provided the Christian Church with the means whereby it could claim that it was the true Israel, and the rightful heir of

Peter Goodliffe

God's promises to the Hebrew patriarchs. This claim is uncompromisingly made in I Peter (2.9). 'But you (Christians) are a chosen race, a royal priesthood, a holy nation, God's own people, that you may declare the wonderful deeds of him who called you out of darkness into his marvelous light.'

But Christianity, in its turn, became faced with the problem of those who remained obdurate to its message or failed to live according to their baptismal profession. Consequently, the idea grew up that the number of God's Elect must be small; for 'many are called, but few are chosen' (Matthew 22.14). In Christian theology the idea of Election became closely associated with that of predestination. St Augustine (354–430 AD), probably from his own personal experience of conversion and his conviction that man can do nothing to save himself and is in need of God's previous grace, referred to 'those whom in his justice God has predestined to punishment' and to the salvation of 'those whom in his mercy he has predestinated to grace'. It is in the words of John Calvin (1509–64), however, that the doctrine of Election found its most notable expression in Christianity. The quintessence of his teaching is contained in the following passage from his writings:

> The seed of the word of God takes root and grows fruitful only in those whom the Lord, by his eternal election, has predestined to be his children and heirs of the heavenly kingdom. To all others who, by the same counsel of God before the constitution of the world, are reprobate, the clear and evident preaching of the truth can be nothing else but an odour of death in death.

This strict deterministic attitude provoked within Calvinism a reaction known as Arminianism (from its founder, Jacobus Arminius, 1560–1609), which maintained that God's sovereignty was compatible with a real freedom of will in man and that Jesus Christ died for all men and not only for the elect.

The idea of election, closely associated with predestination, figures prominently in Islam, the other great monotheistic faith. Thus in the Koran Mohammed declares: 'If Allah will guide anyone, He enlargeth his breast for Islam; but if He will send him astray, He maketh his breast narrow and contracted as if he were climbing into Heaven; thus doth Allah lay the abomination upon those who do not believe' (Surah 6. 125); 'If We (Allah) willed, We should cause to come to every soul its guidance; but true is the saying of Mine, "Assuredly I shall fill Gehenna, with jinn and man together"' (Surah 32.13).

ELEMENTS AND ELEMENTALS

THE THEORY THAT ALL things are made of differing combinations of four basic materials – fire, air, earth and water – was advanced by the Greek philosopher and scientist Empedocles, who lived in Sicily in the 5th century BC. The theory was taken up by Plato and Aristotle, and was accepted by the great majority of Europeans down into the 17th century. It has been reinterpreted by modern occultists to whom the four traditional elements stand for four conditions in which energy can exist: gas (air), electricity (fire), solid (earth) and liquid (water).

The four elements provided a basis for the belief of the alchemists that gold could be manufactured artificially (see ALCHEMY). They were also important in medicine, because they were combined with the doctrine of the four 'humours', stemming from the famous Greek physician Hippocrates and transmitted into medieval Europe by Galen, the great Roman medical authority of the 2nd century AD. The humours (from Latin *humor*, 'moisture') were the four liquids present in the body whose differing combinations determined each man's temperament and physique. The liquids and temperaments were connected with the elements as follows: fire, yellow bile, choleric (or bilious); air, blood, sanguine; earth, black bile, melancholic; water, phlegm, phlegmatic.

The perfect man, if such a thing existed, would have the four liquids and temperaments in perfect balance in his constitution. Disease was caused by an imbalance of the humours. Too much phlegm caused colds, an excess of yellow bile caused jaundice, and a strongly sanguine person would need

Water represents 'the unconscious depths of the human mind, unfathomable mystery, woman'. Diana was goddess of the moon, which rules the tides, and in art she is often associated with water, bathing in lakes or rivers: statues of Diana and her nymphs in the grotto of an Italian palace

The fifth element is earth

to be bled frequently. Cholera was named for its supposed origin in yellow bile and the choleric temperament. (See also DISEASE.)

The symbolic meanings of the elements naturally vary very considerably from one writer or artist to another. Fire and air were usually regarded as active, positive, creative and masculine elements, earth and water as passive, negative, receptive and feminine. This distinction comes out in the French writer Gaston Bachelard's summing up of the characteristic qualities of the elements: 'Earthly joy is riches and impediment; aquatic joy is softness and repose; fiery pleasure is desire and love; airy delight is liberty and movement.'

Briefly, the element of fire tends to be associated with energy, purification and transformation, passion and aspiration. Air is connected with breath, soul, speech, with flight as a liberation from the earth-bound state, and so with freedom, 'free as air'. Earth is associated with the solid and the practical, with the body, with gloom and melancholy because earthly life is so much inferior to the life of heaven, with the dead buried in the earth and with hell under the earth, and with riches and material success because it is in the earth that the harvest grows. Water is the fount and origin of everything, the primeval waters of the abyss before the world was formed, 'the deep' which existed 'in the beginning' in Genesis, the unconscious depths of the human mind, unfathomable mystery, woman. (See also BREATH; FIRE; FOUR; WATER.)

In the ancient world the whole of Nature was peopled with spirits, which lived in every tree and stream, every crag and cloud (see ANIMISM). Once the theory of the four elements had been accepted, four classes of spirits were particularly associated with them, the spirits which much later were called 'elementals'. Gnomes and undines are the elementals of earth and water respectively, sylphs and salamanders the elementals of air and fire: minor spirits of Nature, invisible to human beings but nevertheless substantial, and living in the four elements.

The association of the elements with spirits was probably first made by the Neoplatonists, followers of a school of philosophy which arose at Alexandria in the 3rd century AD. The Neoplatonists had a highly developed demonology and their demons (both good and bad) were thought to people the universe, and were the object of religious and magic rites. The Neoplatonists were deeply influenced by Plato, who developed the mystical and religious themes inherent in Empedocles's doctrine of the four elements, and it was an easy step for them to connect the demons with the elements.

The Greek authors do not go into much detail about the demons and spirits which perhaps in the 15th century first acquired the name elementals. For a really detailed account, one must turn to the works of the 16th century physician, alchemist, traveller and mystic Philippus Aureolus Theophrastus Bombast von Hohenheim, known to posterity by his adopted name of Paracelsus (see PARACELSUS). He invented the word 'gnome' and probably much of the lore about elementals as well, though he may also have drawn on legends and superstitions he encountered in his wanderings through many countries, including Sweden, Russia and possibly even India.

According to Paracelsus, man is made of three substances, spiritual or godly, soulful or astral, and visible or terrestrial. These three substances or elements which go to make up the constitution of man are universal, but whereas man exists in all three, there are other beings which live exclusively in only one of the elements. Various categories of beings are perfectly at home in different elements: gnomes can see and breathe as easily in the earth as undines and sylphs in water and air.

Man himself, it appears, would be an elemental spirit of Nature, but for the divine element in him. The elementals proper occupy a position between men and pure spirits. They have flesh, blood and bones, they propagate offspring, they eat and sleep, and in these respects, and in their physical organization, resemble human beings. But they can move as quickly as spirits.

The elementals are not immortal, being subject to disease. But they cannot be imprisoned, and fire and water do not injure them. They dress, talk and in many ways act like human beings but, says Paracelsus, 'are incapable of spiritual development.' They have reason and language like man – they have minds, but no souls in the spiritual or immortal sense. 'This may appear strange and incredible,' concedes Paracelsus, 'but the possibilities of Nature are not limited by man's knowledge of them, and the wisdom of God is unfathomable.'

He goes on to explain that the undines or nymphs live in water, the gnomes or pygmies in the earth, the sylphs or sylvestres in the air, and the salamanders or vulcans in fire. The four classes of elementals do not mix with each other. Each being keeps strictly to its own element, and to the undines, for example, water is what the air is to us. 'If we are surprised that they are in the water, they may also be surprised because we are in the air.' In their own element, the earth, gnomes can pass through rocks and stones as easily as we can pass through our own element, the air, and it is the same with salamanders in fire. The sylphs are most like human beings, because they would be drowned in water, suffocated in earth, and burned in fire. Each element is transparent for the spirits living in it: the sun shines through rocks for the gnomes.

The Love of an Undine

In size and appearance the undines resemble mankind. The gnomes are about a foot-and-a-half tall, but can expand at will to giant size. The sylphs and undines are kindly disposed towards man, the salamanders can neither be approached by nor approach man, while the gnomes are usually malevolent. On the whole, Paracelsus assures his readers, 'the elementals have an aversion against conceited and opinionated persons, such as dogmatists, inquisitive sceptics, drunkards, and gluttons, and against vulgar and quarrelsome people of all kinds'. What we know of Paracelsus's life suggests that this was a list of his own pet hates. 'But the elementals,' he goes on, 'love natural men, who are simple-minded and child-like, innocent and sincere, and the less vanity and hypocrisy there is in a man, the easier it will be for him to approach them.'

The elementals have their own manners, customs, languages and even governments. They have their own houses or palaces too – at least, the gnomes and undines do. These dwellings are made of special substances unknown to humanity, 'as different from the substances we know as the web of a spider is different from our linen'.

According to Paracelsus, undines have been known to adopt human shape, clothing and manner, and to enter into a union with man – a notion which inspired Friedrich de la Motte Fouqué's charming romance *Undine*. Men have also been admitted to communities of elementals.

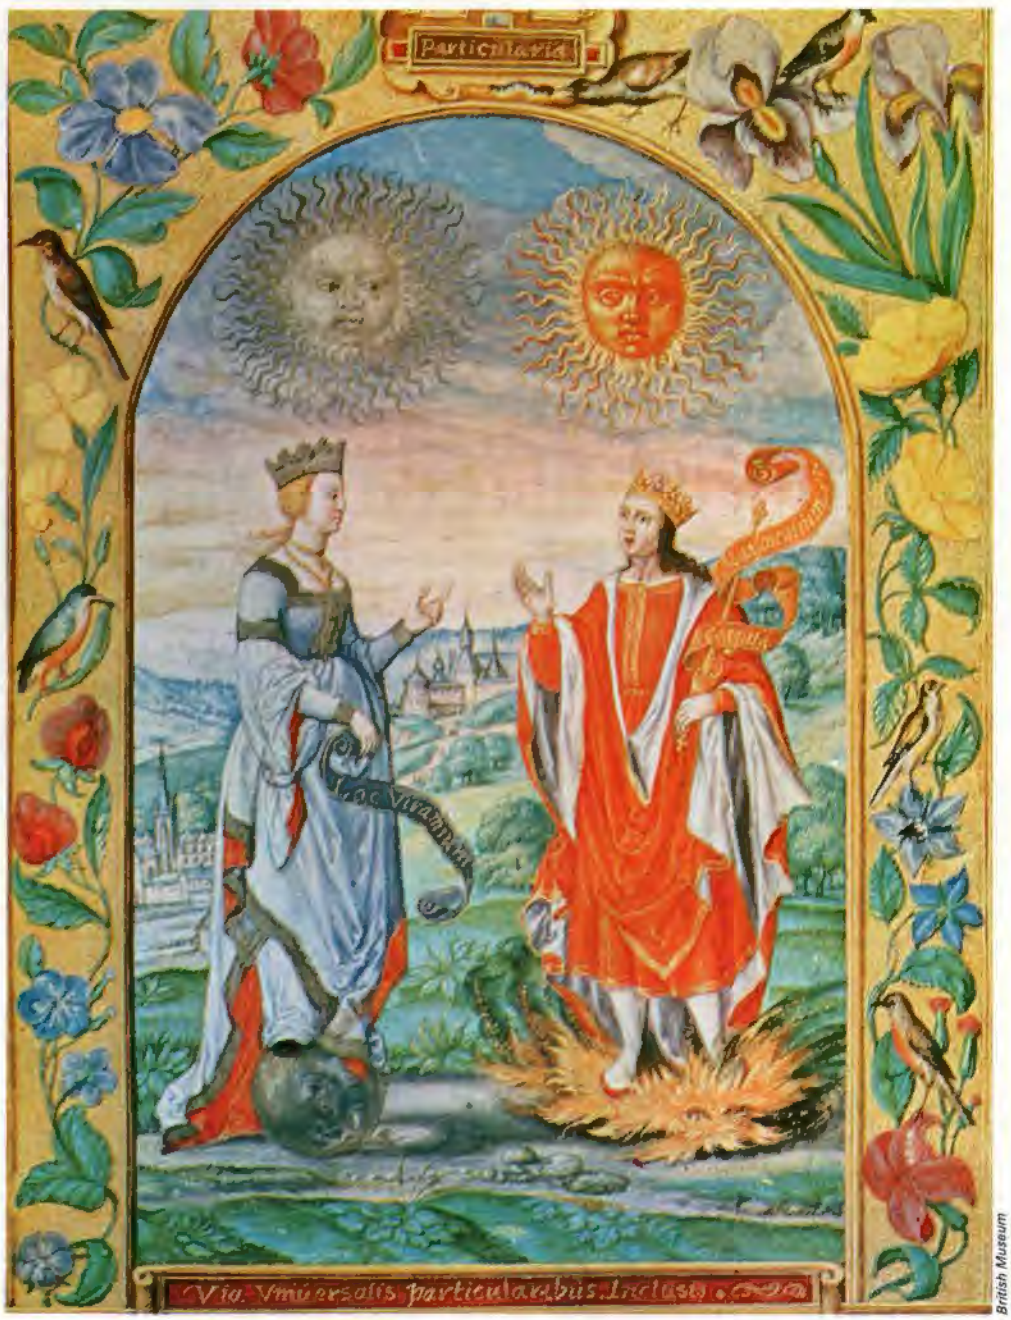
But the spirits of the earth, the air and fire seldom marry a human being, though they may become attached to him and enter his service. They are not, it must be remembered, 'airy nothings', or merely ghosts or appearances. They are of flesh and blood, only subtler than man.

In a special work on undines, Paracelsus supplies more details about them. If a man marries an undine, and she deserts him, he ought not to take another wife because the marriage has not been dissolved. If he does marry another woman, he will shortly die. The children of a marriage between a man and an undine will be human beings, because they will receive a human soul from the man. The undine, too, receives the germ of immortality through her union with a human being. But 'as an undine without her union with man dies like an animal, so man is like an animal if he severs his union with God.'

Finally, Paracelsus issues a warning. If any man has an undine for a wife, he must take care not to offend her while she is near water, as she might be prompted to return to her own element. In the same way, if anyone has a gnome for a servant, he must be faithful to him: 'if you do your duty to him, he will do his duty to you.'

It would seem that the elementals owe much to the imagination and invention of Paracelsus, and if he drew on any popular fancies, he certainly added many touches of his own. The elementals have not entirely lost their grip on the imagination: the undines have inspired at least one modern theatrical work, and the gnomes of this world are still a force to be reckoned with. Modern occultists also, through concentrated imagination and will-power, try to conjure up 'artificial elementals' – cruel, injurious beings which may resemble toads or snakes, not visible to ordinary sight, but real enough to the person attacked or to a clairvoyant.

DAVID PHILLIPS



British Museum

The four traditional elements fire, air, water and earth provided the basis for the alchemists' belief that gold could be manufactured artificially. Later alchemists said that everything was made of mercury, sulphur and salt: the male-female qualities of mercury are depicted in this illustration from the *Splendor Solis*, a 16th century treatise on alchemy

Elephant

Revered in the East for its strength and stability, it was also held to be a symbol of wisdom, moderation and pity, and was associated with kings and royal authority: in Hindu legend Indra, the king of the heavens, rides an elephant called Airavata, and the elephant-headed Ganesha, god of worldly wisdom, is often petitioned for success before any enterprise; the universe was also thought to be supported on the backs of elephants: in Siam, sacred white elephants were reared by human nurses.

Karin Haddle

What exactly happened at the celebration of the Mysteries at Eleusis, secret rituals associated with Demeter, is still a mystery. It has been suggested that at the climax initiates were shown the most holy object of all – one of totally unexpected simplicity

ELEUSIS

British Museum

HELD IN HONOUR of Demeter and Persephone, the Eleusinian Mysteries were ceremonies of initiation, celebrated annually during antiquity at Eleusis in Attica. Their nature was a closely guarded secret, any breach of which was liable to punishment by death. Originally they were a purely local cult, possibly restricted to a single family or clan; their secrecy has been sometimes explained as due to these original restrictions, but it is more probably due to the sense of awe and fear which was felt by those who took part in ceremonies which concerned the forces of life and death.

Like all other rituals of Demeter and Persephone, the Mysteries were in origin agricultural ceremonies, but comparison with similar rituals in other societies shows that the processes of agriculture tend to be associated in ceremonies of initiation with those which govern the life of men. It is therefore probable that already in their earliest stages a personal significance was attached to the Mysteries. Unlike other types of initiation, they were not restricted by age or sex, and their significance was thus potentially universal.

The incorporation of Eleusis into a unified Attica probably led to an expansion of membership. Legend dates this to the mythological period, but adds that Eleusis was allowed to keep control of the Mysteries, according to the Greek writer Pausanias (2nd century AD). Apparently Athens did not interfere much, if at all, with the cult in the early historical period. The Homeric Hymn to Demeter, which dates from the late 7th or early 6th century BC, does not refer to Athens or to Athenian elements of the cult. The management of the Mysteries appears to have been in the hands of the Eleusinian family of the Eumolpidae, from whom the Hierophant was drawn. His title indicates that he revealed the sacred objects, and he was the chief priest at Eleusis. At some stage, however, this management was shared with the family of the Kerykes, who had Athenian connections. They provided the *daduchus* (torch-bearer) and the *keryx* (herald) who were the other chief officials of the cult. Athenian influence first becomes apparent in the 6th century, with the building of an enlarged *telesterion* (hall of initiation), and towards the end of the century there is evidence of the construction of a sanctuary of the Eleusinian deities at Athens. A procession from Athens to Eleusis was instituted and initiation into the rites of Demeter and Persephone at Agrae, on the outskirts of Athens, was made a necessary preliminary to initiation at Eleusis. This first stage was called the Lesser, the second the Greater Mysteries.

A further development was the opening of the Mysteries to all who could speak Greek, provided that they were free of pollution. The first definite evidence comes from an anecdote in Herodotus, the Greek writer of the 5th century BC, which is set at the time of the battle of Salamis in 480. This tells how a great cloud of dust like that of the procession to Eleusis was seen moving towards Salamis and a sound like the cry made during the procession was heard. The story was taken as a sign that the Eleusinian deities had come to the aid of Greece in her struggle against Persia.

This legend must have contributed to the popularity of the Mysteries, and Athenian propaganda during the 5th and 4th centuries BC also greatly increased their

prestige. This remained undiminished down to the Roman period, and they survived in fact until the end of the pagan world, when the invader Alaric in 395 AD finally destroyed the sanctuary.

Dancing by Torch Light

Archeology shows evidence of a series of buildings on the site of the telesterion from prehistoric times onwards, but the first literary evidence for the cult is found in the Homeric Hymn. This throws light on some of the preliminary rituals. One of these was a purification ceremony, in which the initiate was seated on a stool with his head veiled and his foot resting on a ram's fleece, while a priest or priestess purified him. In the Hymn Demeter is portrayed performing a similar ritual on her arrival at the palace of the ruler of Eleusis. On later monuments Heracles is shown undergoing the same purification.

Fasting was also a preliminary to initiation, and the Hymn describes how Demeter fasted for nine days when looking for Persephone and how she would not accept food or wine in the palace at Eleusis. She also carried torches in her search, and these played an important part in the ritual. There were dances by torchlight around the well Callichoron ('of the fair dances') at Eleusis, and this well is mentioned in the Hymn. It is still visible at the entrance to the sanctuary. The dancing formed part of a *pannychis* (all-night festival).

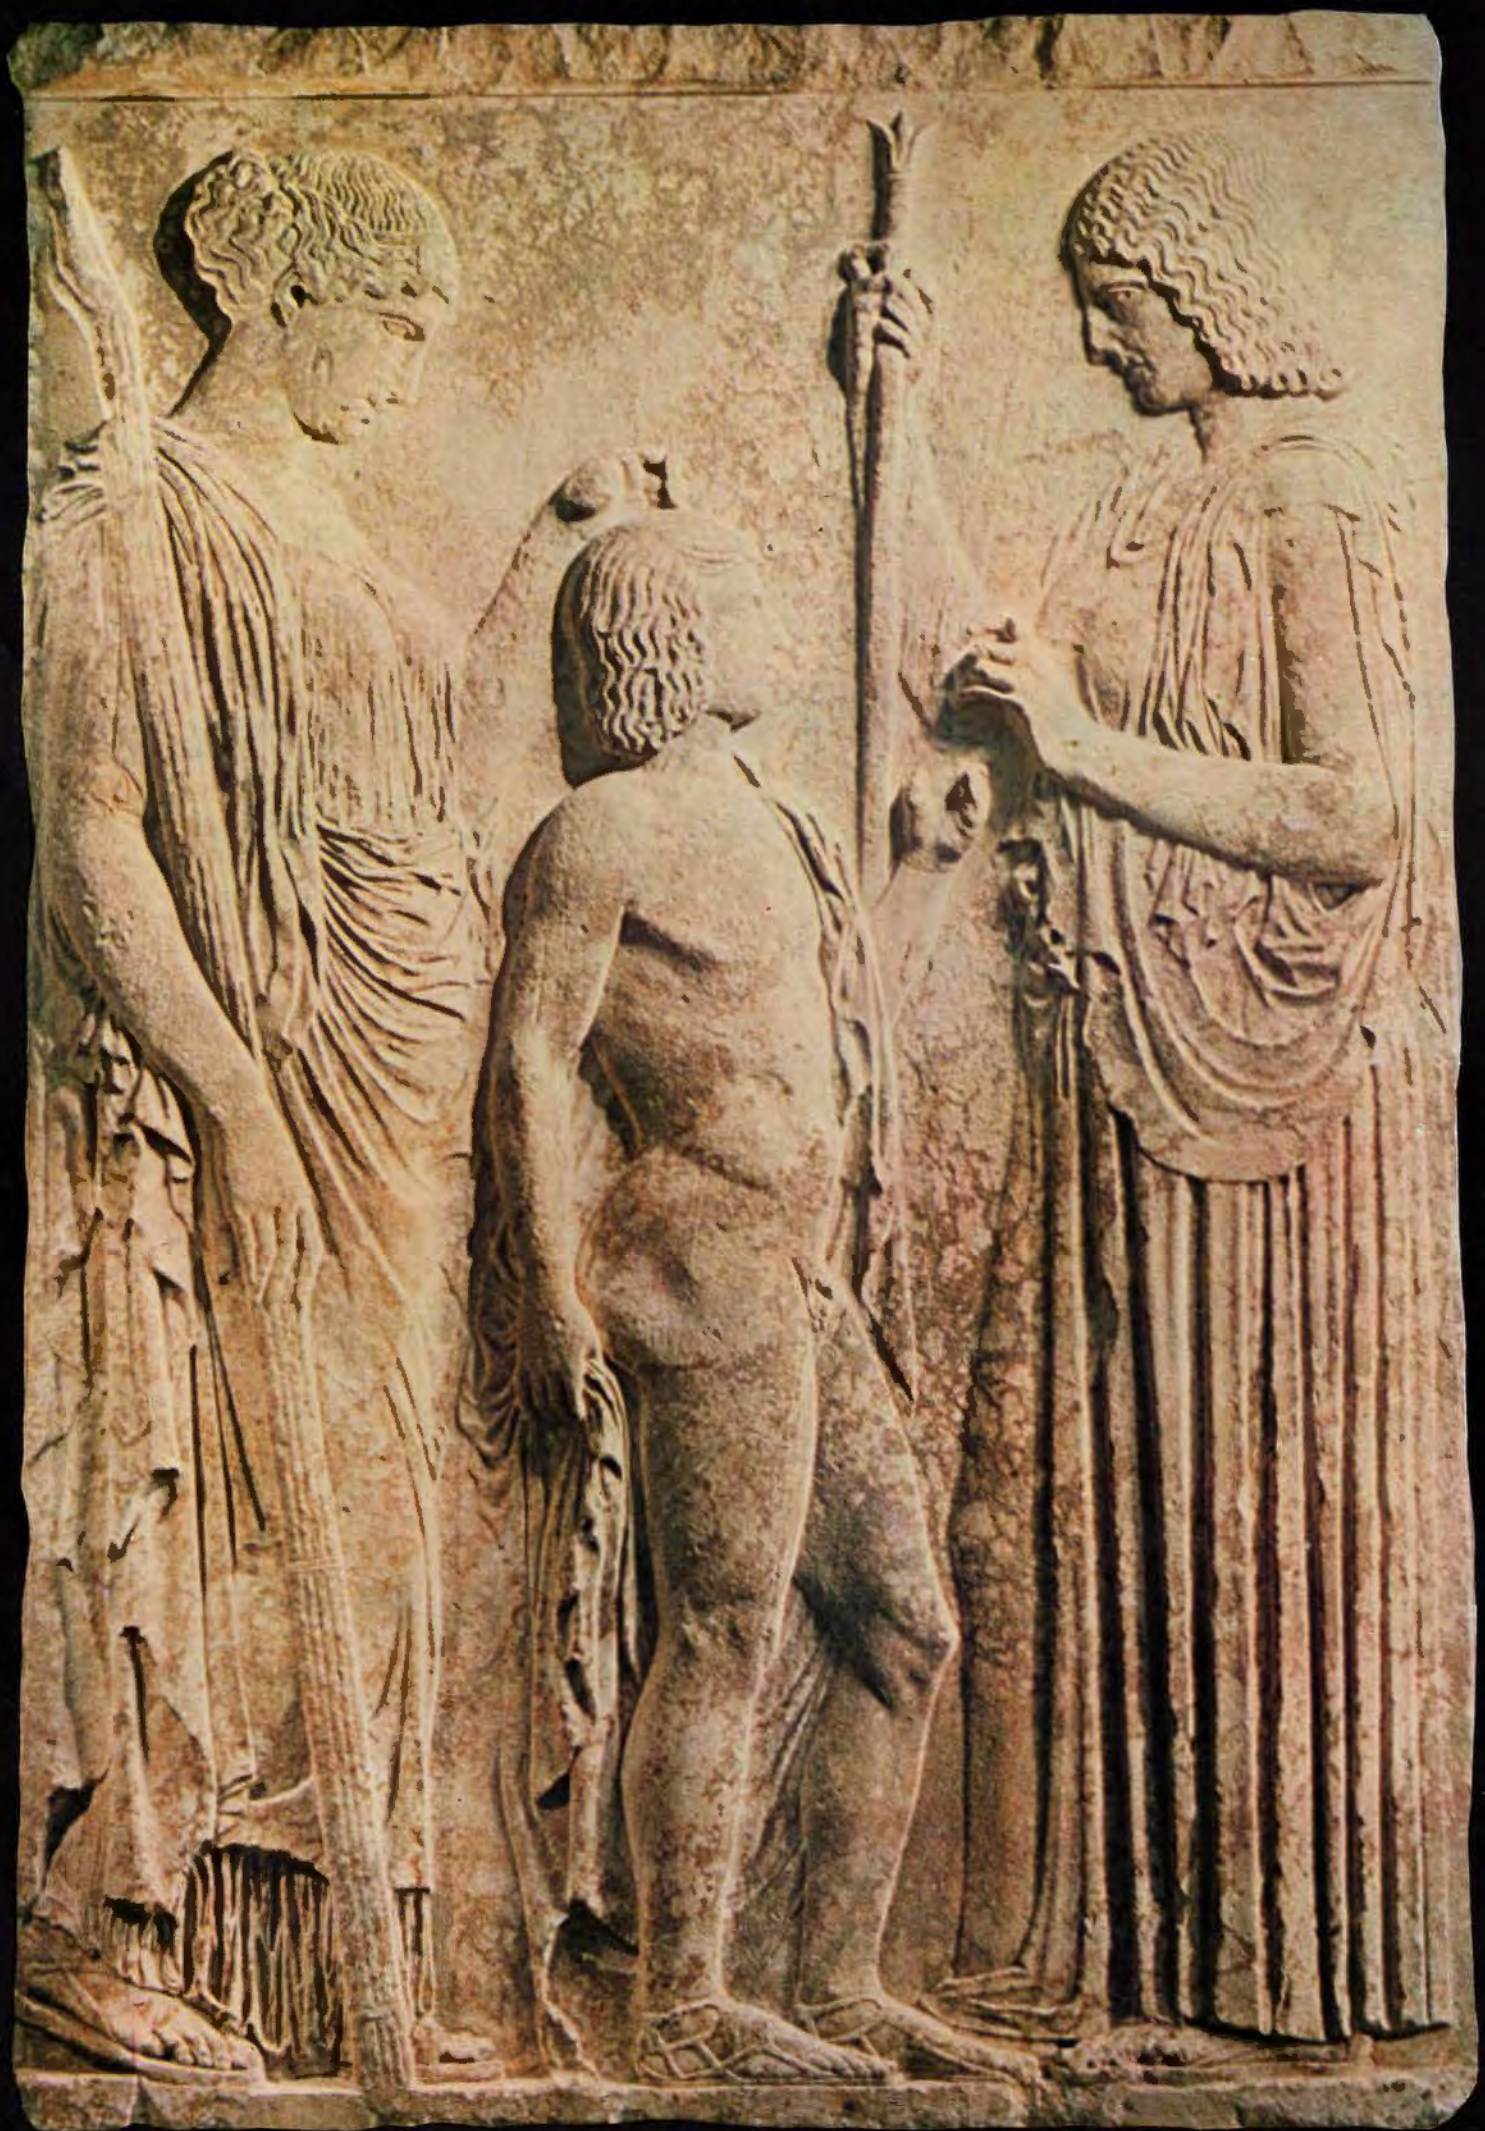
Demeter's fasting is broken when she is made to laugh by the jokes of a servant called Iambe. She then asks for a drink of barley and water, flavoured with the herb pennyroyal. In the cult fasting was also broken with this simple drink, and the making of coarse or obscene jokes (called *aischrologia*), which is common to many rituals of fertility, took place during the preliminaries to the Mysteries.

The Hymn goes on to describe Demeter's attempt to immortalize the king's son Demophon by placing him in the fire every night, her detection by the child's mother and the consequent failure of this project. There might be a reference here to the preliminary purification, in which fire was probably used. It has however been suggested that the story has a deeper significance, and that Demeter's nursing of the child reflects the 'adoption' of each initiate by the goddess in the Mysteries. As Demophon is reborn through his baptism of fire, so the initiate experiences a rebirth and the promise of a new life.

After the takeover of the Mysteries by Athens the preliminary ceremonies increased in complexity. The first stages

Facing page **After staying at the palace of the King of Eleusis during her search for Persephone, Demeter ordered that a temple should be erected where initiates would celebrate her Mysteries; she also taught Triptolemus, the King's son, the art of agriculture and commanded him to travel through the world in a winged chariot spreading this knowledge: scene on a Greek vase, showing Demeter with Triptolemus *Right* Head of a caryatid in Demeter's temple**

Mansell Collection



Facing page **Demeter presented Triptolemus, the hero of agriculture, with the first corn, and it is thought that the 'supreme revelation' of the Eleusinian Mysteries which were originally agricultural ceremonies, may have been the showing of a single ear of corn: relief at Eleusis showing Triptolemus receiving the corn from Demeter. Persephone stands behind him**

were purificatory. These were followed by the Lesser Mysteries, which took place in the month of *anthesterion* (February–March). Their purpose was also mainly that of purification, and they included washing in the river Ilissus. We are told that they had some kind of instructive content and prepared the initiates for the Greater Mysteries.

These took place in the month of *boedromion* (September–October), from the 15th to the 23rd day. There were two grades of initiation, and a year had to elapse before one was admitted to the final grade, which was known as the *epopteia*, meaning 'spectacle' or 'vision'. Before the festival the *hiera*, sacred objects, were brought to Athens from Eleusis. Their nature is unknown, but it was presumably these which the Hierophant or chief priest revealed during the ceremonies. They were kept in sacred boxes which are often represented in art.

The festival began with a solemn assembly at Athens during which the proclamation was made, which stated those classes of people who were forbidden to take part in the initiation. This was followed on the 16th day by a journey to the sea, where the initiates again took a sacred bath. Each took with him a pig, which was sacred to Demeter, and washed this also in the sea, after which the pigs were probably sacrificed. An official sacrifice to Demeter and Persephone took place the next day, and on the 18th day the initiates rested.

The great procession to Eleusis took place either on the 19th or 20th. This was called the Iacchus procession, after the deity who personified the cry which was made during it. The journey was a long one, some 14 miles, and it was interrupted by many ceremonies and included dancing, singing of hymns, and sacrifices. There was also a form of obscene humour in which prominent citizens were abused. On arrival there was a night festival with further dancing. This is portrayed on a votive tablet found at Eleusis.

About the main ceremonies of the Mysteries, which took place on the following days inside the telesterion, much less is known. The various stages of the building itself have been excavated, and the one which dates from the time of Pericles, in the second half of the 5th century BC, was a vast structure of approximately 51 metres in length and width. Along the sides were tiers of steps, wide enough to accommodate an audience of almost 4000 spectators. It is now thought that a small room stood in the centre of the hall, forming a Holy-of-Holies; from which the Hierophant would appear when he displayed the sacred objects.

The ritual took three forms, the 'things spoken' *legomena*, 'things performed', *dromena*, and 'things revealed' *deiknymena*. The first of these are thought to have been brief sentences, rather than a long exposition, and we are told by Aristotle that the initiates did not go to Eleusis to learn, but to have an experience and to be put in a receptive state of mind. Other authors emphasize the emotional experience of initiates to the Mysteries, whose reactions are said to be religious awe and fear, and at the close of the ceremonies joy, encouragement, and hope. The story of Demeter's 'passion', her search for Persephone and joy at her return, was central to the Mysteries, but it is not known how this was represented or referred to. Any form of dramatic representation appears to be ruled out by the nature of the telesterion. There were however important dramatic effects from the interchange of darkness and light, and the sudden blaze of torches at the climax of the Mysteries is often mentioned.

A Single Ear of Corn

Most of the evidence for what happened inside the telesterion comes from Christian writers, and is suspect on the grounds of prejudice and also of confusion with other pagan cults. Several authors refer to a 'sacred marriage' between Zeus and Demeter in relation to the Mysteries, and the Christian writer Asterius accuses Eleusis of celebrating 'a union between the Hierophant and the priestess' in an underground chamber. The Eleusinian myths do not refer to a marriage of Zeus and Demeter, but to that of Hades and Persephone. Originally the divine couple appear to have been anonymous, and they are sometimes referred to simply as 'the God and the Goddess'. If however a ritual union was enacted at Eleusis it cannot have taken place in the telesterion, where there was no underground chamber. Another Christian writer, Hippolytus, implies some form of sacred marriage, and he adds that during the Mysteries the Hierophant announced the birth of a sacred child to the goddess.

A second valuable testimony is given by Hippolytus about the epopteia, the name of which indicates that its essential nature was some form of revelation; references to the Mysteries throughout antiquity stress the fact that it was the *vision* of them that gave the initiates their hopes for the future. According to this writer, the 'supreme revelation' of the epopteia was simply the showing of a single ear of corn. This may seem hard to believe, and Hippolytus is eager to suggest the primitive nature of such a revelation. But if the agricultural basis of Demeter's worship is remembered, and the analogy that was felt between the life of the corn and that of men, one may be less inclined to question this testimony. The Mysteries were celebrated near the season of the autumn sowing, and their foundation is linked to the myth of the rape and return of Persephone, who personified the corn which was sown in the earth and 'came to life' again in the spring. In the symbol of the ear of corn the initiates may likewise have seen the promise of a new life beyond the grave, and the announcement of the birth of a divine child may also have symbolized this promise. At the same time, the child of the goddess of the earth is sometimes named as Plutus, the god of wealth, who in the Homeric Hymn is sent by Demeter and Persephone 'to the house of the man whom they love', and the divine birth and revelation of the corn must also have represented for the initiates the hope of prosperity in their present life.

We do not know much about the closing stages of the festival, but many authors speak of the encouragement and expectation of a better life which visitors to the Mysteries carried away with them. How far this involved moral resolutions it is hard to determine, although it seems that there was a kind of rudimentary ethical code at Eleusis which encouraged respect for family, fellow-citizens and foreigners alike. But the influence and prestige of the Mysteries throughout antiquity is rather to be explained as a result of the optimistic view of life and death which they offered, in contrast to the more pessimistic attitude of traditional Greek religion. Their influence on philosophy was strong, and through Pythagorean and Platonic circles they came to have an important effect on the philosophical and religious thought of the first centuries AD and also to some extent on the development of early Christian theology.

(See also DEMETER.)

N. J. RICHARDSON

Supreme Revelation

The Phrygians also say, however, that he is a 'green ear of corn reaped'; and following the Phrygians, the Athenians when initiating (anyone) into the Eleusinian (Mysteries) also show to those who have been made epopts the mighty and wonderful and most perfect mystery for an epopt there – a green ear of corn reaped in silence. And this ear of corn is also for the Athenians the great and perfect spark of light from the Unportrayable One: just as the hierophant himself, not indeed castrated like Attis, but rendered a eunuch by hemlock, and cut off from all fleshy generation, celebrating by night at Eleusis the great and ineffable mysteries beside a huge fire, cries aloud and makes proclamation, saying: 'August Brimo has brought forth a holy son, Bromios,' that is, the strong has given birth to the strong.

For august is, he says, the generation which is spiritual or heavenly or sublime, and strong is that which is thus generated.

Eleven is the number of revelation, of going beyond the human to a higher plane, but it also has its dangers

ELEVEN

THE ELEVEN DISCIPLES who remained true to Jesus provide the clue to most modern numerological interpretations of the number 11. When you add up the number value of a name, you normally reduce the total to a single figure (see ALPHABET) and 11 reduces to 2. But some numerologists make an exception for 11 (and also for 22). For example, the name Winston S. Churchill adds to 65, and 6 + 5 = 11. If you like, you can halt the reduction process at this point, especially as 11 turns out to fit Churchill's achievements and character better than 2 does. One reason for the exception is that 2 is in many ways a disagreeable number (see TWO) and some numerologists like to avoid disagreeable numbers if possible, though they stress that you should consider whether you are pulling the wool over your eyes if you choose to think of yourself as 11 instead of 2.

If you decide that your number is 11, then you resemble the faithful apostles in having moral courage, visionary insight, and a powerful impulse to teach and inspire your fellow men. You have great spiritual force, you are an idealist, you are not satisfied with anything short of the best. All this is reinforced by the fact that the eleventh sign of the zodiac, Aquarius, stands for determination to help others, to pour out the life-giving water of your faith and vision on a parched world. In addition, you are probably an affable, genial person, because in astrology the eleventh house of a horoscope traditionally influences friendships and social life.

Revelation and Martyrdom

Partly because of Christ's disciples and partly because 11 follows 10, 11 is the number of revelation, received by you and transmitted to others. Since 10 is the number of the bodily plane of existence, the 10 fingers on your hands and toes on your feet, 11 stands for the beginning of a higher set of numbers, the revelation which opens the way to a higher, more spiritual plane.

Sonia Halliday

Because 11 disciples remained true to Jesus it is considered to be the number of moral courage, visionary insight, idealism and spiritual strength: wall painting, in Turkey, depicting the Last Supper

On the other hand, the fact that 11 comes immediately after 10 has given it some less desirable characteristics. In the 12th century Hugh of St Victor said that 11 means 'transgression out of measure'. It goes dangerously beyond normal limits. The number also falls dangerously short of 12, which is a number of completeness because so many things are arranged in groups of 12 (notably the 12 months of the year – see TWELVE). And so 11 combines the qualities of going far beyond the human without going quite far enough, and the numerologists warn of loving your ideals better than your fellow men, of providing universal remedies but not appreciating human needs. 'Needs to cultivate human understanding,' they say, rather in the manner of a headmaster ending a schoolchild's report. The fact that in a good many games a team consists of 11 players has been seen as symbolic of the imperfect attempting to reach the goals of perfection.

The number is also dangerous in a more physical sense because it means martyrdom, the death in this world that brings entry to the higher life of the next. Less lethally, it may mean opposition, enemies, attempts to frustrate you, the common obstacles met by inspired preachers and teachers.

Elf

In northern European mythology elves were originally small supernatural beings of two kinds, the light elves who lived in Alfheim, and the dark elves who lived in Swartheim: they later became the fairy people of Germanic folklore and were often thought of as mischievous and malignant, having the power to harm people with their 'elf-arrows': children born with deformities were said to be 'elf-marked', and knots in hair were called 'elf-locks'.

See FAIRIES.

John Webb

Alchemists were not only concerned with turning base metals into gold but with curing the ills of the flesh: disease and old age. They believed that the two aims were inter-connected and experimented diligently in their laboratories to produce a universal remedy or Elixir of Life

ELIXIR OF LIFE

THE WORD 'ELIXIR' comes from the Arabian *aliksir*, and in early Greek chemical treatises meant the transmuting agent by which base metals could be turned into gold and silver (see ALCHEMY). European alchemists referred to the Philosophers' Stone, which was believed to have universal curative powers, as the Elixir of Life, although many ancient writers claimed that the Elixir could also be made from other stone and is not necessarily identical with the Philosophers' Stone. An entry in an 18th century reference work, the *Universal Lexicon* of H. Zedler, defines 'elixir' as a kind of dark-coloured medicine, composed of many ingredients and dissolved in a strong solvent.

The belief in a panacea or remedy for all ills may be traced back until the days when the long life or immortality of the gods was explained by their partaking of mysterious food and drink, like the nectar and ambrosia of the Greek deities. It was widely believed that these precious and youth-giving remedies could be made of precious ingredients like gold, pearls and other jewels.

During the first centuries AD Alexandria was the home of the secret doctrine which promised to convert impure metals into gold, and at the same time to convert human beings into pure sages; and as the crowning achievement of their alchemical efforts, to prepare the 'universal remedy'. The theory was that if the philosopher or alchemist had attained a state of mind, allowing him to master the problems of metallic transformation, he should also be able to use his knowledge in overcoming all vicissitudes of human life, normally subject to an unknown number of diseases.

Here the aims of the Western and of the Chinese alchemists united. In the Far East the longing for a universal remedy was very strong; there are legends of a great master of the secret art of the 2nd century AD, named Wei Po-Yang who, according to tradition, became immortal together with one of his disciples and also with his little dog, who accidentally ate the rest of the magical panacea. In Europe the search for gold was pursued more single-mindedly and therefore its 'synthetizing' is mentioned more frequently than the other goal of the alchemist, the Elixir.

Normally medicines are designed to cure specific diseases; but what the alchemists strove for was the panacea, which could cure all kinds of sickness and also considerably prolong human life (hence *elixir vitae*, Elixir of Life). The basis for such an aim is the theory that all kinds of disease have a common cause – as for instance a disturbed balance of the 'elements' and 'humours' – so if it were possible to find an agent able to redress this balance, then the universal remedy would be found. Even the scholarly Paracelsus, who always revolted against the ancient humoral theories, claimed to have found a kind of panacea and told of the great number of different diseases he had been able to cure by its use. As late as the 16th century, the German alchemist Gerhard Dorn wrote: 'For since there is one single and most general beginning of all corruptions – and one universal fount of regenerating, restoring, and life-giving virtues – who, save a man bereft of his senses, will call such a medicine in doubt?' It is quite clear that the theoretical basis was the idea that sickness and disease have their common root in 'corruption', comparable to the Church's dogma that it was the original sin of Adam and Eve which was the true reason for all kinds of earthly degeneration.

The basic conception is that normal human life is afflicted by sickness and death as a consequence of impurity; and that by gradual purification, by the refining and purging that is an essential part of alchemical theory, it is almost inevitable that the adept will be enabled to overcome

A universal panacea, the Fountain of Youth, the Elixir of Life: the belief in a remedy that will cure all ills and prolong life is deeply-rooted in human nature. Details from Cranach's *The Fountain of Youth* showing (*left*) old women entering the magical waters which transform them (*right*) into young girls

Staatliche Museen Preussischer Kulturbesitz, Berlin

The immortality of the gods was attributed to the life-preserving qualities of their food and drink, the ambrosia and nectar of the Greek gods, for instance: *The Marriage of Cupid* by Raphael, in the Farnesina Palace, Rome, shows them feasting on Olympus

all these earthly imperfections. It follows, then, that this universal remedy must be a tool against all kinds of disease. The panacea must strengthen the vital energy to such a degree that the patient becomes stronger than all afflictions.

Many alchemists have claimed to possess such a secret remedy, including Paracelsus and Jan Baptist van Helmont (1577–1644). Especially in the writings of Paracelsus's disciples, the medical alchemists who cured with the help of inorganic compounds instead of drugs, there is much talk about the mysterious *'tinctura philosophorum'* or Philosophers' Tincture. One of these texts, c 1560, tells us that by the art of the true alchemist the tincture is made, and 'the true aim of the true medical men is the resurrection and regeneration of nature. In order to find this art the tincture of the physician had to be invented miraculously, which up till our days was always secretly used by the true masters of the spagirical art.' The term 'spagyric' is defined as 'made by means of the art to separate and to combine in the right way' – and refers to one basic maxim of alchemy: *'solve et coagula'*, dissolve and coagulate. Secret medicines are therefore often called 'spagirical remedies', and apparently the great number of prescriptions, describing the ways of making curious substances out of rare minerals, alcohol, metallic solutions, acids, and so on seem to represent nothing else than substitutes for what was so often talked about – the Elixir of Life.

A strange panacea mentioned in Zedler's *Lexicon* is the 'panacea aqua', which was apparently nothing else than water, distilled several times, without any taste, odour or colour. A certain M. de Villars of Paris was said to have used it to cure many diseases. Other elixirs and panaceas, composed from minerals and rare herbs in the most cases, were ascribed to many other chemists and alchemists. Zedler's encyclopedia refers to a case in which a panacea was used; he speaks of a letter from one of Paracelsus's disciples to a certain M. Michael Neander, relating how on one occasion a woman, in great distress, told the famous doctor that her husband would die in the course of the following night. Paracelsus inspected the patient's urine and then told her: 'Tomorrow your husband will have breakfast together with you and recover again.' Then he took a little portion of a white powder ('white elixir'), and told her to give it to the sick man dissolved in warm beer. The patient would then go into a sweat and become well again – and so it happened.

Many stories of this kind could be told but it is not clear whether they originated in the time of Paracelsus or were later attributed to him. At any rate the Swiss physician himself wrote in his books that he had been able to overcome many terrible diseases. The Dutch alchemist van Helmont tells us that by divine inspiration he had found the true remedy by using the ways of the alchemists, and he called himself *'philosophus per ignem'*, meaning 'philosopher through fire'. He stressed his belief that Paracelsus had known the Elixir of Life which he called a universal ferment, necessary for all mixture of the elements and humours. He is said to have cured various diseases by dipping a secret 'stone' into milk or oil which the patients had to drink. Sometimes he speaks of a universal solvent, the 'alkahest', by which he apparently means the same as Elixir and which, in the right concentration, should be able to dissolve everything 'as warm water dissolves ice'.

In a tract ascribed to Paracelsus and published for the first time in 1570, entitled *De Tinctura Physicorum* (On the Tincture of the Physicians) occur the following sentences: 'This is the tincture by which some of the first physicians in Egypt, and afterwards up till our times, have lived for 150 years. The lives of many of them lasted for some centuries, as history clearly teaches, although this does not seem to be true to anybody: because its force is so miraculous, that it is able to enlighten the body . . . and to strengthen him to such a degree that he will remain free of all diseases and, although afflicted by old age, will appear as it had been in his youth. Therefore the *tinctura physicorum* is a universal remedy which devours all sicknesses like a fire devouring wood. Its quantity is tiny, but its force is mighty.' The

Accademia Nazionale dei Lincei

author goes on to claim that he has cured many diseases including leprosy, dropsy and epilepsy.

Prolonging Life to Doomsday

The 17th century French alchemist Jean d'Espagnet, a native of Bordeaux, describes the preparation of this mysterious medicine in the following way: 'Take three parts of red earth (meaning the Philosophers' Stone), water and air, six parts altogether, mix them thoroughly and prepare a metallic paste like butter in which the earth can no longer be felt with the finger. Add one and a half parts of fire and place it into a thoroughly closed vessel and give it fire of the first degree for digestion. Then you prepare an extract of the elements according to the degrees of the fire until they are reduced to a solid earth. The matter becomes like a shining, translucent red stone and then it is ready. Put it into a pot on a modest fire and moisten it by its oil, drop by drop, until it becomes fluent without smoke. Do not be afraid that the mercury will vaporize; the earth drinks the humidity eagerly, because it is a part of its nature. Now you have the elixir ready. Thank God for his grace that he has granted you, use it for his praise and keep the secret.' The meaning of these sentences was probably clear to alchemists of his day but we can hardly guess what substances were referred to when d'Espagnet speaks of adding one and a half parts of fire.

Apparently the belief in the efficacy of the alchemical Elixir was not limited to the time before the beginnings of modern science. The author of *History of Alchemy* (published in 1832), K. C. Schmieder, evidently believed to some degree in the existence of the universal remedy when he wrote about the famous Salomon Trismosin, a mysterious personality said to have lived towards the end of the 15th century: 'He (Trismosin) not only told about the force of the panacea in general, but pointed to certain cases revealing the miracles of it. He regenerated himself by a half grain of it so that his yellow, wrinkled skin became smooth and white, his cheeks red, his grey hair black again, and his bent spine was lifted vertically . . . He was inclined to believe that, using this medicine, human life could be prolonged at one's convenience, probably until Doomsday.' Here Schmeider apparently became sceptical himself, and so he adds: 'Exaggerations, which show a disagreement with Nature, were always the reason that their author was met mistrustfully, and that modern spectators condemned the panaceist together with the alchemist.'

Those rare creatures, the 20th century alchemists, have also not turned away from hopes of the Elixir. In 1917 a Californian couple named Ingalese claimed that they had isolated a substance which they called both Philosophers' Stone and Elixir. Minute doses, they said, acted as a rejuvenator – and they kept themselves hale with it. They also claimed to have used it successfully to 'resurrect' a woman who had been medically dead for a short time.

It is not easy to distinguish between what the alchemist tried to teach in allegories and allusions and should be taken in a higher sense, and – on the other hand – what they were ready to take for granted in a literal sense. The one possibility by no means excluded the other, but it was thought of as a mystical participation of the spiritual with the material aspect. Therefore, if the old texts speak of purification, rectification, refinement and so on, giving the adept miraculous possibilities of influencing his world, then this in the first place is to be taken as a hint of his new spiritual freedom from normal human limitations. At the same time, however, when the opposites, spirit and matter come together, the alchemist was also free to believe in legends such as that of the life-giving and regenerating universal remedy, made from the same 'hidden stone' which can also be used for transforming impure metals into gold.

For us it would be more convenient to think that the ancient alchemists only spoke in allegories when describing the wonderful aspects of the universe one perceives when one is granted ultimate knowledge by God's grace. We would gladly accept these legends as symbols of a purely spiritual immortality, beyond any material affliction, in the face of which one is able to forget all earthly disease and imperfection and to behold only the immaterial light of the purified mind. But such a standpoint would take into account only half of the truth in which the alchemist believed.

If we take the alchemical process in the Jungian sense and explain it by projection

The Wine of Egypt

A great lady, who was also unfortunately for her, an old one, and was unable to resign herself to the fact, was reported to have consulted Cagliostro, who gave her a vial of the precious liquid with the strictest injunction to take two drops when the moon entered its last quarter. Whilst waiting for this period to arrive the lady who desired to be rejuvenated shut up the vial in her wardrobe, and the better to ensure its preservation informed her maid that it was a remedy for the colic. Fatal precaution! By some mischance on the following night, the maid was seized with the very malady of which her mistress had spoken. Remembering the remedy so fortuitously at hand she got up, opened the wardrobe, and emptied the vial at a draught.

The next morning she went as usual to wait on her mistress, who looked at her in surprise and asked her what she wanted. Thinking the old lady had had a stroke in the night, she said –

"Ah, madame, don't you know me? I am your maid."

"My maid is a woman of fifty," was the reply, "and you . . ."

But she did not finish the sentence. The woman had caught a glimpse of her face in a mirror. The Wine of Egypt had rejuvenated her thirty years.

W. R. H. Trowbridge, *Cagliostro: The Splendour and Misery of a Master of Magic*

of a subconscious process onto the surrounding world, then we are quite near to an understanding of the coincidence of the spiritual and the material aspect. A purely spiritual alchemy would never explain the existence of alchemical laboratories in which physicians honestly and fanatically sought for occult medicines. The wish to overcome sickness and pain by having reached a high spiritual stage and by taking part in the divine creative forces is, at any rate, a noble one and therefore we are able to view it more sympathetically than the attempt solely concerned with synthetizing gold.

From the early days of Hellenistic alchemy onwards, the final object of the 'philosopher' was to set the *pneuma* (soul) free of its bodily fetters; the pneuma cannot be open to any earthly affliction – therefore if the highest stage in evolution could be attained, sickness would inevitably be overcome. Whatever we are able to accept as true in the alchemical legends of the Elixir of Life, there is no doubt that this ideal ultimate object of the alchemical doctor's endeavours helped to improve his pharmaceutical possibilities.

It is possible that out of the endless striving for the Elixir man gained access to many secrets of Nature; otherwise for long centuries doctors would have been content with their traditional *materia medica* as described in antique herbals. Alchemy, dealing with inorganic matters (which nevertheless for the alchemist were not without a secret life) opened new doors; and if it could not bring into existence a true Elixir of Life it certainly helped man to seek, to labour, to endeavour – and this is the true beginning of all human progress.

Elm

In Teutonic mythology the first woman, Embla, was created from an elm by the three gods Odin, Hoenir and Loki who gave the tree breath, soul and warmth: in England the elm was also known as 'elven' because of its association with the elves, and in Devon it was believed that lightning would not strike an elm: according to country lore, when the leaves of the elm were as big as a mouse's ear it was time to plant barley, while the shedding of its leaves before the autumn foretold disease among the cattle.
See TREES.

Elohim

One of the chief names for God in the Old Testament: it is the plural form of the Hebrew *El* or *Eloah*, meaning 'god', and is used to denote heathen gods and spirits of the dead as well as the God of Israel: magicians, believing that the 'real' name of the god contained his essence, inscribed Elohim on their magic circles to infuse divine power and ward off evil influences.

Museum of Fine Arts, Boston

Elysium

In Greek mythology a land of perfect happiness and perpetual spring where those favoured by the gods lived exempt from death; according to Homer the Elysian Fields were located at the end of the earth, on the banks of the river Oceanus, and were ruled by Rhadamanthus: later classical writers identified it as the part of the underworld to which the righteous went after death.

Layton-Sun

Emanation

Literally an 'outflowing' of the supreme principle or divine essence into a series of secondary forms: central to the system evolved by the Cabalists was the belief that God revealed himself through ten descending emanations or spheres known as *sefiroth*, aspects of God: they provide a path by which man can reach God and are centres of power which magicians attempt to use.
See CABALA.

EMERALD

POPULARLY ASSOCIATED with romantic love and the sensual side of Nature, the emerald is attributed to Venus and to Friday, the day sacred to that goddess. It is also associated with the zodiacal house of Gemini, the sign of the Twins.

These attributions are the outcome of a long evolution of ideas which had their root in a close and intense observation of physical phenomena. The Venusian attribution is based upon the concept of renewal and rebirth. In ancient Egypt *uat* was the name for water and it also means green. Water and green were synonymous in early mystical lore because water typified the earliest form of soul or generative essence; the affinity of that colour with the element itself is of secondary importance.

The Egyptian word also signified the hard green stone, the emerald, and the green feldspar, a rock-forming mineral of such extreme hardness that a sharp knife is barely able to scratch it. It was used primarily for tablets, another meaning of the word 'uat' being to transmit, as is done by engraving upon tablets. The celebrated Emerald Tablet, containing the 13 precepts of Hermes and revered by generations of alchemists, was said to have been engraved by Hermes Trismegistus (see HERMETICA). *Uat-chat* was the name of a nome or division in Upper Egypt; its capital was Aphroditopolis, and its goddess, Hathor – the Egyptian Venus. The Egyptians depicted the Eye of Horus in the uat or emerald colour, the eye being a reflector of images, both in this world and the next.

The blue-green sceptre of the genetrix, *Uati* (also Uatchit or Wadjet) was a symbol of the Twin Goddesses and blended the blue of heaven and green of earth in one image. This is undoubtedly the origin of the attribute of the emerald to the twin-sign, Gemini, at a later stage of symbolism. Uati brooded over the mummified body of Osiris (the deceased), bringing it to rebirth from the green earth into the blue heaven of eternal life. The uat as the emerald earth containing the dead was – in this instance – synonymous with the *Tuat*, or underworld, from which emerged the glorified spirits at the time of rebirth or resurrection.

The 19th century Egyptologist, Champollion, copied an emerald representation of Atum from the lid of a sarcophagus, showing that this colour typified the invisible world out of which new life burgeoned in verdant raiment of green leafage.

A Graeco-Egyptian magical rite involved the consecration of a scarab 'carved out of precious emerald'. It was bored through and strung with a gold thread so that it could be worn as a charm. Beneath the beetle was carved, also in emerald, a figure of the goddess Isis. On days proper to its use, this spell was recited over it: 'Come to me, thou that art under the earth, rise up to me, thou great spirit.'

The Papyrus Sceptre or Lotus Wand – another magical charm – was made of mother-of-emerald. The papyrus was the typical plant of nourishment and reproduction, also of the transmission of the word. This amulet therefore represented 'the magical power of Isis' which endowed the wearer with rebirth in the spirit world.

The colour and gem attributed to Libra is also emerald, Libra being the zodiacal house of Venus. As the colour green is a blend of yellow and blue, the emerald typified the enduring conjunction of the blue (air) of heaven and the yellow (gold) of the sun. Thus, Venus, who symbolized life, growth and the green earth, had as her most brilliant form the emerald.

...the heavens will pass away
with a loud noise
and the elements will be dissolved
with fire, and the earth
and the works that are upon it
will be burned up

END OF THE WORLD

Man has always been haunted by a sense of the impermanence of this world. The ideo that the final destruction of the cosmos is followed by re-creation is common to many religions

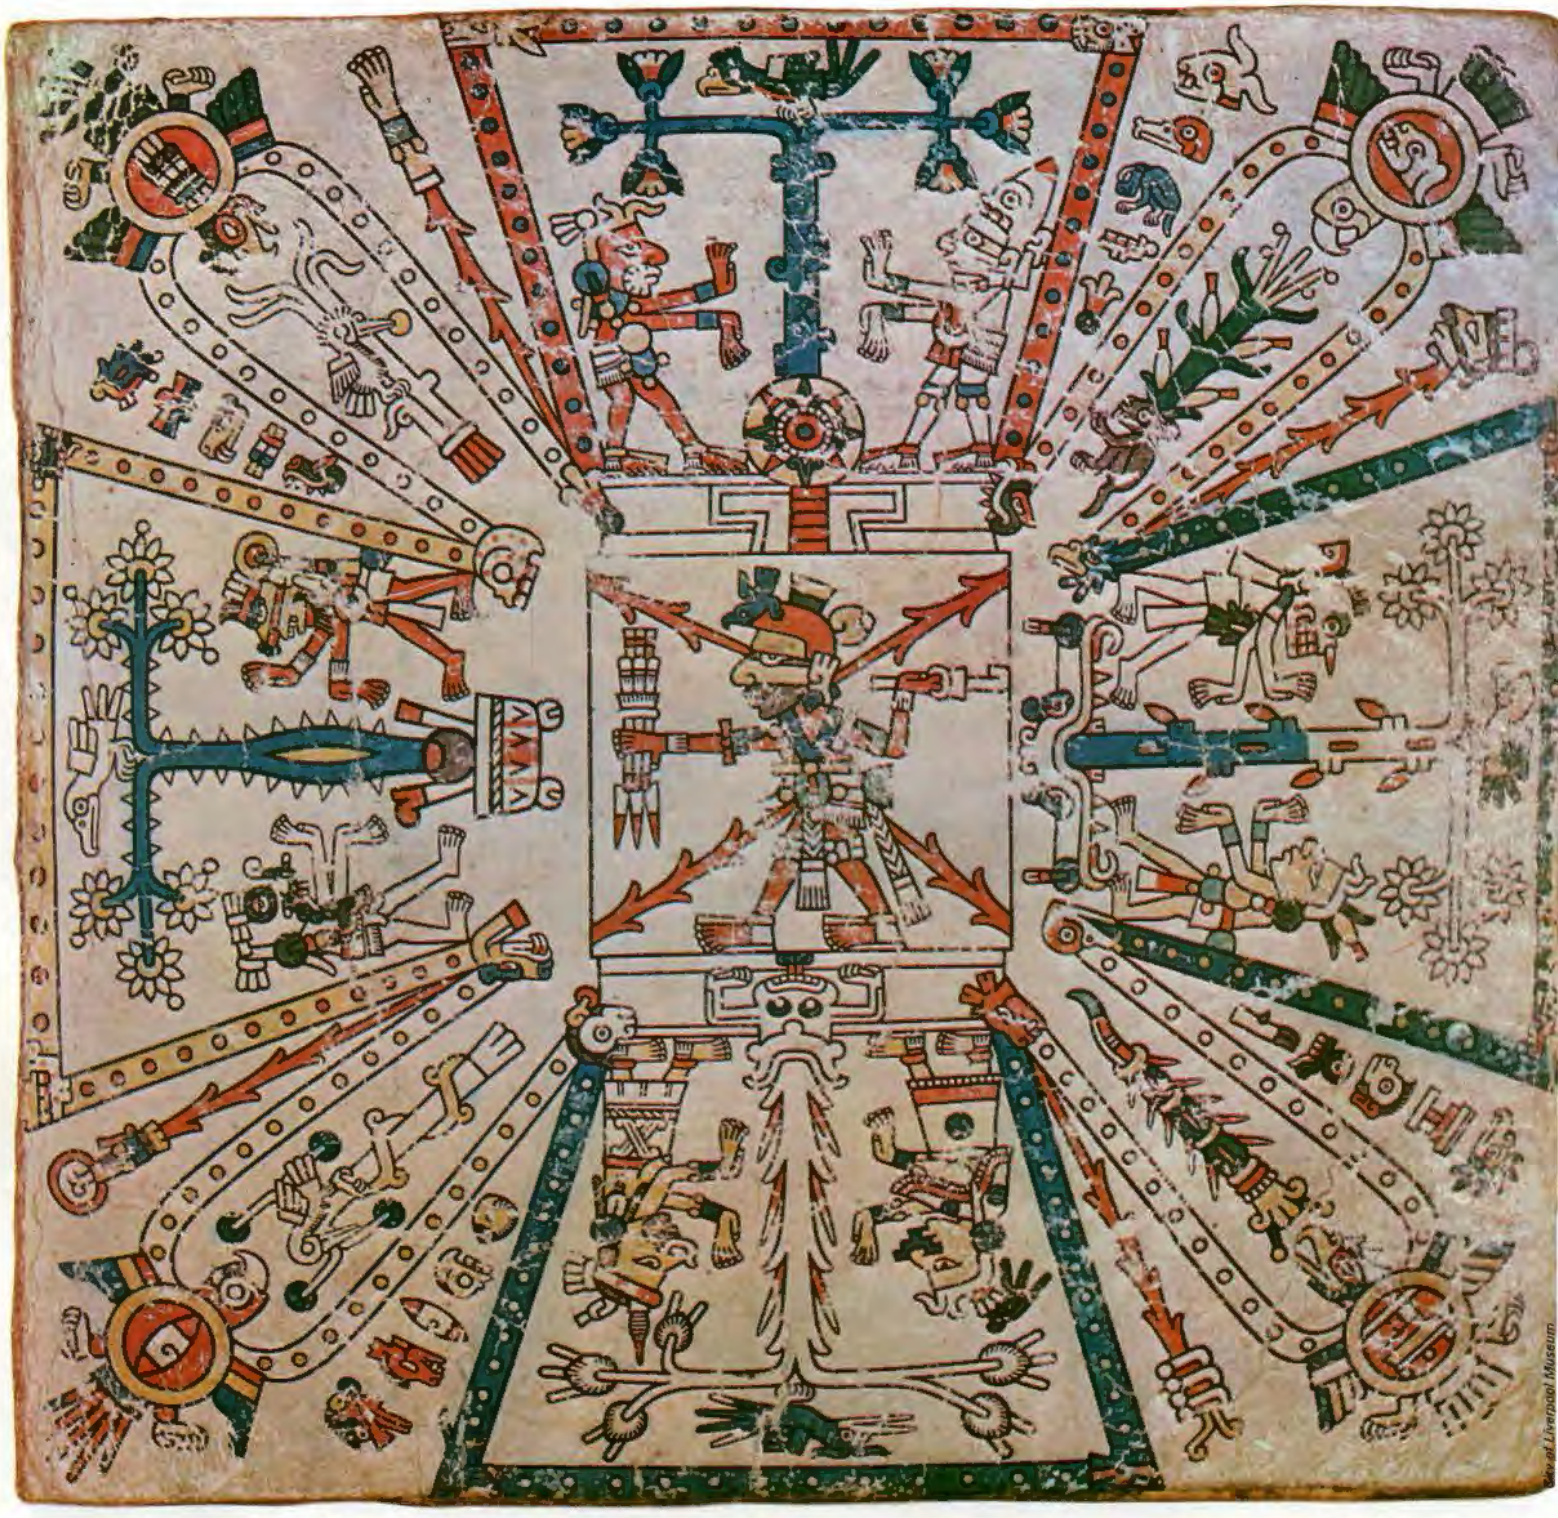
THE RAGGED FANATIC, solemnly carrying his placard announcing that 'The End of the World is at Hand', is an object of ridicule. The image of the mushroom cloud is an ever-present reality to every sensitive person. Between the two – a very real possibility of an end to the world as we know it and the attempt to pinpoint the end and express it in mythological terms – there is much more than an accidental connection. Men have seldom been able to believe wholeheartedly in the permanence of the established order, though they have often poured scorn on the prophet who has dared to remind them of their doubts. It was so in the early centuries of the Christian era: 'Scoffers will come in the last days with scoffing, following their own passions and saying, "Where is the promise of his coming? For ever since the fathers fell asleep, all things have continued as they were from the beginning of creation"' (2 Peter 3.3) and it is so today. The difference now is that the end of the world, if there is to be an end, is seen as coming about through, in some sense, natural causes. In the past, it was held that it would come about through supernatural causes and it was accordingly expressed in mythological terms.

The writer of 2 Peter answered the 'scoffers' by pointing out as a 'fact' that the earth had been created by God out of a watery chaos (as related in Genesis 1.1), that through this same water 'the world that then existed was deluged with water and perished' (Genesis, chapters 6–8), and that by the word of God, 'the heavens and earth that now exist have been stored up for fire, being kept until the day of judgment and destruction of ungodly men' (2 Peter 3.7). Here we have a mythological pattern, repeated in many parts of the world, of creation, destruction and re-creation, and it is in this perspective that practically all end of the world myths must be seen. We may speculate

Camera Press London

Picturepoint London

The mushroom cloud of an atomic explosion (*left*) warns of the very real possibility that the world may end in scientifically created chaos; but the prophet of disaster (*right*) is still ridiculed today, as he has been through the ages



Each of a series of world ages has ended in cosmic catastrophe, according to Aztec mythology: leaf from the Codex Fejervary-Mayer depicting five world regions, four of which have already been destroyed. In the centre is the region of the present world

interminably as to the origins of such patterns as these, without ever reaching more than a probable theory. However, it seems likely that in primitive man's experience the succession of day and night, summer and winter, rain and drought, heat and cold; the rising and setting of the sun; the phases of the moon; the wanderings of some, at least, of the stars – all contributed to a sense of insecurity with regard to man's tenure of the face of the earth.

There is no lack of evidence to show that primitive man conceived of the cosmic process not as something stable, but as a great and continuous battle between the forces of creation and destruction, order and chaos. The world had been brought into being by supernatural forces out of chaos; and unless these forces were supported – by prayer, sacrifice and other ritual acts – then the world would inevitably return once more to that same chaos. The cosmic order was, however, maintained by the gods (particularly the High Gods of the sky), and should they so choose, it could be brought to an end. The annual festivals of agricultural peoples, with which cycles of myth are intimately associated, were meant to ensure the continued existence of the earth, particularly the seasonal renewal of its fertility and its life. But in the background was always the fear that at some time, to be appointed by the gods, a return to chaos would take place. Natural phenomena – hurricanes, floods, volcanic eruptions, earthquakes – suggested the means: man's ritual and moral shortcomings suggested the motive.

Common to a surprisingly large number of races was the conviction that all this had, in fact, happened before. The gods had destroyed the world on certain occasions when conditions had become so bad as to be unbearable from the gods' own point of view. But why should they ever become so bad? No simple answer is possible, except that the ancients were evidently under no illusions regarding the perfectibility of mankind.

Destruction is merely the prelude to new life, a wiping clean of the world's slate, in order that a new start may be made

But even this pessimistic outlook, which placed man's Golden Age in a distant past, and saw his evolution as a development into greater and more sophisticated iniquity, was not the whole of the story.

In ancient Babylon, for instance, where man's position in the cosmos paralleled that of the slave in the city-state, it was up to the gods to decide when the end should come. They had decided before: Sumerian and Babylonian–Assyrian mythology had recorded the legend of the great Deluge, and of the great Ark in which Ziusudra (Utnapishtim) had been saved (compare the Old Testament story of Noah), but had given no cogent moral reasons why this should have been so. Nor were their end of the world myths any the less arbitrary. In Seneca's words: 'Berosus (author of a history of Babylon) says that everything takes place according to the course of the planets, and he maintains this so confidently that he determines the times for the conflagration of the world and for the flood. He asserts that the world will burn when all the planets which now move in different courses come together in the Crab, so that they all stand together in a straight line in the same sign, and that the future flood will take place when the same conjunction occurs in Capricorn.' The astrological aspect is probably to be explained in terms of identification between the stars and the gods themselves, who were ultimately responsible for past and future catastrophes.

The link between past and future is to be seen in a slightly different form in the mythology of the Aztecs of Central America who believed in a series of world ages, each of which had so far ended in a cosmic catastrophe – famine, fire, hurricane and flood respectively. This present age was expected to end on the completion of a 52-year cycle and every 52 years special preparations were made: all fires were extingnished and priests and people ascended a sacred mountain, waiting for the rise of the Pleiades. Only when this happened could the people be sure of safety for another 52 years.

Many South American Indians tell of a similar past catastrophe, thoogh theirs is a less sophisticated conception. Usually the disaster is said to have been the sun or moon falling onto the earth, or destruction by fire or by snow and ice. And in most cases the horrors are sent by an angry god or culture hero – and later a few survivors, with supernatural aid, repopulate the earth. Algonquin tribes in North America have a few end-of-the-world tales, envisaging it either as a great fire or a final and all-inclusive battle.

Hindu and Buddhist belief generally looked on the history of the world as consisting in a series of four ages, or *Yugas*, each of enormous length. These have the names *Krita Yuga*, *Treta Yuga*, *Dvapara Yuga* and *Kali Yuga*, marked by successive declines in morals, righteousness and piety. By the end of the final age, Kali Yuga, of a Day of Brahma (a thousandfold cycle), Brahmins will have come to neglect their devotions; popular piety will be dead; fire, drought and famine will ravage the earth. Then there will be a century of death, after which the god Vishnu assumes the form of Rudra, the destroyer, and dries up all the moisture on or beneath the earth. There follows a universal conflagration, in which the last vestiges of human occupation disappear from the face of the earth. At last the underworld, earth and heavens disappear also in the vast whirlpool of flame; nothing remains save the eternal and uncreated Brahman. But this is a beginning, as well as an end: the cycle is begun again, and a new series of ages ensues, marked by the same stages, the same decline into sin and lawlessness (*adharma*), and earmarked for the same ultimate fate.

Prelude to New Life

Turning to an entirely different tradition, one of the best known and yet in some ways least understood myths concerning the end of the world is that which is found in the medieval Icelandic sources, and which has to some extent passed into the European consciousness through Wagner's opera *Götterdämmerung* (*The Twilight of the Gods*). The earliest version of this myth ends the first poem in the Poetic (or Verse) Edda, the *Völuspá* (12th century). This is no saga, nor a logically constructed prediction of the 'last times', but rather a poetic apocalypse, perhaps reflecting some of the tension between old and new faiths during the years when Christianity was winning its way into the minds of the Northern peoples. Once more, the end of all things is set in the framework of cosmogony: the beginning and the end are equally important and there are hints of a previous catastrophe, similar to those we have already seen.

The end is heralded by a cock-crow, and has been preceded by the 'Fimhul-winter' – three winters of unprecedented severity. The catastrophe begins to unfold with the death of the blind brother of the slain Balder and the fettering of the evil Loki, and the refrain begins: Garm (the hound of death) howls by the hole of the underworld; the fetter breaks; the wolf runs free. There follows a description of the terrors of the Kingdom of the Dead, and of the moral dissolution of mankind, another consistent element in such myths. Then the cosmic tree Yggdrasill shudders, the hound Garm howls once more, the snake wound round the world begins to stir, and the gods, good and evil alike, begin to assemble for the final battle. Odin is killed by the Fenris wolf but is avenged, briefly, by his son; Thor is killed by the Midgard snake. The sun becomes dark, the earth sinks into the sea, the stars fall from heaven, and fire consumes both Yggdrasill and Valhalla, the home of the slain heroes. All is waste and void.

Then the miracle happens: the earth reappears, purified and fresh, ruled by the sons of the gods; Balder and his brother return, and a high and noble temple-hall shines brighter than the sun. The underworld remains, though eternally cut off from the world of light. Chaos has once more been transcended, as in the moment of the first creation; mankind is once more established on the face of the earth – though a new earth freed from the fetters of the past. It has often been thought that the motif of new creation is not part of the original mythological tradition; and yet, allowing that the myth as we have it is post-Christian, can we not see here the fusing of Indo-European and Judaeo-Christian traditions within the framework of high poetry?

A far different Indo-European view of the end of the world, and yet one which has marked affinities with Hindu beliefs, is found in ancient Greece. The Greek writer Hesiod, in his *Works and Days*, speaks of the five ages of Gold, Silver, Bronze, Heroes and Iron, in which there is a gradual descent from joy and innocence to guile, misery and corruption. An elaborate theory of cyclical world history was put forward by Heraclitus (c 500 BC) and later developed by Plato; possibly this theory

According to the New Testament the end of the present world will be heralded by a multitude of signs such as wars, earthquakes and famines. One of the central symbols in the elaborate imagery of the book of Revelation is a scroll sealed with seven seals, the opening of which lets fearful terrors loose upon the world: Death, the fourth horseman of the Apocalypse, is given power over a quarter of the world when the fourth seal is opened. Detail from *The Triumph of Death*, a series of frescoes by Francesco Traini

owes much to Babylonian influence, particularly in respect of the idea of the *magnus annus*, or great year, the period during which eight independently revolving planetary spheres return to their point of departure. In Plato's version, a total revolution in one direction is followed by a revolution in the opposite direction; thus the world as it is known is succeeded by an age of 'history in reverse'.

Also from Heraclitus came the notion of a cosmic fire, the *ekpurosis*, into which the world is periodically dissolved, and from which it is born anew. To be sure, the elements from which the world is made are indestructible, and can never be more than temporarily disturbed, returning after the conflagration to the same relationship to one another. But each cycle is none the less distinct, though hardly distinctive: indeed, one corollary of a theory of this kind was that history repeats itself exactly, down to the smallest detail. Every age is subject to the same forces of disintegration and degeneration and each will dissolve in time, only to be recreated. This theory was developed in its most elaborate detail by the Stoic popular preachers of the 2nd century BC and earlier, and passed over into Christianity through the Church Fathers, some of whom even undertook to attempt to prove the doctrine of ekpurosis from the Book of Genesis.

However, the cyclical theories of the Greek philosophers accorded ill with the Judaic tradition out of which Christianity developed, and these were ultimately attempts to reconcile the irreconcilable, so vast were the differences between them.

The Ways of God with Man

Turning now to this Judaeo-Christian stream of tradition, the developed Christian view of the end of the world differs in certain important respects from these other mythologies particularly in that it incorporates no trace of a cyclical view of time. It rests on the Old Testament view that in God's good time a new and better world will emerge out of this present order, thus vindicating God's final sovereignty over creation.

In later Judaism the Old Testament view was to give rise to elaborate time schemes, in which the lengths of this present age and the age of the Messiah to

Scala

Mansell Collection

come – both preceding the ultimate vindication of the sole and absolute authority of God – were calculated with much precision and not a little imagination. The sequence was: first the present age, characterized by increasing moral turpitude (by now a familiar element); secondly, heralded by great tribulations, the messianic age here on earth, in which righteousness and peace are established throughout creation; and finally, the accomplishment by God of the ultimate act of new creation.

On the practical level, the problem in late Judaism was to reconcile the wisdom, power and justice of God with the actual misfortunes of Israel in the 1st century AD. An elaborate justification of the ways of God with man is contained in 2 Esdras (Apocrypha); beginning with man, with Adam, it then continues with the question 'When have the inhabitants of the earth not sinned in thy sight?' and its answer, 'Thou mayest indeed find individuals who have kept thy commandments, but nations thou wilt not find' (3.35), and ending with the vision: '. . . faithfulness shall flourish, and corruption shall be overcome, and the truth, which has been so long without fruit, shall be revealed' (6.27). The point here is, however, not that the world is going to come to an end, but that past and future alike are in the hands of God, and that the consummation is the responsibility of the Lord of history, just as was creation. The process is planned, and not haphazard.

It is against this background that Christian ideas concerning the end of the world must be viewed. The framework of the absolute sovereignty of God is identical. So, too, is the pattern of the three ages: this present age; the age to come inaugurated by the emergence of Jesus as Messiah – 'in these last days he has spoken to us by a Son' (Hebrews 1.2) – and the age to come consummated by the second appearance of Jesus Christ in power and glory.

In this present age men are helpless, being under the sway of angels, principalities and powers in enmity to God. The coming of Christ heralds the gradual breaking of the power of these evil spirits. Characteristic of this new age are certain 'powers' such as the conquest of sin, suffering and disease.

The consummation of the new age so far as the vast majority of mankind is concerned – those who have either not heard or not heeded the Gospel – will come 'like a thief in the night' (Thessalonians 5.2); in this passage Paul echoes Jesus's words, 'the Son of man is coming at an hour you do not expect' (Luke 12.40). But although the actual end may be unexpected, there will have been ample signs heralding its advent: wars and rumours of wars, nation rising against nation and kingdom against kingdom, earthquakes and famines. The subsequent crisis will be cosmic: '. . . after that tribulation, the sun will be darkened, and the moon will not give its light, and the stars will be falling down from heaven, and the powers in the heavens will be shaken. And then they will see the Son of Man coming in clouds with great power and glory'; 'Heaven and earth will pass away . . .' (Mark, chapter 13).

Alpha and Omega

There seems little doubt that the idea of the immediate end of the world passed into the consciousness of the Christian Church direct from the teaching of Jesus himself. It is prominent in Paul and certain of the later books of the New Testament: '. . . the day of the Lord will come like a thief, and then the heavens will pass away with a loud noise, and the elements will be dissolved with fire, and the earth and the works that are upon it will be burned up' (2 Peter 3.10); and, of course, in the book of Revelation.

The book of Revelation adds little of

Facing page **A woman, pursued by 'the great dragon . . . that ancient serpent who is called the Devil and Satan' is given the wings of an eagle in order to escape him; the monster makes war on her offspring: illustration of a passage from the Apocalypse in a French manuscript**

Through the ages there have been sects and individuals who have predicted the imminent end of the world *Above left* 'The Noeh of Washington Mud Flats': convinced that a second Flood would occur in 1936, he built a gigantic Ark and equipped himself with demon-proof armour *Above right* Believing that the conjunction of eight planets in 1962 foretold global disaster, members of the Aetherius Society climbed a mountain in England's Lake District to pray

substance, however, to the shorter and more cryptic accounts found in other New Testament books, although its imagery is considerably more elaborate. One central symbol is that of the scroll sealed with seven seals; on the opening of the sixth seal there is an earthquake, the sun becomes 'black as sackcloth', the stars fall and the people run in terror; the seventh seal produces silence in heaven for a half hour, then seven angels send seven torments, the 'seven bowls of the wrath of the Lord'. Nevertheless, these and similar convulsive symptoms are not really the point of the narrative, which is to proclaim the passing away of the old order and the coming of the new: 'Then I saw a new heaven and a new earth; for the first heaven and the first earth had passed away' (Revelation 21.1). Of no less importance is the agency – the direct action of God – by which this radical renewal is accomplished: 'And he who sat upon the throne said, "Behold, I make all things new . . . I am the Alpha and the Omega, the beginning and the end".' (Revelation 21.5–6).

Broadly speaking, the Christian Church, while continuing to believe in a vague way in the final summing up of all things in Christ, has long refused to concern itself with the details of the end of the world. There have been exceptions, of course: recurrent periods of biblical orthodoxy have given rise to more or less extravagant claims that the end is in sight. One example of the new mythology which such concerns have brought in their wake is found in the writings of Thomas Burnet (1635?–1715), who reflected in his *Sacred Theory of the Earth* that the destructive fires would be kindled at Rome, the seat of the Antichrist, and would be aided and abetted by all the sources of fire in the world. Since the soil of Britain contains so much coal, he concluded, it would be preferable to be elsewhere when that day dawns.

'The Angel of the Odd' was the guiding spirit of a modern Belgian painter in the fantastic and satirical tradition of Breughel and Bosch

JAMES ENSOR

JAMES SIDNEY ENSOR, born at Ostend in 1860, the son of an English father and Flemish mother, was a man of many facets; he was a poet, musician, painter in varied styles and etcher but remarkable above all as a master of the grotesque. His parents sold souvenirs of Ostend to visitors at the Belgian seaside resort, toys, sea shells, postcards, curiosities and masks at carnival time. There was always a shop full of such things on the ground floor of the building in which he lived and had his studio. In his paintings he gave its oddities an eerie, phantom life.

Ensor loved everything about Ostend. 'fairy queen of skies and multi-coloured waters' in his description. The carnival, always so dear to the Flemish heart with its animal masks, storks with blue beaks and foolish clamour, peculiar insects and tottering puppets, enraptured him. 'I am happily confined' he wrote, 'in the solitary realm where the mask reigns'. Its weird intensity of expression, added to the unexpected gestures and jerky movements of the carnival figure, inspired pictures such as no one else had painted before.

When in 1917 he inherited from an uncle the curiosity shop at 27 rue de Flandres, where he remained until his death in 1949 (it later became an Ensor Museum), he kept its bizarre stock intact, no longer as objects for sale but as the cherished source of his most fantastic conceptions. In this later period of his long life, however, some inner spring of the imagination seems to have failed him. He painted still with iridescent colour but for the sharp impression of the artificial world he fashioned it is necessary to go back to his work belonging to the turn of the century.

After training at Brussels and an early 'dark period' in which he painted figures and landscapes with conspicuous ability in an entirely naturalistic style, fantasy claimed him. He had always had a sense of the strangeness of things. As a child he received a strong impression from a big sea bird which blundered into his room, attracted by the light, and fluttered round him beating its wings. 'I still see' he was to recall 'that horrible apparition and feel the shock of that black and fantastic bird'. As a young man in the 1880s he was encouraged in the spirit of the macabre by the 'decadent' leanings of the XX Group, an avant-garde group of painters in Brussels, to whose exhibitions he contributed.

Death as symbolized by the skeleton was an ironic aspect of life. With a grim bravado, Ensor converted a photograph of his own handsome person into a skull on a body, similarly dressed and posed, in an etching he entitled 'my portrait skeletonized'. The mask as the false outward semblance and the skeleton, the lurking inner reality, were to enact a weird carnival, separately or together, in the prolific output of Ensor in the 1890s.

With a mockery of human behaviour, skeletons in one painting of 1889, shivering under their cloaks, huddle round a studio stove for warmth. In another work a skeletal connoisseur surrounded by his treasures of oriental art might perhaps suggest the axiom that art is long and life is short; though Ensor was not a man to point obvious morals but invests his paintings with an ambiguity, half-humorous and half-sinister. This is the atmosphere of his *Masks Quarrelling Over a Hanged Man*; his *Masks and Death* in which Death opens his jaws in satiric laughter at the lugubrious faces around him. There is a self-portrait, playfully stressing his likeness to Rubens, as Rubens appears in his own self-portrait, but crowned by a carnival hat and looking out almost apologetically from the host of leering visages that haunt him.

Ensor could think himself into the mood of artists he admired. In landscape he sometimes recalls Turner and Monet but his grotesques show him in the tradition of Bosch and Breughel. A picture of fantastic animals, birds and fishes playing on musical instruments was Bosch-like in invention even to a fish sailing through the air while tootling on a pipe. Just as Bosch in his painting *The Bearing of the Cross* surrounded the figure of Christ with inhuman-looking tormentors and spectators Ensor brings together a huge array of false-faced humanity in his celebrated picture *The Entry of Christ into Brussels*. (See BOSCH; BREUGHEL.)

He painted Christ many times but always, as in this instance, as a noble spirit patiently enduring amid the imbecile mass of the human race. His idea of Christianity does not seem to have been defined further than this but his conception of the luminous presence was in no way irreverent, though the *Entry into Brussels* was hotly criticized for impiety. It was too unconventional even for the XX Group and was refused inclusion in their exhibition of 1889. There was even a call for Ensor's expulsion from this society. In its brilliance of colour and originality of design as well as in theme it is now recognized as one of the outstanding works of modern art.

For many years he ran the gauntlet of adverse criticism. He painted himself with ironic humour in an *Ecce Homo*, crowned with thorns and taunted by two of his most hostile critics against whom he could at least retaliate by caricaturing them. Appreciation was slow in coming but in 1920, when he was 60, the first of many retrospective exhibitions since held proclaimed his eminence. In 1933, when a festival at Brussels was held in his honour he was acclaimed 'prince of painters'. In that year he painted himself at the harmonium with all the masks of the vast canvas *The Entry of Christ into Brussels*, staring out from the wall behind him.

When he died in 1949 at the age of 89 he was numbered among the principal modern masters. The violence of his colour caused him to be hailed as a forerunner of the Expressionists, his imagination as a forerunner of the Surrealists. But like Edgar Allan Poe he is unique in works inspired by the 'Angel of the Odd'.

WILLIAM GAUNT

Ensor was enraptured by carnivals, with their strange figures, puppets and, above all, masks: 'I am happily confined,' he wrote, 'in the solitary realm where the mask reigns.' In his early paintings they symbolize false outward appearances and Ensor shows them sometimes separately, sometimes together with grim skeletons representing Death, the inner reality *Above* In *Masks and Death* the skeleton laughs at the sad faces that surround him *Below* The half-humorous, half-sinister atmosphere that pervades so much of Ensor's work is typified in *Masks Quarrelling Over a Hanged Man*

Michael Holford

Any religious sect which claimed to be inspired or possessed by God and which gave free rein to its exalted feelings ran the risk of being called 'enthusiastic' – a derogatory term in the 18th century, when the classical virtue of moderation was greatly admired

ENTHUSIASM

THE TERM 'ENTHUSIASM' was originally employed to describe the psychic state of a man who knew that a god dwelt within him, and was so used of religious phenomena in ancient Greece. In the development of Christianity, the term became much more generally employed for many kinds of religious excitation, and in the 18th century in particular it became a widely used term applied by the orthodox in a derogatory sense to those Christians (usually sectarian) who gave free expression to their exalted religious feelings and who sought to communicate them to others. Many different types of religious belief and practice were labelled 'enthusiastic', and it became common to regard as enthusiasts any who claimed prophetic gifts, or inspiration, or whose beliefs led them to dramatic acts of self-display.

Strictly, however, enthusiasm is not simply religious fervour, fanaticism or intense emotional commitment to heterodox beliefs: it is the conviction of the inward presence of the divine which then justifies the expression and action, and the emotional fervour, of the individual. Religious leaders who claim direct divine inspiration, or possession by the god, may also be properly regarded as enthusiasts. In deference to popular usage, however, it must be conceded that any religious commitment of a heterodox kind, in which strong emotional expression is encouraged, may, even if there is no assertion of possession, be regarded as a type of enthusiasm.

But even on this wider definition, it is clear that those whose faith rests on the Scriptures, even if they employ a very divergent interpretation of their own, or who believe that God's word is the only form of revelation now available to mankind, are not to be regarded as enthusiasts, however fervently they may canvass their beliefs. In these respects, the designation 'enthusiasm' cuts across other classifications of sects, whilst, on the other hand, it leaves some saints of the Roman Church, such as St Teresa, for example, who were convinced of their close relations with God, very near to an enthusiastic position. Sects such as Jehovah's Witnesses and Christadelphians who, however devout and intense they might be about their beliefs, do not believe that their warrant for faith is dependent on direct revelation but is based essentially on the Bible, are not to be counted as enthusiasts. They claim no inner illumination, and no source apart from the Scriptures for their beliefs. But the term is more appropriately applied to Holiness and Pietistic groups that claim some inward sense of the Spirit, and, by extension, to those groups that emphasize

the prospect of the individual's attaining through the operation of the Holy Ghost a sense of assurance about his own salvation and sanctification in his earthly life (see also HOLINESS CHURCH).

Among the early heresies arising among Christians, some were in the strict sense manifestations of enthusiasm. The Montanists who, originating in Asia Minor in the 2nd century AD, appeared likely to become a sect large enough to threaten the continuity of orthodox Christianity itself, were enthusiastic both in the claims of their founder, Montanus, who declared himself to be the incarnation of the Holy Ghost who was to reveal all things to come, and in the visionary experiences that were a commonplace among some of those who became his followers. The special prophecy of the movement was the coming of the millennium, and thus, in this case as in many others, millennial beliefs were embraced by a distinctly enthusiastic religion – so described not because of millenarianism itself, but because of the claims of its founder and members to direct divine inspiration (see MONTANISTS).

From Messenger to Messiah

Movements spawned by the inspiration of prophets, were often enthusiastic in the type of theological justification they invoked. Not infrequently a movement that began on the basis of scriptural prophecies, became enthusiastic as the personal claims of the leader became inflated by success. Men who began as messengers or expositors of the Word, or critics condemning the laxness of the Church and the licentiousness of the clergy, sometimes steadily shifted the warrant for their preaching as their followers grew in number and as they came increasingly to adulate their leader. From being mere expounders of scripture, they sometimes became men inspired by God, who saw visions and experienced revelations: sometimes they even claimed to be the actual Messiah.

Thus, Tanchelm, a notary from the court of a Flemish nobleman in the early 12th century, began as a holy man condemning the wealth of the Church and the tithes that it exacted from the people. He acquired a following in the regions around Utrecht and Antwerp, and steadily advanced in his own claims until he held that he was possessed of the Holy Spirit in the same measure as Jesus had been. His bath water was drunk by his followers for its special holy potency and remedial quality, and he was surrounded by a body of retainers and partisans who persisted in their convictions about his divinity long after he had been killed by a priest in 1115.

The claim to be the special emissary of God was not an uncommon one among the sectarian leaders of medieval Europe and many religious movements arose because men believed in the divine endowment of one or more leaders. The limitations of literacy, communication and organization meant that many of these movements were movements in almost the literal sense of the word, as men followed a leader whom they identified with the Messiah to what they believed would be the promised land, or the place where the saints would gather when the earth was destroyed. As movements they were highly unstable, dependent on the blind trust of followers and on the competence of the leaders in maintaining faith and avoiding capture. Claims of personal spiritual power, and the faith that sustains them, are not readily amenable to discipline and steady commitment; and until modern times such movements often consisted of either loose congeries of meetings and itinerant preachers with secret doctrines, or of sudden dramatic outbursts of fervour that led to suppression and sometimes to warfare. One of the best known outbursts occurred at Münster, Westphalia in 1534.

Radio Times Hulton Picture Library

Facing page **Pentecostalists in the early 20th century came to believe that after the baptism of the Holy Spirit converts might be given the gifts of prophecy and speaking in tongues, as the Apostles were on the Day of Pentecost when the Holy Spirit descended on them: painting by El Greco, showing tongues of fire above the Apostles' heads, and the Holy Spirit in the form of a dove** ***Above*** **Melchior Rinck, an Anabaptist: thorough-going enthusiasts, some members of this sect believed themselves to be the prophets of God**

Individual Fervour

The Anabaptist fervour at Münster included a strong element of enthusiasm which was not a feature of Anabaptism elsewhere. Such was the diversity of views that prevailed among Anabaptists and other radical elements in the early years after Luther's break with the Roman Church, that the dissenters then active in northern and central Europe cannot be regarded as constituting regular and established sects. There were many variants of doctrine and disputes on theological issues went on in many of the principal cities of central Europe. Each disputant spoke only for himself, often disagreeing on particulars even with those whose views closely approximated his own, and sometimes changing his own ideas even within the course of a few months. Initially such volatility was justified by reference to the Scriptures and the need to search out their meanings: eventually, it often led to claims of inspiration and prophetic insight of an enthusiastic kind.

Besieged for their Beliefs

No preacher of the time showed greater capacity for the development of his own teachings than Melchior Hofmann, a furrier who had become a self-appointed lay preacher in his wanderings over northern Europe and the Baltic cities. At one time a staunch Lutheran, within the course of a very few years Hofmann came to adopt increasingly radical positions: he accepted the need for adult baptism, and then asserted the impossibility of obtaining forgiveness for sin committed after adult baptism. He preached the early end of the existing dispensation, the coming of the millennium, and he eventually designated Strasbourg as the city of hope at the time of the end. Finally, he declared himself to be the new Elijah, and designated one of his followers Enoch: claims that approach enthusiasm in the narrower sense of the word. The Melchiorites, as his followers were known, were only a pale foreshadowing of the enthusiasm that was to break out at Münster, and which invoked Hofmann as its prophet, although he remained imprisoned in Strasbourg and eventually disavowed the Anabaptists at Münster.

The earliest advocates of the Reformation in Holland, before the views of Calvin were adopted, were Anabaptists. They stressed the importance of baptizing only those capable of responsible belief. Many of them espoused a position known as sacramentism: that God was in the true saints and they in him, and consequently they had no need for the performance of the Eucharist, nor of effigies, since they already professed to enjoy a higher inner sacrament and an inner apprehension of God. This was thorough-going enthusiasm, and its more extreme exponents maintained not only that God was in the saints, but that they were prophets. Thus, John Mathijs, a baker from Haarlem, who regarded Hofmann as his mentor, declared that he, the new Enoch, was commissioned by the Holy Spirit directly. At the bidding of the Spirit he put aside his wife and took up with a young girl who was reputedly very knowledgeable in the Scriptures. In the licence he permitted himself in conjugal matters he continued an older tradition of enthusiasm and foreshadowed the disposition to 'spiritual wivery' of some later enthusiasts.

Mathijs sent his 'apostles' to Münster to urge re-baptism on the radical Lutheran priest, Bernard Rothman, who already dominated a town divided between radical townsfolk, a conservative Lutheran city council, and the Roman Catholic Bishop and the monastic clergy who remained loyal to him. Rothman embraced the Anabaptist teaching, and his radical call for Christians to share their possessions with others drew in many impoverished countryfolk to Münster eager for immediate advantage

and also for a part in the millennium to come. Mathijs himself ruled the city for a few weeks in 1534, vindicating his decisions by calling them inspiration from God. He was killed fighting with the besieging troops, apparently under the illusion that God would enable him to destroy all those who opposed him.

Mathijs was succeeded by one of his 'apostles', John Beukels (or Bockelson) known also as John of Leyden, who declared himself to be the voice of the Lord, and who imposed stricter communism of goods on all the saints. He also introduced polygyny – the practice of men being allowed to have several wives at the same time – which was partly justified from the Old Testament but which may also have been a practical measure to ensure that the superfluity of women (which increased as men were killed in defence of the city) were gathered under some man's protection. Beukels was crowned king of the new Zion, the new David, and the Messiah of the Last Days. Despite the conditions of siege under which Münster suffered, he found time to establish an elaborate court, to mint gold and silver coins, some of which bore the legend 'The Word has become Flesh and dwells in us'; to serve splendid banquets, although most of the people were starving; and to hold processions and parades. Faith in Beukels may have waned in the fearful last days of the siege, before the insurrection was crushed, but some of the leaders remained Anabaptists to the end despite torture.

The Free Spirit

A more diversified form of enthusiasm is to be found in the tradition of perfectionism in Christianity, which has a long history from the Middle Ages to the end of the 19th century in many different movements. The adepts of the Free Spirit in the Middle Ages claimed perfection because they possessed the Holy Spirit, and this freed them from normal restraints and conventions. The Holy Ghost is the form of deity which Christians have usually referred to when claiming to be possessed by their god. As the most ethereal representation of the Trinity, the Holy Ghost lifts the concept of possession to a distinctly metaphysical plane on which the idea can be represented in ways close to the claims of Christian orthodoxy. The votaries of the Free Spirit maintained that possession of the Spirit rendered them pure and incapable of sinning. They rejected the concept of sin as one which stemmed from uninspired men, and one which had no application to the Spirit-possessed. They could say with St Paul – although such movements found little need for justification from scripture – 'Unto the pure, all things are pure'. They held that God was in all their acts, even in those that men called sin, and some of them maintained that it was thus lawful for them, according to the higher law that applied to them, to do things forbidden to others.

The particnlar conduct that the Brethren of the Free Spirit condoned by reference to their spiritual state was free sexual relations. They maintained that they could not sin by having sexual relations with any person, even including members of their own families. How widely such conduct was engaged in is of course difficult to assess, but in the 14th century the teachings of the Free Spirit were espoused in many parts of Europe, sometimes accompanied by licentious conduct. Some undisciplined companies of roving mendicants known as Beghards espoused the teaching and recruited many religious lay-women, including some of those known as 'Beguines', to the doctrine and its mysteries.

The advocates of the doctrine maintained that a man who knew he possessed the Spirit was already in heaven: hell was to be ignorant of one's own divinity. Some certainly believed that all men might realize this condition, and some believed that the dissemination of the teaching would itself usher in the millennium. Nonetheless, there was also an elitist implication in the doctrine. Adepts distinguished between those who realized that they possessed God now, and those who would discover union with God only after death. Some suggested that Christ had not attained the full perfection that they had realized – for the perfect man *was* God, beyond the power of any to distinguish them. At times some of them declared that they were greater than God, since without their recognition of God he could not exist. For most of them, their direct awareness of the divine permitted them to regard the Scriptures as entirely superseded in legitimating their religious belief and practice.

The movement of the Free Spirit did not give rise to a distinct sect. Its votaries remained amorphously associated, gathering in small fraternities, and embracing many different beliefs and practices. Illuminism, the claim to possess an inner light, as a teaching permits precisely this diversity among the faithful, and makes difficult the establishment of coherent creeds and stable organization. But the ideas of the Free Spirit recrudesce in various periods and places in Christian history. Ideas of recapturing the innocence of a pristine state of nature have frequently been associated with Free Spirit teachings, since before the Fall there was neither good nor evil.

William Sargent

Religious enthusiasm at revivalist meetings can rise to a pitch where members of the congregation fall into trances (*above*) or the preacher, like this woman (*facing page*) at a Holy Roller meeting in Florida, begins to 'speak with tongues'

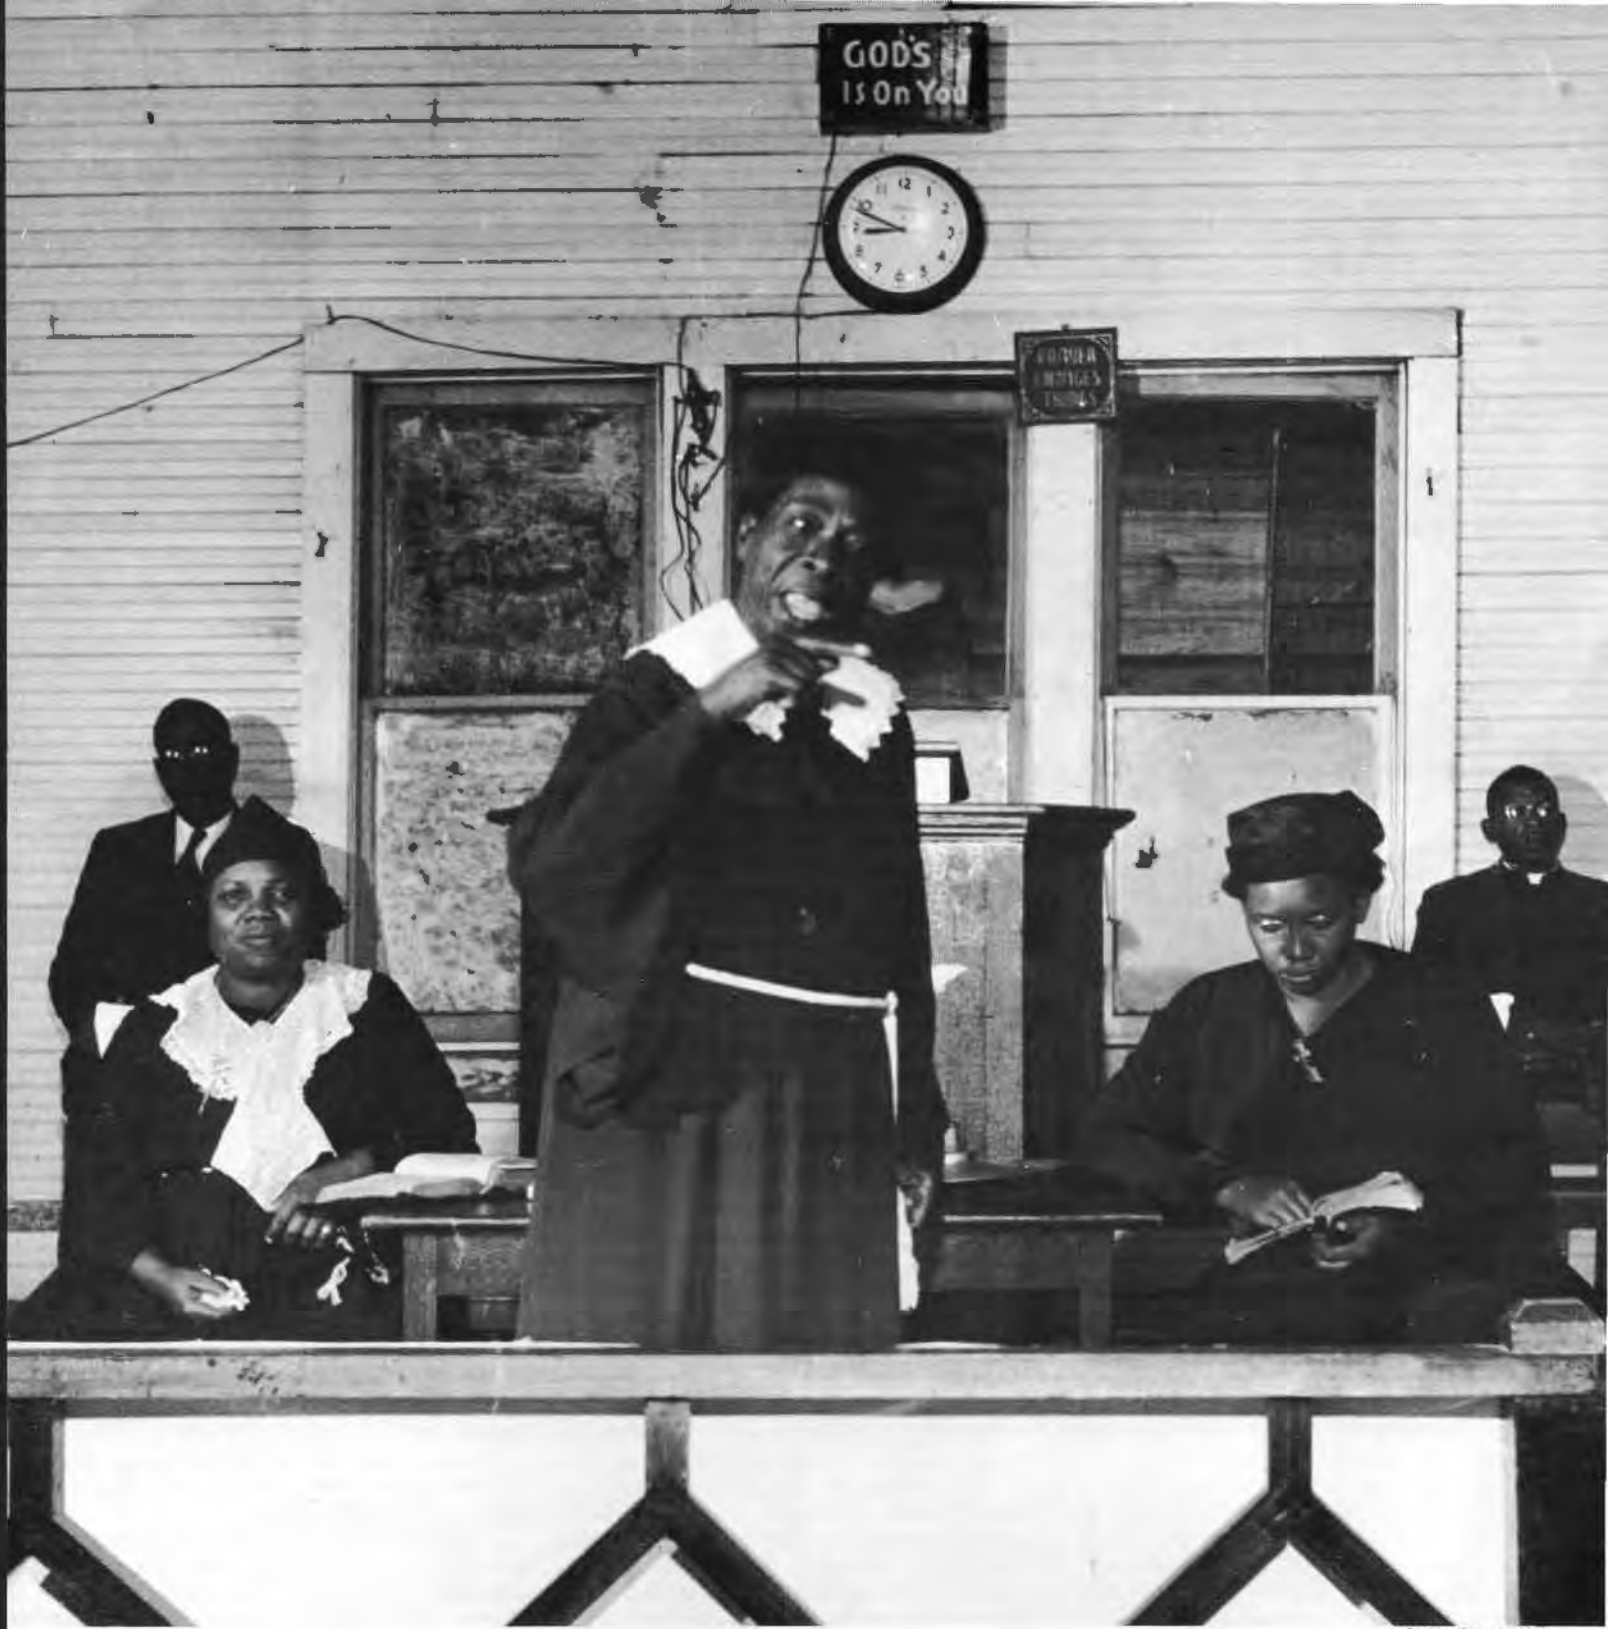
God's Woman

The Quaker James Nayler, who entertained self-conceptions of his own Messiahship and who entered Bristol riding on a donkey in 1656, might be said to have been an enthusiast who took the Quaker doctrine of the inward light further than has been the practice of Quakers since then. Even apart from such aberrant excess, there is an element of essential enthusiasm in Quaker teaching.

The extent to which the Quakers invoke a typically enthusiastic justification for their religious practices is limited, and this is true of other groups that have legitimized their positions by claiming the inspiration of the Holy Spirit. There is a distinction, although it is not one that popular usage has always acknowledged, between possession by a deity and inspiration from a deity. Holy Spirit inspiration has been claimed in many movements that lay greater stress on the Scriptures than do the Quakers (except during their evangelical period in the mid-19th century).

In the revivalist movements of the 18th and 19th centuries, in Britain and the United States in particular, there was an element of enthusiasm in the theological sense, and remarkable manifestations of it in the popular sense. In the teaching of John Wesley, the emphasis that a man could not only be saved but could receive assurance of his salvation might be regarded as an attenuated form of enthusiasm. At revivals, prayers were often made for the Holy Spirit to descend into the hearts of men and convert them, whilst the idea of men becoming deities has echoes in a number of Christian sects in which the faithful are identified with the Church on earth and referred to as 'the bride of Christ'. Even a movement as far removed from the enthusiastic as Jehovah's Witnesses approaches this type of association with the deity in referring to its own elite as 'God's Woman' – the collective body of the faithful who will join Jehovah in his heavenly rule over the new earth.

Salvation is often represented in sexual imagery of this kind, and is consummated in union with the divine which has at least



Camera Press London

some implications of deification of the truly elect. In the Church of Jesus Christ of the Latter Day Saints (Mormons) salvation by deification is given even more explicit expression: Mormons hold that God himself was once as men now are and only gradually evolved as God. They believe that all faithful Mormons will themselves progress in the afterlife until they all become gods.

These teachings are, however, all rather more oblique ways of presenting the idea that men will experience deity directly than are the teachings espoused by Holiness groups and Pentecostalists, in which a direct experience of being filled with the Holy Spirit is awaited, which will be made manifest to others. This teaching stands in direct descent from a more muted form of enthusiasm alluded to earlier as part of the conversionist and revivalist tradition of the 18th and 19th centuries.

Morbid Images and Symptoms

The doctrines of a number of central European Pietists (believers in the need for a revival of piety) in the Lutheran tradition contained elements of an almost enthusiastic kind. When, in the 1720s, Count Zinzendorf gave asylum on his estates at Herrnhut in Saxony to the Moravian Brethren, he infused them with something of his own style of Pietism. Zinzendorf's teachings of grace were an extremely diluted form of enthusiasm when compared with the excesses recorded in earlier centuries, but he believed that since Christ had suffered for men, so men were now free to adore God; the experience of conversion was therefore to be a joyous one as the believer was reunited with Christ.

This faith emphasized feeling above any kind of thinking or theorizing; it emphasized the emotional, particularly in dwelling on Christ's sufferings. Moravian hymns were preoccupied with Christ's wounds and had a particular preoccupation with his wounded side, which was referred to as the 'holy side-wound', 'unfathomable side-hole' in which believers would 'greet each other'. The imagery of Moravian hymns does not in itself reveal enthusiasm in the thoroughgoing sense. The idea of grace which Moravians strongly maintained, falls short of asserting that the believer is possessed by

his God, but the believer possesses certainty about God's intention which he acquires from the Spirit's action within him.

The revivalist activity which Wesley sponsored relied heavily on the idea of the Spirit prompting men and, in the early years of Wesley's preaching, Spirit possession in revival meetings was a commonplace. These phenomena antedate Wesley in fact. During the revival in Massachusetts in 1735–42, scenes of extreme emotional disturbance occurred which have often been called outbursts of enthusiasm. The leader, Jonathan Edwards, favoured restraint in worship, but particularly under the preaching of James Davenport fainting, falling, shrieking and violent trembling were frequent accompaniments of religious conversion, as the Spirit acted on the mind of participants. These signs, indeed, became for some the testimony of the Spirit.

Although Wesley was more restrained than other revivalist preachers, in his early days he too tended to regard dramatic responses to his preaching as the action of the Holy Spirit. He recorded many cases of sensational effects, particularly on the most illiterate members of his congregations among the miners near Bristol and Newcastle. People fell raving and anguished at his meetings. Sometimes whole congregations broke down into spontaneous weeping and groaning; sometimes a man was struck down as if dead; some went blind; and between 1739–42 there were 14 cases of temporary insanity and 9 incurable cases among members of Wesley's audiences. Later, when Wesley became convinced that these manifestations were not the operations of the Holy Spirit, and began to discourage them, they became much less common and subsequently disappeared from Methodism, although there were recurrences among the Primitive Methodists under the preaching of Hugh Bourne.

Extreme manifestations of emotional disorder that were credited to the Holy Spirit were common during the Great Revival in Kentucky in 1797–1805. At the camp meetings at which the brothers John and William McGee, and James McGready preached hellfire, outbreaks of jerks, falling and dancing occurred. Some even fell down and barked like dogs in the excitement of the charged atmosphere in which large numbers had brought home to them God's scheme of reward and punishment as seen by the Presbyterian and Methodist preachers who led the revival. The revivals in more settled societies have not always produced such dramatic manifestations.

Strange phenomena were reported, however, such as the preaching sickness that swept over Sweden in the middle of the 19th century, when many people including children spoke fervently and eloquently as if possessed. In Finland, the incidence of 'sleeping preachers' – people who suddenly preached from a semi-somnolent state – was noted at various periods from the 1770s to the 1930s; these are well recorded and may be regarded as states of possession. The Welsh Revival, in 1905, produced a large number of cases of 'speaking in tongues', visions and trance states. In general, in modern times these phenomena appear to occur among rural populations, and populations experiencing the disrupting impact of urbanization, rather than among settled city populations.

Spiritual Wives

Wesley's doctrine that a man who was saved might obtain the assurance of salvation and be sanctified gave rise, particularly in the United States, to the strong emphasis among some Methodists on a condition of holiness. They taught that entire sanctification was possible as a 'second blessing', subsequent to, and distinct from the experience of conversion, and by the action of the Holy Spirit. The Presbyterian revivalist Charles G. Finney espoused these doctrines in the hope that this emphasis on moral regeneration might consolidate the results of revival-induced conversions. But both revivalism and the doctrine of entire sanctification appeared as threats to the settled Church order of the denominations, and increasingly those who advocated these ideas and practices found themselves somewhat at odds with ordinary denominational fellowships. Emphasizing the possibility of attaining complete sanctity, sometimes as an instantaneous transformation, some of these people found themselves too holy to need ordinary church associations. Not all of those who believed that they had possessed the Holy Spirit in this way were drawn into this position, but at least some of them sought to demonstrate their spirituality by establishing that they could dispense with the normal conventions and restraints of society. As in the Middle Ages, it was in free sexual behaviour that they demonstrated their spiritual excellence.

Ecclesiastical regulation was rejected by these enthusiasts, and so were the Scriptures. The real guides to conduct were experienced inwardly. In asserting their transcendence over the merely carnal, some of these votaries came to practise 'spiritual' unions of a promiscuous kind. 'Spiritual wivery' was one variant on this theme that held considerable fascination for many Perfectionists although not all of them justified promiscuity. Sometimes they simply believed in 'sanctified bundling'. Although the Perfectionist following at the Oneida Community of John Humphrey Noyes practised sexual communism, involving promiscuity, they did so conscientiously and with restraint. Noyes was an advocate of a eugenic theory of planned parenthood, not of promiscuous sexuality (see COMMUNISTIC RELIGIOUS MOVEMENTS).

Modern Enthusiasts

In modern Pentecostalism the revivalist tradition, which gave currency to the idea of the Holy Spirit momentarily affecting the hearts of men at the time of conversion, acquired an added dimension of enthusiasm rather different from the emphasis on Holiness of Finney. In the first decade of the 20th century a number of evangelicals came to believe that the baptism of the Holy Spirit (an occasion when the convert was dramatically filled with the Spirit) and the gifts of prophecy and speaking in tongues were still in operation. The Pentecostalists taught that not only might believers experience a sanctifying visit of the Holy Spirit, but that they might, after Holy Spirit baptism, continue to enjoy the opportunity to be a vessel for the Spirit's possession. At first there was considerable disorder in religious meetings and the Spirit was credited with providing specific guidance for individuals and exhorting men to all sorts of activity; but eventually Pentecostalists re-invoked St Paul to provide a basis of order for their services. Today they assert that the Spirit never utters prophecy contrary to Holy Writ. But both in theory and in the mood of their meetings, Pentecostalists are enthusiasts. (See PENTECOSTALIST MOVEMENT.)

A distinction is to be made between movements in which there is an expectation that all men might possess the deity, or become the deity, and those in which the deity becomes the possession of only a priest or a medium, or is represented only in one prophet or Messiah. Movements arising around individuals who claim to be Messiahs are discussed separately (see MESSIANIC MOVEMENTS), but in the phenomenon of Spiritualism there is a considerable element of enthusiasm.

In the general Western tradition, stemming from the practice of the Fox sisters of Rochester, New York, in the mid-19th century, the medium is possessed not by the deity but by the spirit of a dead person. There is a tendency to regard this spirit as at least acting in concert with the will of God, even though it is not itself regarded as part of the deity. In the older tradition of Western Spiritualism, however, particularly as it was manifested by the Shakers (see SHAKERS), the spirits that prompted speaking in tongues, instructed in dancing, inspired the composition of particular hymns and conveyed messages and revelations, were seen as more characteristically emanations of the divine. In this the Shakers sustained the enthusiasm of the Camisards or French Prophets, whose refugee remnant converted the first Shakers in the mid-18th century (see CAMISARDS).

Enthusiasm occurs in other contemporary movements, particularly those that are described as messianic, but the term covers a very wide range of intrinsically diverse religious persuasions. The imprecision of the term, and its application to any sort of expressive religious phenomena, have caused it to fall out of currency in contemporary sociological studies of religion, although it has been widely employed by orthodox religionists themselves – usually as a term of disparagement.

Originally the god of love was not the pretty boy archer of popular tradition but an all-powerful force which inspired fear in the hearts of gods and men

EROS

THE CHUBBY CHERUB with his bow and quiver, favourite device of Victorian valentines and rococo art, bears little resemblance to the earliest conceptions of Eros, the Greek god of love. His origins are obscure; some say that he was hatched from a silver egg laid in the womb of darkness, emerging as a monstrous being, four-headed, golden-winged and uttering animal cries. Others hold that he was the son of Iris or of Ilithyia, the goddess of childbirth; while later mythology makes him the son of Aphrodite by Zeus, her father, or by Ares, the god of war, or by Hermes. The Greek writer Hesiod (8th century BC) makes Eros, together with Earth and Tartarus, the oldest of the gods. He represents him as the powerful creative force that attracts together and unites the cosmic couples who created the universe, 'bringing harmony to chaos' and making it possible for life to develop (see APHRODITE).

Long before Aphrodite appeared among the gods, the ancient Greeks worshipped a god of sexual potency named Eros. That Eros was not only a creative agent but also on occasions a destructive one was already understood: an implicit acceptance of the power of passion to wreck society and threaten law and order. The Latin writer Apuleius (2nd century AD) in later times makes the same point when he speaks of the god 'running from building to building all night long with his torch and his arrows, breaking up respectable homes.' But it is as a cosmic principle that Eros first makes his appearance in Greek myth, a far cry from the petulant boy archer of later tradition.

Although there is no mention of the god in Homer, the passages in which the word *eros* occur illustrate clearly its early meaning. In the *Iliad* and the *Odyssey* eros stands for irresistible physical desire; it is the force which attracts Zeus to Hera, Paris to Helen, an affliction which causes the limbs of Penelope's suitors to tremble uncontrollably. In the later lyric poets of the 6th and 7th centuries BC the conception of this force is broadened to include mind as well as body.

From his birth, Eros's variously imputed parentage signifies several different aspects of his role as the god of passionate love. As the son of Hermes, god of fertility, who was worshipped with phallic images, Eros represents sexual potency and is himself a god of fertility: at his cult centre at Thespiae in Boeotia he was represented by a simple phallic figure. From the devious god Hermes, too, he draws his cunning and his penchant for trickery. With Ares the warrior for his father, Eros reminds us of the fighting man's

Parmigianino's painting of Eros shaping his bow. The 'bitter-sweet' often mischievous god of love is winged to represent the fleeting nature of passion and with his arrows he can inspire both love and aversion

Sonia Halliday

immemorial attraction for women and the often ambivalent – or, as we would say, 'love-hate' – nature of sexual relationships. As the son of Aphrodite by Zeus, according to Hesiod and the most widely held view, the contrary and perverse element of Eros is symbolized; his parents' union is an incestuous one, signifying that erotic love knows no boundaries and trespasses on forbidden relationships.

God Who Never Grew Up

The changing conception of the god is reflected in art, in which Eros remains perpetually youthful, even growing steadily younger. He is represented as a youth in archaic times, as a young boy in the Classical period and as a baby boy in the Hellenistic age. He is shown winged to represent the fleeting nature of passion, blindfolded to suggest the inconsequence and unpredictability of his attacks, and carrying a torch to symbolize the flame which he kindles in others. He has power over gods and men – even Zeus himself is frightened of him – and no one is immune to his cruel darts.

Indulged by Aphrodite, he is half god, half spoilt, undisciplined boy. His bow and arrows, first mentioned by Euripides (484–407 BC), are his favourite playthings; the sharp arrows from his quiver producing sometimes love and sometimes disdain in their victims. He takes a malicious pleasure in choosing unlikely targets and delights in the misery he causes. Sometimes Aphrodite, who herself suffers from his archery and is led into all sorts of undignified liaisons in consequence, loses patience with him and confiscates his weapons. The poet Anacreon (6th century BC), while dwelling on Eros's playful side refers also to his cruelty. The god is shown (as also on vase paintings) striking the lovelorn with an axe or wielding a whip. At the same time Eros is the embodiment of the sweetness of youth. He is associated with all beautiful things, he walks on a carpet of flowers and wears a crown of roses. Yet it is not for nothing that the rose is his special emblem, for the rose, though sweetly perfumed, has a sharp thorn. The poet Sappho describes his contradictory qualities as 'bitter sweet'.

The playmates of the god in Aphrodite's train are Pothos and Himeros, representing longing and desire. Eros has a brother, the son of Ares and Aphrodite, named Anteros. Earlier writers show Anteros in opposition to Eros, as the god who avenges slighted love; it is only later that he becomes the brother of Eros, standing for mutual affection and tenderness, yet still constantly at odds with the selfish god of love. Anteros was the younger brother and was conceived on the advice of Themis, Zeus's first wife, when Aphrodite complained to her that Eros remained perpetually a child and never seemed to grow any older. Themis suggested that the remedy was for Eros to have a brother, who would spur him on to outstrip him. As soon as Anteros was born Eros grew stronger and the span of his wings increased. If ever he was separated from Anteros, however, he found himself reduced to his former size. The story seems to suggest that passion that is mutual rather than one-sided makes love grow stronger and more mature.

There was not one Eros but many, according to Euripides and a number of later writers, and he was worshipped in many places: notably in Parion in Mysia and in Thespiae with phallic images, as the god of both passion and fertility. A festival in his honour, the *Erotidia*, was celebrated at Thespiae in the spring, every fifth year, with sports and games in which musicians and others took part. If any strife or sedition had arisen among the people, prayers and sacrifices would be offered to the god to resolve the disagreement.

Cupid, That Very Wicked Boy

Known to the Romans as Cupido or Amor, the Latin counterpart of Eros has strongly marked human characteristics, due to the influence of the Alexandrian poets and artists. He is less of a god and more of a mischievous child: he is the 'knavish lad' referred to by Shakespeare (*A Midsummer Night's Dream*), 'this wimpled, whining, purblind, wayward boy'. The word *cupido* means desire but it is an emotion on a different scale from Hesiod's power 'that loosens the limbs and damages the mind.' Apuleius describes him as 'that very wicked boy, with neither manners nor respect for the decencies.' In earlier times, however, he was a more powerful god, accorded the same honour as his mother. It was believed that his influence extended not only over the heavens and the sea but even to the underworld. His godhead was widely venerated

and prayers and sacrifices were offered to him daily.

According to some authorities, there were two Cupids, one of whom, the son of Jupiter and Venus, was a lively and pleasant youth, while the other, the offspring of Night and Erebus, was given to debauchery and riotous living. Cicero indeed mentions three Cupids, their parentage being ascribed to Mercury and Diana, Mercury and Venus, and Mars and Venus. In common with other immortals, Cupid had the power of changing his shape at will: in the *Aeneid* of Virgil, he assumed the form of Ascanius at the request of his mother Venus and went to the court of Dido, where he inspired the queen with love.

In art, Cupid is usually shown amusing himself with some childish pursuit. He chases a butterfly, plays with dice, drives a hoop or throws a quoit. Sometimes he plays upon a horn to entertain his mother; sometimes he marches like a warrior, a spear on his shoulder and a buckler on his arm, signifying that love conquers all. Occasionally he is shown riding on the back of a lion or a dolphin, or engaged in breaking up the thunderbolts of Jupiter.

The Taming of Love

Like Eros, Cupid is vain and cruel, and the Latin poet Ovid speaks of his 'savage spite'. A story in his *Metamorphoses* illustrates the vindictive side of the god of love. Cupid's arrows, he explains, were of two kinds: one golden, shining and sharp, the other leaden and blunt. The first inspired the victim with love and the second produced fear and repulsion. Once Phoebus Apollo teased Cupid for carrying weapons which were better suited to a warrior than a naughty boy. Determined to get his own back on Apollo, Cupid shot an arrow of desire at his tormentor, who promptly fell in love with the nymph Daphne – only to be repulsed, for Cupid had wounded her too, but with a leaden arrow. Refusing Apollo's advances, she fled terrified, but the god pursued her relentlessly. Finally she implored her father Peneus to efface her beauty by turning her into a tree to escape the god.

It is in the legend of Cupid and Psyche, as told by Apuleius that the god of love is shown at his most tender and human. For once he is made to experience the suffering which he has inflicted on others. Psyche is an earthly maiden of such extraordinary beauty that she arouses the jealousy of Venus, who orders Cupid to cause her to fall in love with the vilest and most degraded of men. Cupid, however, himself falls in love with her and has her carried off to a marvellous palace, where he visits her nightly in darkness but conceals his identity from her and tells her that she must never see his face. Lonely during the daytime, Psyche begs to be allowed to invite her sisters and Cupid agrees, though warning her that they will try to set her against him. Out of jealousy at her wealth and good fortune, the sisters persuade her that her husband must be a repulsive monster since he will never permit his face to be seen.

The following night, when the god is asleep, she lights a lamp to look at him. Instead of a horrible serpent, as her sisters had described, she sees a beautiful youth, winged and golden haired. In her ecstasy, she lets fall a drop of scalding oil on his shoulder. Cupid awakes and tells her that for her disobedience she will never see him again. Psyche searches the earth for Cupid, hounded relentlessly by Venus, who has discovered the lovers' secret and has locked up Cupid in his bedroom. Cupid, unable to bear separation from Psyche, flies out of the window to enlist the aid of Jupiter, who puts an end to their troubles by raising Psyche to the level of the gods and making her immortal. Venus is reconciled and accepts Psyche as her daughter-in-law and the lovers are reunited.

Psyche is held to be the personification of the human soul and is often shown in art winged, like her lover, following an ancient belief that the human soul took the form of a butterfly or other winged insect. In Platonic philosophy love, in the most elevated sense, is an agent of the soul's progress and from the 4th century BC Psyche and the god of love were often depicted together in allegorical representations.

ESKIMO

The merciless physical environment of the Eskimo has produced a religion which is tinged with terror; fear of the gods, of ghosts, of spirits and of sorcerers

PRIMARILY A COASTAL PEOPLE, the Eskimo occupy an area extending from Greenland and Labrador in the east to the Bering Sea in the west; some groups live on the Siberian shore of the Bering Straits. In 1979 there were an estimated number of 92,000, of whom approximately half are to be found in Greenland and the rest fairly evenly divided between Canada and Alaska. Thanks to improved diet, hygiene and medical care, the population is increasing, though only slowly. Speculation over their origins is inconclusive; they have affinities with the Mongoloid peoples of Asia, but culturally and linguistically they are a race apart. Their dialects are variants of one distinctive, highly inflected tongue, which has nothing in common with any of the other archaic languages of the American continent. Until recently the Eskimo have had little cultural contact with other peoples: only in Alaska (and to a lesser extent in Greenland) is there evidence of this. However, it has been pointed out that the Eskimo culture is part of the great polar culture circle, stretching around the rest of northern Eurasia. The Eskimo have been divided into about a dozen major groups but resemblances between the groups are so well marked that there is every justification for speaking of Eskimo culture and religion as a whole.

The word 'Eskimo' appears to be derived from a Wabanaki Indian word, *eskimantsik*, meaning 'eaters of raw flesh'. Needless to say, this is not the Eskimo's own description of themselves; their own word is *inuit*, the plural of *inuk*, 'man' or 'person'.

The first Europeans to make the acquaintance of the Eskimo were Eric the Red's Norsemen in the late 10th century, but it was not until the start of the Christian mission in Greenland in the 18th century that their religious beliefs and practices came to the attention of the West. Since then, information has been gathered piecemeal, few Europeans or Americans having anything like an overall knowledge of the Eskimo. And now time is running out. Traditional beliefs and customs are being

The Eskimo believes himself to be at the mercy of capricious gods and spirits which must be placated if he is to eke out an existence in the harsh, unyielding climate of the Arctic *Left* Lithograph of a sea goddess by the Eskimo artist Paulassie: sea spirits in particular are shown respect because they control the main supply of food *Right* Unusual two-sided carving from Cape Dorset of spirits

gradually submerged and forgotten, except in the most isolated areas. Many Eskimo are now at least nominally Christians, and it is a moot point to what extent the old beliefs and practices still have the status of living reality to the majority, rather than in the vague realm of 'folklore'. However, we shall be concerned here with Eskimo religion as it was before the advent of Christianity and Western civilization.

Ungentle Spirits

The religion of the Eskimo, like their entire way of life has been shaped by their environment, and is at one with the harsh, unyielding character of the Arctic in which they live. The Eskimo has always had to fight hard for bare existence with only a narrow dividing line between life and death. He has felt at the mercy of capricious forces and this has made his religion hard, fatalistic, and as bare of gentleness and beauty as the ice fields themselves. Personality counts for little or nothing; environment is all-powerful. The dead may occasionally be counted fortunate; the living, never.

The first need, if life is to be sustained, is for food. The Eskimo are a hunting or fishing people, according to locality and season, and one of the few gifts which the denizens of the spirit world may give is plentiful game. They *may* give – but they may not. Why, a hunter was asked, were there no bears in a certain place at a certain time? 'No bears have come,' he answered, 'because there is no ice, and there is no ice because there is too much wind, and there is too much wind because we mortals have offended the powers.' His reply combines the weather-lore of the experienced hunter and the resignation of a man who knows himself to be at the mercy of great powers.

The supply of food is controlled by the spirits, and should they be offended in any way, they will withhold the bear, the seal, the whale and the caribou, until recompense is made. In practical terms, this means the observance of a variety of taboos.

It has been pointed out that the supernatural world of the Eskimo is strangely timeless and static. Unlike many primitive peoples, the Eskimo have little conception of a past – least of all an ideal past. Everything is adjusted to the present moment. Everything has always been as it is now. Significantly, Eskimo mythology is virtually without creation myths, and those that exist, in Alaska, have almost certainly been derived from the North-Western Indians. Nor is there any reasoned account of the creation of man, save as a very incidental byproduct of the Sedna myth, which speaks of Eskimo, other men and beasts as having sprung from the union of a goddess and a dog-man. Man, it seems, has always been as he is; so, too, have the gods.

It is tempting to speak of the Eskimo deities as a hierarchy; tempting, but unjustified, since the Eskimo themselves certainly do not think of them as such. The Eskimo are animists, conceiving the whole world as the abode of spirits, with every natural object inhabited by some spirit. Over and above these are the animal spirits, the air and sea spirits, and other classes of spirits which do not fit neatly into any of these categories. The hierarchical aspect, to the Western theorist, emerges from the fact that the Eskimo conceive of a Supreme Being, Sila (Silap Inua), who has all the characteristics of a High God.

The Eskimo word for 'spirit' is *inua*, which is the third person possessive of *inuk*, 'man', and thus means 'its man' or 'his man'. The inua is in effect a miniature double of the man, animal, or object in which it lives: this is of course a basic idea on which all animism rests. Silap Inua is the inua of the air, who may be male or female, who lives in, or may be identified with, the sky, and controls atmospheric phenomena. To the Polar Eskimo 'Sila' is a synonym for 'weather', 'the universe' or 'the whole' – again a common characteristic of High Gods – but is not normally the recipient of worship, nor the subject of a developed mythology. Sila is the only 'genuine' Supreme Being in Eskimo religion, though other deities can fill something of the same function.

Second in the rank of deities is the moon spirit (with various names of which one is Tarquiup Inua), who controls all land animals and all fertility, human as well as animal, and as such is of incomparably greater practical importance than Sila. A widespread myth tells how the moon and sun were once a brother and sister who lived on earth. The two committed incest, though the girl did not at first know this; when she found out, she fled from her brother into the heavens. He pursued her, and his pursuit is continued for all eternity. A Greenland variation tells how the moon and his sister the sun live in a double house with a single entrance. Not only must the moon spirit be constantly propitiated if he is to grant success in hunting, but since he is the bestower of fertility, he can be entreated on behalf of barren women. It is believed in some areas that the shaman or medicine man can fly to the moon to obtain children for childless women, and may have intercourse with the woman in question as a further (and in all likelihood more effective) measure. The sun, as the moon's sister, is of comparatively little cultic importance.

Mutilated Goddess

Among Eskimos who rely on sea hunting, the greatest of the spirits is Sedna (also called Nuliajuk, Nerrivik, Arnquagssaq) who 'owns' the seals, whales, walruses and all other sea creatures, and is worshipped (and feared) in Greenland and in the central areas of northern Canada. The most elaborate Eskimo myth tells how a girl named Avilayoq married a dog, and brought forth offspring – Eskimo, white men and other creatures. The children made so much noise that the couple moved to an island, from which the dog husband had to be sent to the girl's father for food. This was put in a pair of boots, hung round the dog's neck. One day, while he was away, a man came and took the girl away, revealing himself later as a petrel. Her father went to look for her, and took her away from the petrel's country in a boat. But the petrel followed them, called up a storm and threatened to upset the boat. In terror, the old man threw his daughter overboard, and when she clung to the gunwale, cut off her fingers one by one. The upper joints became the whales, the second joints the seals, and so on. Eventually she sank in the sea, but only after her father had struck out one of her eyes. On his return home, the old man filled the dog's boots with stones, and he, too, sank. The daughter became one-eyed Sedna, ruler of the sea, who dwells with her father and dog husband in the depths of the ocean. She is both sea goddess and a goddess of the dead.

As ruler of the sea creatures, she must be appealed to for success in hunting. This involves the observance of taboos and the intercession of the shaman when taboos have been broken. The shaman goes into a trance, during which his spirit is believed to

Since women are regarded as unclean in hunting contexts, absolute sexual continence must be observed before and during hunting expeditions

NFB-West Baffin Eskimo Co-op

fly to Sedna's realm; on arrival, he steps over the dog, and does his best to placate the sea goddess. This involves the combing of her hair, since it is believed that broken taboos cause filth to collect in her hair. He may be told that the hunt will not prosper because of some secret offence or breach of taboo, such as the eating of boiled meat. All being well, Sedna is eventually placated, and the shaman returns to his body; he tells the people what has happened, and in many cases spontaneous confessions follow. A similar procedure is followed in respect of the land animals guarded by the moon spirit. Again, the shaman is able to 'fly' to the moon and intercede for his people. Obviously there is ample room for trickery on the part of the shaman – but his supernatural capacity is seldom questioned.

Other rituals are observed in connection with hunting, since all the spirits controlling the supply of food must be kept well disposed. So, for example, a seal which has been killed may be left a drink of water in order that its spirit may carry a good report to the spirit world. Similar mourning rituals are observed when an animal is killed as those which obtain in human affairs – again in order not to harm or offend the spirit of the dead animal. Particularly elaborate precautions are taken on the death of a bear or a wolf, since their spirits are thought to be more dangerous than those of other animals.

In Alaska, there is an annual 'Bladder Festival', in which the accumulated bladders of animals killed during the year are offered in order to ensure future hunting success. There is a constant need to observe the taboos: for instance, since women are regarded as unclean in hunting contexts, absolute sexual continence must be observed before and during hunting expeditions. There are many ways of discovering breaches of taboo. The most obvious is the lack of game; another is to 'weigh' the head of a recumbent person by means of a thong passed round the back of the neck. Lightness or heaviness determines the degree of guilt involved.

Sky and sea deities may in some cases 'divide' themselves in such a way as to delegate their functions. On Baffin Island, the Kadlu are three sisters who produce thunder and lightning by rubbing skins together – probably an original function of the High God. Other minor deities are connected with the earth. One particularly repulsive specimen is the 'Disemboweller' of Greenland, a female demon, cousin of the moon spirit, who disembowels anyone she can make laugh. Most local deities in fact are malevolent, and inspire nothing but fear. An interesting group of spirits not quite deities, are the *tornait*, from which the shaman's familiars are recruited. They may be associated with the dead, and one can see in them distorted popular reminiscences of the people of the Thule culture (the earliest known Eskimo culture), in much the same way as the Celts of Britain are believed by some to have become the 'little people' of folklore. The chief *tornait* is known as Tornarsuk, and treated in some areas as a Supreme Being.

The Wandering Soul

Like other primitive peoples, the Eskimo believes that man has not one, but several 'souls', *inuas*, all of which are associated with the body only temporarily. There are many variations but it is broadly true to say that man can have three types of soul: the 'free-soul', an immortal spirit and source of power which lives on in another world after death, or may return as a ghost to plague the living; the 'life-soul' which animates the body and dies with it; and the 'name-soul',

which attaches to the name, and which can be passed on to another human being. It must not be thought, however, that these can be sharply distinguished from one another. An Eskimo of the Great Fish River, asked what he understood by the soul, answered: 'It is something beyond understanding, that which makes me a human being.'

The soul may be conceived of as a miniature of man, living in some part of his body; or there may be many such miniatures, scattered around the body, and especially the joints. What is basic to Eskimo belief however is the connection between the soul and power or life-force. Sickness, for instance, is often interpreted as loss of soul, and therefore to be cured by the catching and bringing back of the wayward soul by the shaman. Death and disease are quantitatively, rather than qualitatively different, and it is, perhaps, not altogether surprising to find in some quarters a belief in the powers of the shaman to raise the dead – to bring back the soul from the very borders of the realm of the dead. In no case does 'loss of soul' occur without a cause: either negative (the breaking of taboos) or positive (black magic); it is the task of the shaman to eliminate the latter cause, by neutralizing the spirit force concerned.

Closely connected with these ideas is the belief that the wandering soul of the dead man or woman is potentially dangerous to the living. Clearly the dead live on, because they are seen in dreams; clearly they are dangerous, because of the things that happen to the living, and for which an ultimate cause must be sought. Unaffected by the bounds of space or time, their only chance of making their wants known is through the person of the shaman, and man can only live a relatively troublefree existence by acceding to their requests and demands. Ghosts may, sometimes, be seen: but this is a misfortune of the first order, exceeded only by the touch of a spirit, which brings instant death.

Football in Heaven

This is not to say that in Eskimo belief, all the dead become malevolent ghosts. Most pass after death to a state in which they are at least happy; it is only the few who have had the misfortune to meet death in an unsuitable way who are forced to wander. There is little or no idea of post-mortem judgement on the basis of good and evil deeds involved. What really matters is whether or not the person in question has observed all the taboos, and the manner of his death. So the Eskimo of the Bering Straits believed that the souls of shamans and those who have died by accident (especially in hunting), suicide, violence, starvation or in childbirth go to a land of plenty in the sky. Some Eskimos regard the Aurora Borealis as the spirits of the fortunate departed playing football in the heavens. Those who die a natural death descend to the underworld or to the underwater realm of Sedna, a land of gloom and deep darkness, but accessible to the shaman so that he may succeed in releasing the unfortunate soul. The central Eskimo distinguish between a sky heaven (Qudliparmiut) and a subterranean hell (Adliparmiut) – again on the basis of the kind of death.

For four or five days – the length of the journey to the land of the dead – the soul remains in the house in which the person has died, and may then stay by the grave until summoned to enter the body of a new-born child. This is actually the 'name-soul', which is passed on as the child receives the name of the deceased, and which represents a kind of transmigration doctrine. The house in which the person has died is abandoned, and his possessions thrown away to avoid contaminating the living. Belief of this kind can lead to terrible consequences: a sick person may be removed from a house, and left to die in isolation; the burial shroud may

NTB-D. Wilkinson

be put on before the person is actually dead; and in extreme cases, the dying man or woman may be put in the coffin while still alive. Elaborate safeguards are also observed in order to prevent the ghost from returning to the death house. The corpse may be removed through a window, or through the smoke-hole, a temporary door, or anything but the proper door, in order to prevent the ghost from finding its way back again.

When the dead man is a shaman, the precautions are intensified. So, for instance, a snare may be placed at the door to frighten the ghost, who might anticipate being trapped on trying to re-enter his house. The living too, take precautions: they may plug their nostrils in order not to become prey to 'spirit infection'; they may keep a knife under the pillow at night; and a sledge may be set up either at the grave site or at the death house as a warning to unwary travellers. During the period of mourning, various taboos are enforced. Some Eskimos will avoid uttering the name of the deceased, perhaps for fear of attracting his ghost; almost all impose a ban on working with sharp instruments such as knives, needles and harpoons, lest they should injure the ghost (however unwittingly) and bring trouble on themselves. Hunting expeditions will be suspended for a few days, out of respect for the dead, or in order not to deprive the dead of their proper nourishment.

Burial beliefs and practices vary. As the ground is too hard for interment, the normal practice is surface burial, either covered by stones or uncovered, or in some cases cave burial or sea burial. In the Bering Sea area the covering is added to surface burial as a further protection against the ghost walking. Similar reasons may be suspected in instances of flexing and binding the corpse. Most Eskimo provide the dead with grave goods – food, water, tools, weapons, and so on – for his use in the beyond. In most cases, the objects provided are broken, not, as has sometimes been assumed, to prevent theft, but to liberate the spirit essence of the pot, pan, kayak or paddle in question. Human sacrifice has been known to have occurred in the past, though rarely.

The need to neutralize the dead extended to the practice of periodic feasts, in which the dead were invited back to the land of

Musées Nationaux du Canada

Left **Christmas barely recalls the pagan festival which it usurped, celebrating the returning sun. the living in order to partake of the bounty of their descendants. In the Norton Sound area of Alaska there were three such 'ordinary' festivals annually; but these were eclipsed by the Great Feast of the Dead, held every 10 or 15 years. This feast lasted five days, with dancing, and the giving of presents to the representatives (normally the namesakes) of the dead. This should not be confused with the 'Inviting-in Feast' of the Yukon, in which a similar pattern was observed, only this time with regard to the inuas who grant good hunting. In both these cases, elements appear to have been taken over from the Indians of the North-West such as the wearing of masks.

A Religion of Fear

It is the medicine-man (*angakok*), mediator between the living and the spirit-world, who gives the everyday practice of religion much of its distinctive character and most of its point. He, or she – for women might also fulfil this role – was known all around the polar regions, from Lapland to Labrador. The qualifications were twofold: aptitude, which in practice might involve mental abnormality; and training. For the angakok had to possess supernormal powers and be seen to possess them. He had to be able to enter into a trance, and to communicate that trance to others; he had to speak the shaman language (a mixture of archaic Eskimo and gibberish); and above all to learn to control the spirits, heal disease by restoring 'lost' souls, and obtain food for the people by propitiating Sedna and her like.

His equipment was simple, and centred on the drum on which he summoned spirits to help him undertake his spirit-flights. Exact details of his training are not known, for these matters were kept hidden, but we do know that it began at an early age (seven or eight), with apprenticeship to an older shaman, when he set out on the quest of a vision of his own familiar or guardian spirit. Dark tales are told of shamans who brought about the death of infants in order to have these spirits at their call. But the angakok, although a past master at deception, was not evil; he worked for the people, not against them. There are Eskimo sorcerers, workers of black magic, but even less is known about these. So much is, however, certain, that the practice of Eskimo religion revolves around the shaman, and that any powers the ordinary individual may possess are very much subordinate to those of the angakok.

Not that the individual is altogether devoid of power. Power can be inherited or bought; an amulet may be traded for a kayak, and even a familiar spirit may be made the object of a good 'deal'. Obviously this would not be done if it were not thought that the most important thing in life is the possession of power. For the world is full of 'negative power', derived from the spirits, but capable of attaching, like a virus, to any person or any object; and the only defence is similar power harnessed to one's own ends. Amulets are carried and worn by most Eskimo for this very purpose: a man's umbilical cord or afterbirth, teeth, toenails – any one of which might be used wrongly by sorcerers – animal bones and hair; carved stones and other objects. Almost anything will serve. The end justifies any means.

And what is the end? Simply to dispel fear: fear of gods, ghosts, spirits, shades, shamans, sorcerers. For the religion of the Eskimo is a religion of fear. As the great explorer Rasmussen was once told: 'We do not believe, we only fear. And most of all we fear Nuliajuk (Sedna) . . . Nuliajuk is the name we give to the Mother of Beasts. All the game we have comes from her; from her come all the caribou, all the foxes, the birds and fishes . . . We fear those things about us and of which we have no sure knowledge; as, the dead, the malevolent ghosts, and the secret misdoings of the heedless ones among ourselves.'

Essenes

A small pre-Christian sect, many of whose members retired in isolation to caves on the banks of the Dead Sea, to await the triumph of God over the powers of darkness: they have been identified with the community at Qumran which produced the Dead Sea Scrolls: through a life of simplicity and mysticism, devoted to the love of God, virtue and man, they aspired to the perfection which would initiate them into the mysteries of God.

See DEAD SEA SCROLLS.

ETERNAL RETURN

THE PROBLEM of the interpretation of history and understanding man's remote past are questions which have greatly fascinated the mind of modern man. The West has long been aware of these issues, but they came into sharp focus in the middle of the 19th century, when the doctrine of evolution undertook to explain the entire course of history from its distant origins to the present day in terms of a continuous and on the whole steady development. But despite the value of the evolutionary theory to the biological and geological sciences, it raised certain questions in the realm of the spirit which it was incapable of answering. It failed altogether to provide more than a temporary justification for the temporal process; in other words, it could not explain satisfactorily what was the ultimate *meaning* of history. And it was only able to speculate on the modes of thought of our ancestors.

Theories of origins – the origin of society, of religion, of mythology and many more – flourished; but almost without exception, they attributed modern attitudes to the past. It was assumed that the thought processes of 'primitive' man must be accessible to the investigator, and this assumption gave rise to considerable speculation concerning the nature of 'primitive mentality'; but in the absence of all but the most ambiguous evidence, such theories were never far removed from sheer guesswork.

Among the most recent, and the most consistently worked out, of these theories is that put forward by the Rumanian historian of religion Mircea Eliade in his book *Le mythe de l'éternel retour* (1949) since published in English as *Cosmos and History: The Myth of the Eternal Return*. In it, he undertakes both to offer an explanation of the workings of the mind of primitive man and to account for the essential differences between that and the mind of 'modern' man in the Judaeo-Christian tradition.

Briefly, Eliade's thesis is that primitive or archaic man was afraid of the passage of time, and sought to annul history by a repeated return to a mythical past (the 'eternal return'); Judaeo-Christian man, on the other hand, recognizes God at work within history, and can thus accept his historical existence and his own place in history without fear. In Eliade's own words: 'The chief difference between the man of the archaic and traditional societies and the man of the modern societies with their strong imprint of Judaeo-Christianity lies in the fact that the former feels himself indissolubly connected with the Cosmos and the cosmic rhythms, whereas the latter insists that he is connected only with History.'

No one can approach primitive religions, or study them on even the most superficial level, without being made aware of the importance to their structure of cycles of time – the recurrence of day and night, the progression of the seasons, the phases of the moon, and the reproductive cycles of human beings, animals and plants. In the widest sense this may be seen as the eternal struggle between life and death, light and darkness, fertility and barrenness, chaos and cosmos. Just as creation itself is believed to have been a conquest of chaos so each new fertile season and each new beginning is seen as a repetition of the same creative act.

Eliade maintains that this is the pattern which alone made life tolerable for archaic man. Eternal return is thus defined as 'the cyclical recurrence of what has been before' – and what has 'been before' is the creative act. Primitive man, Eliade holds, believes that 'everything begins over again at its commencement every instant. The past is but a prefiguration of the future. No event is irreversible and no transformation is final.' So the beginning of a new year for instance, is looked upon, not as something utterly and completely new, but as a repetition of what has already been.

In Ancient Mesopotamia, the recitation of the epic of creation, *Enuma elish*, at the New Year (*Akitu*) Festival, with its attendant ceremonies of atonement and regeneration, brings about the effective creation of another solar cycle. First chaos is temporarily re-established, as the king is deprived of his symbols of office; but then the creation of the world is re-enacted: the fates are cast for the subsequent 12 months, and finally the fertility of the land, man and beast is symbolically ensured by an act of hierogamy – ritual intercourse – between the king and a priestess.

The problem of pain and suffering is, in a sense, solved by this view of life. In archaic societies, pain, suffering and death are always believed to be caused; they never just happen. The Hindu doctrine of *karma* provides one possible explanation: suffering is brought about by moral and ritual lapses in a previous cycle of existence. Elsewhere the suffering of a god or goddess may be postulated, and this, too, provides a consolation, since the sufferer knows that his unhappiness is shared. Again, the suffering of the deity is seen within the framework of the repetitive, cyclical pattern of the eternal return. The typical vegetation deity of agricultural societies suffers and dies as the vegetation withers and dies at the onset of winter or the dry season, or, in a lunar-orientated setting, as the moon wanes.

Banishing the Terror of Time

Cyclical time is sacred time. The cyclical pattern is that pattern in which the *passage* of time is minimized, and in which man feels at one with Nature. The knowledge that the cosmos in which he lives periodically 'dies' and is renewed enables him to accept the troubles of life with equanimity, because no distress is other than transitory, and death is inevitably followed by resurrection. The mystery religions of the ancient Mediterranean world offered precisely this – assimilation by initiation to gods and goddesses (Isis, Osiris, Demeter, Persephone, Orpheus and many more) who themselves shared in the earth's universal pattern of death and resurrection (see DYING GOD).

The mysteries, therefore, satisfied a profound need – the need for security in the face of the changes and chances of mortal life. They abolished 'the terror of history'

Radio Times Hulton Picture Library

(Eliade's term) by offering an escape from the present moment into a timeless mythological past, in other words, by an 'eternal return' into myth.

The situation of modern man is very different. Judaism and Christianity postulated a linear view of time, in which the cosmos created by God pursues its course to the summing up of all things, and the destruction of the temporal order, by the same God. For centuries, this view was as it were superimposed on the cyclical view of the common people, and was scarcely accepted; but the new view of history which emerged in the West in the 18th and 19th centuries taught man to look to the future, and not to the past, for his fulfilment. Cyclical theories of time gave way to the ideas of progress, development and evolution. Every event came to be regarded as unique, irreversible and, at least in Christian theology, as a new manifestation of the will of God. Consequently, Western man came to concentrate as never before on capturing the essence of the irreversible instant: turned to the past, this means the obsessive writing of history and the cult of primary source; turned to the present, it means one or other form of existentialism; turned to the future, it means the spinning of utopian dreams or the prediction of catastrophe (the twin myths of science fiction). What modern man seems unable to do is to retreat from history into a timeless world of universal myth.

Man the myth-maker, deprived in the West of access to the myths that told of the time in the beginning when the world was shaped by the gods, makes myths out of film stars, pop singers and football players. Regrettably, whatever they may give him, immortality is not theirs to give.

Subconscious Level of Myth

Does the myth of the eternal return enable us to understand the mind of primitive or archaic man? And does it offer any explanation of the meaning of history? In a sense, the answers which one is prepared to return to such questions as these are as subject to intuition as they are to logic. The cyclical view of time which the myth of the eternal return presupposes is an incontestable fact of human experience. But does the evident fact that primitive man lives close to Nature necessarily mean that he *chooses* to identify himself with it? This is certainly Eliade's view. Concerning archaic man he writes that 'placed between accepting the historical condition and its risks on the one hand, and his reidentification with the modes of Nature on the other, he would choose such a reidentification.' It is the word 'choose' which rings a little false in this context, since it assumes that archaic man has the data on which a choice may be based, and that it is a conscious process.

Neither case seems to be proven. In fact, what the myth of the eternal return is offering us is a modern Western understanding of archaic man; whether archaic man would recognize himself in what is being said about him must be – and remains – an open question. True, this is what he seems to be doing: he seems to be living in a continual present; he seems to the sophisticated Westerner to be refusing 'to accept himself as a concrete being'. But a measure of agnosticism is never out of place when attempting to describe the remote and the exotic, and it is perhaps of more value, in the long run, to describe what can still be observed of the practices of primitives than to indulge in too much speculation about the mental processes that have given rise to them.

One must learn to discriminate. It is certainly a fallacy that all men of ancient cultures are to be judged by identical criteria. By the standard of pure antiquity, the cultures of ancient Egypt and Mesopotamia are 'primitive' and 'archaic'. But both were writing cultures, and both knew the value of chronicles. As Professor S. G. F. Brandon has pointed out in his book *History, Time and Deity*, the Egyptian and Mesopotamian evidence can be interpreted in quite a different way from that proposed by Eliade. These early civilizations were far from being indifferent to history, much less afraid of it; kings and commoners alike sought to perpetuate the memory of their achievements, in dynastic lists, commemorative inscriptions (in the most durable of materials), portraits and autobiographical funerary texts, recording not only names but deeds. As Brandon writes, 'Such records of the past clearly attest a belief in the unique and definitive nature of the events thus commemorated, as well as the conviction that the memory of them was worth preserving.'

Perhaps we might conclude that in any civilization, except perhaps that of India, we are confronted by a superstructure of intellectual acceptance of history on the part of an effective minority; but that in practically all cases there is a vast and amorphous substructure in which instinct and tradition take precedence over reason. The myth of the eternal return works largely on this subconscious level, on the level at which instinct affirms the myths and archetypes. It is the critical Western mind which asks the leading questions, and disturbs the age-old patterns.

ETHIOPIA

Magical beliefs and practices are still widespread in Ethiopia, despite this country's ancient Christian tradition

WHILE ETHIOPIA STRUGGLES to pull herself into the 20th century, her large non-urban population clings to traditional manners and ancient beliefs. The nation is made up of a wide variety of peoples, faiths and cultures; it is dominated by the Monophysite Church (which believes in the single nature of the incarnate Christ) to which the Emperor and most of the ruling class owe allegiance. Many have commented on the almost Biblical stamp of Ethiopian Christian practice and have marvelled at the remnants of old pagan beliefs which lurk just below the surface. Yet, although Christianity is the official religion, almost half the population is Moslem and considerable numbers of pagans thrive in isolated groups throughout the land.

In their impenetrable mountain fastness, immune from any unwelcome outside influences, the dominant Amharas and Tigreans of the highlands have been Christian since very early times, living in family-based villages and pursuing a relatively advanced form of agriculture. The one foreign influence which they have been unable to resist is that of Christian (Coptic) Egypt which has always supplied their higher religious values and, until recently, their ecclesiastical leaders. Moslems are particularly strong in Eritrea and the Province of Harar where spiritual contacts with Arabia and Somalia are easily maintained, though there are also Moslem communities in the Christian regions.

The fertile lowlands of the south and west are the domain of animistic pagan tribes, often worshipping a sky god, such as the settled, agriculturalist Sidama group. The migration of Galla tribes with their high god, Wak, into Shoa and the western provinces, and the survival of aboriginal Agaw tribe remnants in and near Simen has added independent pagan islets to the cultural patchwork of the High Plateau. Among the Agaw tribes particular interest attaches to the Falasha, the indigenous Ethiopian Jews, who live according to the pre-Mosaic code of the Pentateuch in settled villages, fulfilling the despised roles of metalworkers and potters. Their Judaism is heavily tainted with pagan and Christian practices and permits offerings to Sanbat, Goddess of the Sabbath.

A few negroid remnants, such as the Kunama, survive on the north-western borders, formed into clans which marry outside the group and practising totemism. Their high god, Anna, having created Heaven and Earth, now remains aloof and leaves his people to worship ancestral spirits. In the Christian highlands, the various religious groupings tend to keep to themselves and fulfil specific roles in society, the Moslems engaging in trade and commerce and the pagans forming low-status artisan classes.

The Coming of Christianity

The original population of Ethiopia was probably negroid but in remote antiquity these were driven to the southern and western fringes by invading Cushitic tribes. At various periods during the first millennium BC, groups of South Arabian colonists migrated to Eritrea, bringing with them their Semitic language and religion along with other material benefits of their superior culture. Judaism may have followed in the

wake of this movement. Though the invaders inevitably were submerged by the local population, their cultural values survived and, once adopted by the Cushitic peoples, permitted the development of a ruling elite in the northern highlands. This cultural synthesis matured in isolation and somewhere before 200 AD the city of Aksum rose to prominence as the centre of a large tribal empire covering much of the Horn of Africa.

Aksum was already familiar with Greek culture when, about 330 AD, Christianity was introduced under the Emperor Ezana; though there is reason to believe that the initial conversion of the court was politically motivated and that the true conversion of the people rather occurred in the following century when a number of Syrian monks came to the land to escape persecution after the Council of Chalcedon (451) had banned Monophysitism. Aksum now maintained close trading and cultural links with the Byzantine world, but the spread of Islam in the 7th and 8th centuries isolated her from her spiritual contacts.

Son of the Invincible Ares

The South Arabians had introduced to Ethiopia their pantheon, which consisted of the moon god Ilmuqah or Sin, the sun goddess Dhat Himyam or Shams, and the male morning star Athtar, the Astarte of the Phoenicians. It is difficult to assign relative importance to these gods but it is significant that only Athtar was known to all the South Semitic peoples by the same name. Ilmuqah is purely Sabaean whilst Sin is from the Hadramaut, and the sun existed under many local designations. The crescent and circle symbol of the moon and sun is frequent in early Aksumite art and featured on some coins of the reign of the Emperor Ezana, latterly giving way to the cross. Even now it appears sporadically in magical drawings. However, only Athtar survived in the speech of the people to give a northern word *astar*, meaning 'sky' and 'god'. The pagan inscriptions of Ezana modified the pantheon into Astar, Beher or Medr (Earth) and Mahrem (War). It is clear that the last of these was the most important, for in several Greek inscriptions the king of Aksum styles himself 'son of the invincible Ares', and other deities receive no mention. The pagan

British Museum

system has remained so rooted in the beliefs of the people, that the usual Ethiopic word for 'God', *Egziabeher*, literally means 'Lords of the Earth', while 'the Lord' is rendered by the plural form *Amlak*, obvious echoes of polytheism and an indication of how Christianity accommodated itself to popular feeling.

Despite internal threats in the 8th century, the Church somehow survived as the pivot of the state and so it has remained although occasionally troubled by schisms. However, as it has always been impervious to outside influences, except those transmitted by Coptic Egypt, its chief features remain decidedly Oriental. As Edward Ullendorff has pointed out (*The Ethiopians*, 1965), many elements in Ethiopian Monophysitism are unquestionably of Judaic origin and must be very ancient. One may mention circumcision, which conforms closely to Jewish practice, the maintenance of Mosaic dietary prohibitions, the insistence on ritual purity, and the ground plan of churches. Moreover, the Ethiopian national saga, which probably dates back to Aksumite times, argues that the royal house is descended from the union of Solomon with the Queen of Sheba, a legend now incorporated as a fact within the Constitution and no doubt a reflection of the Arabian origins of the dominant culture.

Cult of the Serpent

Paganism has left its mark in many areas. The favoured site for a church is a hill-top, usually in association with a sacred grove. The cross surmounting the church is often adorned with an ostrich shell, a practice encountered in shrines in Arabia and Syria too. Possibly a reflection of an ancient cult of the Mother Earth goddess may be detected in the excessive veneration accorded to the Virgin Mary, often to the detriment of God himself. Similarly local spirit worship may be viewed as the origin of the widespread cult of miracle-working saints, native and foreign.

The classic motif is that of the saint who comes from distant parts and enters an inaccessible region to convert the people and to found a monastery, by preference on a mountain-top and frequently in association with a cave. The multiplicity of recurrent festivals, of which the Ethiopians probably have more than any other branch

The reference to Christ as the Lion of Judah is one of the titles adopted by the Emperor of Ethiopia *Left* In the market at Addis Ababa hangs the banner of the Lion, embracing both Church and State *Above* The Emperor Haile Selassie in ceremonial dress

of Christianity, may also derive from an ancient cycle of pagan festivals; the New Year Masqal festival in September, for example, culminates in the burning of a mammoth bonfire on a hill-top, round which oxen and sheep are led three times before being sacrificed and left for the birds and jackals to consume.

Most of the races of Ethiopia draw on a common stock of mythical beliefs. There is abundant evidence in all faiths of an aboriginal cult of the sky god who is involved in fertility and rain-making rites, whilst the earth, particularly woods and streams, is inhabited by genii, not necessarily evil, but requiring propitiation.

The official Solomonic legend in its turn has had more ancient traditions grafted onto it. The Tigreans tell how in Tamben there once lived a tyrannical snake king, Waynaba, who required of his subjects an annual tribute of a maiden and a quantity of milk. The people of Aksum ultimately found a young man, Angabo, who was to become the father of Sheba, and he, by the exercise of magic, succeeded in killing the snake and thus became king of Aksum.

A snake cult, evidence of which is forthcoming in South Arabia and Socotra, must be deep-rooted in this part of the world. The Ethiopians believe that in ancient times the land was divided between those who followed the Hebrew faith and those who worshipped Arwe ('serpent'); another old tradition alleges that the world is encircled by two serpents, Leviathan and Behemoth. Attitudes to snakes nowadays vary from province to province. In Shoa house snakes are shown respect, but in Begemder they are regarded with outright fear and the people wear talismans of herbs to get protection from them.

Other creatures also assume importance from cultic association. Augury by the behaviour of birds is an important preliminary to any expedition or hunt, whilst the cock seems to be connected with kingship. The legitimacy of the future Solomonic king Yekuno Amlak (1268–83) is said to have been recognized when as a child he unwittingly consumed the head of a cock.

A very important symbol of royalty is the bee, whose honey and wax were formerly reserved to the king. A legend tells how the future greatness of the Zagwe king Lalibela (d 1220), builder of the famous rock churches, was recognized in childhood when a swarm of bees settled round his head. On a more general level the hunt had a major ritual function for all warriors as proof of bravery, and the coronation of a king was traditionally followed by one in which animals otherwise reserved to the king were killed, a clear sign of totemism.

Church's Attitude to Magic

Belief in the efficacy of magic is universal throughout Ethiopia, not least amongst the Christian communities. The attitude of the Church here is ambiguous. It accords at least tacit recognition to certain facets of magic which do not specifically run counter to Christian dogma. In the *Anaphora* of

Nucleus of the Truth

Mass in an Ethiopian monastery

There were twenty or thirty monks around us and some women and babies from the *tukuls*. Communion was administered to the babies, but to no one else. Many of the monks were crippled or deformed in some way; presumably they were pilgrims who had originally come to the spring in the hope of a cure, and had become absorbed into the life of the place. There seemed to be very little system of testing vocations in the community. The priests and deacons wore long, white-and-gold cloaks and turbans, and had bare feet. Now and then they emerged from the sanctuary, and once they walked round in procession. The singing was monotonous and more or less continuous, accompanied by a drum and sistrums (silver rattles). For anyone accustomed to the Western rite it was difficult to think of this as a Christian service, for it bore that secret and confused character which I had hitherto associated with the non-Christian sects of the East. . . At Debra Lebanos I suddenly saw the classic basilica as a great positive achievement . . . I saw the Church of the first century as a dark and hidden thing, as dark and hidden as the seed germinating in the womb; legionaries off duty slipping furtively out of the barracks, greeting each other by signs and passwords in a locked upper room in the side street of some Mediterranean seaport. . . The priests hid their office, practising trades; their identity was known only to initiates; they were criminals against the law of their country. And the pure nucleus of the truth lay in the minds of the people, encumbered with superstitions . . .

And I began to see how these obscure sanctuaries had grown, with the clarity of the Western reason, into the great open altars of Catholic Europe, where Mass is said in a flood of light, high in the sight of all, while tourists can clatter round with their Baedekers, incurious of the mystery.

Evelyn Waugh, *Remote People*

Jacob of Serug, for example, there occurs a reference to the magical name Melos, the fiery sword, which some have interpreted as a form of the name Solomon in reverse. A number of short magical texts where the religious content is clear have been given approval despite a ban on such materials issued by the Councils of Nicaea and Galatea. Consisting largely of extracts from the Scriptures, stories of saints and other holy writings, their magical content is innocuous, hardly more than the mention of 'acceptable' magical names, and their practical value to the owner is largely prophylactic, though a very few may find their way into use in Church services.

However, when confronted with witchcraft or anything suggestive of black magic, the Church takes a severely prohibitive, if unavailing, line. It has always been an offence to practise magic and in early chronicles one reads of punitive measures taken against pagan and magical cults. The Emperor Sara Yaqob (1434–68) in particular took a stand against such practices and personally composed disputations on the subject. During his reign large sections of the people had abandoned Christianity in favour of paganism and the Emperor is praised as one who 'eradicated Dask and Marit and Tafant and Maqawzay and Dino, magicians and all who worship idols and their sorcery.' The measures do not seem to have been effective, for even now these very names recur in magical writings.

The people, however, are more sympathetic. By nature conservative and superstitious, they lay greater stress on practice than on dogma. Their God is the jealous deity of the Old Testament rather than a source of compassion and they feel that the Church's promise of happiness to come is poor compensation for tribulation on earth. To some extent Christ and the Virgin are more reliable in this respect.

The superstitions to which they fall victim are prevalent throughout the Near East and North Africa. Perhaps the greatest fear is of the Evil Eye which they believe to be exercised by malevolent spirits and also by certain humans, notably blacksmiths and other artisan groups such as the Falasha. Talismans of coloured ribbons or gold and silver plates are often placed round the necks of children as a protective measure and most Ethiopians will not appreciate a compliment paid to a child, unless accompanied by the saving phrase, 'God be praised'. Animals and houses are also at risk and for the latter a dried aloe plant or a stuffed crocodile set over the door is held to afford some protection.

Names are another source of danger. The Ethiopians believe that a name is the essence or soul of the person or object to which it is applied. Whoever learns this name gains power over the bearer. Utterance of a name thus becomes a potential act of creation or of destruction. Though not perhaps as cautious in this respect as, say, the Berbers, Ethiopians are unlikely to reveal their baptismal names, if they can remember them, and the use of nicknames to thwart evil spirits is widespread. On a higher level great virtue attaches to the names of God, knowledge of which facilitates one's progress to Paradise. Since God has many powers and attributes, he also has many names and it is said that Christ revealed the greatest of these as Berhana'el. Typical is the belief that the three Persons of the Trinity existed in name only in primordial ocean and that each assumed form by pronouncing his name.

Possession by Zar and Buda

It is in the popular view of diseases as spirit-induced that we are best able to study magic in practice. Most of the evidence we possess concerns the northern provinces, particularly Begemder where the town of Gondar has emerged as a major centre for magic and sorcery.

Perhaps the most ubiquitous type of spirit is the Zar, whose name is variously said to be of Galla or Agaw origin. Although probably derived from Devil-worship, of which much evidence exists elsewhere, they are represented as white-faced and so are not evil. There are many Zars and their activities and social organizations exactly parallel those of humans. They have a king, own property and engage in various trades. They fall ill, are subject to the evil eye and may be attacked by other types of spirit. Unfortunately, they have a predilection for possessing humans, usually unmarried women who have offended them. The victim, called *faras*, or 'horse', betrays signs of mental illness, behaving like a horse and singing heroic songs. Since the Zar is not actually maleficent, it is sufficient to propitiate him and persuade him to leave his 'horse' and reside elsewhere. This is the task of certain individuals who are known to possess the powers of mediums. To the accompaniment of songs and dance and the burning of scented herbs, the victim is driven into a frenzy till the Zar, speaking through his victim, ultimately reveals his name. Once this is known, he can be persuaded to depart in return for various offerings, such as meal and the sacrifice of a cock. Although Zar possession provides a convenient opportunity, for malingering, reliable observers have often been convinced of its genuineness. Michael Leiris, a scholar who has made a particular study of Ethiopian magic, has drawn attention to the theatrical aspect of the performance and the fact that the victim will go through a set range of actions specific to the Zar without any apparent foreknowledge or prompting, to the extent of distorting his speech into an argot of which he will later claim no knowledge.

Far more serious is the malevolent Buda with his Evil Eye. He is not strictly a spirit but a human being practising black magic. One is born a Buda and cannot change. Blacksmiths and the Falasha are particularly suspect here and receive much ill-treatment in consequence. The Buda, who has the power to change himself into a hyena, is said to lure people to lonely spots, where he attacks them, eats them and drinks their blood. Less harmfully, he may change into a stone on a path and trip up his victim, or simply cast the Evil Eye on him so that he becomes unaccountably ill. The favoured season for this is the end of August after a shower of rain. The Buda is dealt with in a manner very similar to the Zar but his exorcism involves a contest of wills with the medium, rather than persuasion. Once he has been named, the unfortunate blacksmith will be summoned and forced to release his victim.

While possessed by a Buda one may experience a craving for charcoal, and afterwards there is total amnesia. As a talisman one may wear a hyena skin pouch containing the root of the tenadam plant (feonel).

Among the many lesser spirits there are the Ser'era, the midday spirits of rivers and deserts. Each household has one and he is good or evil according to his reception. There are also the Aganent who are river

To gain protection from diseases it is the custom to wear magical amulets, consisting of long strips of leather inscribed with texts intended to avert evil

deities who live in villages and possess property which one may see reflected on the surface of the water. They have human form and are black. Though some are liable to drown the unwary swimmer, others render assistance to men in the home or on the farm. When crossing a river one must conciliate the Aganent by throwing in herbs or food, naming oneself and the river and drinking some water. A deity associated with empty houses, thresholds and closed doors is Maggaña. Sacrifice must be made to him when a house is built, and most urgently when it is reoccupied. He is a menace to the first person to open a door, and dawn becomes a hazardous time to go visiting. To thwart his power one must spit into the house just as the door is opened.

Spells and Charms

All ailments are said to be the work of specific demons, and demand treatment as such. Infertility and complications of childbirth are attributed to Shotelay, whilst childhood illnesses are caused by a witch called Werzelya (probably identical with the Hebrew Lilith), who slew the son of Saint Susneyos and was speared to death by him. Another belief alleges that the negroid Barya tribe work in consort with the Devil to cause epilepsy.

To gain protection from diseases it is the custom to wear magical amulets, consisting of long strips of leather inscribed with texts intended to avert evil. The term for this, *ketab*, is pure Arabic, where it means 'book', above all the Koran. A brisk business in these is carried on by *dabtaras*, or lay Church deacons, as a lucrative side-line to their ecclesiastical and teaching duties. Dabtaras have a reputation for cunning and some are said to be able to conjure up the Devil from a stream and elicit from him information about the future.

Amulets, composed in the dead Ethiopic language, may be of a general nature and are often the semi-official texts approved by the Church, but there is a wide range of purely magical ones, drawing on a common stock of legends, prayers and hymns which are selected and adapted as required by the individual case. Into these are inserted innumerable magical names, of God, and the angels, Solomon, and the like, and also of less reputable personalities such as Satan. Frequent also are unintelligible magical words. These are only effective if not generally understood, so that foreign words are specially favoured. Research into these has revealed traces of words of Greek, Latin, Arabic, Hebrew and probably Cushitic origin. Hebrew is very desirable, though most examples given are highly suspect, and the letters of the Hebrew alphabet are regularly named. Curiously one encounters the Ethiopian equivalent of the ancient Latin palindrome (a word or phrase that reads the same backwards and forwards), 'Sator arepo tenet opera rotas', in the garbled form 'Sador alador danat adera rodas'; the phrase is said to represent the names of the five nails of the cross.

The Semitic tradition underlying these texts emerges just as clearly from the drawings which punctuate the narrative, without necessarily being related to it. Designs themselves indeed may constitute an amulet. These have now been subjected to analysis by Ewald Wagner who has revealed thematic links with magical materials from Egypt, Greece, Asia Minor, Iran, and Armenia. The drawings are often obscure and it is probable that there is a given range of motifs which the dabtara may draw on at will. Two popular designs are the open-ended Greek cross with the face of God in its centre, and a spider-like device, perhaps representing the net used by Solomon to catch demons. A common figure is that of a guardian angel with drawn sword, probably Fanu'el, the exorcist. The Werzelya amulet usually depicts Saint Susneyos, mounted, driving his spear into the prostrate, black-faced witch. Animals appear more rarely, though snakes, fish and lions are occasionally depicted. A convention of Armenian origin demands that an evil figure must be shown in profile to counteract the effects of the Evil Eye, or occasionally simply omitting the pupil of the eye. There are also groups of deformed Ethiopic letters bearing circles at their extremities, which are worked into the actual text; these were probably intended to ward off evil.

If a man falls ill despite these precautions, he may go to the local dabtara who will copy out a prescriptioo from his book of remedies and sell it to the invalid. Alternatively, he may prefer to consult a *tankway*, 'sorcerer', who will prescribe less orthodox, magical methods of treatment. The remedy may include the wearing of an amulet, repetition of magical words and names, burning herbs, sacrifice, and other forms of sympathetic magic. Specific days are regarded as propitious for treatment and the position of the patient is important. The scholars Marcel Griaule and Stefan Strelcyn have published examples of prescription books, and Maxime Rodinson has produced a sort of Ethiopian medical directory of specialists for the Gondar area. It lists their names, addresses, specialities, methods and their fees.

With a prayer stick from ancient Egypt the *dabtara* ceaselessly sings psalms while awaiting death and sainthood: these holy men are often consulted about the future

Ethiopian Christians crave for immortality and in order to assure their transitiоn to Paradise without too much tiresome preparation, they bury an amulet with their dead known as *Lefafa sedq*, which E. A. W. Budge names the 'Bandlet of Righteousness'; traditionally this should be the same length as the owner. Budge has drawn attention to many features common to this interesting document and the version of the Egyptian 'Book of the Dead' current in Graeco-Roman times. It lays great stress on knowledge of the secret names of God, by whom it was allegedly written. These names were revealed to Christ at the insistence of Mary who was anxious to spare her servants the terrors of Judgement and the torments of the River of Fire. The text contains many ideas derived from Egyptian Gnosticism and apocalyptic Hebrew works. It is noteworthy, however, that the elaborate funerary rites prescribed in the *Lefafa sedq* are not in fact supported by actual practice in Ethiopia, where burial is carried out with little ceremony other than dramatic mourning. The mere fact of possessing the amulet was a sufficient guarantee to the owner, who probably could not have read it anyway.

The sombre, savage religion of the mysterious ancient Etruscans included a preoccupation with divination and sacrifice, and a morbid obsession with hell and damnation

ETRUSCANS

'MYSTERIOUS' is the word popularly applied to the Etruscans. This conventional epithet has arisen for many reasons: the uncertainty shrouding their origin, the fact that their language is partly undeciphered, the apparent concern of much of their religious beliefs with the underworld and divination, and the fact that when the archeologist first began to uncover their material remains the chief source of investigation was provided by large chamber tombs with frescoes which included scenes of the tortures of the damned, reminiscent of the Hell of some medieval painters.

The discovery of their civilization has sometimes led to an overappraisal of its achievements and similarly their religious beliefs have often been surrounded by an aura of mystery not always justified by the facts. As a result of this attitude, even a well-known Etruscan scholar can regard the central pillar in their chamber-tombs as symbolizing the uniting of the world and the underworld, whereas the prosaic fact probably is that the pillar was designed merely to keep the roof up.

Who were the Etruscans? A partial answer, with which few would quarrel, is that the Etrusci (or Tusci), as the Romans called them, lived in Tuscany in central Italy from at least the 7th century BC. They extended their influence southwards to the area around Naples (in the process engulfing the Latin city of Rome, where Etruscan kings ruled in the 6th century) and later northwards to the northern plain of the Po valley. About 500 BC the southern area including Rome shook off their rule, confining their power increasingly to the district of Tuscany, and in the 4th and 3rd centuries they were finally forced to submit to Rome's expanding might: they were absorbed into Rome's Italian confederacy and in 90 BC became Roman citizens.

It is when one tries to look back before the 7th century that difficulties arise as to their identity. It is generally agreed that their language, although written in a form of the Greek alphabet, does not belong to the Indo-European group which was spoken in historical times by most of the peoples of Italy (Iron Age peoples, Latins, Samnites, Greeks and others), and it is the opinion of most of the ancient writers from Herodotus onwards that the Etruscans had settled in Italy as a conquering aristocracy coming from Asia Minor. However, one Greek writer, Dionysius, who lived at the turn of our era, believed them to be indigenous, descendants of the prehistoric peoples of Italy. Today emphasis is laid less on the problem of origin and more on the fact that Etruscan civilization, as we know it, evolved on the soil of Italy.

Although perhaps insoluble, the problem is important, not least from the religious point of view. If the Etruscans came from the East, it is easier to explain certain affinities between their beliefs (in divination, for instance) and those found in Mesopotamia. In any case there is a strong 'oriental' element in Etruscan civilization which was partly transmitted from the Greeks. If they were indigenous to Italy, one would have to seek the origin of their religious beliefs primarily among the earlier inhabitants of Italy.

One thing is beyond doubt: the basis of the population of Etruria from the 7th century onwards was descended from the earlier Iron Age peoples. Either these people, who cremated their dead, somehow developed the Etruscan civilization, where burial was the main rite – and certainly this process would be a major mystery – or else a small minority of Etruscans with a superior culture came from overseas, conquered the land, and by exploiting its natural resources and the manpower of its earlier inhabitants, built up a complex political system based on city states in an area which had seen little more than the huts of the Iron Age villagers.

Clues from the Past

Our sources of knowledge of Etruscan religious thought and practice fall into three groups. Firstly, a few Etruscan inscriptions, secondly the archeological remains which are numerous but cannot speak and are subject to varying interpretation, and thirdly the writings of later Greeks and Romans.

The chief Etruscan inscriptions include a clay tablet from Capua (near Naples) of the 5th or 4th century BC, which deals with funeral ceremonies and contains the names of several Etruscan deities; a liturgical text written on the wrappings of an Egyptian mummy now in Zagreb, of the 2nd and 1st centuries; a model bronze liver with inscribed names of gods from Piacenza in northern Italy; a lead tablet with names of deities from Magliano, Tuscany; and two sheets of gold, discovered in 1964 at Pyrgi (southern Etruria) which date from about 500 BC. This source of knowledge, is however, limited by its paucity and our inability to translate it completely.

Archeological evidence includes numerous tombs and their contents. Whole cemeteries survive, at Tarquinii and Caere, laid out like towns containing streets of tombs of varying size and style, many being great tumulus mounds with circular stone bases cut in the rock. Usually the interiors are decorated like houses, which suggests that the Etruscans wanted the dead to 'feel at home' in replicas of their earthly houses, and often the walls were painted with scenes of daily life, depicting banquets, dancing, music, and athletic games. In the later tombs, however, the paintings are more concerned with the underworld and its terrifying demons suggesting that the earlier gaiety was being suppressed by a grimmer attitude to the hereafter.

These tombs underline a weakness in our evidence in almost all spheres: so much of it is late in time and represents the later stages of Etruscan history and belief; much less is known about the 7th century, and indeed about the lower classes in society than about the rich who could afford these magnificent burials. Reliefs on sarcophagi and urns depict the dead starting on their journey to the underworld, and their lids may bear sculptured figures of the deceased. Smaller objects, such as statuettes, reveal the characteristics of the various deities, while the backs of bronze mirrors often decorated with mythological scenes indicate how much the Etruscans borrowed and adapted from Greek mythology.

As for literary evidence, apart from scattered references throughout Greek and Roman literature, a valuable source was provided by such Roman writers of Etruscan origin of the 1st century BC as Tarquinius Priscus and Aulus Caecina, who translated into Latin some of the Etruscan religious books. Unfortunately only a few fragments survive, and even these are probably contaminated with later ideas; but they confirm the important fact that Etruscan religious belief, unlike Greek and Roman, was 'revealed'. It is said to have been taught to the Etruscans by seers, such as the mythological Tages, who miraculously appeared to a peasant and then revealed to the assembled Etruscans the science of divination by the inspection of the entrails of sacrificed animals or by the flight of birds. Many sacred books were later attributed to him (*libri Tagetici*), while a prophetess named Vegoia, or Begoe, expounded cosmology and the ordinances of the God Tinia, the Etruscan Jupiter, regarding the division of land. All this teaching was embodied in a code of religious practices, the *disciplina Etrusca*.

This sacred literature included the Books on Lightning, Books of Haruspices (diviners) and Books of Ritual. The first dealt with the interpretation of thunder and lightning: various gods threw thunderbolts which thus revealed their will if rightly interpreted in accordance both with the part of the sky in which they appeared – it was divided into 16 parts – and with the places or objects struck; the latter became sacred or taboo. Tinia threw three kinds of thunderbolt of varying import, while eight other gods threw one each. A special type of calendar known as brontoscopic, interpreting the significance of the bolts for each day of the year, has been preserved by a late writer, John Lydus.

The *haruspices* were priests concerned particularly with divination through the inspection of livers; this art, known as hepatoscopy, was a particular Etruscan ritual. On an Etruscan mirror the seer Calchas is depicted foretelling the future in this way; on another a *haruspex* is making predictions in the presence of a god and the Etruscan hero Tarchon. Even better known is the bronze model of a sheep's liver, found at Piacenza. It is divided into 44 sections inscribed with the names of gods and represents the heavens orientated by the cardinal points and the home (*Templum*) of the gods.

The liver of the sacrifice represents the state of the world at the moment of sacrifice and indicated the will of heaven; its various parts were related to the corresponding parts of the heavens, and predictions turned on the appearance (especially abnormalities) and colour of the liver. In later times the Roman Senate, when in doubt about the meaning of omens, would appeal to these expert Etruscan diviners.

Scala

Scenes of daily life, banquets, dancing, music and games, painted on the walls of vast Etruscan tombs, suggest that the Etruscans wanted their dead to 'feel at home' in replicas of their earthly houses: Tomb of the Lionesses at Tarquinii

The *Libri Rituales* probably contained directions for all aspects of public and private life. We know that they laid down instructions for the founding of cities, the consecration of temples and altars, the surveying and allotment of land, matters of property and many affairs which should be regarded as legal rather than religious.

Books of Fate and Death

There were also Books of Fate and Death which were probably included in the *Libri Rituales*. The duration of an individual's life was determined by fate, and even that of the Etruscan nation was limited to ten *saecula* or cycles, the eighth of which ended in 88 BC; although the threat of fate might be delayed by sacrifices until the tenth saeculum, thereafter it could not be averted. Similarly the universe, according to a late passage which may have been influenced by the book of Genesis, had its determined history of 12 millennia: during the first 6000 years the demiurge or creator of the universe had created heaven and earth, the firmament, the sea, waters and land, the sun, moon and stars, all that creeps, flies or runs in earth, air and water, and man, who would endure for the next 6000 years.

In Macaulay's poem, *Lays of Ancient Rome*, he speaks of the 'nine gods' by which Lars Porsena of Clusium swore 'that the great house of Tarquin' (the Etruscan king) 'should suffer wrong no more'. We know the names of more than Macaulay's nine gods worshipped by the Etruscans, but little about their functions and relationships, and while many have Etruscan names, they were early affected by Greek and oriental influences and equated with the names of Greek and Roman deities. Such equation of names does not of course always involve complete identity of function.

The chief god Tinia or Tin, a thunder-god, was identified with Zeus and Jupiter. Voltumna (Vertumnus) was also very highly honoured. Tinia was worshipped alongside Uni (Juno) and Menrva (Minerva) in tripartite temples of which the most famous is that on the Capitol at Rome, built by the Etruscan kings, in the 6th century BC. The god Sethlans was identified with Hephaestus-Vulcan, Fufluns with Dionysus-Bacchus, Turms with Hermes-Mercury, Turan with Aphrodite-Venus. The Greek Apollo, Artemis and Hercules appear as Aplu, Aritimi and Hercle. No doubt many of the gods had mythologies of their own before they were identified with Greek counterparts.

The Greek Charon and other lesser deities of the underworld gained increasing importance as this aspect of the future loomed larger in Etruscan thought. Other deities had local or family names, and the city of Populonia near Piombino may have been named after Fufluns. The process by which alien deities might be welcomed into the Etruscan pantheon is illustrated by the Pyrgi inscriptions which record the introduction of the Punic Astarte into the Sanctuary of Uni with the name Uni-Astarte. In addition, there were many groupings of gods and a host of minor deities. Beside the triad of Tinia, Uni and Menrva, there were the 'nine' gods who hurled lightning, *Dei Superiores* who counselled Tinia about when to throw his worst thunderbolt, other advisers named *Dii Consentes*, the Penates, the Lares and others, many of whom were perhaps regarded as gods of fate.

The gods were worshipped in temples, the earliest known dating to 600 BC. It may be that open air sanctuaries with altars were used in more primitive times. The temples were set in sacred precincts, usually against the rear wall, with an altar standing in the space in front. They contained the cult statue of the god: the most famous surviving one is the terracotta statue of Apollo at Veii near Rome.

Funeral Games

Little is known of the ceremonies, sacrifices and prayers, which may be described in the inscriptions found at Capua and Zagreb. Doubtless there were formal litanies. Votive gifts could take the form of statuettes of the deities to whom they were offered, and clay models of parts of the human body were offered in gratitude for the cure of these parts or the desire for such healing. Animal sacrifices took two forms: they were called *hostiae animales*, in which the soul or life of the animal was offered to the god in place

of a man's, and *hostiae consultatoriae* by which the sacrificer sought the will or advice of the deity in the victim's entrails. Prisoners were also slaughtered for sacrifice.

A less grim aspect of Etruscan religious life is reflected in the games, dances, music, horse-racing, processions, prize-fights and other activities practised in honour or service of the gods and indeed of the dead. Funerals of heroes as in Homeric times were followed by elaborate competitive athletic games, and they are represented in Etruscan art, wall-paintings and sarcophagi. In the Tomb of the Augurs at Tarquinii are depicted two wrestlers with august referees and bronze vases which were the prizes; the frescoes of the Tomb of the Olympic Games show horse and foot races, jumping, boxing and discus throwing. But even this had its sombre aspect. In the Tomb of the Augurs a masked figure (Phersu) with a wild dog on a leash fights a man armed with a cudgel and with his head covered by a sack. Such scenes lend colour to the belief of the ancient writers that Rome originally derived her bloody gladiatorial combats from Etruria, and they no doubt reflect a milder version of the human sacrifices which in more primitive days had accompanied the funerals of princes. We know little of religious festivals as such, but representatives of all the Etruscans met annually at the sanctuary of Voltumna near Volsinii.

The tomb frescoes, with their scenes of feasting and dancing and their more sinister glimpses of torturing demons, suggest the prospect of paradise or hell in an afterlife in which the individuality of the dead survives. Since the wealthy were buried with great riches – shields, weapons and chariots for the warriors and jewellery and toilet articles for the women – the fortunate may have hoped for a continuation of the joys of earthly life. The horrors of hell prefigure the demons of Michelangelo and Dante. The gruesome figures of Charun with his hammer and the vulture-beaked Tuchulcha with donkey ears and armed with serpents, carry off the dead. The parting, when the dead man starts on his long journey, either on foot, horseback, chariot or boat, is vividly shown on many sarcophagi.

Livy described the Etruscans as 'a nation more than any other dedicated to religion, the more so as they excelled in practising it', while the Christian writer Arnobius later described Etruria as the 'creator and mother of superstitions'. The general impression is that unlike the Greeks, the Etruscans felt the insignificance of man dominated by fate and the divine will. Heaven and earth were closely linked, the vault of heaven being orientated and divided up into sections where lived the various deities; sacred areas on earth were correspondingly orientated and divided, while the position in the sky where signs occurred, indicated the god responsible. The omens were interpreted by priests who played an important role in Etruscan society. By means of the received *disciplina* it was man's task to discover the divine will and then passively to follow. Seneca sums up: 'The difference between us (the Greeks and Romans) and the Etruscans is that whereas we believe lightning to be released because clouds collide, they believe that clouds collide in order to release lightning.'

Euhemerism

The theory that mythology has its origins in history; propounded by the Greek scholar Euhemerus in the 3rd century BC, who tried to prove that the gods were in fact ancient kings who had been deified: in an account of a fabulous journey to islands in the Indian Ocean, he claimed to have discovered inscriptions commemorating great kings and heroes, whose names corresponded with those of the Greek gods: Christians later used the theory to discredit the pagan gods.

EUROPEAN WITCH PERSECUTIONS

In an atmosphere of suspicion both inside and outside the courtrooms, witch hysteria rose to a peak in the 16th and 17th centuries, accusations breeding further accusations

WITCH SCARES and witch-hunts in Europe began in the very late Middle Ages and culminated in the 16th and 17th centuries. Nothing of the kind is known to have happened before about 1300 AD. The whole historical problem involved in interpreting the phenomenon of these persecutions can be summed up in that one fact.

Sorcery – the use of, or pretending to, occult powers – was always against the laws of the Church. It was probably fairly common in early medieval society, but would have been handled by the ecclesiastical penitential system, which became vastly more ambitious in the 13th century. Secular legal codes of the period are mostly silent on the subject, not out of enlightened liberalism but because it was considered strictly the affair of the Church. The change to an atmosphere of public panic and the demand for violent solutions came quite slowly, and at a time which we are accustomed to think of as one of intellectual progress, although the same period saw an apparent increase in the practice of astrology and alchemy.

Geographically, the first witch-hunts of all were probably on French soil, but the centre shifted eastwards later. In the early stages the panic seems to have been most deeply rooted in the Alpine region. It lingered longest in the Danube basin where quite large scale persecutions occurred as late as the 18th century. Certainly the German-speaking countries suffered the most. After the Reformation persecution seems to have flourished predominantly in territory under Calvinist control, but a causal connection between Calvinism and witch hysteria has not been proved. In the British Isles the scare arrived very late – after the Reformation – and rose to a peak in the Civil War period. It then died down almost completely in England and Scotland; Ireland had scarcely been touched at all. In all three

countries individual witches might be punished from time to time until new legislation under George II made it impossible, but individual cases are not persecutions.

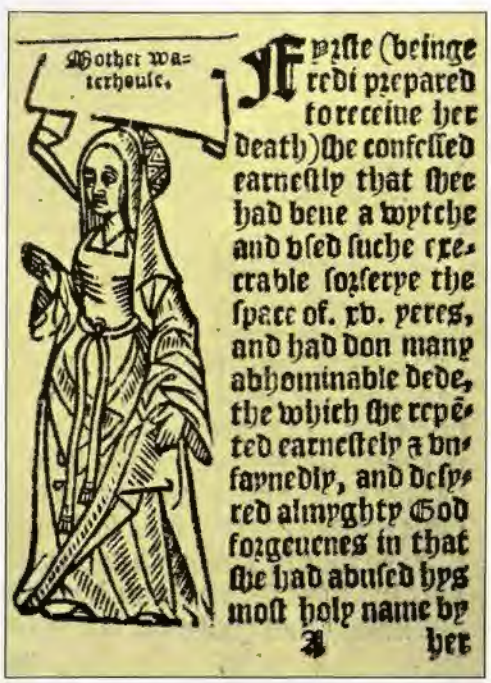
In countries controlled by the Inquisition (Roman or Spanish) there were no major witch-hunts in the period when panic was highest elsewhere. There may have been a continuous stream of trials, and certainly the Inquisitors were not reluctant to punish witchcraft – in the early days of witch-hunting they were the acknowledged experts in the field. In the age of the Reformation, Italy and the Iberian peninsula were more completely under the Church's control than anywhere else, which may account for the fact that they seem to have been more peaceful than elsewhere in this respect.

The Work of the Devil

'Witchcraft' is a word that can have several meanings, and it can be feared and give rise to public panic, for more than one reason. In the Renaissance epoch it is probable that not all those who participated in the persecution of people they thought of as 'witches' attached the same meaning to the word or could have given the same reasons for their fears, but the body of literature which grew up around the subject, including manuals for witch-finders, gives a fairly clear picture of what officials of Church and State understood themselves to be fighting against.

The type of witchcraft which men in authority were trying to stamp out – whether it really existed or not, and whether the general public understood it or not – was

Above left **Calvin, a ruthless persecutor of witches, saw in witchcraft the Devil's alarmed defense against the spiritual progress of the Reformed Church** ***Above right*** **Matthew Hopkins, the Witch-Finder General, charged high fees for his services: he specialized in finding the 'Devil's mark' and extracting confessions** ***Below*** **Extract from a horror pamphlet containing the confession of a notorious witch. These pamphlets helped to create the witch hysteria**



something quite different from the furtive fortune telling and spell peddling, cursing and blessing, which the Church had been trying to put down since the Dark Ages. This was looked upon as sinful, partly because many things that witches were believed to be able to do were obviously evil and partly because even their relatively benevolent practices implied disrespect towards Providence and the Church's own ministrations. It was almost irrelevant whether the culprits could or could not perform what they claimed, but probably most bishops and their judges thought that they could.

The new witchcraft, discovered and revealed to the world by zealous Inquisitors in the late Middle Ages, was something else again. The older kind indeed survived, and was taken into and absorbed by the new, but there was one vital new element in the situation: witchcraft had come to be recognized as the work of the Devil.

Of course, all sin is the Devil's work in a sense, but the Inquisitors, and later Protestant witch-finders, meant something altogether more precise. They meant that the witches (who from this point onwards begin to be of both sexes, although women, as in folklore, continued to predominate) had put themselves consciously under the guidance and command of Satan to work his nefarious will in the world, while gratifying depraved desires and ambitions of their own. Thus it followed that they really did enjoy occult powers, supplied them by their infernal master; it now became a mark of orthodoxy to believe in witchcraft, and a

The Devil's mark might take many forms, it might even be invisible, but it was a spot somewhere on the body which was insensible to pain

ground of complicity to deny it or express scepticism. Moreover, all witches being servants of one master were members of a huge all-pervading conspiracy. Eventually, the propagandists were to claim to know something about the details of the organization and by the time when we can reasonably use the phrase 'witch persecution' association of one suspect with another was sufficient evidence of guilt.

The Obscene Kiss

The associating together of witches had not been prominent in earlier beliefs so far as we can tell, but was not unknown. The two annual occasions when witches are supposed to foregather – Walpurgisnacht (30th April) and Hallowe'en (31st October) – are important in the folklore of most European countries and although it is impossible to be certain that those parts of folklore which are relevant to witches are not later accretions, it is unlikely. However, the older superstition most clearly involving the assembly of a number of witches is one that the Church had earlier tried to suppress as delusory. This is the story of the witches' ride, recorded in the so-called Canon Episcopi. This famous document (first referred to c 900 AD) denounced 'certain wicked women' who falsely claimed to have ridden by night, covering immense distances, with 'Diana', whose servants they were. The suggestion was that they had dreamed it and that good Christians ought not to believe that such a thing could really happen. In later copies Diana changed her name; her best known aliases being 'Herodias', 'Holda-Perchta' and 'Dame Habonde'. Until the 15th century a succession of churchmen, lawyers, poets and others continued to deny that this lady existed or that witches rode with her by night. None of them mention broomsticks. The witches rode on animals, presumably monstrous. As with other tales of supernatural journeys, it is very hard to guess whether in the teller's mind they actually flew or not. The witches' flying through the air eventually became an integral part of the idea of witch assemblies on such occasions as Hallowe'en. Witch-hunters believed that it really happened, and the Canon Episcopi was definitely inconvenient.

One thing they knew which Regino of Prüm, the earliest writer to use the Canon Episcopi, certainly did not know, was what happened at the assemblies. The real leader, of course, was Satan and not Diana. He appeared in the form of an animal – usually a goat – and required his devotees to kiss him under the tail – the '*osculum infame*'. The proceedings also included a sexual orgy. The participants, apart from the Devil, were naked. These details are fairly constant. There might also be some act of conscious blasphemy, but the Black Mass dear to modern magicians does not play a conspicuous part in the picture drawn by the propagandists. The remarkable thing about all these accusations is that they had previously been used to blacken the reputations of heretical sects such as the Waldenses.

In the 13th century, especially in the South of France, a variety of heresies became sufficiently firmly established to require vigorous action on the part of the Church; the Dominican Order and the Inquisition were both founded at this time and for this purpose. By the time that the Albigensians, Waldenses, Picards, Patarenes and so on had been thoroughly crushed, the Church's machinery of repression was stronger and more efficient than ever before, and Inquisitors and preachers had learnt a great deal about the way in which the Devil used dissident groups that fell under his control. By the end of the century it quite suddenly becomes easy to document the idea that he requires everybody who has become his servant, not only heretics, to kiss his hindquarters.

Indeed only one major charge that was useful to witch-hunters appears not to have been used by heresy-hunters. This was the charge that the Devil had physically marked the culprit as one of his own. The Devil's mark might take many forms, it might even be invisible, but it was a spot somewhere on the body which was insensible to pain. This belief differs from those already mentioned in being of very little use as a propaganda smear but useful as *evidence*; it suggested ways of detecting who was and who was not a witch.

This brings us to the subject of witch trials, about which remarkably little is known for certain. In all the countries of Europe, the survival of court records from the period of major persecutions is incomplete and dependent on chance, nor did official court records attempt to give a complete transcript of proceedings. Only occasionally and by accident do we know whether a confession was extracted by torture or not, and we can never hope to know what kind of ordeals were imposed on suspects by lynch mobs, although it is pretty obvious that much of the persecution took that form. The uneven survival of records makes it futile to attempt a statistical analysis of witchcraft cases. In addition to court archives, information about particular trials is sometimes found in general manuals for witch-finders such as the *Malleus Maleficarum* and often occurs in the numerous pamphlets that describe individual witch-hunts.

The *Malleus Maleficarum*, was the most influential authority of all on the subject. It spawned a numerous progeny of handbooks, and nowhere else is the witch-hunting temper, in its earlier, pre-Reformation phase, better conveyed. It was the work of two Dominicans, Heinrich Kramer or Institoris, and Jacob Sprenger, natives respectively of the Tyrol and Basel and thus of the same general region, from which nearly all their examples are drawn. Kramer had been active, as Inquisitor, in witch-hunting in the Tyrol, where he had actually been removed from office for excessive zeal. The book was intended to vindicate him as well as to urge the necessity of witch-hunting in general. Pope Innocent VIII in some sense commissioned the work by his bull *Summis Desiderantes* of 1484, in which he speaks of immense harm being caused by supernatural means and Satanic influence; this bull was afterwards quoted as papal endorsement for the authors' views.

The *Malleus*, which ran into 13 editions by 1520, became for Catholics the most authoritative manual available, so that later works tended to appeal to its authority or to that of the bull. It conveyed in fairly developed form the picture of the Satanic witch cult described above; it disposed of the inconvenient Canon Episcopi with the argument that what was a dream and a delusion on one occasion might be true experience on another, and it supplied detailed advice to judges on how to go about examining witches.

Joan of Arc, who was tried long before this, in 1431, was asked whether her angels came to her in the form of naked men and whether she had danced round a tree which was reputed to belong to the fairies. Had she been tried after the *Malleus* and its imitators had gained currency she would

Examination of Witches

Item, there must be great persuasion used to all men, women, and children, to accuse old women of witchcraft . . .

Item, the little children of witches, which will not confess, must be attached (seized); who (if they be craftily handled, says *Bodin*) will confess against their own mothers.

Item, witches must be examined suddenly, and as unawares as possible: the which will so amaze them that they will confess anything, supposing that the devil has forsaken them; whereas if they should first be committed to prison the devil would tamper with them and inform them what to do . . .

Item, if they will confess nothing but upon the rack or torture: their apparel must be changed, and every hair in their body must be shaved off with a sharp razor.

Item, if they have charms for taciturnity, so that they feel not the common tortures and therefore confess nothing: then some sharp instrument must be thrust betwixt every nail of their fingers and toes . . .

Item, at the time of the examination there should be a semblance of great ado, to the terrifying of the witch: and that a number of instruments, grieves, manacles, ropes, halters and fetters, etc., be prepared, brought forth and laid before the examinate, and also that some be procured to make a most horrible and lamentable cry, in the place of torture, as though he or she were upon the rack, or in the tormentors hands: so as the examinate may hear it while she is examined, before herself be brought into the prison; and perhaps she will by this means confess the matter . . .

Item, if she will not yet confess, she must be told that she is detected, and accused by other of her companions: although in truth there be no such matter: and so perhaps she will confess, the rather to be revenged upon her adversaries and accusers.

Reginald Scot, *Discoverie of Witchcraft*

probably have been asked as a matter of routine whether she believed in witchcraft. 'No' was the wrong answer, and almost proved one was a witch. Questions would follow about her more intimate relations with Satan, as well as any accusations that might emerge from neighbourhood gossip about actual wicked deeds. For witches, as for heretics, there was a presumption of guilt. The only authorized defence against any accusation was that the accuser was motivated by malice, but the accused had no right to know who the accusers were. Torture was highly recommended, even though it was sometimes held that the Devil could counteract its effects by anesthetizing his servants.

The familiar procedures of the Inquisition were of course normally employed on Catholic territory, and were reinforced by the technical advice of Kramer and Sprenger and their later disciples. Elsewhere secular courts with different procedures were sometimes involved. In England confessions were legally useless as evidence and therefore nobody troubled to extract them. The search for the 'Devil's mark' was accordingly more important. In the great panic of the 1640s in Britain, when witch-finders were encouraged by the Roundhead party in the Civil War, men such as the notorious Matthew Hopkins who specialized in locating the mark could charge £1 a head. (See EAST ANGLIAN AND ESSEX WITCHES.)

In a very famous case in Newcastle in 1649 the finder, having scared an hysterical subject out of her wits, stuck his pin into the chosen spot and duly demonstrated that the woman could not feel it. An unusually sceptical Roundhead officer insisted that the test be made again when she was calmer, and saved her. The finder eventually confessed that his method was a fraud.

Although they never had the same official sanction, there were of course other traditional ways of identifying a witch, such as the well-known practice of throwing her, bound, into water and seeing if she would float. If she was a witch, she would, because witches were believed to be preternaturally light. This could also be tested by weighing them against the big Bible in the parish church. This latter test was probably never accepted as evidence in a court; the water-test was occasionally accepted on the Continent, but most references to it are references to attempts to forbid it.

John Webb

Contagious Hysteria

It seems safe to assume that people accused of witchcraft were rarely given a fair trial, both because of the spreading panic that the accusation inspired and because the accused were nsually drawn from the poorer, more downtrodden and unpopular members of the community. What no court records can convey is the atmosphere of suspicion, inside and outside the courtroom. Yet this atmosphere, in which accusations breed further accusations, is the most outstanding feature of the witch persecutions.

It seems likely that popular hysteria was less important in the earlier part of the period and became a major factor later. The early Lutherans were relatively calm and sceptical, though they fell victims to the common dread about the 1580s. Calvin and his followers were zealous persecutors and in Geneva in the 1540s some hundreds were arrested, and 34 executed in less than a year. Calvin himself urged every severity, claiming that witchcraft was on the increase. He believed that the Devil, alarmed by the progress of the Gospel, was making a special effort to encourage sorcery in the territories of the Reformed Churches. Puritans of Calvinistic inspiration were active in the dissemination of horror pamphlets about witchcraft, and the persecution in Presbyterian Scotland was fiercer than in England.

A case could be made, however, that persecution was most virulent of all, if only for short periods, in the territories whose political and religious future was uncertain.

John Webb

Various methods of torture were employed to extract confessions from suspected witches *Left* The victim is stretched with ropes and a tourniquet is applied to his thighs *Above* Water is poured into the victim's mouth to force an admission of guilt

The Prince Bishop of Fulda in Germany recovered the city from the Protestants in 1602 and within five years he had burnt 250 witches, and his witch-finder, Balthasar Ross, claimed to have achieved 700 executions in his lifetime. In another threatened Prince Bishopric, Bamberg, the decade 1623–33 saw around 600 executions and they had been common enough before (see BAMBERG WITCHES). At Quedlinburg, Saxony, in 1589, where the ruler was Protestant and the population mixed, 133 witches were burnt in one day. These are among the most dramatic figures to be found.

A new element in the post-Reformation phrase is the much greater use of the printing press. Horror pamphlets could help spread hysteria among the general public in areas not previously affected. Some late scares look as if they were wholly stirred up by this means, notably that in Mohra, Sweden, in 1669 (see SWEDISH WITCHCRAFT). The evidence here supplied by children, was a fantastic mixture of standard anti-witch propaganda and local folklore, amounting to the tallest and most unbelievable tale in the whole literature of the subject. It was, however, believed. Three hundred were arrested, many of them children themselves and 100 were punished, a minority receiving the death penalty. There are obvious similarities between this and the best known American scare at Salem, Massachusetts, in 1692 (see SALEM WITCHES).

On the other hand, the age that saw an increase in popular witch-baiting literature and an increase in the number of actual executions also saw the beginnings of counter-propaganda. The suggestion that witchcraft was a mere delusion, at one time a dangerous thing to say, was urged by many throughout the 17th century. Reginald Scot's *Discoverie of Witchcraft* (1584) provoked King James I to write his *Daemonologie* (1597) in reply, but James,

Radio Times Hulton Picture Library

At the witches' sabbath the most notorious rite was the 'obscene kiss': the Devil supposedly appeared in the guise of an animal, usually a goat, and worshippers were required to kiss him beneath the tail

when investigating witchcraft cases in person, was extremely cautious and sceptical.

In the last age of persecution the impetus to persecute came from the common people, and judges and officials tried to restrain it. All the evidence goes to show that this was a late development, and that it was the official, ruling and learned classes who were the original instigators of the witch hysteria.

Eve

According to the book of Genesis, the name of the first woman, 'built' by God from one of Adam's ribs to provide him with a mate: her Hebrew name, *Hauwah*, means 'the mother of all living' and her making from Adam's body is the origin of human love: by succumbing to the serpent's temptation and persuading Adam to eat the forbidden fruit, she was held responsible for bringing evil into the world, an example of the myth of the evilness of woman.

EVIL

The Persian hero Rustem was a great enemy of demons; his most famous exploit was his rescue of the King of Persia by slaying the White Demon within his cavern in the mountains of Tabaristan

Michael Holford

As Mahan journeyed through the Wilderness of Ghouls he met an army of evil monsters, whereupon his horse turned into a seven-headed dragon. Ghouls were demons of the Mohammedan world who inhabited lonely places and fed on human bodies; they seem to have personified the terrors of the desert: according to Babylonian legend, the appearance of demons was so dreadful that they fled in horror when shown reflections of themselves in giant mirrors: from a manuscript in the British Museum

How evil and its attendant woes of pain and death came into the world has been variously ascribed to the caprice of the gods, to human sin and to error. The belief that the Evil One had a hellish host of agents, bent on man's destruction, lasted well into modern times in Europe

TWO THINGS have been regarded by mankind down the ages as fundamentally evil: pain and death. Naturally these experiences have been seen in different ways. In some of the more sophisticated interpretations a deeper spiritual evil has been assumed behind the physical realities of pain and death: for example, Christian theology has followed St Paul's pronouncement that 'the sting of death is sin' (1 Corinthians 15.56). However, it is invariably found, on the last analysis, that the concept of evil is essentially inspired by man's experience of pain and his fear of death. The significance given to sin ultimately depends upon the evaluation of death in the pattern of human destiny.

Most religions, consequently, have sought to explain the origin of evil in terms of the cause of pain and death. And they have generally tried to find this cause in the action of some supernatural being or some primordial happening involving the supernatural. Very rarely have pain and death been regarded as natural features of biological life. The most notable exceptions to this general view have been Buddhism and Stoic philosophy. Buddhism, which accounts for the individual person as a temporary combination of various physical and psychical entities, the *skandhas*, explains death as an inevitable disintegration of this combination. Stoicism, a school of thought which originated in Athens, explained death as physical change occasioned by the physics of the universe, and counselled men to live 'according to Nature', in other words, to accept and endure the fact that they were part of a cosmic process that was not designed to accommodate their personal likes and dislikes.

The various explanations of the origin of evil advanced by the chief religions can be reasonably grouped under three headings: as attributable to divine action; as resulting from cosmic dualism; and as due to sin or ignorance on the part of human beings.

It is invariably found, on the last analysis, that the concept of evil is essentially inspired by man's experience of pain and his fear of death

The most notable example of the first view – that evil is the result of divine action – is provided by the religion of ancient Mesopotamia. The three peoples who lived in this area and shared in a common cultural tradition, namely, the Sumerians, Babylonians and Assyrians, viewed life very pessimistically. They believed that the gods had created mankind to serve them, but that they had withheld immortality from their human servants. One Sumerian myth told how the god Enki and the goddess Ninmah, after creating mankind, in their sport made various human freaks such as eunuchs and barren women or diseased and decrepit persons (see CREATION MYTHS). In other words, the evils of disease, malformation, decay and death were due to the gods. The most that the Mesopotamians could hope from their gods by faithful service to them was a long and prosperous life, and defence from demonic attack. Although they believed that their gods had arbitrarily imposed pain and death upon them, the Mesopotamians never seem to have questioned the justice of this.

A similar acceptance of the basic ills of life as being of divine origin occurs in some other religions, although it does not find such vivid mythical presentation: ancient Hebrew and Greek literature and the Koran provide examples. This interpretation of the origin of evil inevitably results when a religion assigns the creation of the world and mankind to divine agency alone, without suggesting the existence of an evil power that rivals that of God or the gods. The problem here is inherent in any monotheistic interpretation of the universe, and it finds expression in varying forms in the great monotheisms of Judaism, Christianity and Islam.

The Battle of Good and Evil

What are known as dualistic interpretations of the origin of evil are based upon a more realistic estimate of man's experience of life than are those of the monotheistic faiths. Such experience seems to show that the world is a battleground between a good creative force and an evil destructive force, and that mankind is involved in the struggle both actively and passively. (See DUALISM.)

The most notable example of a dualistic religion is Zoroastrianism, which originated in Iran from the teaching of Zoroaster (or Zarathustra) who was born about 570 BC, and which became a distinctly presented dualism between Ohrmazd (identified with Ahura Mazdah) and Ahriman (Angra Mainyu). All that is good in the world was attributed to Ohrmazd, with Ahriman responsible for all that is evil, including death, disease, demons and noxious animals. (See AHRIMAN; ZOROASTRIANISM.)

Dualistic interpretations of life have been propounded in some other religions, though not so consistently as in Zoroastrianism. The Hindu gods Vishnu and Shiva were conceived of as being both creators and destroyers of life; in China all existence was explained in terms of the two alternating principles of Yin and Yang (see CHINA). Judaism had come, by the 1st century AD, to account for evil in terms of a modified dualism. This view represented a change from the earlier conception of Yahweh (Jehovah) who, as the sole omnipotent deity, was regarded as the source of both good and evil: 'Shall we receive good at the hand of God, and shall we not receive evil?' asks the pious Job (Job 2.10).

However, probably due to Iranian influences during the Exile in Babylonia in the 6th century BC, the Jews developed a demonology which held that God's good purpose in this world was thwarted by the Devil and his demonic forces. Both the Dead Sea Scrolls and the Christian gospels show the prevalence of this dualistic outlook. In the latter, physical and mental disease are attributed to demons, and Jesus is tempted and afflicted by the Devil as the 'Prince of this world'. St Paul called death 'the last enemy' that Christ would destroy, and in early Christian thought death was often identified with the Devil.

The Soul in Prison

A dualistic explanation of the origin of evil of a very different type arose out of the conception of man as an immortal soul incarnated in a physical body, and doomed to inhabit a material world. Where the body was regarded as a corrupting prison of the soul, the origin of evil had to be sought in whatever put the soul in such a direful situation. One of the earliest explanations is Greek, given in the Orphic myth of the devouring of Dionysus-Zagreus, the son of Zeus, by the wicked Titans. From the ashes of these Titans, blasted by Zeus for their crime, mankind arose, having a dual nature, for they were compounded of the evil Titans and the divine Dionysus whom they had eaten. Each human being had, therefore, within his Titanic body a soul, divine of origin and longing to return to heaven. The Orphic mystery cult was designed to free the soul from its contaminating prison and the misery of existence in a material world, and enable it to ascend to the ethereal realm to which it rightly belonged.

Gnosticism, which flourished in the 2nd century AD, in a somewhat similar myth accounted for the present unhappy lot of mankind as being due to the incorporation of a divine soul, fallen from heaven, within a physical body derived of material Nature. Likewise Manicheism, which had a great vogue in Graeco-Roman society, explained the suffering of human existence as resulting from a primeval fall whereby the two contrary principles of the universe became intermixed; these principles were variously designated Spirit and Matter, Good and Evil, Light and Darkness.

Man's First Disobedience

The third way in which the origin of evil has been explained is in terms of some primordial sin or ignorance on the part of man. The best known and most influential version of the former view is the account of the Fall of Adam as recorded in the book of Genesis (2.4–3.24); it was composed about 900 BC. The writer was concerned to show that death and the miseries of human life were due to the sin of the first parents of mankind. Accordingly he represents Adam and Eve, after their creation by Yahweh, as living an idyllic existence in the garden of Eden. They are immortal; but Yahweh warns them not to eat of the mysterious Tree of the Knowledge of Good and Evil in the midst of the garden, for if they do they will surely die. (See FIRST MAN.)

There has been much discussion among scholars about the meaning of this forbidden Tree. For if 'Knowledge of Good and Evil' should mean moral or ethical knowledge, it would be strange that Yahweh should prohibit the first man and woman from acquiring such knowledge, and also threaten them that, if they did acquire such knowledge, they would die. The serpent, however, in tempting Eve, declares that 'God knows that when you eat of it your eyes will be opened,

and you will be like God, knowing good and evil.' When they do eat the forbidden fruit, they do not immediately die; instead, they become conscious of their nudity. Their act of disobedience nevertheless has fatal consequences. For when God discovers that they have broken his command, he pronounces Adam's doom: 'In the sweat of your face you shall eat bread till you return to the ground, for out of it you were taken; you are dust, and to dust you shall return.' In other words, by disobeying his Creator Adam becomes subject to death.

There has been much speculation about how this penalty was connected in the mind of the Yahwist writer with eating of the Tree of Knowledge. The most likely interpretation seems to be that to this ancient Hebrew writer 'Knowledge of Good and Evil' meant knowledge of how to reproduce human life. This seems to be implied by the fact that the immediate consequence of eating the forbidden fruit was that Adam and Eve became conscious of their nudity, which meant their sexual potency; it is only after acquiring this knowledge that 'Adam knew Eve his wife, and she conceived' (Genesis 4.1). But such knowledge was fatal; for the first human pair thus created those who must inevitably replace them.

Whether that was indeed the idea of the Yahwist writer in connecting the Fall of Adam with the mysterious Tree of the Knowledge of Good and Evil, must necessarily remain uncertain. What is certain is that he traced the origin of death to Adam's disobedience to his Maker's command. With death, as the penalty of that original sin, the Yahwist writer also associated the hard toil of agriculture and the pain of childbirth.

The part of the serpent in bringing these evils upon Adam and Eve must be noticed. In the Genesis story, the serpent is described as 'more subtle than any other wild creature that the Lord God had made' and it is represented as having the ability to speak. However, it is not identified with the Devil, as it was in later Hebrew and Christian thought; for instance, in the Wisdom of Solomon: 'By envy of the devil death entered into the world.' The part played by the serpent in the fall of Adam was possibly inspired by the serpent in the Mesopotamian *Epic of Gilgamesh*. In this celebrated poem the hero is robbed of his opportunity of immortality by a serpent, an idea doubtless derived from a primitive belief that the serpent, by sloughing off its old skin, rejuvenated itself (see GILGAMESH).

The Genesis story of the Fall of Adam exercised a profound influence on Christian thought about the origin of evil. It inspired St Paul to formulate the concept of original sin, which became one of the basic tenets of the Christian doctrine of salvation. He writes in his Epistle to the Romans (5.12-13): 'Sin came into the world through one man and death through sin, and so death spread to all men because all men sinned.'

Christianity, accordingly, came to teach that death and all the other ills which afflict men and women are due, primarily, to their partaking in the original sin of Adam. Furthermore, it taught that mankind add to this inherited penalty by their own actual sins, making themselves even more deserving of the wrath of God. Accordingly, Christianity accounts for the origin of evil in terms of human sin, both original and actual. However, since Christianity inherited the demonology of 1st century Judaism, it has also associated the origin of evil very closely with the Devil, sometimes tracing evil back to the Devil as a fallen angel named Lucifer, who revolted against God before the creation of the world (see DEVIL).

Ignorance or Error

Judaism and Christianity, therefore, both find the origin of evil in human sin, but with some dualistic suggestion of a pre-cosmic revolt of an angel or angels against God. Other religions have also traced evil back to man; however, they assign it to his ignorance or error, not to his disobedience to his Maker's command. Hinduism and Buddhism are the two great religions that account for evil in this way.

According to a view that first finds expression about 600 BC in Hindu compositions known as *Upanishads*, through a primeval ignorance *(avidya)* human beings have made two fatal mistakes: they have taken the phenomenal world, that is, the world apprehended by the senses, as reality; and they cling to existence in this world, believing that they are individual persons or selves *(atman)*. But behind this phenomenal world is the true Reality or *Brahman*, which is the source and ground of all being (see

Prodnose Studio

Demons took an immense variety of shapes, as shown by these illustrations from Collin de Plancy's *Dictionnaire Infernal*: from left to right, Amduscias, who gave concerts on the trumpet; Lucifer; Ronwe, who gave knowledge of languages; Orobas, grand prince of hell; Ukobach, inventor of frying foods; Xaphan, who fanned the furnaces of hell; and Eurynome, prince of death

BRAHMAN). By clinging to the phenomenal world as reality and involving themselves with it, men become subject to the process of *samsara*, a ceaseless process of birth and death, with all its consequent pain and suffering. Deliverance can be achieved only when the individual, by a vigorous mental and physical discipline, achieves effective detachment from desire to live in the phenomenal world and realizes his identity with Brahman.

Buddhism insists even more emphatically on the suffering and pain of human existence as constituting the essence of evil. In the legend of the Buddha, the beginning of the quest for enlightenment comes when the young Gautama is first confronted with the brute facts of disease, old age and death. He is represented as telling his disciples: 'Before my enlightenment . . . I thought: Into wretchedness, alas, has this world fallen; it is born, grows old, dies, passes away and is reborn. But from this pain it knows no escape, from old age and death. When indeed from this pain shall an escape be known, from old age and death? . . . And as I duly reflected there came the comprehension of full knowledge: it is when there is becoming (or desire to be) that there is rebirth . . .'

A sequence of causes is then traced out, ending with the original cause which is avidya (ignorance), meaning thereby ignorance of the true constitution of things. Buddhism, although it differs from Hinduism by rejecting the idea of a 'self', has also been concerned to offer a way of deliverance from the suffering of an unceasing cycle of birth, death and rebirth, and of achieving Nirvana, which is the negation of the phenomenal world.

It should be noted in conclusion that while evil has been primarily identified with pain and death, there has also been an ancient and widespread disposition to associate it with the violation of cosmic order. The idea of a cosmic order appears already in ancient Egypt in the third millennium BC, in the concept of *maat* ('truth' or 'justice'), with the maintenance of which the sun god Re is identified (see JUDGEMENT OF THE DEAD). What has been called the 'dawn of conscience' was closely linked with it. A similar conception appears in ancient India as *rta*, in Iran as *arta*, and in Greece as *themis* or *logos*. This notion of a cosmic order had its social aspect: it followed that the established pattern of social relations and behaviour was regarded as sacrosanct and its violation correspondingly heinous. However, in accounting for the origin of evil the religions of mankind have generally concentrated on explaining the causes of pain and death as the basic forms of evil.

S. G. F. BRANDON

Evil Spirits in Europe

Demonology, the scientific study of demons, belongs properly to the past, yet by some paradox it has revived in popularity only now that belief in Satan has reached its lowest ebb among the general public. As a subject it relates to the pre-scientific world of magic which, broadly speaking, was based upon the animistic concepts of the distant past. Animism was a primitive philosophy in which Nature's domain was peopled by elemental spirits, each having jurisdiction over a specific area of natural phenomena and supplying the motive power that induces change (see ANIMISM). The gradual evolution of elemental spirits which were capable of both good and evil into good spirits and bad spirits and finally demons and angels, was the product of ages of slow development.

Demons have been described as malevolent spirits having supernatural powers and dedicated to destruction. They were winged and travelled to the uttermost limits of the earth, always at night. They had the power to see, while at the same time remaining invisible, and were committed to a cruel conspiracy against the human race. Many theologians, in attempting to reconcile the role of demons with the existence of an omnipotent deity, classified the former as instruments of divine punishment, when not acting as agents of witches and sorcerers.

There was, therefore, from the beginning a tendency to regard demons as playing a somewhat ambivalent role. Although extremely powerful in their own right, they

could be compelled to submit to the incantations of the magician. The problem was further complicated by the fact that the gods of conquered peoples tended to be incorporated among the demons of the conquerors.

Historically the development of a sophisticated creed of demonism, with a clear line of differentiation between the forces of good and evil, light and darkness, coincided with the emancipation of social institutions from the thraldom of a mere subsistence economy. With the growth of the concept of gods and devils, the minor demons of earlier stages of belief tended to occupy a subordinate position in the diabolic hierarchy, at the same time retaining most of their distinctive features.

It was characteristic of demons in the East that they favoured lonely sites, particularly deserts, from which they emerged in truly terrifying hordes. The appearance of an army of demons that haunted the deserts of Assyria, said to be comprised of 'warriors, destroyers, vampires, phantoms and ghosts', was so dreadful that when shown their own reflections in giant mirrors placed on the walls of cities they fled in terror from the scene.

The Master of Evil

During classical times dualism survived among the Greeks; their *daimon*, later in history to be transformed into the more familiar demon of Christian mythology, combined good and evil elements. The ancient Jews shared the general terror of the demons of darkness, which is reflected in the words of Psalm 91: 'Thou shalt not be afraid for the terror by night; nor for the arrow that flieth by day; nor for the pestilence that walketh in darkness; nor for the destruction that wasteth at noonday.' In the earlier period of their history, before the development of the idea of Satan, the imaginations of the Jews peopled the deserts with malevolent spirits; these were later reduced to a minor role as servants of the Master of Evil. The word 'devil' itself derived from the Greek *diabolos*, and originally meant an accuser or traducer.

The emergence of Satan transformed demonology into a major influence in the affairs of mankind; for the pre-eminence allocated to the supreme Devil created the climate for the heresy of witchcraft. The Church became dominated by the conviction that Satan was intent upon making himself God's equal and that he sought ceaselessly to undermine God's kingdom by the corruption and destruction of humanity. That Satan was a truly formidable opponent is evident from the words of the eminent Johann Weyer, written in the 16th century: 'Satan possesses great courage, incredible cunning, superhuman wisdom, the most acute penetration, consummate prudence, an incomparable skill in veiling the most pernicious artifices under a specious disguise, and a malefic and infinite hatred towards the human race, implacable and incurable.'

The presence of a supreme spirit of evil in society's midst was a factor hardly conducive to emotional stability. Malevolent demons were held responsible for every mishap to which flesh was heir. Even the ordinary temptations of the flesh, the inevitable occupational hazard of anchorite and hermit, were laid at the door of demons who were assumed to feel affronted by chastity and piety. St Godric, a 12th century English saint, after being all but seduced by a demon disguised as a naked woman, was hurled from his bed and soundly thrashed with a stool. An unexpectedly sensitive demon, however, which attacked the Holy Man of Farne, withdrew in terror after being denounced in most vituperative terms by that sharp-tongued saint.

Even more troublesome were those agents of demonic lust, the incubi and succubi who harrassed men and women under cover of sleep (see INCUBUS AND SUCCUBUS). St Augustine in his *De Civitate Dei*, written in the 5th century AD, had drawn attention to their activities in the following terms: 'It is a widespread belief that sylvans and fauns, commonly called incubi, have frequently molested women, sought and obtained coitus from them.'

An incubus was a demon that copulated with women, while a succubus had sexual intercourse with men. It was generally admitted that there were few nunneries free of the ravages of the former, while the latter were active among communities of monks. We have it upon the authority of Albertus Magnus (1206–80) that 'there were places in which a man can scarcely sleep at night without a succubus accosting him.' Learned theologians debated long and thoughtfully such points as how a demon, which was by definition sexless, could indulge in sexual intercourse. After earnest consideration it was decided that a demon had the power to utilize a corpse for this purpose or could create a body from the very air itself.

Demonic Specialists

There were dire physical as well as moral consequences in sleeping with incubi and succubi, for not only was the sin classed as bestiality but the offspring were likely to be monsters. Despite such dangers there was considerable interest in this specific type of demonic activity and it is on record that in 1468 an enterprising brothel keeper of Bologna staffed his entire establishment with succubi. These female demons had their own separate organization within the satanic hierarchy under an arch-demoness, Princess Nahemah. The penalty reserved by the heavenly powers for those who trafficked with demons was an eternity in hell, a domain of fiery torments under the ministration of hordes of demons skilled in the art of inflicting perpetual pain.

Opposing the satanic host was a vast army of angels organized in hierarchies, who from the general state of secular and ecclesiastical affairs would seem to have

Scala

Picturepoint London

been remarkably ineffective. As for the number and variety of demons, these grew ever more powerful as Christianity matured. Their numbers were greater than the sands of the desert, amounting to as many as 7,405,926; according to one demonologist they were divided into 12 classes whose functions were so organized as to cover every aspect of human suffering, ranging from hunger to death. According to another, demons were grouped under the headings of fire, air, earth and water, with subterranean devils and shadows thrown in for good measure.

The demonologist Binsfeld in 1589 compiled a list of devils to cover each of the seven deadly sins: Lucifer was the devil of pride, Mammon the devil of avarice, Asmodeus of lechery, Satan of anger, Beelzebub of gluttony, Leviathan of envy and Belphegor of sloth. Another writer increased the number of groups to ten, divided into fates, poltergeists, incubi and succubi, marching hosts, familiars, nightmare demons, demons constructed from human semen, deceptive demons, clean demons and those who deceived witches into the belief that they flew to the sabbath.

Demons were allocated specific territories, the north being under Zimmar, the south under Gorson, the east under Amayan and the west Goap. In addition there was a parliament of devils and an ambassadorial court which dispatched diabolical emissaries to every land of the earth. When the army of demons went on parade the whole earth trembled from the thunder of the march past of infernal dukes riding on the backs of griffins, winged dogs and phantom dromedaries screaming blasphemies in Egyptian. It is on record that the chief of the demons during the course of a conversation with three monks declared: 'The strength of our army is such that if all the Alps, their rocks and glaciers were divided among us none would have more than a pound's weight.'

This was the substance of accepted belief in devils in the 16th century held by the greatest intellects in Europe. Even by medieval standards the situation would have been ludicrous were it not for the fact that vast numbers of human beings were being driven almost mad by terror. In

Mankind stood perpetually on guard against the attempts of demons to penetrate the human body

Left The likeness to the fearsome goddess Kali is apparent in this representation of the Indian demon, Kalbhairab. In her more terrifying and destructive aspect, Kali was depicted with black skin, a hideous face and four arms, and humans were at one time sacrificed to her, to satisfy her thirst for blood *Above* Another Indian demon, Beyrevra, tore off one of Brahma's five heads as punishment for his insolence: from Collin de Plancy's *Dictionnaire Infernal*

appearance most demons, and especially Satan, were truly horrifying. On the Continent Satan might assume the shape of a fearsome black cat, a horned dog, a goat or a hideous human being. As masters of disguise even ordinary demons could assume an infinite variety of shapes, as is indicated in the 14th century miracle play *The Passion of St Quentin*:

> Smooth Devils, Horned Devils,
> Sullen Devils, Playful Devils,
> Shorn Devils, Hairy Devils,
> Foolish Devils,
> Devils, Devilesses, and Young Devils,
> All the offspring of devildom,
> Come from your devilish tricks
> Quicker than light.

For protection against the hellish host there were in existence a number of time-honoured charms and similar devices of proven efficacy, including holy water, the sign of the cross, firelight, spittle, bread, salt, objects of iron, herbs, amulets and incantations, not to mention the rude gesture known as the 'fig'. Every symbol that could possibly be equated with the creative impulse might be utilized against an enemy who was in essence the spirit of corruption.

Raising the Devil

Inevitably perhaps, a number of people, disappointed by the inadequacies of piety and prayer, were tempted to turn to the Devil in the hope of obtaining a better guarantee of reward than that offered by the Deity. From such an attitude developed devil worship in its various forms, together with attempts to summon demons from the infernal regions by the aid of spells. Using books of magical directions called grimoires, the magician endeavoured to bind the demon temporarily to his will. There were certain rituals to which even the great Lords of Darkness, Lucifer and Beelzebub, had no alternative but to respond. The magician, armed with a magic sword, prepared a ritual circle and uttered words of occult power. In one ritual it was necessary to utter the nine mystic names: Eheieh, Iod, Tetragrammaton Elohim, El, Elohim Gibor, Eloah V a-Daath, El Adonai Tzabaoth, Elohim Tzabaoth and Shaddai. Following the ceremony the demon could be dismissed with the words: 'I am pleased and contented with thee, Prince Lucifer, for the moment. Leave thou in peace now, and go in quiet and without trouble. Do not forget our pact or I shall blast thee with my wand. Amen.'

The certainty that demons were always ready in waiting for the summons of the magician is attested by the old legend describing how the actor Edward Alleyn, after invoking Mephistopheles during a 17th century performance of Marlowe's *Dr Faustus*, discovered a real devil reeking of brimstone upon the stage. This experience impelled him to abandon the theatre once and for all and to embark upon good works, which included the founding of Dulwich College.

The age of diabolic domination was essentially one of social disarray and general anxiety which the demonologists, whether from conscious or unconscious motives, exploited to the full. Everywhere lurked the spirits of evil, terrifying the more neurotic among the community. Mankind stood perpetually on guard against the attempts of demons to penetrate the human body by one of its natural orifices and to assume diabolical possession. Catholics were well aware of the dangers from the warning given by Gregory the Great, in his description of the awful situation of the nun who had absentmindedly eaten a lettuce without crossing herself. Thus exposed, she fell victim to a demon who leaped down her throat. Protestants were equally wary but sought protection more in prayer and by the rejection of impure thoughts.

Demons often opened their attacks by buffetings and beatings or by obsessing the victim with abstractions that left his soul temporarily undefended. Diabolic possession was usually manifested by writhings, foaming at the mouth, twitchings, grotesque grimacings, insensitivity and occasionally paralysis. Another remarkable feature was the tendency for the victim to answer in French questions addressed to him by the exorcist in Latin. These disturbing symptoms lay completely beyond the comprehension of medical men of the time and were automatically ascribed to the Devil.

Beatings and Fumigations

To drive out the unwanted demon was a task requiring the trained specialist in exorcism, although there were occasions when a gentle admonition plus a sprinkling of holy water appear to have been sufficient. There was even an exceptional 17th century case in which an extremely sensitive demon retreated after being sneered at by the exorcist as a 'ninny, a drunkard and a sow'. In the main, however, demons were not so easily intimidated and every device of the exorcist's art was required to accelerate their expulsion. It was not uncommon for a group of Protestant divines to conduct a mass prayer meeting at the bedside of the writhing demoniac, while furious arguments and lengthy dialogues took place between the indwelling demon and the exorcist, the former often revealing the most intimate details of himself and his activities, including his name. Devils were expelled by forcing the possessed man or woman to inhale some vile-smelling concoction, or by beatings with sticks. One case is on record in which a demon was drawn out of the victim through the nostrils.

In an age when the whole of society seemed beset by the forces of hell it was inevitable that the Devil's agents upon earth, the witches, should have come under heavy attack; almost every type of natural calamity was laid at their door, particularly the onset of diseases, the sinking of ships at sea, storms and bad harvests. It was accepted theology that a witch attained her powers by a compact with Satan; and as a penalty for forswearing her immortal soul and imperilling the human race there existed no logical alternative but to kill her, for which there was sound biblical authority, in particular the injunction from Exodus: 'Thou shalt not suffer a witch to live.' The pact with Satan became a standard charge against magical practitioners throughout Western Europe, but although it was rumoured that no less than seven Popes had traded their souls for temporal delights, there is no record of their prosecution for sorcery. Incidentally at

The Dweller in the Abyss

In the North African desert the magician Aleister Crowley and his disciple and scribe Victor Neuburg, also called Omnia Vincam, conjure up an evil demon

Crowley described the Tenth Aethyr as accursed, and before beginning the invocation he marked out amid the sand dunes a magic circle to protect Omnia Vincam, and fortified it with the holy names of God: Tetragrammaton and Shaddai El Chai and Ararita. Then he traced nearby a triangle in which he inscribed the name of this terrible demon Choronzon, the Dweller in the Abyss . . .

Suddenly the spirit of the Aethyr, that mighty devil Choronzon, sprang forth, crying aloud: 'Zazas, Zazas, Nasatanada Zazas!' . . .

Choronzon was 'the terror of darkness, and the blindness of night, and the deafness of the adder, and the tastelessness of stale and stagnant water, and the black fire of hatred, and the udders of the Cat of slime; not one thing but many things. Yet, with all that, his torment is eternal. The sun burns him as he writhes naked upon the sands of hell, and the wind cuts him bitterly to the bone' . . .

Then Choronzon broke out into another torrent of obscene blasphemy, and while the scribe was writing it down as best he could and had his eyes glued on to the page of his note-book, Choronzon began to throw sand from the triangle into the circle, so that a gap was made in the circumference . . . The circle was now broken and Choronzon, in the form of a naked savage, leapt from his triangle into the circle and fell upon poor Victor Neuburg, throwing him to the ground. 'He flung him to earth,' wrote Crowley of these memorable events, 'and tried to tear out his throat with his froth-covered fangs.'

But Omnia Vincam invoked the names of God, and struck at Choronzon with his magical dagger. The demon was cowed and writhed back to the triangle. Omnia Vincam then repaired the circle.

John Symonds *The Magic of Aleister Crowley*

this particular period of history any sudden and apparently inexplicable acquisition of fame and fortune might be automatically ascribed to a pact with the Devil.

The pact, which might be negotiated by either Satan or one of his subordinates, was signed in the witch's blood and ratified by the simple expedient of a bout of sexual intercourse, following which the contractee became bond slave to the Devil for the remainder of her short life. Ratification was far from pleasant since intercourse with a demon was generally painful. The next stage was for the witch to be supplied with a minor demon as a personal familiar; he had the dual task of keeping watch over her on Satan's behalf and carrying out the diabolical missions which she entrusted to him. The possession of a familiar was fraught with extreme danger, since it was laid down in Leviticus chapter 20 that 'a man also or woman that hath a familiar spirit, or that is a wizard, shall surely be put to death.'

Familiar Spirits

The familiar assumed all manner of guises to deceive the authorities, including that of rabbit, sparrow, cat, dog, goat and chicken. One woman possessed as her imp a cat of brilliant blue. In the St Osyth witch trial of 1582 the accused, Ursula Kempe, admitted to maintaining four imps, two hecats called Titty and Jack, a black lamb called Tyffin and a toad called Pigin. The familiar was fed with blood from the witch's supernumerary nipples, and it was the finding of these, together with certain spots on the body insensitive to pain known as Devil's marks, that so often led to the witch's downfall and death. The unfortunate animal familiar was usually burned. A case is on record in which a familiar actually claimed to be the prophet Daniel, and another in which it materialized as a bishop vomiting streams of fire. The difficulty of deciding whether such phantoms were demons or ordinary workaday ghosts was further complicated by the opinion then current that ghosts were no more than devils in disguise.

In those many cases in which the Devil assumed human shape, he commonly took the form of a man dressed in black, who from the general description might well have been a Puritan divine. During the witch-hunts organized by the Witch-Finder General Matthew Hopkins, it transpired that a devil dressed in black had presided over a banquet where he had received homage from a congregation of witches. One man in black was active in the educational field, trading degrees in divinity for human souls; his clients, it appeared afterwards, committed suicide. In Scotland the man in black was described as 'sometimes hairy and grim and sometimes merely clad in black clothes and with cloven feet'.

The overrunning of most of Europe by hordes of men in black, witches and familiars, incubi and succubi, engaged the earnest attention of the most eminent minds of the day, including Jean Bodin, Nicholas Remy, Francesco Maria Guazzo of Milan and Pierre de Lancre (see BASQUE WITCHCRAFT). On the other side of the argument were a few brave men who were, intellectually speaking, far in advance of their times, including Bishop Hutchinson of England, Robert Calef of New England and, most important of all, Balthasar Bekker, a Dutch clergyman who strove to demonstrate that the idea of a personal Devil was no more than an assumption. Opposition to orthodox opinion was not undertaken lightly in the witch-hunting days, since it led almost automatically to the stake, and the number of anti-demonists remained pitifully small.

Indeed it was not until the 18th century that mankind had matured sufficiently to shake off the influence of the Devil and his hordes, and this was due as much to a general reaction against religious dogmatism as to any conversion to new ways of thought. For yet a further century Satan played a prominent role in religious doctrine, although by now he had been divested of his retinue of minor demons, and the phantom rabbits, demonic dogs and diabolical toads were seen no more. Hell too remained long in vogue until outmoded by the greater horror of man-made warfare.

Hallucinations under Drugs

As for the victims of diabolical possession, these still remain in our midst, although the regular diagnosis of their disturbances as due to paranoiac phantasies has robbed their visions of much of their former glamour. There is very little difference in essence between the phantom cat seen by the so-called victim of Jane Wenham, the last woman to be charged with witchcraft in England, and the modern hallucinatory

Western philosophers arranged demons in elaborate hierarchies. Buer was a demon of the second class, who taught philosophy, logic and the virtues of medicinal herbs and brought health to the sick; he rolled like a wheel and commanded 50 legions: from Collin de Plancy's *Dictionnaire Infernal*

experiences of elves, dwarfs and other phantoms under the drug LSD, as described by R. E. L. Masters and Jean Houston in their book *The Varieties of Psychedelic Experience* (1967). In one case cited a victim described how: 'Something was there all right. Something coming for me from a distant and empty horizon – and there loomed before me a devastating horror, a cosmic diamond cat. It filled the sky, it filled all space . . .'

It would perhaps be too much to expect that the great army of phantoms has now disappeared entirely from the domestic scene. In fact, much activity that seems explicitly diabolical in its evil has become something of a fad or fashion in many lands. Devil worshippers in London, for instance, in the fall of 1968, conducted a ceremony in which a newly buried corpse was impaled vampire-like through the heart. And other graveyard desecrations in Britain since have had equally Satanic overtones.

In the United States devil worship rides so high that a national magazine devoted much of an issue to it, in 1970, under the title 'Evil Lurks in California'. One writer said: 'The acid (LSD) vision bends the illusory vector from good to evil in a circle.' Evil as a by-product of the drugs culture is a modern fact of life.

Evocation
In magic the summoning of evil spirits and on occasion the Devil himself: by performing rituals and reciting magic formulae, the magician tried to cause demons to appear and to impose his will on them: precautionary measures were taken to protect the magician from attack by the spirit.
See INCANTATION; MAGIC.

Excalibur
The enchanted sword of King Arthur: as a youth Arthur proved his right to kingship by drawing Excalibur out of a great stone; in later stories Arthur obtained his magic sword from the Lady of the Lake, and at his death ordered Sir Bedivere to return the sword by throwing it into the water; also called Caliburnus, Excalibur is probably connected with another magic sword, *Caladbalg*, which belonged to the Irish hero Fergus.

Progressive rigidity and withdrawal from society has marked the history of this Nonconformist sect. The Brethren may not join a trade union, do not vote, shun entertainments and may even be called upon to leave husband or wife

EXCLUSIVE BRETHREN

THE CHRISTIAN SECT known as the Exclusive Brethren today has a significant following, not only in Britain but in America – particularly in the industrial areas of the eastern states and on the west coast, and in Australia, New Zealand and South Africa. The Brethren trace their origins to the same individuals who founded the better known movement of 'Plymouth' or 'Open' Brethren. The earliest Brethren came together in the late 1820s, when a number of devout Anglican clergymen, candidates for ordination and laymen became steadily convinced that the ecclesiastical organization of the Church of England lacked all scriptural, and all divine, warrant. The clergy in this group abandoned their orders and the attempt was made to restore the simple and, as they saw it, non-sectarian and non-denominational life of the earliest Christians. Although most of the early members were Englishmen, it was in Dublin that the movement first made itself known. Only somewhat later, when some of the founders had returned to England, and from their meeting hall in Plymouth had begun to evangelize the surrounding districts, did the name 'Plymouth Brethren' come into being.

The movement was intensely evangelical and accepted a fundamentalist interpretation of Scripture, including belief in the second advent (the second coming of Christ). The members rejected both doctrinal tests of fellowship and formal leadership, in particular disavowing any form of professional ministry. Liturgical practice was deliberately simple, and the principal ritual was the 'breaking of bread' at the common table, to which all who shared a Christian life could come. The leaders were convinced evangelists and they undertook, sometimes at their own expense, missionary work in Mesopotamia and in France, Switzerland and Germany, as well as in Britain.

The attempt to maintain an 'open table' at which Brethren were prepared to offer 'fellowship with all believers', as one of the early principals, John Nelson Darby, put it in 1836, proved more difficult than the Brethren had imagined. In the course of a few years there were those among them who wanted to define just what principles a 'believer' must necessarily accept, and just what was to be regarded as heresy. Darby himself came to lead the demand for clearer formulation of true beliefs, particularly after he discerned 'heresies' in the teaching of Benjamin Wills Newton, the leader at Plymouth, whom he also accused of behaving like a cleric in relation to the congregation of Brethren there. In 1845 Darby established a fellowship consisting only of those who accepted the Christian teaching that he endorsed, and who refused all dealings with outsiders. This action, and the rivalry between Newton and Darby, produced the first division of the Brethren. The 'open' Brethren continued to admit to their services and their communion table Christians who had not relinquished other Church affiliations, provided that they were fundamentalist Protestants. The 'closed' or 'exclusive' Brethren admitted only those who abandoned all other allegiances and all teachings other than those defined by Darby.

The two major branches of Brethrenism grew from this schism, the Exclusive Brethren or Darbyites dating their existence from this time. Abandoning the old interdenominational fellowship, the Exclusives became increasingly withdrawn. They came to emphasize the importance of their own distinctive teachings and rejected not only Christian fellowship, but any type of social intercourse with those who were not members of their meetings. Many assemblies of Brethren in London and the north of England became Exclusive, whilst those in the west country, where the influence of the two Bristol leaders, George Müller and Henry Craik, was strong, remained open fellowships. Nominally each side rejected all authority, but each had its own informal but well-recognized 'leading Brethren'.

Darby increasingly emphasized the importance of keeping apart from those who held false doctrines and this became the central issue for Exclusives as they adopted an increasingly sectarian position. As the great architect of distinctive Exclusivist theology, Darby was also the arbiter of disciplinary procedures within the sect; but all was done in the name of opposition to established ecclesiastical hierarchies, which were – and are still – referred to as 'system'. In fact, the Exclusive Brethren themselves evolved a much tighter internal pattern of control than any of the major Churches.

Exclusives came to believe that the truth about 'the Church' (with which they identified themselves) had been recovered by Darby. This was, of course, the spiritual body of the Church referred to in Scripture, not the apostate Church of England, much less the Church of Rome. Since Darby devoted himself to reformulations of biblical exposition and continued to develop new symbolic and allegorical interpretations of biblical events, the Brethren came to accept the idea that the truth was continually being 'opened up' to the Church through its faithful leading Brethren. Although these Brethren did not claim any special spiritual status, the idea of continuing revelation has persisted among Exclusives to the present day.

God's Plan for the Church
The need for the Church to be separate from the world was a thesis given repeated allegorical justification in Darby's distinctive interpretation of the Bible, which came to be known as 'Dispensationalism'. Interestingly, Darby urged that the Church of the saints was not part of God's original redemptive plan, since God's promise was to Israel, and 'Israel' was not a symbolic allusion to the Christian Church, as many theologians supposed, but literally meant the Jews. For the Church, God had quite different intentions. At the second advent, Darby argued, Christ would again offer the Kingdom to Israel, and David's throne would again be occupied; the temple would be restored; and the traditional Jewish sacrifices would be reinstituted. All this had nothing to do with the Church, however. The Church, Darby maintained, would be raised up before the tribulations that were to come on earth: indeed, through her special relation to Christ, she dwelt already with him in 'heavenly places'.

Since Darby's time, therefore, the Exclusives have not, strictly, expected the second advent, since they do not believe that they will still be on earth when it happens; they expect, rather, to be taken up to Christ before his reappearance on earth. The Church has no part in the tribulations of the world, no responsibility for it, and this

justifies the Brethren in remaining aloof. God's covenant with Israel put the Jews under the Law, but the Church had quite a different dispensation – that of grace.

Although Darby referred repeatedly to 'the Church', he did not explicitly claim that the Exclusive Brethren alone were the Church. He came near to doing so, but in the light of Scripture, the point would have been difficult to assert unreservedly. In practice, however, this has certainly been the informal assumption of Exclusives in recent times. The difficulties of this position were somewhat resolved by a teaching developed by one of Darby's 20th century successors, James Taylor Sr, whose doctrine of subjective and objective salvation distinguished salvation to be attained in heaven from the sense of salvation experienced on earth.

The Saintly Elite

The latter could be found only in an Exclusive assembly, the company of saints. Only there could the believer gain the practical enjoyment of eternal life, through the operation of the Holy Spirit in the assembly. Taylor went on to assert that 'morally' (a word of which Exclusives are particularly fond) the Church *was* Christ, and since salvation was in Christ alone, experience of salvation was to be had only in the assembly. This assertion and other 'lines of ministry', as Exclusives refer to new doctrinal trends, led to an increasingly sectarian position whereby Brethren were taught to see themselves as the saintly elite. The sect became the only acceptable context for the saint.

The process by which the Brethren came to accept this intensified separation from the world involved repeated schisms. Since there was no formal authority to judge issues, each separate assembly decided whom it would accept into fellowship. Diverse judgements, attempts at compromise and even hesitation in deciding led to recurrent and ramifying processes of schism, and intense insecurity. In more recent times, the telephone has helped to prevent embarrassment in assemblies faced with a stranger seeking to break bread with them; an informal network of information has become more readily available, so preventing the perhaps irreparable error of refusing to admit a righteous saint (recognized elsewhere) or the certainly irreparable error of admitting one who was elsewhere rejected. These difficulties led to a number of mutually excommunicated fellowships coming into being in the later 19th and early 20th centuries.

The Exclusives proper trace their descent from Darby and, after him, through successive (but quite informal) 'leaders': J. B. Stoney, F. E. Raven, James Taylor Sr and, in the 1950s and 60s, James (Big Jim) Taylor Jr. This branch of the Brethren, in the course of repeated schisms, steadily abandoned their interest in evangelism, until today they are almost completely closed. The concern with inner purity has almost eclipsed the idea of preaching salvation to outsiders. Strangers are admitted to only one service, and if they repeat their attendance they are likely to come under very close scrutiny and interrogation. It is still possible to join the sect, but to do so is to put one's entire life and activity to the test. Former members, whether they have left or been expelled, are not readily received back.

Since 1950 or thereabouts, the Exclusive Brethren have undergone successive crises, and expulsions and divisions have become virtually the principal preoccupation of members of the movement. The period of leadership of Big Jim Taylor of New York has been characterized by uncertainty about the standing of particular individuals and the acceptability of particular 'lines of ministry'. The expectation that the truth will continue to be 'opened up' has led to a steadily accelerated development of doctrine. New variants of accepted teachings are continually propounded among them, and these are said to 'link on' with past teaching. But because of the uncertainty about authority, and the danger in which a man stands if what he expounds as new truth comes to be regarded as heresy, this process has been attended by acute anxiety.

Typically, young men seek prestige by asking questions of visiting speakers and by developing new lines of interpretation; this is one of the few ways they can acquire status. If a man's ideas are accepted, in his own assembly and beyond, prestige is gained and the individual rises in the unofficial status system of the movement. The process, however, is dangerous. The individual may develop a teaching that proves unacceptable and this will lead to humiliation or, if persisted with, to expulsion. Rivalries between 'up-and-coming' expositors of Scripture lead to keenly fought judgements and bubble reputations have burst on various occasions in recent years. In practice Big Jim Taylor, whose own position of leadership has not always been secure, has tended to be the final arbiter of acceptable teaching, though in fact the latent assumptions about how the truth of new teaching is to be tested are obscure. His inclination, following that of his predecessors, has been to drive the movement into ever more intensified separation from the world.

Today, in consequence of the most recently developed teachings, Exclusives rigorously avoid all other associations and all but the most essential contacts with the world. Trade union membership, and even membership of professional bodies, is not now permitted. A recent attempt to gain exemption for the pharmacists in the movement in Britain from compulsory membership of the Pharmaceutical Society failed when the House of Lords refused to pass a measure of toleration (already passed in the Commons and by the Pharmaceutical Society itself). In consequence all but one of these pharmacists abandoned their profession rather than abandon their sectarian allegiance. New regulations within the movement about not working on Saturday have caused difficulty for one sizeable community of Brethren, the fishermen of the Moray Firth in Scotland, but others have simply accepted the new regulations. Such is the dependence on the movement – members usually have no friends and few acquaintances outside it – that new regulations are almost always accepted by the Brethren.

The distinctive beliefs of the Exclusive Brethren were formulated by John Nelson Darby: his supporters left the original Brethren to become the first Exclusives

Bad Press Publicity

The Brethren espouse the strong 'work ethic' typical of extreme Protestant groups, and they value typical Puritan moral qualities. Family life is of special importance, but since separation from all who are not in fellowship is absolutely insisted upon, families expel their wayward members just as do assemblies. This demand for separation, even from a spouse who fails to fulfil the demands of the movement, has brought the Exclusives bad press publicity in Britain in recent years. Entertainment, including television, is avoided. Children are as far as possible insulated from other children. Brethren refuse to eat food cooked by outsiders; they will not occupy a flat in a house in which persons other than Brethren use the same door; they refuse to shake hands with non-Brethren. Members do not move to any place where there is no assembly in being. They do not vote, and they see their whole well-being in the 'heavenly' experience of the meetings. In recent years the interest of the newspapers in the Brethren has led, in both Australia and Britain, to much greater secrecy in their affairs.

Innovation in teaching and liturgy (which has grown more elaborate, and has come to include confessional exercises) has not, in recent years, led to schism so much as to numerous individual expulsions. Those expelled have not generally found it easy to form new assemblies. Membership has dropped and the sect appears to have entered a vortex of successive purges. It is difficult to assess the strength of the Brethren, but in Britain they probably number between 10,000 and 20,000, with strong concentrations in the southeast and home counties, the Midlands, industrial Yorkshire, the Clyde Valley, Moray Firth and around Belfast.

British Museum

Excommunication

The ultimate penalty inflicted by the Church, whereby a flagrant sinner or heretic is excluded from taking the sacraments: in the greater form the offender is cast out of the Christian community and solemnly cursed with 'bell, book and candle'; in the lesser form the person to be disciplined is merely refused communion; the excommunication can be lifted if the sinner repents.

See CURSE.

Karen Hoddle

Exegesis

The interpretation of sacred texts, especially the Bible: deeper meanings may be found to underlie the plain sense, so that passages of scripture are seen as allegorical, as giving rules for moral behaviour or as referring to future events; the term also applies to textual commentary in general.

BIPS

BIPS

BIPS

The man kneeling before the altar, a postman, believes that he is possessed by an evil spirit which is trying to kill him; he has come for help to a London vicar who regularly performs exorcisms. The vicar lays his hands on the man's head, becomes tense with concentration and begins the exorcism: 'I rebuke thee! I rebuke thee! I rebuke thee! I abjure thee and summon thee forth from this man . . .'

Greater knowledge of psychosomatic illness and mental disease has led to the afflicted being treated by the doctor rather than the priest; yet even today the cleric is still sometimes called upon to use his powers in cases of apparent possession

EXORCISM

THE EXPULSION of an evil spirit by a command, ritual or prayer is called exorcism and supposes some theory of the inhabitation or infestation of a human soul or a place by evil spirits. Until quite recently much modern thinking on the subject was dominated by the view of E. B. Tylor (*Primitive Culture*, 1871), who propounded a theory of animism, saying that primitive man, when once he has built up a concept of his own soul out of dreams and other psychic experiences, extrapolates this same soul, finding its semblance in beasts and even in lifeless objects. Professor Evans-Pritchard, however, in his work on the Azande, a tribe in Central Africa (see AZANDE), refuted the theory of animism in this connection.

The Azande have the idea that the powers of witchcraft reside within a witch's body, and think that by cutting out a gland or pouch in the region of the witch's liver they can be removed. They hold that a wizard can have wizard sons but no witch daughters, and a witch likewise has witch daughters but no wizard sons. The Azande say that when a man has been bewitched 'the soul of the wizard's magic has eaten the soul of the flesh of that man'. Below the grade of wizard they recognize what they call 'gall-bladder men', who are thought to be less dangerous. All this is very physical. In a modern primitive tribe one does not necessarily see the same process of thought as can be projected

back into the earliest stages of humanity, yet this example is helpful because it suggests one way in which the idea of possession by evil spirits may have developed.

At the root of exorcism lies belief in the power to transfer a spiritual being from place to place by ritual acts and words. Such a belief seems to have been at work in the minds of the early Romans when they carried out their *evocatio*, which may be looked upon as an exorcism of a community rather than of an individual. In war, before the final assault on a hostile town, the Romans conducted a solemn ritual of calling out the gods of the enemy. This happened, for instance, in the campaign against the city of Veii. The gods were invited to join Rome, with promises of worship and good treatment if they did. Correct use of the name of the god or goddess was an essential part of the ritual, and fear lest an enemy should try to evoke Roman gods led to the concealment of the true name of the *genius* or guardian spirit of Rome; the Roman writers Servius and Pliny say that it was not known whether this original tutelary deity was male or female.

The Romans must have begun by regarding the gods of the enemy as themselves hostile, for otherwise the ritual of propitiation would have been pointless. This belief can be traced with some probability to the Hittites of Asia Minor; one of their tablets speaks of an offering of beer being set out for three gods of an enemy town, along with coloured ribbons to mark the way to the beer. The colours used are red, white and blue.

The Forgiveness of Sins

The Jews of the Old Testament were quite different in their outlook; the Baals – gods of enemy Canaanite towns – were not propitiated but looked upon as captives and slaves when victory had been won. In the Old Testament there are no stories of exorcism save for the episode of Tobias and Sarah in the Apocrypha (Tobit, chapters 6–8). Sarah was not in fact possessed by a demon but guarded by one, much as in later stories the princess is guarded by a dragon. Later Jewish writings have plenty of exorcism stories and the Qumran documents have shown (in the so-called Prayer of Nabonidus) that a Jewish exorcist could be credited with the forgiveness of sins and consequent healing. Josephus made the claim that Solomon had been taught by God the art of exorcism and that he passed this on in his writings, but the Scripture has no trace of this. Certainly by the time of Christ exorcism was well established among the Jews; apocryphal writings such as the *Testaments of the Twelve Patriarchs* bear witness to it, and in the Gospels (Matthew 12.27 and Luke 11.19) Christ refers to it as a well-known fact.

Christian exorcism was not originally confused with healing, for the Gospels differentiate between the two in their accounts of the

Onlookers beat their drums feverishly in an attempt to expel the evil spirits which have possessed the bodies of these two Zambian girls. Psychiatrists might attribute the girls' behaviour to depression

William Sargant

work of Christ (Matthew 4.24 and 8.16; Luke 6.17). Sometimes disease and diabolical infestation are regarded as combined: for instance, the woman bent double is said by Christ to have been bound by Satan (Luke 13.16). Some take this as a concession to the contemporary Jewish way of thinking, but more reasonably one may argue that psychosomatic maladies (whose roots are in mind, body and soul) are sometimes more and sometimes less spiritual in their origins. Human suggestion, by hypnosis or even by telepathy, can go to work upon a bodily flaw or weakness; superhuman intellects, if such can be thought to exist, would clearly be more powerful still.

Exorcizing the Water

Waterless places are spoken of in the Gospel (Matthew 12.43) as an unsatisfactory abode for evil spirits when they have been driven out of a man. It was generally thought that water was their element, and the Christian Church began quite early – about 150 AD – to have a blessing or exorcism of the water that was to be used for baptism.

The practice grew of treating all mental defectives and epileptics as if they were troubled by the Devil. A part of the church was set aside for those who came within this broad category and exorcists were appointed to stay with these sufferers during the service and keep them quiet. In Rome in 251 Pope Cornelius had a total of 52 men as exorcists, readers and doorkeepers. The regions into which Rome was traditionally divided were 14, and it is probable that the exorcists were one to each region. The overriding idea seems to have been that the afflicted should as far as possible be treated as a part of the Christian community, since this would help their rehabilitation. These official exorcists were more like male nurses and differed wholly from those rare individuals who were considered to have a gift from God to deliver men from evil spirits. St Paul drove a spirit out of a girl who foretold

Detail from Botticelli's painting, *Three Miracles of St Zenobius*: the saint has successfully exorcized two young men of evil spirits, which issue from their mouths in the form of black imps. Spirits were thought to enter and leave the body by the natural orifices

National Gallery, London

the future (Acts chapter 16) and he had unsuccessful imitators (Acts chapter 19). Even Christ had such imitators (Mark 9.38 and Luke 9.49–50). The magical papyri that have come to light in recent times advise exorcism in the name of 'Jesus, god of the Hebrews'; spectacular success in exorcism naturally bred imitation.

Baptism was preceded by exorcism from the earliest Christian times. The theory was that the candidate for baptism had been engaged in worshipping pagan gods who were no better than a cover for demons; in fact, the whole world was considered to be in the power of the Devil until it was redeemed by Christ. A voluntary renunciation of the Devil was required of the candidate, because the human will was a vital factor in the problem of possession; no one could be manoeuvred by the Devil unless he had given his consent. When infants were baptized, the renunciation was undertaken by sponsors on their behalf. An apocryphal work of the 2nd century, *The Gospel of Truth*, compares the baptized to jars which have been filled and then sealed; before filling with the Spirit of God they would have to be emptied of all previous contents.

The Neoplatonist philosophy developed in Greece in the early centuries of the Christian era brought in the concept of spiritual bodies for demons and angels, made of the most subtle of the elements, air. Some of the Greek theologians, from Gregory Nazianzen down to Michael Psellos in the 11th century, were attracted by the idea, and this made for much cruder theories of exorcism. If air had to be extracted from the possessed person, then the use of torture did not come amiss. Whereas in 1080 Pope Hildebrand could write to King Haakon of Denmark to say that women accused of weather magic and spells were innocent and that to attempt to punish them was foolish and would provoke the anger of God, in the East Michael Psellos was writing a blood-curdling treatise on the power of demons. In the West the Synod of St Patrick had decreed excommunication for anyone who brought an accusation of witchcraft or believed in witches, and this decree was copied into many of the early codes of canon law, providing a brake on popular scares which was lacking in the East. The learned cleric John of Salisbury (c 1115–80) gave stern warnings on the abuse of exorcism: holiness was required in the Church's ministers and if they were lacking in this, they might seem to effect an exorcism but the final outcome would be worse infestation.

A Willing Surrender

St Thomas Aquinas (c 1225–74) argued that intellect and will, the finer points of the human soul, are opaque to devilish scrutiny. Devils can infer from the play of imagination and stirring of sense-appetite what a man is thinking about or choosing, but they cannot be sure. Possession, when it occurs, must be due to a willing surrender on the part of the man or woman. An exorcism formula going back to Anglo-Saxon times prays that God will turn the thoughts and heart of the possessed man, that he may confess all his sins. It continues: 'Wherefore, accursed demon, recognize thy doom; give honour to God; depart from this his servant, so that, when grace comes to him, he may serve God with a pure mind.'

Such views excluded the possibility that men could be bewitched against their will. None the less, the influence of Arabic medicine and the beginnings of what may be called the experimental science of the Middle Ages (a confused welter of ideas about the properties of gems, herbs and rare or fabulous animals) led those familiar with the Neoplatonist teaching about demonic bodies of air to a ready belief that bewitchment and exorcism might both come about without reference to a man's own choice. A long conflict between 'progressive' Neoplatonist experimenters and conservative theologians ensued which had not been resolved at the time of the Reformation. One such progressive, Peter of Abano, in the early 14th century put down the deadly gaze of the basilisk to the emission of a corrupting vapour. The practice of testing a suspected witch by throwing her into water was based on the same set of ideas. If she floated, the devil, in the form of air, was proved to be still in her; if she sank, she was free.

The period of the witch-craze runs approximately from 1484 to 1648. Lorraine, the Rhineland, Scotland, East Anglia and Switzerland being the areas most affected. Exorcism was a more merciful proceeding in those times than witch-trial, when at the trial search was made for the witches' mark or the victim was condemned on the hearsay evidence of scared or hysterical citizens (see EUROPEAN WITCH PERSECUTIONS).

Hearken, Then, Satan . . .

The following conjuration comes from the Appendix to the edition of the Rituale Romanum *published in 1631. It forms part of a ceremony for exorcizing a house troubled with an evil spirit and was to be pronounced by a priest*

I adjure thee, O serpent of old, by the Judge of the living and the dead; by the Creator of the world who hath power to cast into hell, that thou depart forthwith from this house. He that commands thee, accursed demon, is He that commanded the winds, and the sea and the storm. He that commands thee, is He that ordered thee to be hurled down from the height of heaven into the lower parts of the earth. He that commands thee is He that bade thee depart from Him. Hearken, then, Satan and fear. Get thee gone, vanquished and cowed, when thou art bidden in the name of our Lord Jesus Christ who will come to judge the living and the dead and all the world by fire. Amen.

Quoted by H. Thurston
Ghosts and Poltergeists

Apart from the notorious case of the devils of Loudun (see GRANDIER), there were many instances of exorcism upon doubtful subjects. In 1618 a young widow, Elisabeth de Renfaing, while on pilgrimage to a shrine in Lorraine accused another pilgrim, one Dr Poirot, of trying to bewitch her. He fled in alarm, was caught at the frontier and, flight being taken as admission of guilt, was put to death. The lady was exorcized by two Sorbonne theologians. She spoke in English to a lay brother from the English Benedictines at Dieuleward with whom she was confronted, floated up to the roof of the chapel and performed other prodigies. Later she settled down to found a convent at Nancy (which is still there) and to care for the reformed prostitutes of the town.

Signs of Possession

The *Rituale* of Pope Urban VIII directs the exorcist to be slow to believe he has a case of possession before him. Diagnostic signs are the knowledge of matters (a language, for instance) which the subject could not have learnt normally and the use of abnormal strength. Urban also provided a ritual for the exorcism of places troubled by poltergeists.

It is now known that the ancient symptoms of possession usually have natural causes, though the philosophy of Descartes (1596–1650), as it retarded the growth of psychosomatic medicine by its emphasis on the division between body and soul, for a long time rendered more difficult the diagnosis of true from false possession. Hypnosis can produce corpse-like rigidity, subconscious memory can bring up scraps of unknown speech and proofs of extra-sensory perception are now on public record. A modern exorcist, Fr J. de Tonquédec, who acted for the archdiocese of Paris from 1919 to 1939, has written that over 90 per cent of the cases submitted to him were of pseudo-possession, where psychiatric treatment was needed, but that there was a residue of what he thought to be genuine possession.

Telepathy between two human beings has been the subject of much recent investigation; it seems to be more in evidence when it has a physical basis, as between identical twins. The incursion of thoughts and suggestions from a being that is more than human (for this is what possession must amount to, if there is such a thing) would also perhaps require a basis in physical temperament as developed by the bias of a human will that is dedicated to what is evil. It would then be true that there can be no possession without consent.

(See also articles on possession.)

ESP

One type of extra-sensory perception, precognition or knowledge of the future through dreams, is typical of a vast amount of reported human experience

In June 1981, a British magazine told readers that Uri Geller would concentrate his powers to bend forks and spoons. They asked readers to write in and report any results of this. Many years' patient research into clairvoyance, precognition and telepathy indicates that extrasensory powers, working independently of known physical laws, may be common to all mankind.

THE RECEPTION of information by a person through other means than the senses is known as extra-sensory perception or ESP. It is thus one aspect of a two-way exchange with the environment that is not mediated by the senses and muscles. This more inclusive 'extra-sensorimotor' interaction is the area of study of the branch of science known as *parapsychology* (or psychical research), and it is now conveniently identified in common practice by the use of the Greek letter *psi*. Extra-sensory perception is therefore one kind of psi communication, the other or 'extra-motor' part of the exchange being called *psychokinesis* (the manipulating of matter by mind alone) or PK.

Three types of ESP have so far been recognized. They were known long before the term extra-sensory perception was first used in 1934. Clairvoyance is the ESP of objects or events, precognition that of future events, and telepathy the direct experience of another person's mental state.

This is obviously an odd way to divide up the sources from which knowledge might be gained by ESP – that is into objective events, future events and the thoughts of other people. Other claims have been made, as, for example, that of *retrocognition*, the ESP of past events, but it has no basis for acceptance in parapsychology. It is well to remember, however, that ESP may at some later time be subdivided differently than it is at present.

The types of human experience represented by these three ESP classifications are not only very old but broadly distributed through the cultures of mankind. One recognizes the similarity of examples throughout this very wide distribution. For example, premonitory dreams of personal tragedies, which are among the most commonly reported psi experiences in our own time, can be found among the records of ancient times. The dream credited to King Croesus, in which he foresaw the murder of his son, differed from the general type today chiefly in the point that it was the guard the King appointed as a consequence of his dream who turned out to be the murderer. This circular feature, which rarely appears in modern premonitory dreams, could well have been invented by a clever storyteller, as indeed the whole story itself may have been.

Abraham Lincoln's dream too, in which he is said to have seen himself in the coffin in which he lay some days later, also has to be viewed against the background of literary licence. But the point is that this type of ESP, precognition, in which information of a future event is seemingly acquired in the dreaming state, is typical of a really vast amount of reported human experience. The dream is one of the vehicles of extra-sensory communication; future events definitely appear to be conveyed in some way, even against the stream of time; and all this has been going on a long, long time all around the world. Just how many of the dreams people have are ESP dreams it is futile to guess. Not all ESP dreams are precognitive either; although a great many of them are, they can also be clairvoyant or telepathic.

The Person 'Just Knows'

In the waking state, however, while ESP can be carried along in the daydreams that sometimes intrude, the device that most often gets ESP to the conscious experience of the individual is intuition, a form of knowledge that hides the means by which it is accomplished. The person 'just knows', and while he may know of something yet to happen or may intuitively know the thought of a distant friend or loved one, somewhat more commonly he knows of an objective event. But in most of these cases of ESP in everyday life there is no sharp boundary and no one can tell for certain that a case is pure clairvoyance or half telepathy. The woman who knew there was something wrong at home and who insisted on being driven home by her host in the midst of a dinner party seemed to have only a dim half-awareness of the tragic situation; but this and the house afire, and her invalid husband asleep, at least suggest clairvoyance.

But the mother who in the midst of a bridge game telephoned her home to ask what was the matter with the baby may have been telepathically experiencing the baby's painful predicament at the moment rather than 'seeing' the objective picture by clairvoyance. What emerges is the strong probability that in a few rare cases it is thought alone that is conveyed. In other cases it seems as clearly to be the objective situation that is conveyed. Such experiences have provoked the scientist to ask the question: 'Is it possible for one mind to convey a message directly to another without using sensory channels? Is it possible for an objective crisis to be picked up in some way by a person far beyond sensory range?' The experiences as they accumulated and fell into types threaded themselves on a common hypothesis long before any experiments were undertaken to verify it.

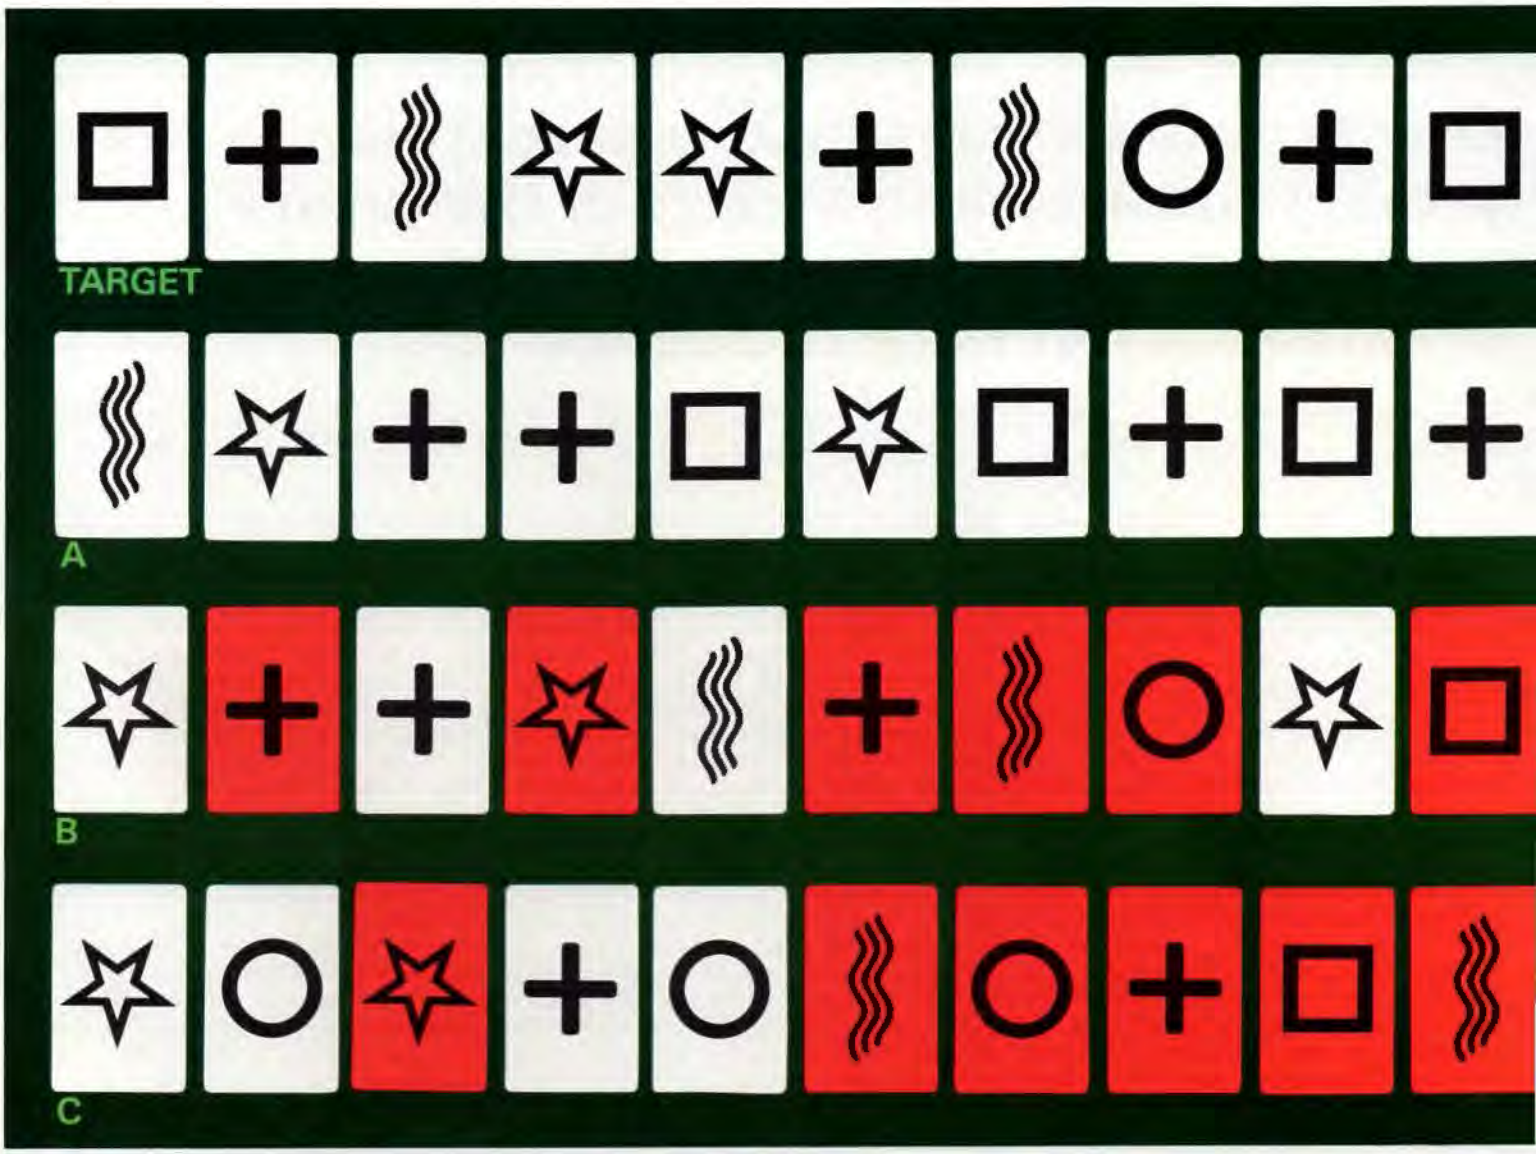
In the waking state there are other ways of getting information to a person's mind by ESP besides intuitions. One of these is hallucination, which is a comparatively rare experience, but among those that do occur telepathy is a common ingredient. The recipient usually sees or hears the person from whom he seems to be getting a message. Voices are more common than visual apparitions. A person experiencing the mental state of his 'sender' may undergo the specific state and even the suffering actually felt by the sender. This may involve going through the birth pains of the other, or the agonies of a heart attack, or even falling to the ground as the other had done in his crisis.

There will be no doubt in anyone's mind about the importance of these puzzling human experiences if they are what they seem. It was the fact, however, that it was impossible to be sure about them that so long delayed the investigation of the questions they raised. They were also not as easy to investigate as were the phenomena of the more objective physical and biological sciences.

These case reports of mysterious happenings represent a class by themselves. If reported, as most of them are, by sane and respectable people, they cannot be lumped with the pathological and they definitely do not fit in easily with any other branch of the sciences. If then they have any sound basis of fact it would have to be something new for

Machines are used in ESP research for strict control and efficiency, and often to randomize targets in clairvoyance or precognition tests, to exclude telepathy between subject and tester: Prismaton 70 used in Germany

Leif Geiges



The first column shows a possible target order of ESP cards used in parapsychological tests: 1 hit in 5 attempts can be expected on the basis of pure chance. Column A, where the subject has scored 4 hits out of 20, has to be put down to chance. Column B, with 8 hits in 20, is the type of result that suggests ESP. In Column C the subject has consistently anticipated the target, providing an example of 'displacement'

the scientific world – something different, radically different.

Because of this sharp difference the tendency developed among the easier and earlier sciences to regard these claims as not amenable to serious scientific treatment. They were looked down on as something that could not be explained, as most scientific findings could, by the known and familiar principles of Nature. This meant they would have to be classified as supernatural, which amounted to putting them on the shelf so far as scientific investigation went, and of course it greatly delayed their investigation.

ESP in Religion

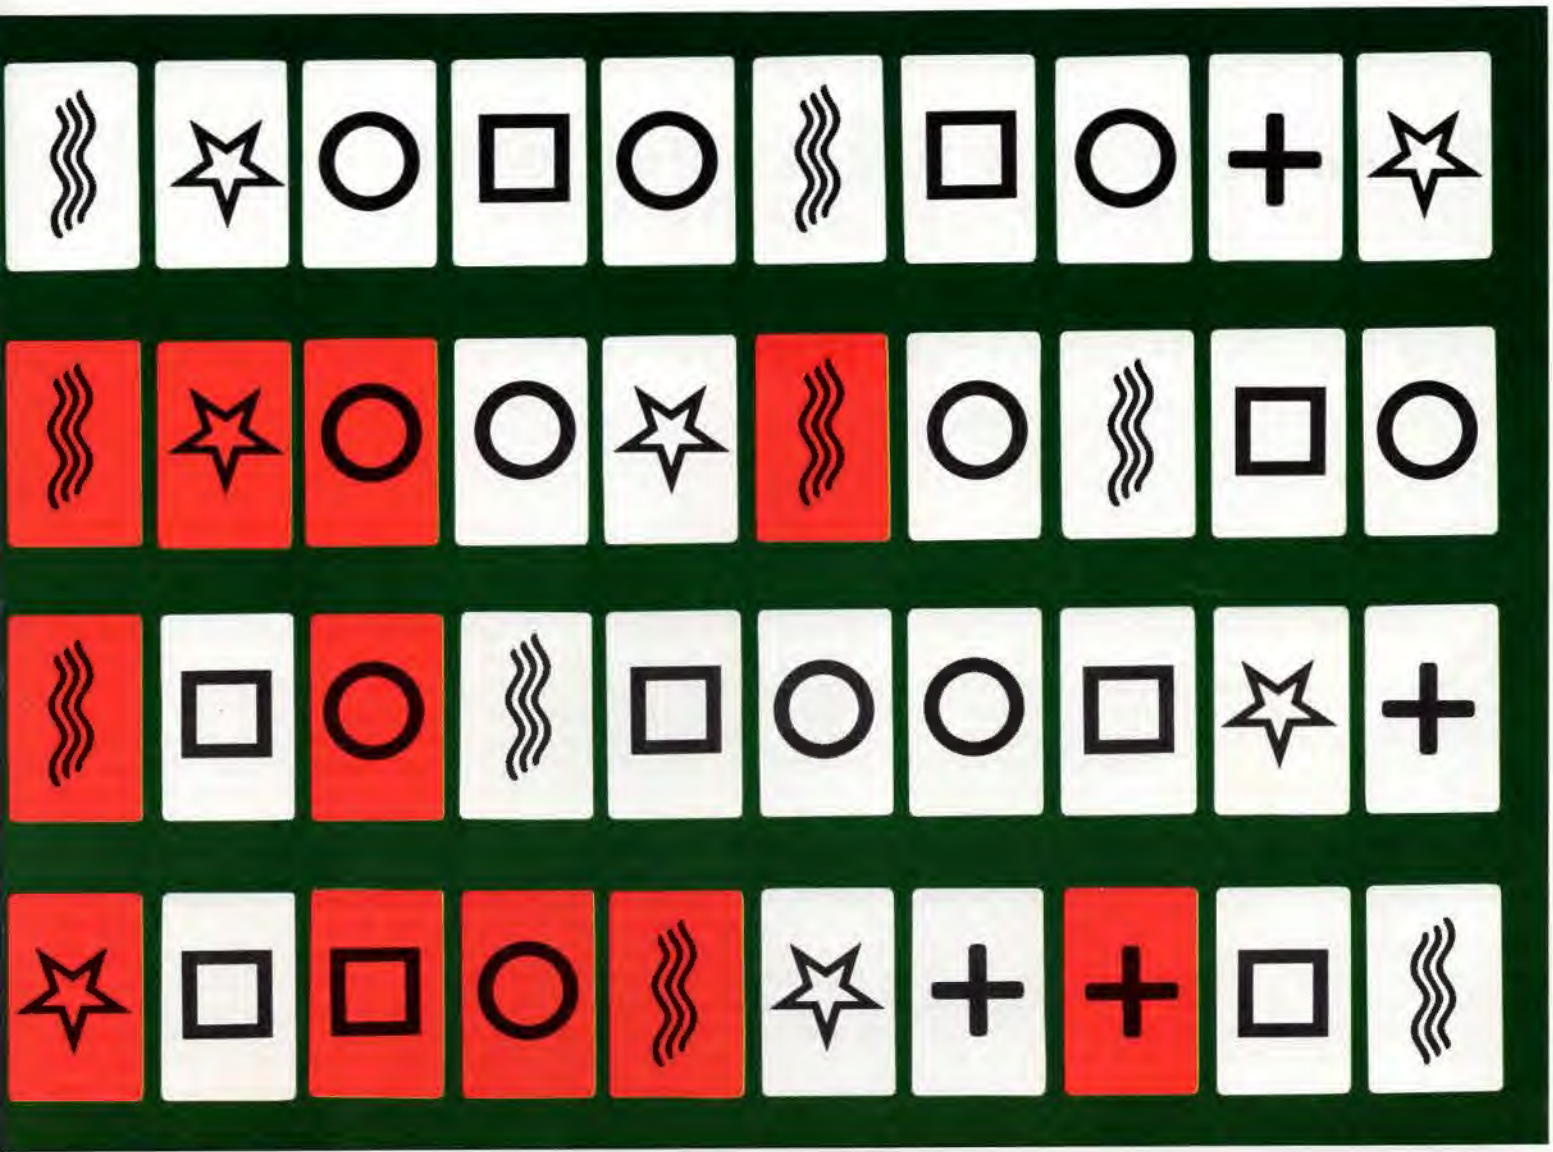
It can be said with unreserved confidence that man's belief in ESP (and the related ability, psychokinesis) has had a long and a powerful impact on his life and his institutions. Quite probably no other single belief has exerted so large an influence on mankind. But this is much harder to see now that over much of the world belief in ESP is at a low ebb in comparison with ancient times. Consider first what such belief did for the individual who could impress his fellow men with his superior powers of knowing of events to come, of distant happenings, of matters on all sides which the senses could not reach. Such a man, other things being equal, would assume leadership and power. Governing systems long clung to the counsel of the 'wise men', the prophets, the soothsayers, the oracles. Most of the magic which was such an important part of all cultures the farther back from modern technology we go, depended heavily upon belief in extra-sensorial cognitive powers. Even such magic as lingers in our Western cultures still usually carries an element of belief in ESP, obscured as a rule under other formulations. The dowser may have his theory of terrestrial magnetism, while essentially assuming an ability more properly recognizable as clairvoyance.

Even the popular concept of luck in games of chance comes close to qualifying as magic; and the casino games themselves so far approximate to loose tests of psi ability as to provide important elements for testing techniques for ESP and PK.

It is in religion, however, that psi has played by far its greatest role in human life, and here it is important to stress that it is belief in psi that is under discussion. How much genuine capacity has underlain this belief would be difficult to estimate. But it can be said that it is the belief in the powers of psi that has given the religions of mankind their main principles of communication between man and the divine. There is of course a great deal more to religion than the mere basis of exchange, the modes of interaction. But what has come to be called the supernatural (the miraculous and the transcendent) in religion is much the same as the types of capacity that are now the subject of study in parapsychology.

The parallel is rather impressive. All the types of psi are present in the theological system: precognition as prophecy, clairvoyance as revelation, telepathy in prayer, and the answer to prayer through physical miracles as psychokinesis. It would be hard to conceive of religion without psi principles of communication. In a word, the religious follower is bound to believe in psi. This is obvious regardless of the validity of either psi or religious doctrine.

The change from thinking of divine agency as the reason behind such puzzling



phenomena as psi, to thinking of psi as a natural principle of communication, called for some explanatory idea that made sense. The mere thought of a natural principle of that kind had to wait until men were at the cultural stage when they began to grasp at general laws that could explain natural phenomena. By the 18th century, however, the emergence of the science of physics had brought forth theories of universal fluids and interplanetary forces. Franz Mesmer's theory of a universal animal magnetism encouraged rational thinking as to how people could influence each other without sensory contact and how communication with the spirit world might occur. Emanuel Swedenborg was believed by his followers to have demonstrated that it actually did so. The 19th century concept of a universal ether and of wavelike communication in this medium favoured the search for a natural explanation for what had been hitherto regarded as completely miraculous. It brought within the bounds of the more venturesome speculation of the day the claim of survival after death of spiritual or ethereal bodies, as well as possible communication with the dead on telepathic lines.

The Spiritualist movement based on communication with the dead through mediums was a natural result of these and other favouring systems of thought. The somnambulism that developed from later mesmeric practices contributed an important device for the practice of mediumship. By the 1880s enough evidence from mediumship had accumulated to impress a number of scholarly people and to bring the methods of science to bear on the claims made. The Society for Psychical Research, founded in 1882 in London to investigate 'mesmeric, psychical and spiritualistic claims', set an example that was followed by similar societies in a number of other countries in succeeding years. This movement was capably led, especially in Britain, and made considerable progress in drawing the problems connected with mediumship into better focus, but it did not succeed in bringing the major issue, that of spirit communication, to a scientific conclusion. Rather there was a growing realization over the next 40 years that the problem was much more difficult than the Spiritualist demonstrations had suggested.

Nevertheless the attack on the problem of survival after death did direct attention to the claim of thought transference. It was obvious from the start that a medium would have to be gifted with telepathy to intermediate between two worlds; but at the same time, if she were gifted with telepathy she might in this way be able to get the information for her messages from living sources rather than non-material. Telepathy became almost as important an issue as the survival issue itself. It led to experimental work not only under the sponsorship of the Society for Psychical Research but also, during the first quarter of this century, within university departments of psychology, particularly in America. The American universities of Harvard and Stanford and the University of Groningen in Holland, stand out especially. The experiments at these three universities, judged by the standards of the day, fully justified continuance but in no case did this happen. Telepathy turned out to be much more difficult to work with than most of the other mental abilities being tested in those days, and ease of demonstration had much to do with the eligibility of a subject for a university programme. Psychology itself was still on trial. Psychical research could add nothing to its respectability, and it could not offer young scientists a successful career. The effort was premature.

But something was established that was important. First, a number of psychologists had obtained significant results in telepathy tests; beginnings had been made. Second, in some of these tests the subjects were unselected volunteers, not especially gifted

If it had been easy to get significant evidence of ESP repeatedly and at will, there would probably have been little criticism

individuals. The way had certainly been made easier for the work undertaken at Duke University in North Carolina in 1927.

With the sponsoring interest of the Professor of Psychology, William McDougall, and a new and liberal university administration, a more favourable setting was provided for psychical research at Duke University in 1927 than had existed anywhere before. In addition, the two biologists, J. B. and Louisa E. Rhine, who went to Duke to work under McDougall, had undertaken the exploration after some years of independent and critical study of the claims and the evidence for ESP.

Clairvoyance Testing

The major problem, however, which brought the Rhines to Duke was not the problem of telepathy. It was the question of survival after death, as based upon the analysis of mediumistic communication. The telepathy problem was recognized as important, and research was to be carried out on that and related problems too. But the first issue was survival, so long as it could be scientifically handled.

That, however, was the question. Eight years later a tentative conclusion was reached that the mediumistic approach to the problem of survival could not bring a solution. The medium tested in the Duke Laboratory did obtain reliable information pertinent to the appropriate sitter in the adjoining room; and the evaluation of the results was done under what are called 'double-blind' conditions. But the question as to where the medium obtained her information could not be answered. Because it need not have been from non-material sources, the method could not be considered conclusive, and there the matter still stands.

Telepathy of course was part of the alternative explanation of the medium's success. Accordingly, as the survival question had lost ground, ESP had received more attention and by 1933 and 1934 was clearly in the ascendancy. In 1934 the Duke Laboratory issued its first report, a monograph entitled *Extra-sensory Perception*.

But telepathy testing too hit a snag almost at the outset. It was found, on making a survey of all the past telepathy experiments, that none had ever been carried out properly – that is, in such a way that the subject (the person trying to establish extra-sensory perception) could not have got his information by clairvoyance as well as by telepathy. The sender of the message had always looked at a card or other object. There had never been a pure telepathy test controlled to exclude clairvoyance.

As a matter of fact, it was not easy to carry out a tightly designed test for telepathy that excluded any possibility of clairvoyance. The sender could easily originate his own order of targets (the messages the subject would try to pick up) purely mentally and on each trial wait until the receiver recorded his response before making a record of the mental target. But this, although the tests succeeded, still left questions. Telepathy would have to wait, interesting though it was. If any headway could be made with clairvoyance, using tests with the simple guessing of concealed cards, as had been done as early as the 1870s by Professor Charles Richet and others, it would be an easily controlled performance. So clairvoyance testing became the first point of attack in the systematic experimental parapsychology begun in J. B. Rhine's laboratory in the late 1920s.

By 1933 experiments had been conducted with subjects under such conditions as to allow the conclusion that extra-sensory perception of the clairvoyant type had been demonstrated. Among other controls, the subject was sent to a building 100 yards away from that in which the experimenter handled the target cards. These were isolated one at a time at one minute intervals, and the card order was not recorded until after the run of 25 trials. The cards were of course kept face down throughout the run. The subject in the other building recorded his guesses as he made them. Duplicate records of both the cards and the calls made double, independent checking possible. With the completion of a planned series of 300 guesses under these conditions, over a six-day period, the results were so highly and so uniformly successful that there was no doubt the result could not be due to chance. Out of the 300 guesses, 60 hits were expected on the basis of pure chance; but with 119 hits, the odds were millions to one against such a result coming by chance.

The next stage brought in a two-experimenter arrangement to ensure increased vigilance against error or deception. The success still continued under these stricter conditions. Then other subjects were brought into the testing programme to broaden the range of people used. Later still, a wide variety of testing methods came into use with the aim of making still more certain that no experimental weakness could be involved in any general conclusions reached. Accounts of these methods may be found in the early volumes of the *Journal of Parapsychology* and in books published in the late 1930s.

Criticism and Self-Criticism

How was the ESP report in 1934 received by the scientific world? On the whole the reaction was at first comparatively open-minded and friendly. Many psychologists attempted to repeat the Duke experiments. None of these efforts was undertaken with anything like the long experience and training for ESP research that had accompanied the seven years of work at the Duke laboratory, and by no means all who tried succeeded. There is no way to estimate the percentage who did. Even among those who reported positive results, there were questions in some cases as to the adequacy of the precautions taken. In a number of instances there were requests to keep the work done confidential, while in several instances of research known to have been done by American psychologists nothing could be learned about the results.

If it had been easy to get significant evidence of ESP repeatedly and at will, there would probably have been little criticism. If ESP had been as consciously controllable a capacity as those with which the psychologists were already familiar, unreserved acceptance would probably have followed. But as a number of failures were reported and only a few of the successes reached publication, there was disappointment with the new claims. Unhappily press and radio publicity ran wild, and sensational writers gained excessive public attention; as they did so antagonism developed among psychologists. By 1937 and 1938 there were even sensational 'heresy trials' and published attacks on the ESP researchers. A few psychologists began also to think about the implications of the evidence that psi appears to be non-physical and ESP came under attack as 'impossible'.

J. B. Rhine

Camera Press

The progress of parapsychology is likely to bring about a greater scientific revolution than any that has occurred in the past. A long series of experiments at Duke University, conducted by J. B. Rhine and Louisa E. Rhine *(left)* produced the first major body of systematically gathered evidence for ESP. In England another celebrated parapsychologist, S. G. Soal *(right)* carried out a successful demonstration of pure telepathy

Most of the numerous critical reviews of the new findings about ESP came out during the years 1937 to 1940, and then they ceased almost entirely. In 1940 *Extrasensory Perception After Sixty Years* was published with the aim of answering all existing criticism. The seven leading critics were asked to contribute to it. Since then both the quantity and the quality of criticism by 'outsiders' has fallen to a level that does not deserve serious attention from the psi research field.

On the other hand self-criticism by the psi-workers within the laboratory continues as a necessary policy. It is important for ESP researcher and student alike to avoid easy conclusions, either positive or negative. Certain practices have been developed to insure against error, such as the appointment of one or more statistical editors to the *Journal of Parapsychology*. Unusually high standards of judging statistical significance have been maintained from the first and still continue. Certain devices have been used to help workers to avoid hasty conclusions. One of these is the requirement of a confirmatory repetition before publication. Others involve supplementary tests of consistency to buttress a finding that in other sciences would be accepted forthwith. ESP research is recognizedly 'far out', and is going farther yet. It needs all the devices of scientific method that reinforce the inquiry at any point, and it needs especially deliberate judgement in making conclusions.

Testing Precognition

By December 1933 the clairvoyant type of ESP seemed well enough established to justify taking the next step. However, the direction of the next advance did not appear a matter of course. Telepathy was still waiting. It was now clear that if the sender in a telepathy test had an objective record of the target, clairvoyance alone could enable the receiver to identify it, leaving telepathy only a hypothesis. But this only made it more important to develop a new design for a test of pure telepathy. However, there were easier things to do and equally important ones at that.

It was decided to try precognition next. Besides the ancient beliefs in this capacity, there had been many instances of spontaneous experiences to suggest the hypothesis of extra-sensory perception of future events. The ESP tests already carried out did not indicate any decline of success with increased distance of subject from targets. If space did not influence ESP performance, as seemed well indicated, there was no reason to expect time to limit success either. There was no suggestion as to how precognition could occur, but for that matter there was none for clairvoyance either. It was simply a good empirical question whether time could bar any principle such as ESP that distance could not.

The actual testing techniques for precognition were so simple a modification of those of clairvoyance, that they seemed almost too casual and trivial for so great an issue. In the last month of 1933 the same subject who had done so well in the distance tests of clairvoyance was asked to predict the order of cards in a pack as it would be after the cards had been put through a certain shuffling routine. For comparison he was also asked to call down through a pack of 25 cards as it lay in its box until the end of the guessing. In these two series, the one testing precognition and the other merely calling down through the pack as it was, the subject obtained approximately the same (significant) rate of scoring.

The method had been sufficiently successful to constitute a basis for a thorough reconsideration of the adequacy of the shuffling methods. Could it be that some psi factor might be entering in, even though the methods of shuffling were varied and the randomization of the card order was extended? It was finally decided by the research staff that the shuffling of cards by hand could be sufficiently guided by ESP itself, and that this 'psychic shuffle' could be a reasonable alternative explanation. Precognition itself was so difficult a hypothesis to accept that any reasonable alternative had to be honoured, and of course tested as well. And since the tests supported the 'psychic shuffle' hypothesis, a shift was made to mechanical shuffling of the cards for subsequent precognition tests.

It is true that no one in the laboratory really thought it likely that the various ways of shuffling the cards had contributed the continuing significance of the results obtained in precognition experiments. But in order to be sure, the older method had in every case to be abandoned and the final conclusion on precognition still further postponed. A very considerable amount of work had already been done; but now the question was almost back where it had been at the start, and mechanical shuffling of the target cards was begnn.

The results reconfirmed the earlier work, and all went well for a time. Yet this too ended in a similar stalemate many years after it had begun and fresh evidence of precognition had accumulated.

Mind over Matter

The story of the clash of psychokinesis (PK) and precognition is briefly this. A few months after the precognition experiments had begnn, the experimenters in the Duke Department of Psychology were precipitated, ahead of schedule, into an exploration of the claim popularly known as 'mind over matter'. The group had undertaken to test the claim that rolling dice could be directly influenced by mental concentration to fall as they were willed, with a designated face or combination of faces uppermost. This work had progressed to the point where the PK hypothesis, as it came to be called, was being taken seriously as probably another 'parapsychical phenomenon', one that was to be considered along with clairvoyance, telepathy and precognition.

But these different phenomena could not easily be separated; they tended rather to relate closely to each other as the research advanced. The reasoning ran thus: 'If extrasensory knowing occurs, why not extramuscular action on matter, as in PK?' The dice throwing tests had confirmed the PK hypothesis fairly satisfactorily, but the idea did not stop with cubes alone as target objects. One of the research staff members found that he could influence the behaviour of test cards in a mechanically operated shuffling machine, leading them to match to a significant degree a target series set up in advance. This was naturally

Serious investigation of parapsychology, with testing under controlled conditions, grew out of the intense interest in Spiritualism and mediums of the 19th century, when controls were at first rudimentary *Left* The famous medium Eusapia Palladino levitating a table (if genuine, a case of psychokinesis) *Right* An observer holds Eusapia's arm and leg to prevent trickery

an interesting variation on PK demonstration or at least a parapsychical effect of some sort. But it automatically devalued a large block of precognition results, at least as crucial evidence for that specific ability.

But with still another new start the precognition research went on. There was another retooling of the randomization method, one that again went on for many years before its adequacy was seriously questioned. Then, again, the same kind of readjustment took place, with further improvement to ensure that no human factor, with or without psi involved, could be influencing the randomization of the precognition target order. That brings the matter to the present day, when there is a very large block of evidence of freshly accumulated precognition test results.

Today the precognition test seems to be based on techniques that exclude all possibilities of PK. It has also become a favourite type of test because it is the most adaptable and safe. The subjects also like the special challenge of guessing future events. It has revolutionized psi testing in large groups and in public mass tests, since no precautions against deception or error are necessary until the point of checking results; also, there is the advantage that each subject can be given a different target order.

The conflict between PK and precognition, which made research on the latter so difficult, was not, however, all one-sided. Around the mid-40s precognition became in turn a counter-explanation for PK results and this too required some changes of method and some fresh experiments to accommodate them. A steadily increasing body of evidence accumulated over the years, showing that direct mental effect could be exerted upon moving dice and other objects. In a standard type of test, a pair of dice might be released mechanically or otherwise, and allowed to roll down an inclined plane onto a table top. A designated face or combination of faces would be set by the experimenter and a series of releases made, while the subject attempted to will the dice to fall with the designated targets turned up. In most experiments the selected target face was changed after a scheduled number of releases and, in order to keep a control against dice bias, each face was used as a target for the same number of releases.

Telepathy on the Cards

As soon as enthusiasm cooled a little with regard to precognition and PK, as had happened by the mid-40s when finally the results of both developments had got into publication, the psi research group at the Duke parapsychology laboratory turned its attention to the long-shelved problem of telepathy. A team of five members undertook to design and carry through an adequately safeguarded telepathy test on the following lines. With sender and receiver in different rooms, the former was to use a deck of 25 number cards connected with the standard ESP symbols by a code which he or she alone knew. The receiver was to identify the symbol of which the sender was thinking as the trial signal was given. At the end of the session of four runs of 25 trials each, the experimenter would check the subject's guesses against the target number code, making no indication of the hits but recording only the total number of hits for the page.

The aim in making no other record was to keep clear of any objective basis by which a subject could conceivably discover the experimenter's code precognitively and thus use the number cards as a basis for clairvoyant identification of them. By not making any translation of the number card record, precognitive clairvoyance would not have any access to the code at any time. This ruled out clairvoyance and precognitive clairvoyance.

However, the problem of getting an independent check on the accuracy of the record of the number of hits remained. To avoid this difficulty the code was communicated by the experimenter to an associate experimenter using no physical record and no actual spelling out. Rather, it was done by subtle reference to common memories that would not have meant anything to the subjects even if they had been

J. B. Rhine

present. The two experimenters alone could by means of hints and non-recorded signs of recognition transfer the code, and the recheck was made in the same fashion, dealing only in page totals. The results were quite significant and the experiment was so well supervised that it seemed to make a good case as far as this design can be considered a test of telepathy. Later, from 1941–1943, another successful demonstration of pure telepathy was carried out by S. G. Soal in England. In 1978, however, a study by Betty Markwick claimed that Soal had altered his figures to get results.

But as the English researchers R. H. Thouless and B. P. Wiesner pointed out, there are a number of ways of getting round the necessity of direct mental exchange even under the carefully guarded conditions of these experiments. Conceivably some contact with the receiver's or the sender's brain might intermediate and still leave no detectable indication.

But while these efforts were being made to identify the types of psi ability so carefully that every other type would be excluded, the attitude of workers toward this subdivision of the psi process was undergoing some reconsideration. The disputes between precognition and PK were vigorous, especially at first, and a similar contest arose later between different groups of workers over the adequacy of the claims made for clairvoyance. There was in fact some resistance in psychical researeh groups to the primacy given the work in

Modern tests of psychokinesis, or PK, in Russia and the United States *Left* Stills from a film recently taken in the Soviet Union, showing a woman apparently moving small objects about on a table without any physical contact. In the top picture she is concentrating intently: the pictures below show her efforts to move a number of matches, which had been placed under glass. Medical tests are said to have indicated that during the trials her endocrine system was disturbed and she suffered from vertigo and lack of co-ordination *Right* Thousands of experiments have been carried out in American laboratories to investigate PK ability: this girl has attempted to will two dice in a mechanically rotated box to fall with the two-spot face uppermost, and one of them has done so

J. B. Rhine

J. B. Rhine

Researchers now class the types of parapsychical ability (clairvoyance, precognition, telepathy and psychokinesis) as effects of a single ability, called 'psi'. Evidence for one of these effects, precognition, or the ability to forecast future events, has been found through tests which raise difficult questions about the nature of time *Left* One of the Schmidt Psi-Test machines with which significantly successful results have recently been obtained. The girl presses one of four buttons to indicate which of four coloured lights will come on next. The machine selects the order of lights by a method that starts with electrons emitted from a radioactive substance *Right* Children, who frequently do better in the tests than adults, try to guess which picture will fit the story being told them

clairvoyance. Telepathy had seemed a sort of halfway point to proving survival after death, since communication with the spirit world was of course dependent on telepathy. The research on clairvoyance and, later, precognition and PK, had tended to push telepathy off the map. It was argued on the British side that in the clairvoyance experiments the subject might be using precognitive telepathy to pick up the target order as the experimenter checked on the success of the subject's guesses. But this alternative explanation was considerably discouraged by the use of matching tests in which the order of the separate trials was not kept and the experimenter in checking up made no attempt to keep the sequence of several trials. From the American side the argument had been pushed equally strongly that the telepathy test had not excluded clairvoyance, and especially precognitive clairvoyance, until the two cases of pure telepathy experiments were produced.

The Unity of Psi

Another important development was the growing tendency to think of the different types of psi as only surface effects of a basically unified ability. With the suggestion of Thouless and Wiesner of a common inclusive term, the Greek letter *psi*, this became easier to adopt and there has been little discussion in recent years of any one of the types as an independent function in itself. Rather, as knowledge grows about these different psi phenomena, their common properties and similarities are so striking as to leave little doubt that a single psi process is involved, but one that can both bring information extra-sensorially and effect an extra-motor influence in PK. However, the integrated problem area loses none of its complexity in this working hypothesis of unity and each type still raises its own particular set of questions.

Perhaps nothing has helped more than this unitary character of psi to give the impression that, in this body of findings with its common problems, we have to do with a new branch of science, distinctive enough to be treated autonomously. In the monograph *Extra-sensory Perception* (1934), an attempt was made to define the boundaries of this group of problems even before it was as clear in its unitary tendencies as the succeeding years indicated. There the boundary line was said to be that 'its phenomena . . . escape . . . certain laws of the natural world . . . that we have come to regard with relative certainty', and that they had to do with persons or personal agency. We can say more simply that parapsychology deals with the exchange between a person and his environment without the mediation of his sensorimotor system.

It will be interesting also to see the ways in which parapsychology goes about its researches. By its methods and standards it can best be judged as to reliability. From the beginning under Professor McDougall at Duke University the more continuous experimental work has been guided by certain distinctive precautions. Emphasis has been laid on experimental tests and statistical appraisal, with other evidence regarded as at best suggestive. A larger ratio of odds against chance has been required for significance than is usual in other sciences. The two-experimenter plan of safeguarding against error has been used in all key experiments. Statistical editors were appointed for the *Journal of Parapsychology* to judge the mathematics of all papers and the pilot-confirmation plan of research was introduced to reinforce the standard use of statistical significance. These and a number of other special safeguards have characterized the research programme of parapsychology, giving it, as perhaps no other procedure could so well do, reinforced confidence in its own findings regardless of how far the scientific world in general may understand and recognize them. In this way it can become an actual branch of science without having to wait until it becomes a recognized branch of science.

Physics Powerless to Explain

It is time now to look at psi in general terms, and to ask first what common properties it is known to have exhibited. This is, in other words, to try to relate it more generally to the other sciences – physics, biology and psychology – asking what common descriptive terms will apply, and where there are lines of difference.

It is the relation of psi to physics that, as matters now stand, best indicates the uniqueness of psi and marks it off as a distinctive branch of study. Psi exchange can

The picture of psi ability as common to mankind led naturally to the question of whether psi is found in animals

be described not merely as extra-sensorimotor communication but as non-physical interaction as well. As may now be seen, it was this extra-physical character that gave religion its alleged supernatural quality, the factor that made the miraculous appear incredible to those who believed the entire universe to be physical.

It is true that this general acceptance of an all-encompassing physicalism is largely an act of faith in itself. On the other hand, all that can rightly be said at this stage about psi phenomena and physics is that psi phenomena are found not to be physically explicable. However, even that is saying a great deal.

What is the evidence? The best indication of the non-physical nature of psi, as far as the testing has gone, is provided by its apparent independence of time. The very fact that precognition can occur at all seems to exclude any tenable physical theory. By this time, however, there are so many other kinds of evidence against a physical theory of psi that it would be impossible to review them all. There is, though, some ground for keeping up the search for possible physical effects that may have secondary or indirect connections: for example, the way the subject thinks about distance may be a factor; or a physical situation may have secondary psychological effects or influences on psi operations. Then too it is hard to think of PK as not limited by physical considerations at all. (Can faith really move mountains?) But for that matter who can 'make sense' of precognition at all?

In any event it is not so much what one tentatively says about the physics of ESP or PK as what one does about it. Ideally the findings will lead on to further experimenting with the problem. The experience of the past is also encouraging, as when scientists have encountered physical phenomena which no existing energy could explain and another type has been inferred and later verified. New elements, new planets, and other natural entities have come to knowledge in this way. Since psi communication is real in the physical order in which it is measured, it is of course 'doing work', and that is what 'energy' means. In a preliminary way, this hypothetical energy has already been measured by a Swedish engineer in his PK researches. It does not matter that little is known as yet that could enable us to describe this hypothetical psi energy. Enough is known to justify setting it up as a worthy research objective; this is better than trying by rational speculation alone to decide whether or not it is possible.

In any case it is not a new step to infer a non-physical energetic determinant in the mental life of man. A number of outstanding psychologists have already proposed that mind requires a special energetic principle. The novelty is that this new claim of a special psi energetics seems to be experimentally verifiable, and the best aspect is that the research has only started. It opens a trail into some good basic research problems that are both physical and psychological.

Psi Common to All Mankind

Had the research on survival after death succeeded in proving that man has something in his personality that does not end with his bodily death, psi would probably have been described as not only extra-physical in character but extra-biological as well. But even if it can only be described as extra-physical, this almost gets it ruled out of what the biologist of today is likely to say is his acknowledged domain. Hardly any biologist will admit even to considering an extra-physical factor in the living organism. This means that biology has been largely physicalistic and has resisted the idea of a peculiar life energy, a specific vital principle. One sees no escape however for the biologist now, since parapsychology has given psi the status of fact. At least the human organism no longer completely fits the mechanistic theory that has long dominated the life sciences.

A first question for biology about psi ability is its distribution. Who haa it? While at first it was thought that only special individuals possessed psi capacity, none of these older limiting beliefs has been validated. Instead the working view has developed that psi ability is potential throughout the human species, and that individual differences of attitude, habit and interest determine whether or not psi will express itself or be inhibited. Work with people of different ages has given an impression that the younger the age of the subjects the more likely they are to adapt to the test conditions and respond favourably to efforts to elicit psi effects in tests. In recent years numbers of mass tests have been conducted throughout schools across America and also in the Netherlands, which have given only thinly distributed evidence of psi ability; but the effect is very widespread and so recognizably consistent that they reinforce the working hypothesis of psi as part of the natural inheritance of all mankind.

The ability appears to be 'normal' in other respects as well. No reliable connection has been found with pathology, either organic or mental. Only a few spontaneous cases suggest abnormality; for example, one of the hypotheses regarding the recurrent PK happenings called 'poltergeist phenomena' is that the violent physical effects disrnptive to the household may be due to the latent frustrations of one of its members; that is, they erupt in disturbances produced by his unconscious PK activity. But in such a case the psi function would, like any ability, be merely an incidental instrument.

This picture of psi ability as common to mankind led naturally to the question of whether psi is found in animals. Ample anecdotal material had been collected over the years to make a plausible case. As with human beings themselves, so much still remains mysterious about the behaviour of animals that it well may be that psi is a factor in some of the many remaining mysteries of the animal world. The research efforts to check up on this possibility have been few, as might be expected at this stage. The branching off of the 'Anpsi Project' occurred at the Duke parapsychology laboratory in the early 50s and involved studies of cats, dogs and pigeons. As a whole it left aome fairly solid indications of the existence of psi beyond the human species.

Recently the 'anpsi' problem has been taken up in a French university with rodents as the test animals; fortunately the experiment was initiated in a biological laboratory and was carried out with completely automatic equipment for the minimization of errors of observation. ESP evidence has been produced in this experiment that in general confirms the earlier findings on cats and dogs. This time however a new advantage was introduced: the completely automatic test equipment

Mental Radio

In his book *Mental Radio*, published in 1930, the American writer Upton Sinclair described a series of tests which he conducted with the assistance of his wife, Mary Craig Sinclair, who seemed to possess extra-sensory perception. Above are the results of three of these tests, in which Mary Craig, by concentrating on the thoughts of her husband, attempted to reproduce *(on the right)* little sketches drawn by him, without her having seen the originals *(on the left)*. Comments describing her 'mental visions' were often attached to indistinct drawings.

eliminated the possible role of the human observer, who might be suspected of adding his influence through psi itself.

These French workers are seeking a 'guinea pig', that is, an experimental animal that will offer advantages for psi research that lie beyond human limitations. As biologists, too, these workers have an eye on larger questions regarding the role of psi in evolution, its origin, its genetic character and other major problems. Indeed, an exciting field of comparative parapsychology may already be opening up, since this new work has already inspired several researchers on similar lines.

A Branch of Psychology

It is in psychology of course that one expects to find the greatest number of properties common to psi phenomena. While psychology is the university branch that is most affected by the findings of parapsychology, this is actually because (as the older psychologists such as William McDougall and William James well understood) parapsychology is only a branch of the properly conceived field of general psychology. Psi is of course as much a function of personal agency as the rest of the general field. It is likewise intelligently and purposively oriented; it involves an unconscious level of functioning; and psi tests closely parallel a number of psychological tests in which comparably marginal levels of conscious control are used. The card guessing tests long used in ESP research show some similarities to those in subliminal sensory psychology, and certain general principles apply to both.

The unconsciousness of the psi function is a very important property, and the recognition of it has given more help in the understanding of psi than any other single item. Something was known from general psychology as to what would be expected from an unconscious process and with this general information in mind some of the oddities of psi testing turned out to be 'normal': for example, the subject's sudden loss of his ability under emotional stress. This lack of conscious guidance also went far to explain why ESP could not be learned as most sensory skills could be. Understandable too was the fact that under certain conditions the subject might 'displace' in his ESP guessing and hit the target just before or just after the one he was consciously trying to identify.

Most revealing of all the clues given by the unconsciousness of psi was the explanation it gave of what has come to be called 'psi-missing'. The effect occurs when, under certain conditions, usually of stress or conflict, the subject goes into reverse and actually avoids the targets while going on using his ESP as well as ever. It was found that 'goats' (subjects who did not believe in ESP) would score on the negative side of the chance line while the 'sheep', the believers, would tend to score above. There were signs however that the goats were not just trying to miss and that the effect was unconscious. Similar situations have bolstered this interpretation: for instance, high school students who liked their teacher scored above the chance line while those who disliked the teacher scored below. Or if subjects are given a 'double header' experiment, in which two aspects are closely compared, they generally show a positive scoring trend on one of the conditions and a negative deviation on the other. This differential effect is so reliable it has become both an identifying criterion and a useful testing device.

These and many other side effects have come out of the realization that the essential judgement in psi is largely unconscious, although of course it would not be testable if it were not, at least to some extent, consciously directed. But while there are very few real distinctions between psi and the territory of psychology, the few differences that mark off the psi territory are very important at least for the present, and the more they disturb the general psychologist the more meaningful they may be to the ultimate understanding of man's nature.

For one thing, psi phenomena are the only mental operations that can be crucially tested for non-physicality. How much of the rest of mental life has a non-physical link in its operation no one knows, and apparently no one knows how to find out. But in parapsychology we do know how to find out something definite about the place of the mind in Nature, with regard first of all to physical nature.

Parapsychology has brought us a long way from the supernatural interpretation of such powers as ESP. In doing so it has followed the course that has been taken by all the basic sciences, giving to man a certain amount of control which his ancestors did not know was possible over the phenomena concerned. But it is well to remember that the major contribution of psi research thus far is in what it reminds him that he does not yet know. The findings have indicated still wider horizons and require a wide range of new explanations; for example, man now needs a concept of the universe that can explain his mental influence on matter at a distance and his precognition. Probably no greater scientific revolution has occurred in the past than that which parapsychology will bring about as it progresses into full recognition.

Naturally too there will be expanding interest in the practical application of psi as the ability comes under adequate control. While this will be exciting enough in its range of possibilities, the simple fact that man has psi at all overshadows all other foreseeable consequences. It must be obvious to anyone that if man can produce these amazing results (even irregularly as yet) under controlled test conditions in the laboratory, he must be close to the root principle his ancestors glorified as supernatural omniscience and omnipotence; as close, for example, as Benjamin Franklin's experiments with a kite in a thunderstorm were to demonstrating the power that lay behind the Jovian thunderbolt. It seems all the more important that the new world he has touched in this instance lies within his own nature.

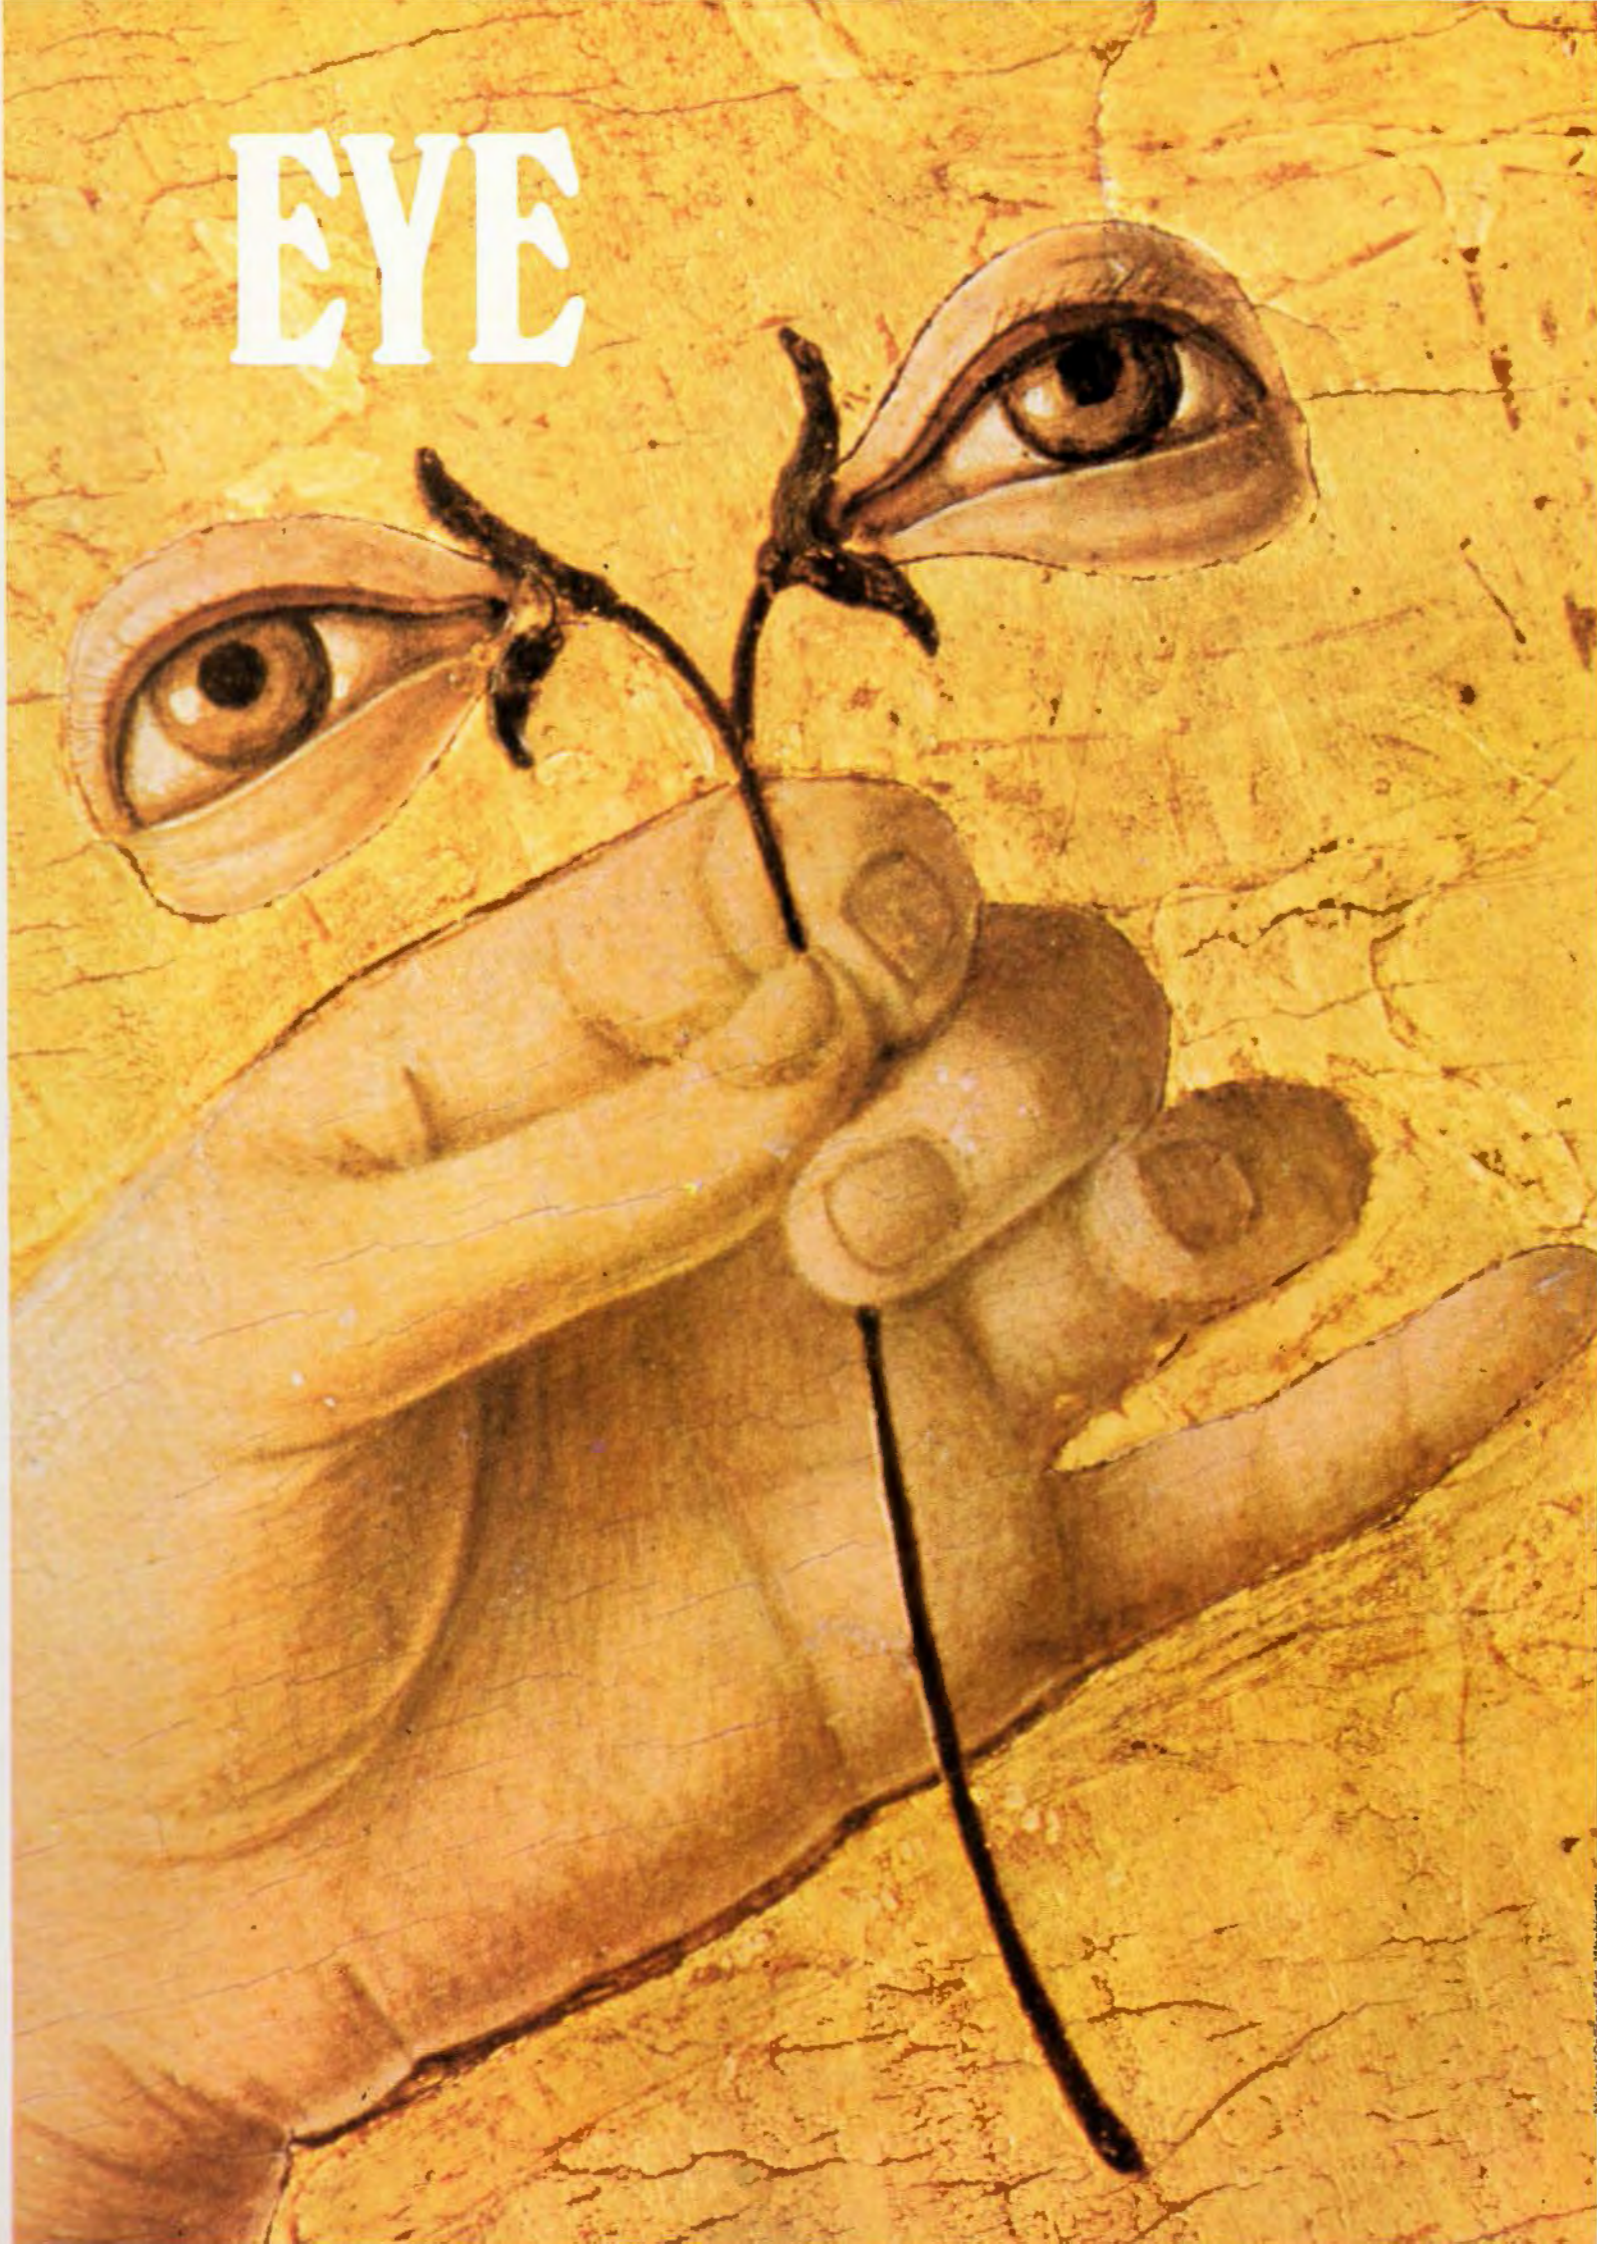
MAN, MYTH & MAGIC

VOLUME 4

Eye - Grea

EYE



The eye can stand for intelligence and spirituality in symbolism but it is also an emblem of terror, from the destroying eye of the sun to the dreaded Evil Eye of folklore

THE GLITTERING EYE of the ancient mariner in Coleridge's poem compelled the wedding guest to listen in spite of himself, and in literature a profusion of eyes that are bright, melting, twinkling, hard, commanding, suggest the effectiveness of the human eye in conveying emotions and influencing others. The importance of the eye in magic and symbolism stems from the fact that your eyes not only enable you to see but allow you to affect what you see, to organize the world outside you into shapes and patterns, to bend or persuade other people to your will (see BODY).

The eye is frequently connected with the sun (and sometimes with the moon) as the all-seeing eye that watches the world. The sun is the universe's source of light and the human eyes with which we see are like suns, lighting up the world about us. Light is itself a symbol of intelligence and spirituality, and if the sun is an eye, the eye is correspondingly a sun and stands for mental and spiritual 'vision'.

Deities and semi-divine beings are sometimes shown with several eyes as a mark of their all-seeing, and therefore all-knowing vision and power. The Babylonian god Marduk had four eyes. The Egyptian Bes had eyes all over her body and Isis was called 'many-eyed'.

In the Bible the ruins of the four wheels of Ezekiel's vision (chapter 1) 'were full of eyes round about'. In the vision of Zechariah (chapter 4) the seven lamps of the lampstand were 'the eyes of the Lord which range through the whole earth'. In Revelation (chapter 4) the four cherubim are 'full of eyes all round and within' and the Lamb of God (chapter 5) has seven horns and seven eyes, the horns for strength and the eyes for omniscience.

A great multiplicity of eyes sometimes stands for the stars which watch in the night sky, as in the case of the Indian god Varuna who had a thousand eyes. A French Tarot card shows the Devil with eyes all over his body, presumably a reference to the fallen angels, the Watchers, who were the stars which the Devil dragged down from the sky in the book of Revelation (see DEVIL; LUCIFER). Modern Cabalists, including Aleister Crowley, have also connected the Devil with the eye, by linking the Devil of the Tarot pack with the Hebrew letter *ayin* (our O) which is traditionally supposed to represent an eye.

The Third Eye

An eye shown in some abnormal position on the body may stand for supernormal sight, clairvoyant vision and power. In Hindu theory each man has a third eye, concealed from normal view, which is a channel of great hidden power. It is in the middle of the forehead, just above the point where the eyebrows meet, at the place where caste marks are made and where married women wear a red, yellow or white spot. The third eye of the God Shiva, the creator and destroyer, could wither the entire universe in its flame.

On the other hand, a creature with less than the proper complement of eyes, like the one-eyed Cyclops of Greek mythology, is likely to be an embodiment of subnormal vision and wisdom, brutish stupidity. We still use the expression 'one-eyed' for something substandard, as in a 'one-eyed town'.

Lady of Slaughter

The eye has a particularly important place in ancient Egyptian symbolism, usually in some connection with the sun which played a dominating role in the everyday life of Egypt and in Egyptian religion (see EGYPT). Many Egyptians wore an amulet called the Uzat-eye, made of gold, silver, precious stones or wood, and giving its wearer health, strength and well-being, the vigour of the life-giving sun.

In mythology, the evil god Seth tore out the eye of the god Horus. When Horus went to look for his dead father, Osiris, to restore him to life he took the eye with him and presented it to Osiris. As soon as Osiris was given the eye, he 'became a soul' or received new life in the afterworld, and so the eye of Horus became a symbol of the funeral rites which a son should provide for his dead father. Twin eyes frequently keep watch from the sides of Egyptian coffins, protecting the dead from harm.

The eye could also be a symbol of the sun's destructive power, of blasting and withering heat. One of the Pyramid Texts refers to a time when 'that fear did not exist that came into being through the eye of Horus'. In a coffin text the eye says of itself: 'I am the all-seeing Eye of Horus, whose appearance strikes terror, Lady of Slaughter, Mighty One of Frightfulness.'

Before 2000 BC the myth had developed that human beings had plotted against the sun god, who sent his Eye to punish them. It came upon them in the form of the goddess Hathor who slaughtered men in droves and would have exterminated mankind altogether if the sun god had not distracted her attention by making her drunk on beer.

According to one version of the creation myth of Heliopolis (see CREATION MYTHS), when the god Atum had created two other deities, Shu and Tefnut, the three of them lay embraced, locked together in the primeval waters. But this divine unity disintegrated, for Shu and Tefnut became separated from Atum, drifted away and were lost in the abyss. Atum sent his Eye

to find them and they returned with the Eye. Atum wept over them and man came into being from the tears of his Eye: this is partly a pun on the Egyptian words for 'men' and 'tears' but possibly also a lingering trace of the old connection between eyes and the great goddess, the mother of all living things (see below).

The Eye was furious with rage when it returned because Atum had put another eye in its place. To pacify it Atum placed the Eye on the front of his face, where it would rule the entire world. In other words, it became the uraeus, the rearing swollen-necked cobra placed at the front of the royal crown of Egypt. The Eye was the ruling sun in the sky and Pharaoh, the human sun, on earth. 'The Eye is personified might', says R. T. Rundle Clark, 'the essential violence that is used to protect the gods and kings against disintegration in the waters or spirit enemies in the created world.'

RICHARD CAVENDISH

The Eye Goddess

When an ancient Mesopotamian site at Tell Brak, in the Khabur valley, was excavated in 1937–8 by Professor M. E. L. Mallowan, the remains of a temple were found which has become known as the Eye Temple of Brak. The reason for this designation was the discovery of thousands of 'eye idols' in the temple, made of black and white alabaster. Their general form is that of a thin biscuit-like body surmounted by a pair of eyes. But there are variations: some specimens have two pairs of eyes placed side by side or one above the other; another type comprises two smaller eye idols superimposed on a larger one; others have crown or caps upon the head-knob. Somewhat similar objects have been found at certain other Mesopotamian sites, Ur, Mari and Lagash. These examples are of a similar design, having the same biscuit-like body surmounted by a pair of open loops which has caused them to be called 'spectacle idols'.

There has been much discussion about the meaning and purpose of these strange objects. That they had some cultic significance is obvious. Various explanations have been suggested: that they are votive offerings, representing themselves, made by devotees to the deity worshipped in the temple; that they are images of an all-seeing god who watched over the inhabitants of the city; that they depict a goddess. The last suggestion seems to be the best supported, and the goddess concerned has been identified with Ninhursag, the Sumerian goddess of childbirth, since one eye idol has been found engraved with the form of a stag, with a bird on its back, which was a symbol of this goddess.

If the identification is sound, this association of the Sumerian mother goddess with the symbol of a pair of eyes represents the earliest phase of a long traditon of such eye symbolism. The Brak Eye Temple dates from c 3000 BC. From the middle of the third millennium BC onwards the symbol, usually consisting of two eyes divided by a beak-like nose, can be traced westwards, mostly connected with megalithic culture, through Anatolia, Cyprus, Crete, Greece, Sicily, Malta, Italy, Spain, Brittany, Ireland and Britain. A striking British example is provided by two chalk-drums, found in an Early Bronze Age grave at Folkton, Yorkshire, dating c 1900–1700 BC.

Why the mother goddess should have been represented by a pair of eyes is unknown. The symbol appears on a great variety of objects, on crudely anthropoid images, pots, standing stones and rocks. The attribution of many eyes to deities, doubtless to symbolize their all-seeing power, has been a widespread custom.

S. G. F. BRANDON

The Evil Eye

The expression 'if looks could kill . . .' contains an echo of a very primitive and ancient fear of being watched, perhaps unaware, by an enemy. In ancient times man had not only to fear the gaze of his mortal enemies but also the watchfulness of the gods who might be envious. To primitive man, Nature is a capricious, vengeful and above all jealous god, perpetually seeking to regain from the hunter or farmer the riches so hardly won from the earth. Even the deserts were once assumed to be populated by hostile demons whose looks could, quite literally, kill; according to Pliny, Libya was once the domain of the basilisk whose eyes possessed such devastating power that it would itself die if it saw its reflection in a mirror.

From the idea that the eyes of envious gods, of demons and monsters had the power to harm develnped the terrifying belief that the human eye could emit a ray which under certain circumstances could be highly dangerous to the person on whom it was focused – particularly if the onlooker was malicious or jealous. An attack of this kind was usually anticipated at the birth of a child, or on those rare occasions when man seemed temporarily to have overcome the hostile forces surrounding him.

The Evil Eye took two distinct forms, the one voluntary, which was inspired by malice, and the other involuntary, over which the unfortunate possessor had no control: animals were often suspected of possessing an involuntary Evil Eye, and the sorcerers of Central American Indian tribes were kept especially busy counteracting the effects of the involuntary sort. Presence of the power in an individual was usually shown by some abnormality—crossed or diverging eyes, one eye set above the other, or eyes of contrasting colours. The English scholar Walter Map (c 1140–c 1209) wrote of Scythian women who had two pupils in one eye and the figure of a horse in the other, a truly frightening combination. While some in the West might adhere to the old proverb 'In the country of the blind the one-eyed man is king', in India any individual so afflicted was shunned like a pariah. Those unfortunates whose eyebrows happened to meet above the nose were regarded everywhere with utter dismay. (This feature has other associations: it is seen as the mark of a murderer in America, but of a werewolf in most of Europe.) Others whose physical deformities were believed to indicate the ownership of an Evil Eye were hunchbacks and dwarfs. The glance of a woman when pregnant or in her menses was equally dangerous.

To a victim of the Evil Eye it must have been of little consequence whether the cause of the affliction was due to malice or otherwise, since the consequences were identical – ruin, sickness or death.

It excited the most terror when its effects were thought likely to cause the greatest disaster. The most vulnerable in the community were the most precious, young children and farm stock – especially the one cow or pig that would be the mainstay of many poor backwoods American farms.

British Museum

In modern Italy the term for the Evil Eye is the '*malocchio*', in France the '*mauvais oeil*' and in Germany '*bose Blick*'. The old word 'fascination' has long been superseded among English-speaking peoples by the term 'overlooked' and even this is rapidly becoming extinct. The Jews, inspired no doubt by the biblical proverb 'Eat thou not the bread of him that hath an evil eye' (Proverbs 26.3 in the Authorized Version), to this day remain wary of the *ayn-hara*.

The immediate effect of a blast from the Evil Eye upon a victim involved not only misfortunes of every kind but the infliction of the worst diseases, often leading to death. The sexual organs were particularly liable to psychic assaults of this character and almost as a matter of course impotence and frigidity were ascribed to the jealous eyes of some rival. Minor disorders such as headache and hiccups were common signs of having been overlooked. There once existed a curious belief that if the Evil Eye of the moon were cast upon a pregnant woman she would give birth to a monster.

Led Into Court Backwards

The situation of the involuntary possessor of the Evil Eye could become extremely precarious during phases of witch mania. This became apparent during the trial of the Malmesbury, Wiltshire witches in the 17th century, when the various forms of witchcraft came under discussion; even then, however, it seems to have been generally agreed that an individual so afflicted was more to be pitied than condemned. Two examples quoted were those of a man named Lee, of Christian Malford, near Chippenham, who had been responsible for destroying his own cattle 'by his natural evil look' and farmer Snigg of the adjoining parish whose children were appallingly thin and apparently wasting away - from the effects of their father's loving gaze. In a source quoted by Christina Hole in her *Encyclopaedia of Superstitions* reference is made to a Yorkshireman whose eyes were of such potency that he found it necessary to direct 'the first glance of the morning', generally agreed to be the most lethal, upon a pear tree which, as a result, gradually withered and died.

Any individual held responsible for inflicting the Evil Eye out of malice might find himself indicted for witchcraft during the 16th and 17th century witch-hunting manias, for it was then the fashionable doctrine that witches derived the power to cast spells with their eyes as the result of a compact with Satan. The *Malleus Maleficarum* handbook of the Continental Inquisition laid it down that 'there are witches who can bewitch their judges by a mere look or glance from their eyes . . .' and it was for this reason that those charged with this crime were generally led into court backwards.

Above **The thousands of 'eye idols' discovered at the ancient Mesopotamian site at Tell Brak are thought to represent an all-seeing mother goddess** ***Right*** **The ancient Egyptians held the eye in particular esteem and often equated it with the sun, believing it to have both the life-giving properties of the sun's rays and the withering power of its heat: detail from an Egyptian obelisk in Istanbul showing the sacred eye**

The close identification of the Evil Eye with witchcraft persisted in folk belief well into the 19th century. In America, New Hampshire legend tells of an old woman who took revenge on a household that would not make a breakfast for her. One glance from her eye and the doors of the house would not open, nor could anyone hear the householders' calls for an entire day. Other New England tales refer to witches killing pigs, breaking the yokes on oxen, preventing the secure tying of a horse, afflicting butter churns and so on – all with little more than a glare.

Occasionally the power of the Evil Eye was thought to need reinforcing: in parts of Britain, it was said that nine toads strung together and buried alive would aid the power. Nanny Morgan, a Shropshire witch who was murdered in 1857 was believed to keep a box of toads under her bed, to strengthen her eye.

Scotland was equally worried about the Evil Eye. If a stranger was seen examining a farmer's cattle, he would be offered some of the milk as an assurance against disaster. During childbirth a mother's house would be sprinkled with urine to defend against overlooking. If the Evil Eye was suspected, it could be offset by burning cloth cut from the witch's coat.

A community would usually defend itself from the Evil Eye by private rites and

C. M. Dixon

psychic defences, without recourse to the magical specialist. Among the most common was disguise of those considered to be specially vulnerable, which ranged from plastering a newborn child with mud or soot in order to render it unworthy of the jealousy of the supernatural powers, to dressing the boys of the household – these being the most valuable – in the clothing of their sisters to deceive the spirits. Another example of disguise was the bridal veil which is still regarded as affording protection against the envious, and therefore hostile, eyes by many communities.

Plants were also used for psychic protection, including sage and rosemary, in Spain and Portugal, garlic in Greece, and the shamrock in Ireland. The human body provided its own defence in the form of spittle, a universal panacea; to spit three times was considered a particularly powerful safegnard, as was the act of making the sign of the cross upon a child's forehead with the tongue. Artificial aids were also employed such as the wearing of little bells by children and cattle and the carrying of salt, symbol of eternal life, in the pocket.

Phallic Teething Rings

The first glance of the Evil Eye, especially if delivered from an oblique angle, was always the most dangerous. A precaution against this attack was to wear an amulet with a grotesque design of a toad or hunchback to distract the glance from the human being and to absorb its venom. Based on a different principle was the choice of the pig as a motif since this animal was known to be extremely vulnerable to the Evil Eye. The ancient Greeks wore the amulet of the Medusa, and the caduceus, the traditional wand or staff of the god Mercury, which protected him from the Evil Eye of the gods, was naturally a great favourite. The male genitals, symbols of the life-force, were pitted against the enemies of life—corruption and death – in the form of gold, silver or bronze phalli worn by the Romans, while babies were given coral phalli to use as teething rings. Beads bearing the design of the human eye were also worn. The fleur-de-lys, another symbolic barrier against the Evil Eye, became also the emblem of the white witches in parts of France. A curious example of a latter-day amulet was the necklace of white nuts, known as mullaska beans, which was hung around the necks of young children in the Isle of Harris. It was assumed that the beads would turn black if the child were ever in danger of being overlooked.

Far older and best known are the manual gestures still used as an act of psychic defiance, the most popolar being the *mano fica* in which the thumb is inserted between the first and second fingers with the fist clenched, and the *mano cornuta*, known as 'making the devil's horns', in which the two middle fingers are held down by the thumb and the first and little fingers are raised.

Psychic protection could also be secured by employing certain colours, words or designs. The Turks inscribed passages from the Koran upon the outer walls of their houses and suspended magical globes from their ceilings and from the caparisons of their horses. Coloured glass spheres known as witch balls performed a similar function in rural England. Blue beads seem to have been employed all over southern Europe for the protection of humans and domestic animals. An eye symbol was often tattooed on the back of a child or painted upon the prow of the fisherman's boat. American lore recommends a heart-shaped locket or brooch as a protection – or, oddly, a red spot painted on the forehead.

In England, in former times, the cautious householder placed a red ribbon over his front door, and ribbons of this colour were attached by the Scots to the tails of cattle. A reminder of the symbolic importance attached to the colour red is contained in the well-known lines:

> Rowan tree and red thread
> Will put the witches to their speed.

To achieve the maximum defence it was advisable to tie the thread in magical knots accompanied by an incantation. The power inherent in sacred or magical words, whether pronounced by the private individual or the specialist magician, provided another useful antidote to the malicious or injurious glance, as did special prayers and countercharms which were inscribed upon paper and worn in small containers upon the body. Known as phylacteries, these were very likely the ancestors of the modern locket.

Dangerous Praise

When complimenting a fortunate person, it was always necessary to be extremely careful with one's choice of words, since all forms of congratulation were likely to provoke hostile intervention from the jealous deities of fate. To express admiration of a herd of cattle would be tantamount to inviting its destruction. Even to remark favourably on a child's beauty could be disastrous; hence it was customary to speak disparagingly of it to the parents, who would be prepared if necessary to counter the malice of the gods by spitting judiciously. This curious process has been described by W. G. Sumner in *Folkways* (1959) as 'the Doctrine of Offsets – an artificial effect which will avert fascination', in the hope of offsetting the jealousies of both gods and men. At modern horse shows it is not unknown for owners to say 'break a leg' if they consider their entry likely to gain a prize. Vituperation

A self-styled Italian wizard attempted to bring occult influences to bear in support of his favourite football team, by putting the Evil Eye upon their opponents

and ribaldry, which in other circumstances would never have been tolerated for a moment, were used in the past against national leaders in their hour of glory to deflect the Evil Eye of the jealous onlooker or tribal god. Hence it was customary for soldiers in the triumphal procession of some Roman general to recite derisive verses drawing attention to his personal shortcomings and physical defects, to the delight of the otherwise envious crowd.

A direct appeal for intervention of the gods as a form of protection against the Evil Eye was integral in certain religious rites; whereas the Greek and Roman would address himself to Nemesis, the Christian made his appeal to St Nicholas of Myra, patron saint of children, whose picture was painted upon the walls of churches, affording protection to all who looked upon it.

One of the most ancient remedies for those who had been overlooked known to man is a form of transference, by which the affliction is passed on to another, by some means. Among the southern Slavs, the victim of the Evil Eye would ceremonially wash himself in water in which a copper coin had been placed, and, after muttering an incantation, charitably present the money to a blind beggar – hoping thereby to transfer the affliction with the coin.

To meet a cross-eyed person is still regarded as unlucky in some places, particularly by fishermen and miners and others in dangerous trades. In the theatrical profession, which is notorious for its superstitions because of a different kind of insecurity, many actors maintain a tenacious objection to the presence of peacocks' feathers on the stage, the eyes in the tail being reminiscent of Juno's jealous eye. The peacock was sacred to Juno who, after the death of hundred-eyed Argus, had his eyes put on the bird's tail so that they could keep a perpetual watch over

Left **Many people have a superstitious horror of peacock feathers because the eyes in the tail remind them of the dreaded Evil Eye** ***Above*** **According to a Greek legend, after the death of the hundred-eyed Argus, the goddess Hera placed his eyes in the tail of the peacock to spy on her husband Jupiter**

Michael Holford

Egyptian eye, probably from the inside of a mummy case: eyes were often depicted on the sides of Egyptian coffins to protect the dead from harm

her husband Jupiter's amours. (In New York in 1965 the peacocks were removed from the lawns of the United Nations building, because they made some delegates uneasy.)

There is one positive use of crossed eyes, from American folklore. The most effectual rabbit's foot is said to come from a rabbit killed in a graveyard at midnight under a full moon by a cross-eyed (and sometimes red-headed) man.

Among famous men considered to possess the Evil Eye in the past were the Emperor Napoleon III of France, King Alphonso XIII of Spain and the poet Lord Byron. Popes Pius IX and Leo XIII were believed to be similarly afflicted, much to the alarm of their congregation. The Italian dictator, Benito Mussolini, is on record as having refused to travel in the same plane as two deputies who were reported to have the Evil Eye. Modern examples crop up frequently in the newspapers. In 1957 it was disclosed in the United States that an unscrupulous company had employed a well-known *iettatore*, the Italian phrase for the possessor of the Evil Eye, 'to keep dissatisfied workers on the job'. More recently, in 1966, a self-styled Italian wizard attempted to bring occult influences to bear in support of his favourite football team, by putting the Evil Eye upon their opponents, the famous team 'Internazionale'.

The progress of medicine has led to the discarding of many of the absurd beliefs of the past, and the reduction or elimination of many of the optical disorders once regarded as infallible signs of the Evil Eye. Nevertheless, the old fears are not yet extinct, even in communities apparently dominated by scientific principles. Many school children believe in the Evil Eye and in Ireland the 'Eye of Balor' is still feared, inspired by the ancient legend of the giant Balor, King of the Fomorians, who possessed a single lethal eye.

Modern Views of the Evil Eye

The modern approach to the problems of belief in the Evil Eye is discussed in an interesting article 'Delusions of Witchcraft' by M. Risso and W. Böker, published in *The British Journal of Psychology* (114, 963–972) 1968. It appears that in Luciana in Spain, where the fear of fascination is extremely strong, 'the nursing mother can often be the victim of the Evil Eye which may charm the milk away from the breast. The cessation of lactation in an impoverished country where practically no substitute for mothers' milk can be made is a threatening event.'

The Evil Eye, it would appear from the study of the past and present evidence, is a phobia most prevalent in societies living at subsistence level, and among individuals afflicted with strong emotional disturbances. Its presence symbolizes the eternal anxieties produced by the never-ending contest between primitive man and his gods for the right to happiness. As Sumner said in *Folkways*: 'The evil eye is an affliction that befalls the prosperous and fortunate in their prosperity . . . It is the irritated demons who inflict disaster at the heart of good luck.'

Certain psychologists have interpreted the Evil Eye as representing 'aggressive impulses turned inwardly, because of a guilty need for self-punishment arising from prohibited sexual urges', or as E. S. Gifford has said in *The Evil Eye*, it is the result of neurotic guilt feelings since individuals in prosperity tend to project their expectation of failure into the eyes of those whom they consider most likely to be envious. In this sense we are all victims of the Evil Eye, since it represents the envious demon called fate who stands poised at the very moment of human triumph ready to hurl presumptuous man from the pinnacle of success into the abyss of despair.

Eyeless in the Next World

The eye *(akshi)* is regarded as a receptive, neutral organ, except when intent is added to seeing. It is said to be the last organ to come into activity, since the child within the womb employs all its organs except the eyes, which it opens only after birth. On this analogy sculptors used to give the final touch to an image after the rest of the work was completed, in a ritual operation called *nayononmīlana* (*nayana-unmīlana*, 'eye-unclosing'), the chiselling of the eye image. It was preceded by a period of meditation and prayer, and followed by the rite of 'enlivening' the idol.

Similarly it is believed that on death the deceased are quite blind, and grope about eyeless in the next world. The eye is essentially the organ of the earthly body and can only be transferred to the dead by special ceremonies, one of which is the *diakshu-dana*, 'eye-bestowal', performed by a certain class of professional painters.

The deliberate beholding *(darśana)* of an auspicious person or thing brings blessing, since the sight of the beneficent object infuses the beholder with its own virtue. Hence the visit of devotees to their spiritual leaders, of subjects to their rulers, of pilgrims to shrines, to obtain a darśan or viewing.

EZEKIEL

LAST OF THE THREE major prophets, Ezekiel was a younger contemporary of Jeremiah. He was a priest by birth and his preaching combines prophetic and priestly elements. Scholarly opinion is divided regarding the biography of the prophet and the authorship of the book ascribed to him. Some hold that he was of Palestinian origin, receiving his call to be a prophet in 592 BC and beginning his ministry in Jerusalem. According to this view he left the city shortly before its destruction by Nebuchadnezzar. Perhaps he was deported to Babylon together with King Jehoiachin in 597 BC, and later continued his ministry among the Babylonian exiles. Others again hold that his whole ministry was exercised in Babylonia and that the whole of the book was written there. It is not quite certain, however, that the whole book is by one hand, and some scholars argue for dual authorship and later editorial revision of the book.

The book clearly divides into two main parts: chapters 1–24, predicting the imminent fall and destruction of Jerusalem, and chapters 25–48 prophesying ultimate reconciliation with God, the return of the exiles, and the restoration of Israel, Jerusalem and the Temple. This second half of the book subdivides into three sections: chapters 25–32, containing prophecies against several foreign nations (Aram, Moab, Edom and others); chapters 33–39, prophesying the redemption and restoration of the Jewish people; and chapters 40–48 describing in great detail Ezekiel's vision of the reconstructed Temple and the ideal rule of God to be established in the future. It is in the attention to cultic details and in his emphasis on holiness and on the majestic splendour of the future Temple that the 'priestly' element in Ezekiel's prophecy is particularly noticeable.

There is a very strong visionary element in Ezekiel's prophecy, and his prophetic activity was often accompanied by symbolic behaviour of an almost compulsive character. He exhibits to an even greater extent than the other biblical prophets the overpowering effect of the divine call on both the prophet's mind and his body. Some psychiatrists have thought to detect schizoid tendencies in Ezekiel: his teaching shows an extraordinary combination of universalism on the one hand and consciousness of the unique election of Israel on the other, as well as the tension between the corporate and individual responsibility. Whilst he is mainly concerned with the collective defection of Israel and profoundly aware of the corporate character of the religious community, he also emphasizes individual responsibility (18. 2–31). He insists that 'the son shall not suffer for the iniquity of the father, nor the father suffer for the iniquity of the son' – evidently in dispute of current misconceptions on the subject of collective guilt, which were probably part of a more general mood of despondency and despair that had seized the Jewish exiles in Babylonia. Whilst unremitting in his harsh denunciations of all forms of idolatry and iniquity, Ezekiel's message was one of hope, expressed most powerfully in his vision of the dry bones being clothed with flesh and skin and coming to life again (chapter 37) – a symbol of Israel's future regeneration.

The overwhelming splendour of the divine majesty and its throne of glory is described in the opening vision of the book (chapter 1). This vision formed the basis of later Jewish mysticism, the *Merkabah*, which taught the ecstatic ascent to heaven and the vision of the throne of glory (see CABALA), and also influenced subsequent angelology and apocalyptic writing.

The anthropomorphic elements in Ezekiel's vision of the throne of glory, as well as certain contradictions between his description of the future ritual in the Temple and the Law of Moses – that is between Ezekiel's priestly law and that contained in Leviticus – gave the book a questionable character. The ancient rabbis forbade the reading and study of chapter 1 in public, and some rabbis in the 2nd century even opposed the canonization of the book. Its authority was already too firmly established, however, and it remained part of Old Testament scripture.

Fable

A short story with a moral purpose in which animals talk and act like human beings: a development of the animal tale, it is one of the earliest forms of folktale and is thought to have originated among the Semites and spread west to Greece and east to India: the most famous examples, dating from 600 BC, are those by the Ionian slave Aesop.

FACELESS GODDESSES

FIGURINES OF WOMEN, characterized by emphasis upon the sexual or maternal features of the body and the complete absence of any facial features have been discovered on many Paleolithic sites extending over a wide area from France and Italy to South Russia and Siberia. They are known technically as 'Venus-figures'. Sometimes the head is merely a knob; on the so-called 'Venus of Willendorf', in Austria, the whole head appears to be covered with horizontal layers of thick curls. Most notable among these Venus-figures is the 'Venus of Laussel', in the Dordogne, France, which is sculptured in relief on a slab. This figure has reasonably been interpreted as a Paleolithic prototype of the mother goddess, so widely worshipped later in the Ancient World.

Among the many problems connected with these Venus-figures is the absence of facial features. That this characteristic was deliberately intended by their makers, and not due to artistic ability, is certain from the fact that the bodily features are skilfully represented. The reason for this strange differentiation in treatment of face and body can only be guessed at; the most likely explanations would seem to be that either there was some reluctance, probably inspired by magical considerations, to depict the face, or attention was concentrated exclusively upon the sexual or maternal significance of the female as the source of new life.

Many millennia after the making of these faceless Paleolithic figurines, statues were made of a faceless goddess in the Greek city of Cyrene, in Libya. One of the most striking examples was unearthed by the Manchester University Cyrenaican Expedition during its excavations there in 1955–57. The statue has the form of the upper portion of a female body, in classical costume, holding in the left hand an alabastron or small vase. But, instead of a woman's neck and face, a cylindrical column rises from the shoulders, on top of which, at the appropriate level, the waved hair of a woman is sculptured; this, in turn, is surmounted by a *kalathos* or *modius*, a symbol of fertility worn by the Graeco-Egyptian underworld god Serapis, and also by Hecate and Cybele, goddesses who had similar connections. The

C. M. Dixon: National Museum of Valletta

Venus-figure from Malta, thought to represent a fertility or mother goddess because of the emphasis on sexual features

statue originally stood on a sarcophagus, from which the figure must have appeared as though it were emerging.

No inscriptions reveal the identity of the figure or its curious mounting upon tombs. There is, however, good reason for believing that it represents Persephone, the goddess of the underworld. This is strengthened by the existence of temples of Persephone and Hades or Pluto at Cyrene. If the identification be sound, then the half-length statues and their mounting could be well explained in terms of the myth of Persephone.

According to this myth, Persephone, the daughter of the corn goddess Demeter, was carried off by Pluto to Hades, his subterranean realm. The sorrowing mother sought for her lost daughter, neglecting her duties as the corn goddess. Zeus finally had to intervene; he arranged that Persephone should spend part of the year above the ground with Demeter and the remainder with Pluto in Hades (see DEMETER).

This annual ascent *(anodos)* of Persephone from the realm of the dead symbolized the resurrection of vegetation in spring – Persephone was the corn maiden – and gave hope for life after death. The Cyrene statues thus probably represent the anodos of Persephone as signifying the assurance of resurrection to a new life for the dead, from whose tombs the goddess appears to emerge.

This explanation, however, still leaves unaccounted for the faceless image of the goddess. A clue to the answer here is probably given by the cylindrical column that replaces the face and neck of the statue. It looks almost as though the body and hair have been attached to a stone column or pillar. Now, since there is evidence of a native Libyan cult of stone pillars connected with a fertility goddess, it would seem likely that with the establishment of Greek culture in Cyrene this native Libyan goddess, with her underworld attributes, was identified with the Greek Persephone, who had similar connections with fertility, the underworld and the dead.

The idea of an 'unknown god' finds its classic expression in the speech which the Apostle Paul is recorded to have made on the Areopagus hill at Athens (Acts, 17. 22–31). Paul, having been invited by certain Epicurean and Stoic philosophers to explain his new religion, opened his discourse by remarking: 'Men of Athens, I perceive that in every way you are very religious. For as I passed along, and observed the objects of your worship, I found also an altar with this inscription, "To an Unknown God". What therefore you worship as unknown, this I proclaim to you.' Paul then proceeded to introduce Christianity to his Athenian audience.

Paul's reference to this altar and its inscription has long aroused curiosity and much learned discussion. There is no other evidence that there existed at Athens such a dedication to 'an unknown god' *(agnosto theo)*: but there are references by ancient Greek writers to altars to 'unknown gods'. Thus Pausanias (2nd century AD) records that on the road between Athens and Phalerum there were 'altars of gods named as unknown', and that near the great altar of Zeus at Olympia there was 'an altar to unknown gods'.

This evidence, although it does not actually confirm Paul's statement about the altar to an 'unknown god' does show that altars were dedicated to collective groups of 'unknown gods'. Who these deities were is a matter for speculation; but it seems likely that in Greece the reference was to foreign gods whom it was thought wise to propitiate – or such dedications could represent a kind of comprehensive religious insurance policy, based on the principle that it was dangerous to neglect any deity.

John Webb

FAIRIES

They are tricksy and unpredictable at best and at the worst, baleful and terrifying. Fairies of many shapes and sizes are believed to have existed alongside man since ancient times; sometimes to his benefit but often to his cost

BELIEF IN FAIRIES has been explored by many people, and frequently explained, but remains one of the most mysterious and bewildering subjects that the folklorist can investigate. One reason for the mystery is the widely held belief among believers that it is unlucky to speak of fairies. Besides this, the fairies themselves are so various and the theories about their origin so diverse that it is often difficult to paint a consistent picture of them.

The word itself is perhaps a very unfortunate one. The original word was 'fay', now so archaic as to seem hopelessly affected. It is believed to derive from the Latin 'fata', the individual fates of men, who were personified as supernatural women visiting the cradles of newly-born children. The word was used both as a noun and as an adjective, for 'fay' meant enchanted or bewitched, and 'fay-erie' (faerie) was used for both a state of enchantment and for an enchanted realm. The state became confused with the person, and 'fays' became 'fairies'. Even so, the believers in fairies did not think it wise to use the name, and the more complimentary the term could be made the better the fairies would be pleased. The principle was the same as that by which the Greeks called the Furies 'the Kindly Ones.'

The fairies of English tradition were thought to have their own realm with king and queen and royal courts: 'The Fairy Queen Takes an Airy Drive', from a series of water colours by Richard Doyle

Anyone who wants to study the characteristics of fairies all over the world cannot begin better than by reading a little book, which, though a century old is still extremely valuable, *The Fairy Mythology* by Thomas Keightley. The subject is a wide one; this article is confined to the fairies of the British Isles, including not only those of the Arthurian legends and medieval romances, and many other types of fairies, but also pixies, hobs, goblins, gnomes, mermaids, hags, bogeys and elementals.

Most fairies have powers of a kind, and can at least bring good or ill luck, strike mortals with paralysis, slay cattle and feed on the goodness of grain and milk

Fairies vary in powers, size, character, appearance, habits and the origins ascribed to them. When it comes to the question of origins, there are two different lines to follow. In the first place there are the opinions of those who have actually believed in fairies, either in the past or the present – and these are by no means unanimous – and in the second there are those of the students of folklore, who have advanced a number of different theories.

Aristocrats and Commoners

Fairies are said to range from the great and potent ones of more than mortal size to the very small creatures who are occasionally captured, and either make their escape or pine and die in captivity. Most fairies have powers of a kind, and can at least bring good or ill luck, strike mortals with paralysis, slay cattle and feed on the goodness of grain and milk. Some of them can do good or ill, some are wholly wicked; even the best of them need to be treated with respect. Many a helpful brownie has turned into a malicious boggart because some fool has played a practical joke on him.

There are first the heroic or romance fairies of the Arthurian legends and medieval romances. The great example of these is the Dana o'Shee of Ireland. They are the aristocracy of fairyland, who ride and fight and hunt, and live in a beautiful land exempt from death or change, the Land of the Ever Young. These heroic fairies are associated with many tales of the Fairy Ride (or Rade) in which a procession of these lordly creatures would be seen riding in a gallant troop, headed by their king and queen. In the English tradition these fairies are generally held to be a smaller race, sometimes tiny. They have their own realm with its royal courts, they enjoy music and dancing, and wear jewelled, glittering clothes; in some parts of England they are so tiny that the whole royal dais can be caught under a man's hat.

The common people of fairyland live either in small family groups or as solitaries and some of them live in villages under the fairy knolls. There are many little fairies who ask for help in mending tiny shovels or three-legged stools, and who pay their helpers with small gifts of food, and with good luck. An example of the solitary fairy is the leprechaun, the fairy shoemaker, whose hoards of gold are much coveted by mortals. These fairies are generally small, though varying from the size of a three-year-old child to a height of a few inches.

Forgotten Gods and Guardians

In a different category are the nature fairies and forgotten gods, spirits of streams, springs and lakes, and mermaids; spirits of individual trees or of woods, guardians of animals and plants and growing crops. These are rarer in Britain than in some other countries, but examples can be found even in English tradition, though they are more common in the Celtic parts of Britain.

Akin to these, though not identical with them, are the tutelary fairies, often guardians of one particular family, like that who gave the fairy flag to the MacLeods of Skye, or the one who watches over the Grants. Others are homely domestic spirits, brownies, lobs, cellar ghosts, down to Awd Goggie who guards the gooseberry bushes. The most tragic of these tutelary fairies are the Irish or Highland banshees, each attached to a family or clan. Banshee means 'fairy woman', but the general type has come to be applied to a special type of spirit possibly an ancestral ghost, who is to be heard weeping before the death of any member of her special family. Lady Wilde, in her *Ancient Legends of Ireland* (1887), gives a vivid and poetic description of the banshee. In the Highlands of Scotland she is often called 'The Washer by the Ford' because she is generally seen washing the bloodstained garments of those about to die.

Brownies and other hobs are attached either to families or to places, but if they are offended they will move to another farm. Sometimes they follow the families to which they are attached. They have even been known to emigrate to Canada.

The fifth group consists of the bogey beasts and goblins. These are often closely linked to the homelier of the tutelary fairies. A boggart can be a brownie gone to the bad. John Rhys in *Celtic Folklore* has a rather touching story of a brownie who was driven from one farm to another, always leaving when practical jokes were played on him, until he came to a farm where there was a manservant called Moses, with whom he struck up a great friendship. He was perfectly happy and very useful until Moses went to fight for Henry VII, and was killed at Bosworth Field. Then the poor brownie went completely to the bad, and became so troublesome that he was at length caught by an awl thrust through his long, sharp nose, and kept pinned to the spot while an exorcism was read over him. Then the awl was drawn out, and a magical wind bore him away to the Red Sea.

Most of the boggarts are mischievous rather than dangerous, and Will o' the Wisps and various forms of bogey beasts are much the same. They delight in misleading travellers and playing practical jokes. A typical story is told of the bogey beasts known as the Hedley Kow. He took the form of a pot of gold, and was dragged along by a delighted old woman; then he changed in quick succession into a bar of silver, a piece of iron and a big round stone; then finally he shot up over four long legs, and leapt away like a lean colt, swishing his long tail in delight. But the old woman had the best of it after all, for she was equally delighted by every change for the worse, and finally uplifted with joy at having met the bogey beast in person, and made so bold with him.

The Hedley Kow is harmless enough, though mischievous, but some of the creatures of this class were dreaded as really evil and dangerous. The Border Redcaps are an example. They inhabited tower houses along the Border where violent deeds had been done, and their red caps were dyed in the blood of the travellers they had murdered. The Highland glaistigs appeared like beautiful women, but they were vampires who sucked the blood of any human partners who would dance with them. Shellycoat, a Scottish water spirit, dressed in seaweed hung with clattering shells, sometimes played Will o' the Wisp tricks

John Webb

John Webb

on travellers, but had been known to toss a benighted man up and down like a ball until he killed him. Water kelpies, like bogey beasts, often took the form of a horse, but their desire was always to carry their victims into the water and devour them.

The last group of fairy creatures consists of supernatural hags, giants and monsters. Giants are always creatures of the past; the evidence for them is the great works they have left behind, but even the most credulous believer never expected to see a giant. The same is true of dragons, though not of all monsters. The supernatural hags, Cailleach Beurh (the blue hag) or Cally Berry, as she is called in Ulster. Black Annis of the Midlands and a few more of the same kind are not believed in now, but they were once believed to be alive and dangerous.

Fairy Ethics

The fairies have a morality of their own that does not correspond in all ways with that of respectable humanity. They are great lovers of cleanliness and order, and expect this to be respected by the humans whom they visit. As a rule they have few scruples about taking any mortal goods, milk, meal or cattle, which they require, but they punish severely any mortal who steals from them. They hate miserliness above all things, and love a free, open, cheerful character. Perhaps because of their interest in fertility, they are rather free and wanton in their own conduct, and are friendly towards lovers. Politeness is very important in all dealings with them, though there are some that must not be thanked. They are passionate lovers of privacy, and punish spies and eavesdroppers. At the same time they are grateful for hospitality and kindness, and often repay it disproportionately. In fairytales, as distinct from these fairy legends, fairies are fond of disguising themselves in order to test the kindness of mortals, and reward a cheerfully shared dinner with magical gifts of great value; this is a widespread fairy trait.

Of all the fairy pilfering habits the most distressing to mortals is that of stealing babies out of their cradles and leaving changelings in their place. This belief has probably caused more cruelty and unhappiness than any other piece of fairylore, for the usual means of getting rid of a changeling is to ill-treat it, though very occasionally the mother is told to take special care of it, so as to win the gratitude of the fairy mother. (See CHANGELING.)

Children are not the only people stolen by the fairies. Nursing mothers were believed to be in special danger until they were churched, and they were coveted by the fairies to serve as foster mothers for the fairy babies who did not thrive. Young men with special skills were sometimes decoyed away, and young girls, particularly those with golden hair, were carried off as brides.

The Fairy Midwife story, one of the commonest and most widespread, may have some connection with this, for in one story at least the midwife recognizes in the young mother a mortal girl who has disappeared. In the most usual version of the story the midwife is called out at night by an odd-looking old fellow, and taken to a neat cottage where a young woman is in labour. She duly delivers the child, and is given a box of ointment with which to anoint its eyes. Accidentally or on purpose she touches one of her own eyes with the ointment, and at once the whole scene is changed. The cottage becomes a cave, the young woman a lady of great beauty, the children round the bed are seen as hairy imps, and the old father is even uglier than before. The midwife manages to keep her surprise to herself and gets away safely, but some time later she sees the old man pilfering in the market, and accosts him. He asks which eye she sees him with, and when she points to it, immediately blinds it.

Equally common is the story of the brownie, lob or pixie working for a farmer or in a huuse, and being left a gift of a suit of clothes. Various reasons are given for this, but the event is invariable. Another common fairy habit is to visit houses at night, to bath their babies in the water left for them. The room must be left tidy, the hearth swept, the fire made up and fresh water left in a pail by the fireside. The maid who attends to this will find sixpence in her shoe, which will be left after every visit as long as she keeps it secret; for fairy gifts must not be talked of. A lazy maid who neglects her duty is punished with cramps or lameness.

Fairy methods of flight and levitation are very like those practised by witches. A ragwort stem or twig is used by a small fairy instead of a witch's broomstick. Some form of incantation is used; the antiquary John Aubrey (1626–1697) gives the operative words as 'Horse and Hattock!' Sometimes the power of flight is given by a blue cap. The same story is told about both fairies and witches, in which a mortal joins the charmed flight and visits the cellar of a distant castle or palace, where he drinks so heartily that he is insensible when the time comes to return. He is found in the cellar next day, can give no account of himself, and is just about to be hanged for his offence, when he is rescued by one of his late companions. This story is told in England, Scotland and Ireland.

Rays of Coloured Light

The fairies vary even more in their appearance than they do in their other characteristics. The astral fairies seen by some of the modern Irish seers are described as of about seven or eight feet in height, radiant and beautiful, with rays of coloured light streaming from them. On the other hand some fairies of the Isle of Man described by Walter Gill in *A Third Manx Scrapbook*, as seen by a friend at the beginning of this century, were little men about 18 inches high, greyish in colour, like a fungus, their bodies rather swollen in front. Their eyes and heads were clearly distinguishable, and their heads moved as they danced. The Welsh Tylwyth Teg are small but beautiful; they generally wear white, though some Welsh fairies wear striped, many-coloured clothes. Green is the most usual colour for fairies to wear, both in England and Scotland. Geoffrey Hodson, a clairvoyant who claimed to be able to see fairies, described in his book, *Fairies at Work and at Play*, a group of fairies about six inches high, with oval fluttering wings, dancing in a ring, and wearing floating draperies of pale blue. This is an unusual colour for fairies. A fairy whose appearance in Perthshire is recorded in the archives of the School of Scottish Studies is described as 'a wee green man, with peakit boots, with a cap like an old gramophone horn on his head.' His face was dark and furrowed. The kings and knights of the Trooping Fairies are generally as beautiful as their ladies, but the men in the second grade of fairies are often wizened, hairy and stunted, though their women are beautiful. Pixies have turned-up, snub noses, red hair and squint eyes. They

Left Fairies, like witches, were supposed to be able to fly; but instead of broomsticks, they used ragwort stems or twigs and the smaller creatures rode on the backs of butterflies and moths: 'An Evening Ride', from Richard Doyle's series of pictures of Fairyland *Right* Flower fairies were considered to be the most exquisite and dainty: according to one belief, fairies were the souls of the dead who had died before their appointed time *Below right* The Chinese fairy Ma-Kuh lived in the 2nd century AD. She was a beneficent sorceress who reclaimed a large area of land from the sea and converted it into a mulberry orchard

generally wear green, but are occasionally naked. The tiny flower fairies are exquisite and dainty. There are any number of hideous fairy creatures, like the spriggans of Cornwall, who can be large or small at will, but are grotesque at any size. Brownies are grotesque, hairy and ragged, and were supposed to have no noses, only nostrils, while the boggarts had long, sharp noses.

Beauty and Shapeless Horror

The fairies of the British Isles have many characteristics in common, yet there is a different flavour about them in every region. The gentlest are the fairies of central England. They are often small in size, and though tricksy are not often dangerous. Their insistence on order and cleanliness, their habit of visiting houses, their influence over crops, all suggest that they were once agricultural spirits. If so, their function is gone. The fairies known to Shakespeare and Drayton, and recorded by Aubrey disappeared over a century ago. Only occasional single fairies have been recorded within the last few years.

In the Fen Country, along the east coast of England, the traditions are grimmer. The Yarthkins of the Lincolnshire Fens were small, ugly, malicious creatures, always ready to do evil. They have gone with the draining of the Fens, and no one can regret them. As we move north the picture becomes darker. Though there are still tales of little, merry fairies, there are also many boggarts and many bogey beasts, and on the Border we have the murderous Redcaps. The picture is again a little different in Wales, where there is a preponderance of female fairies, and the special feature of Welsh fairy lore is the Fairy Wife. There is a Welsh King of the Fairies, and many stories of the miraculous passage of time in fairyland. In the Lowlands of Scotland there are traditions of the Fairy Rade and the fairies of the Border ballads, but on the whole the creatures are more prosaic than in Ireland. In the Highlands the Celtic imagination has again full play, but the duality of the fairy nature is strongly stressed; there are the good and bad amongst them. Strains of great beauty are heard from the fairy hills, but there are traditions of monstrous creatures, blood-suckers and water kelpies and shapeless horrors.

The fairies assume their most beautiful

Michael Holford

Ian Pleeth

Belief in fairies has largely disappeared, but the fairy of pantomime, although sometimes a figure of fun, still captures the imagination of little children

form in Ireland. We hear much of their music, and of the beauty of their women and the stateliness of their men. There are small, grotesque, comical fairies, and even the most beautiful of the Irish fairies are dangerous; a man goes with them at his peril, and many of them that appear beautiful are the evil host of the dead. It is impossible in a short time to do justice to the diversities of these various creatures, and yet a strong resemblance unites them.

The early heroic legends of Ireland and the Highlands have been so well preserved in oral tradition that the fairy beliefs have retained a remarkable continuity; they have been more varied and fluctuating in England with its great admixture of races. In all countries the fairy beliefs are ancient, and probably stem back to primitive gods and religions. As it has already been said, *fata* is the accepted derivation of the word 'fay', and the sophisticated fairies who were guests at Sleeping Beauty's christening are remote descendants of the Fates who appeared at Meleager's cradle and of the Norns, who were the female fates of Nordic mythology. They were older than the gods, and more potent. In Greece, Italy and the Romance countries, the nymphs and *genii loci* – spirits of the place – became fairies. In Ireland the Dana o'Shee are generally accepted as the personifications of the lost gods of the land.

Fairy Weddings

In England the earliest mention of the fairies is the Anglo-Saxon charms against elf-shot, which was the infliction of disease by elf arrows; it is possible even that in the 9th century Utrecht Psalter we have the first picture of fairies with wings, in what appears to be the representation of an elf-shot man; a suggestion made by Brian Branston in *The Lost Gods of England* (1958). After the Norman Conquest less is heard of the elves, but the 12th and 13th century chroniclers have a variety of fairy anecdotes to record. Walter Map (born c 1140) wrote a fascinating book called *De Nugis Curialium* (Courtiers' Trifles). He told an early version of the Fairy Wife tale, already mentioned. It comes from the Welsh Border, and is the legend of a real historical character, Wild Edric, who for some time resisted the Norman Conquest; he fell in love with a fairy and snatched her away from a fairy dance in a house in the

The more uncompromising puritans held the opinion that the fairies were outright devils

Forest of Clun, near the Border. She consented to be his wife on condition that he never reproached her with her origin. They were happily married for many years and when Edric had made submission to William, he took her to Court, where her beauty was much admired. At last, however, in an impatient moment, he asked if she had been with her sisters, and at once she vanished. The fairy house in the forest was not to be found, and he sought her in vain until he died. He was long said to ride, with his lady beside him and his train following, over the Welsh Border country. The last recorded appearance was in the 19th century when they were seen by a girl and her father; the girl, though illiterate, correctly described their Saxon costume with the cross-gartered leggings.

An earlier ride described by Walter Map is that of King Herla, who ruled over Ancient Britain. One day, King Herla was visited by the King of the Fairies, a small grotesque creature riding upon a goat. He said that he was the lord of many realms, and he offered to attend King Herla's wedding, bringing some of his people with him, if King Herla would return the compliment a year later, and honour his wedding with his presence. King Herla promised to do this though he had no wedding in mind at that time. It happened that a match was soon arranged, however, and on the wedding day the Fairy King arrived, attended by many servants, as grotesque as himself, but all with courtly manners and loaded with gifts, food and drink, and many costly presents. They undertook the service of the banquet, and by their readiness, alacrity and good cheer they won the favour of all the guests. At cockcrow they departed, but before he went the King reminded Herla of his promise.

Accordingly, in a year's time King Herla set out, accompanied by his knights and carrying many rich gifts with him. He was royally received, and three days and nights were passed in feasting and merriment. Then King Herla wished to return to his young wife and his people. The Fairy King gave him many gifts, and last of all a little greyhound to sit on the King's saddle before him, and he charged them all not to dismount until the dog leapt down.

The King and his knights rode towards home, but everything was changed, and he could not find his palace. He asked the way of a peasant passing by, but he could hardly make himself understood, nor understand what the man said, for 300 years had passed since he entered fairyland, and in the meantime the Saxons had conquered Britain. When they understood this, some of Herla's knights leapt to the ground, and at once the weight of their years came upon them, and they crumbled into dust. Then King Herla remembered the warning of the Fairy King, and he called to his knights to ride through the centuries, waiting for the dog to leap down; it is said that he will never do this until the Day of Judgement. The belief in the supernatural passage of time in fairyland has persisted.

Dining on Roast Frog

Another source of fairy legends is Gervase of Tilbury, author of *Otia Imperialia*, who flourished about 1210. His stories come from several parts of Europe, but he tells of our earliest tiny fairies, called Portunes in England and Neptunes in France. They were only a few inches high, with faces like wrinkled old men, and came into human houses at night, where they roasted frogs in front of the fires left burning for them. Gervase gives us the first Fairy Midwife story, complete with the fairy ointment and the blinding of the seeing eye. He tells us too of the English Grant, a bogey beast who changes his shape like the Hedley Kow.

Some of the medieval chroniclers give interesting and curiously convincing fairy legends. The fairy changeling, Malekin, is from Ralph of Coggeshall, and he tells us too about Nicholas Pipe, the Merman, and the strange story of the Green Children. Giraldus Cambrensis gives us the story of Elidor and the Golden Ball, one of the best known of the early fairy legends. From William of Newburgh we have a story of a fairy mound and the theft of the fairies' drinking-cup, something like the legend of the Luck of Edenhall.

These fairy references of the early chroniclers are not frequent, but they cover a surprising number of fairy types and legends. There is not such a variety in the medieval romances. Except for giants, dwarfs and unexplained enchantments, we chiefly hear of the fairy women, with their power of enchantment. Some of these are treated as fairies, some as mortals with magical powers. In Malory, Morgan le Fay is a mortal, but she derives from a fairy, Fata Morgana. On the other hand, Nimue, the Lady of the Lake, seems to be thought of as a fairy, though the French author of *Lancelot du Lac* gives a determinedly matter-of-fact account of her: 'Now the story saith that the Damosel that carried Lancelot into the lake was a fay. In those days all maidens that knew enchantments and charms were called fays, and there were many of them at this time, and more in Great Britain than in other lands'.

According to this author the appearance of the lake was made by magic, but a German version of the same story has no doubt that Nimue was a fairy, and writes a highly picturesque account of her fairyland, protected by a magic wall through which none could enter, with flowers blooming all the year as if at the height of May; a land in which none could grow old or perish, even after a century had passed.

With Chaucer begins the refrain of the passing of the fairies, which has been echoed ever since. Two centuries after Chaucer's reference to the disappearance of the elves, this thought is echoed in the words of another poet:

> But now alas they all are dead
> Or gone beyond the seas.

In the 19th century Hugh Miller tells the same tale, 'The People of Peace shall never more be seen in Scotland'. Yet in spite of this, rumours of fairies continued to run through the land, and even today there are still people who claim to see them.

Fallen Angels or Ghosts?

What is the explanation of this strange, evanescent and yet recurrent body of belief? Very various explanations have been given, and no single one seems to cover the whole ground. Most medieval churchmen accepted St Augustine's suggestion that the supernatural beings of the heathen were not senseless idols but fallen angels trying to usurp the place of God. The more uncompromising puritans held the opinion that the fairies were outright devils, but a more charitable belief, still held in Ireland, is that the fairies were indeed fallen angels, but those deluded by Satan and not wholly in his councils. They were ejected from heaven with the rest, but were not wicked enough for the depths of hell. As they were falling, the Son held up his hand, and they stopped short in flight;

Deliverer of Dreams

O, then, I see Queen Mab hath been with you.
She is the fairies' midwife; and she comes
In shape no bigger than an agate-stone
On the fore-finger of an alderman,
Drawn with a team of little atomies
Athwart men's noses as they lie asleep:
Her waggon-spokes made of long spinners' legs;
The cover, of the wings of grasshoppers;
The traces, of the smallest spider's web;
The collars, of the moonshine's watery beams;
Her whip, of cricket's bone; the lash, of film;
Her waggoner small gray-coated gnat,
Not half so big as a round little worm
Prickt from the lazy finger of a maid;
Her chariot is an empty hazel-nut,
Made by the joiner squirrel or old grub,
Time out o' mind the fairies' coachmakers.
And in this state she gallops night by night
Through lovers' brains, and then they dream of love;
O'er courtiers' knees, that dream on court'sies straight;
O'er lawyers' fingers, who straight dream on fees;
O'er ladies' lips, who straight on kisses dream, –
Which oft the angry Mab with blisters plagues,
Because their breaths with sweetmeats tainted are . . .
Sometimes she driveth o'er a soldier's neck,
And then dreams he of cutting foreign throats,
Of breaches, ambuscadoes, Spanish blades,
Of healths five-fathoms deep; and then anon
Drums in his ear, at which he starts, and wakes;
And, being thus frighted, swears a prayer or two,
And sleeps again. This is that very Mab
That plats the manes of horses in the night;
And bakes the elf-locks in foul sluttish hairs,
Which once untangled, much misfortune bodes:
This is the hag, when maids lie on their backs,
That presses them, and learns them first to bear,
Making them women of good carriage:
This is she –

William Shakespeare
Romeo and Juliet (Act I, Scene 4).

the most wicked, the *Lucifugi*, fell into the mines and caverns below the earth, and became gnomes, kobolds, and other light-hating creatures. Some fell into the sea and became mermaids and water spirits, others into woods or flowery places, others near men's habitations, who became brownies and hobs, whose duty it was to work for man without reward.

Another equally common belief was that the fairies were the dead who had died before their appointed time, or those that were too good for hell and not good enough for heaven. In Cornwall they say that the fairies are the ghosts of the old Druids, though their stock is recruited from time to time by kidnapped mortals. A less common theory is that the fairies fill an intermediate space between man and angels, 'spiritual animals', as one writer describes them. The 16th and 17th century magicians, who had many recipes for raising fairies and putting them to use, seem sometimes to have regarded them as elementals; that is, creatures made out of one of the four elements only, sylphs from air, undines from water, gnomes from earth, and salamanders from fire. Modern believers in fairies often regard them as nature spirits, whose special function it is to fertilize plants and look after flowers. They are presumably created specially for that purpose.

The theories of the students of fairy lore, who study the subject more objectively, are equally diverse. In the 19th century, a theory was put foward by David MacRitchie that the fairies were a conquered, pre-Celtic race; the primitive men who inhabited these islands, small, forced into hiding in caves and mounds, and therefore nocturnal in their habits. They knew the ancient traditions of the land, and were considered masters of its magic. They would be thought also to be on intimate terms with the local gods, and therefore formidable. They might occasionally make shy advances to their conquerers, and do odd jobs about the farms in return for food. They would be expert pickers and stealers, and might occasionally make raids on the new settlers to carry off cattle or brides. Some of the more matter-of-fact stories fit very well into this pattern; The Woman of Sanntraigh, for example, in Campbell's *Popular Tales of the Western Highlands* (1860), seems as if no other explanation would fit so neatly. There are, however, many elements of the fairy legends which are not covered by this theory. A variation on it is Dr Margaret Murray's suggestion that the fairies were the devils of the witches' sabbaths. They would be drawn from wandering bands of gypsies, or even from primitive peoples, forced into hiding generations ago.

Perhaps the best case of all is made out by those who think that the fairy beliefs originated in a cult of the dead. This view is ably presented by Lewis Spence in *British Fairy Origins* (1946). There is no doubt that there are many traditional connections between the fairies and the dead. In many of the Irish stories given by Lady Wilde the fairy host is explicitly stated to be the 'host of the dead'. The fairy man who advised Bessie Dunlop, one of the Scottish witches, was alleged to be a man killed at the Battle of Pinkie, in 1547, some 30 years previously. That striking story, 'The Fairy Dwelling on Selena Moor', in Bottrell's *Traditions and Hearthside Stories of West Cornwall* (1870), gives a detailed description of the fairies who are also the pagan dead. Many of the brownies and hobs are expressly described as ghosts. The Cauld Lad of Hilton is one, and in Ireland the Phooka of Kildare, though it took the form of an ass, was the ghost of an idle scullery boy, forced to work in the house, until he was considered worthy of reward. He was laid, like other brownies by a gift of clothing. The minute size of the tiniest of the fairies can be plausibly accounted for by the primitive notion of a man's soul being a tiny creature, in human or insect form, which comes out of his mouth when he is asleep and whose wanderings account for human dreams.

There are other factors, which, though not accounting for the whole body of fairy beliefs, seem to have had their share in building them. Previous reference has been made to the lost gods as ancestors of the fairies, and as far as one can say that anything is a certainty in this perplexing subject, it may be taken as certain that a few of the fairies are descendants of the gods. Spirits of trees and woods seem to be true nature spirits and not the ghosts of people sacrificed in the groves in the time of primitive nature worship. The habit of personification is natural to man, and it would after all be strange if trees, streams, mountains and rocks should be left empty of personality in men's imaginations until a dead man could be found to haunt them. Animism is a primitive habit that dies hard. Certainly the foundation sacrifice beneath the hearth may become a ghost that in time grows into a tutelary spirit, but to what was the sacrifice made? Besides these, psychic phenomena, poltergeist activities and so on, whatever their cause, had an obvious part in building up fairy beliefs.

A further element, still to be explored, is the symbolism of the unconscious, which everywhere produces metaphors inexplicably satisfying to the souls of men. Jung's penetrating exposition of this theme has yet to be fully examined by folklorists. He has already investigated fairy tales, but fairy beliefs may prove to be equally relevant. All these together form a fascinating complexity of beliefs and theories which merit further investigation.

Elves feasting and frolicking among the fuchsias, a water colour by Richard Doyle; elves were originally the fairy people of Teutonic mythology who possessed magical powers to help or harm mankind

John Webb

Fairy Rings
Circles of grass of different colour or texture from that of the rest of the field, where fairies are traditionally supposed to hold their dances: anyone running nine times round a fairy ring during a full moon was thought to be able to hear them talking and laughing, but it was dangerous to sit in the ring on May Eve or All Hallows' Eve as the fairies might spirit the offender away.

Faith
In theology, confident belief in religious doctrines, apprehension of religious truth apart from proof or logical argument: also a system of religious belief, as in 'the Christian faith': often contrasted with 'works', in the controversy over whether salvation is gained by faith in God alone, or by good behaviour, or by both.

Thousands of people have testified that faith healing 'works' – yet its efficacy, by its very nature, is incapable of scientific proof. What cannot be disputed, however, is that faith healing is 'a great source of hope to the otherwise hopeless'

FAITH HEALING

FAITH HEALERS CLAIM to have, usually in the absence of medical knowledge or skills, the gift of healing; treatment methods vary with the individual healer but in general are not those appropriate to orthodox medical practice. Attitudes about the faith aspect (that is, belief held in the absence of, or in spite of, logical argument based on available facts) of faith healing vary so widely that it is not even possible to establish that such belief is an essential element in the process either for the healer or for the patient. Noel Bayon and Maurice Colinon worked experimentally as healers during recent years without the slightest faith in their powers, but both achieved considerable reputations.

The words 'illness' and 'disease' arouse widely differing subjective and objective responses. Dr A. E. Clark-Kennedy gives a good working definition: 'A disease . . . so far as definition is possible, is that condition of man, woman or child of a certain psychosomatic constitution, and at a certain stage of his or her life, when a pathological process of body or mind is leading to alteration of structure or disturbance of function, with the result that he or she sooner or later starts to complain of symptoms, or signs are discovered on examination, most diseases being due to complicated interactions between genetic weakness, the adverse factors to which a man is exposed in his environment, and the psychosomatic machinery of his individual constitution. No two cases, therefore, are ever quite the same, although certain types of reaction are

Peter Goodliffe

From his 'sanctuary' at Shere, in Surrey, Harry Edwards practises both direct and absent healing. He claims a high percentage of successful cures and is visited by ailing people from all over the world. The pictures on the right show the faith healer trying to relieve a patient suffering from an acutely stiff neck

common, justifying the abstract conception of the real existence of disease, apart from the individual patients who actually suffer from them.'

Another authority, Professor Emilio Servadio, suggests that the study of healing and the study of cures is by no means the same thing, and that spontaneous recovery may be one of the reasons why no rational theory of healing exists. It is difficult to define a boundary between paranormal healing and orthodox medical practice; a doctor giving a patient a placebo (a pill or other medicine which is a 'dummy' and which has no known chemical action) in the hope and expectation that the sufferer will benefit by being humoured in this way is a good physician; the faith healer may *believe* that he is doing something positive and his actions and his belief may also serve as a placebo; the patient feels better.

The methods of orthodox medicine change continuously. Mesmer's 'unorthodox' activities were investigated in 1784 by a commission of physicians and scientists, including Benjamin Franklin, and their unfavourable conclusions forced him to retire 30 years before his death in 1815 at the age of 80. By the 1850s some of his methods, under the name of hypnotism, were again considered seriously and as a result of Professor J. M. Charcot's work had become respectable by the end of the century. (See MESMER.)

The concepts of the unconscious mind elaborated by the Freud-Adler-Jung group were embellished by discoveries with the aid of hypnosis of mental processes hitherto unrecognized. The relevance of the patient-doctor relationship has received increased recognition and in this sense some of the faith healing methods are being incorporated into orthodox medical practice.

Christ healed the sick man of paralysis by commanding him to 'Arise, take up thy bed, and walk'. Christ and the disciples performed many healing miracles and saints too have been known to effect cures by the power of faith: painting by Jan van Hemessen

National Gallery of Art, Washington

Definition of a Cure

How does one decide whether a patient is cured, particularly of minor illness? Probably the majority of patients simply stop attending their doctor when they feel well. But few illnesses, major or minor are static: there are periods when the symptoms are worse, and periods when they are less severe, and these altered states may last for weeks, months or even years. A further problem is that at present only organic states are roughly measurable. 'Feeling better', though of tremendous importance to most patients, is not necessarily evidence of lessening of organic disease, of the complete elimination from the body of the anatomical, pathological state of illness. On the other hand, a doctor may have laboratory evidence and a healer reasonable belief that sufferers are cured although some may still continue to complain of symptoms.

Bearing these problems in mind, we can now consider the methods by which unorthodox healers work; these may be loosely categorized into three groups. Firstly, there are 'magical' methods not based on observable and constant cause and effect but adopted as a result of falling into the old trap of *post hoc propter hoc* (after this, therefore because of this). These methods include the practices of early historical times – for example the use of charms and talismans.

The second group contains the vast array of methods involving touch – among them anointing with oil, 'stroking', the method used for his cures by Valentine Greatrakes (1629–1683) the laying on of hands and, according to Plutarch (c 46–120 AD), the highly individual method of laying on of toes by Pyrrhus, King of the Molossians.

The final group consists of those methods by which the patient has no physical object to reassure him and does not gain the comfort of touch. These include exorcism, commands to be well and merely being stared at, as advocated by the zouave Henri Jacob. Indeed, the sufferer may not be physically close to the healer, or even aware of his existence, as in some forms of absent healing.

Christ the Healer

There seems little connection between the evolution of faith healing methods and the intellectual evolution of mankind; although these groups are placed in what looks like an order of increasing sophistication no particular one seems more effective than the others; all are still in use and many healers do not confine themselves to a single technique or to one group of methods. Christ, for example, healed the right ear of Malchus by touch after it had been cut off by one of

the disciples – a rare example of the restoration of a severed part of the body – and he healed the centurion's servant of palsy without going near him.

Among the many other healing miracles performed by Christ is one of particular interest – the cure of the woman 'who had had a flow of blood for twelve years' (Luke 8. 43–48) – for in this case the sufferer who touched the border of his garment was healed without the conscious will of the Healer.

The disciples (who had sometimes failed to effect cures 'because of . . . unbelief') continued healing after the Crucifixion. St Peter excelled: 'they even carried the sick out into the streets and laid them on beds and pallets, that as Peter came by at least his shadow might fall on some of them.'

Christ's healing instructions to the twelve disciples were evidently not construed as intended for them alone: St Paul, after his conversion, was able to heal and a famous passage (James 5. 14–16) implies that healing gifts were normally to be expected among believers – although St Paul drew attention to the likelihood of specialization in spiritual gifts (I Corinthians 12. 30): 'Do all possess gifts of healing? Do all speak with tongues? Do all interpret?'

The ministry of Christ and the healing work of his immediate successors, which may have been responsible for many conversions to Christianity, was followed by a decline in the activity of unorthodox healers. Some work continued, but the only massive revival was the Spiritualist movement. Spiritualist healers believe that not only do they have the gift of healing but that they are also actively assisted in their work by doctors and guides 'on the other side'. 'Spiritualism' was not, of course, unknown even in the Old Testament times : Saul's visit to the Witch of Endor might well be described as a seance (I Samuel 28. 7–19). But an organized sect did not emerge until the middle of the 19th century. Many unorthodox healers today encourage their patients to continue in the care of their family doctors, which is a valuable safeguard to the sufferers. Unfortunately, the safeguard makes scientific study in the field very much more difficult because so few patients receive unorthodox healing only. Of the religious healing groups, only Christian Scientists reject the need for doctors, but this is by no means true of all members.

Seven Rules for a Miracle

Many Roman Catholic saints have been renowned for their powers of healing, both during their lives and after death, and indeed when a pious soul is being considered for canonization healing miracles may be taken into account; shrines commemorate them and are visited by believers seeking miraculous cures. The best known of the Roman Catholic healing shrines is Lourdes, about which Dr D. J. West, in his book *Eleven Lourdes Miracles*, gives a wealth of detail, including the criteria for miraculous cure from the treatise on Beatification and Canonization by Pope Benedict XVI in the early 18th century. There are seven requirements and all must be fulfilled; they are as follows. Firstly, the illness should be serious, and impossible, or at least very difficult, to cure. It should not be on the decline or of such a nature that it might in any case improve. No medication should have been given, or if it has been given, its inefficacy should be clearly established. The fourth condition is that the cure should be sudden, instantaneous; it must also be complete. Sixthly, the cure should not correspond to a crisis in the illness brought about by natural causes, and finally, that after the cure there should be no recurrence of the illness.

On the subject of Lourdes, Dr Michael Balint states that 'inexplicable, almost miraculous, healings occasionally occur in the average medical practice', and adds that they belong in the same category as authenticated Lourdes miracles – they constitute recovery from psychosomatic illness, slowly progressing tumours of chronic incapacitating states and 'as is well known in medicine, these three types of illness may show sudden physical changes under normal medical treatment, or even spontaneously'; Dr West points out that 'there are no cases of lost eyes or amputated legs sprouting anew', although most Catholics would accept that God could and would achieve this if he felt it to be appropriate.

Attitudes among the Christian Churches towards faith healing vary from total disapproval to intense enthusiasm. As I said in my book *Faith Healing*, 'Possibly there is today a consensus that God wants men to be healthy: that prayer and other religious techniques can help to bring this about: that paranormal cures must be attempted with love and are at best only a means to the end of salvation. Beyond this we find . . . many voices but little harmony.' Despite this, the ministry of healing is by no means altogether neglected in Christian Churches today.

Christian Scientists and Spiritualists are committed to healing for its own sake, and in this they are akin to the orthodox medical practitioner. But many individoals work alone, outside the framework of any religious denomination. Britain's best known contemporary faith healer is a Spiritualist, Harry Edwards, born 1893. Since he began healing in the 1930s he has acquired an international reputation. Comparing his 'sanctuary' at Shere, Surrey with Lourdes at the time of the latter's centenary in 1958, he claimed to have cured 10,000 people, mainly 'incurable' in four years. He practises both direct and absent healing, claiming (in 1944) between 85 % and 90% success. In 1962 his average postbag was stated to be 10,000 letters a week, and over the years sufferers from all walks of life, including many eminent people, have come to the Shere Sanctuary.

Orthodox medical opinion as represented by the British Medical Association was summed up in 1956 in a booklet entitled *Divine Healing and Co-operation between Doctors and Clergy*. This contained the findings of a committee set up to assist the enquiry by the Archbishops' Commission. The medical committee concluded that they could 'find no evidence that there is any type of illness cured by "spiritual healing" alone which could not have been cured by medical treatment' and no evidence that organic disease is cured by the various methods of 'spiritual healing'.

This is the consensus of scientific opinion at present, but it makes no impact upon the faith of those who believe that paranormal forces frequently intervene in human affairs; healers believe they have a vocation to heal; sufferers believe that they have been cured by such healers when orthodox medicine may have failed them. The majority are not concerned with how the healing in which they believe happens; but answers to this question range from the simple reply 'from God' to the statement that the faith healer 'is feeding in nervous energy into the patient's body at the point where it is "leaking out". It is "leaking out" at the site of the pain which the patient experiences . . . The healer's energy, applied at the site of the pain, runs up the patient's nerves and reaches the seat of the trouble' (Faith Healing, *The Messenger*, June 1952).

Illness with a Purpose

Theories are continually being presented. Sigmund Freud (1856–1939) began writing about conversion hysteria (a loss of physical function resulting from an emotional disturbance in the absence of disease) in 1886. Within recent years a vast amount of work has been done in the field of psychosomatic medicine. (Briefly, psychosomatic diseases are those in which harmful local changes occur in an organ, usually as a result of psychic stress). Both hysterical and psychosomatic disorders are, at least in their early stages, reversible and it is very likely that some of these illnesses lend themselves more readily to the unspecific methods of the faith healer.

Georg Groddeck (1866–1934) has been called the father of psychosomatic medicine. This assessment is largely based on his paper *The Psychic Origin and Psychoanalytical Treatment of Organic Disease* (1917) in which he says 'I consider it a basic and dangerous misconception to suppose that only the hysteric has the gift of making himself ill for whatever purpose. Every man has this ability and each uses it in an extension beyond comprehension. In being ill a distinct purpose is served' and he went on to say 'A great many miraculously easy cures which we credit to suggestion or to the personal influence of the doctor are basically to be led back to the sudden realization . . . that man will no longer need this or that protection.'

In *The Unknown Self*, a selection of his writings, Groddeck added in 1925 that a patient 'may reject the methods approved by scientific and ordinary experience and choose to be cured by other – in some cases quite ridiculous means, or without any assistance from other people . . . may work out his own salvation by using the conditions of his own environment.'

The theory does not explain why the will to health may be aroused by unorthodox approaches after conventional methods have failed, but it does illustrate the possible complexity behind the simplest symptom, and underlines Dr Clark-Kennedy's words

quoted earlier, 'No two cases . . . are ever quite the same'.

The will to health may finally express itself in the patient who has failed to gain relief of illness in the usual medical environment; and even though such a patient may say that he does not believe in faith healing, he has, usually unconsciously, reached the point at which he *must* become well, and this is the time when the healer may contribute to the reversal of a psychologically-based illness or to the mental well-being of a patient suffering from organic disease. It should be remembered that there is a common prejudice against neurosis and neurotic symptoms, implying that they are in some way less respectable than organic disease. Whatever the cause, the symptoms are just as real for the patient. Pain hurts.

Playing One's Part

Suggestion is, of course, relevant, to both orthodox and unorthodox healing. Argument still continues about the basic mechanism of hypnotism, which can certainly be used for the removal of symptoms, sometimes dramatically; and the removal of symptoms, which is of the greatest importance to the patient, rather than the removal by psychological methods of the cause of symptoms, has become academically respectable over recent years. This replaces the earlier assumptions that the relief of symptoms without insight into the nature of their origin would result in relapse or in a group of new symptoms.

While discussing suggestion the concept of 'role-playing' should be mentioned. In any given situation people will tend to do or say what they think or feel to be expected of them. In other words they fulfil the role indicated for them by the dominant factor in the situation — in this context, the healer. He will tell a sufferer, for example, to leave aside his crutches and walk, and at least for the time being that is what he can do. It is important to point out that he is able to do so because he feels expected to do so, even though before such an occasion he did not himself anticipate such a possibility. In the experimental situation it has been established that experimenters tend to get the results they anticipate; this does not mean that they are in any way consciously or deliberately mishandling data or results but that expectation is somehow communicated to their subjects.

It has not so far been possible either to prove or to disprove that faith healing cures organic disease, and further investigation is needed, particularly in the rigorous following-up of claims of reputed unorthodox cures. But man does not live by science alone, and so long as the obvious safeguard of medical supervision is respected it is unlikely that faith healing can do any harm. Indeed it can lead to an improvement in emotional state which is in itself a good thing in that it makes life easier for the sufferer even though it may not basically affect his physical condition.

In fact, it is doubtful whether hard-and-fast conclusions will ever be reached on this subject. The existence of adequate medical records implies that patients have undergone medical treatment, yet it is only with such records that the existence of disease can be established in retrospect. And even in the case of the patient with a full medical history who has been 'given up' by the medical profession and has subsequently been 'cured' by a faith healer, the conclusions of the British Medical Association in the report mentioned earlier should not be forgotten: 'The evidence suggests that many such cases . . . are likely to be either instances of wrong diagnosis, wrong prognosis, remission or . . . spontaneous cure'.

It may be that without some dramatic breakthrough in the methodology of investigation faith healing, like faith itself, must, in its very nature, remain beyond the realms of science. Not proven, not unproven, a subject for belief and ridicule and controversy; but perhaps most important of all, a great source of hope to the otherwise hopeless. FAKIR

Radio Times Hulton Picture Library

THE ARABIC WORD 'fakir' means a poor person, in the sense of poor in the sight of God rather than needy by misfortune. In the Islamic world it is used of those often wandering mendicants, who have renounced the world and put their trust in Allah, remembering the famous saying of the Prophet Mohammed, *Al-fakr fakhri* — 'poverty is my pride'.

The concept of a fakir is clearly similar to that of the medieval Christian friar. Although this is the strictly correct usage of the term, fakir is, in European languages, also used to describe Indian ascetics, somewhat doubtful individuals often pictured by the popular imagination as lying on beds of nails. These latter are more properly named 'sadhus' but as the word fakir is widely applied to both, this article considers the true Islamic fakir and the Hindu ascetic.

The Islamic fakirs may be historically divided into two groups, those 'within the law' (*ba shor*) and those 'without the law' (*be shor*). The former have always strictly based their lives according to the doctrines and practices of Islam, while the latter, although describing themselves as Mohammedans, have been freer in their ways.

The ba shar fakirs are often called *salik*, a word denoting a traveller on the road to heaven. They have been organized in a large number of orders, all of which trace their descent back to either Abu Bakr or Ali, the first and fourth 'successors', or caliphs, to the prophet Mohammed. The earliest of these fraternities was founded about 770 AD. It seems that they were formed by religious enthusiasts as vehicles to ensure the continuance and transmission of the teachings of the prophet, perhaps more in a social rather than in a doctrinal sense. Not infrequently, an order of fakirs was drawn entirely from one walk of secular life — fisherman, camel-drivers and the like. These orders sprang up all over the Moslem world, obliging their members to devote time each day to private prayer and to attend a weekly prayer meeting called a *dhikr*.

The be shar orders were also numerous and often indulged in extremes of asceticism and self-mortification. The most popular order was founded by Zinda Shah Murdar, whose shrine is at Makanpur, in India. From this order have sprung the Islamic fakirs of India between whom and the Hindu sadhus there has been some interaction.

The Indian sadhu is a holy man, often an itinerant beggar, pedlar or wonder-worker, 'poor in the sight of God' like the fakir of Islam but usually more involved in the communal life of a still primitive country. Although sexuality may play an important part in the lives and practices of some, most folluw rigorous asceticism — one sect, for instance, wear an iron ring on the penis to show that their sexual desires

***Left* and *Right* Indian fakirs who practise various forms of self-mutilation as a means of acquiring spiritual or magical powers, often remain rooted to one spot for many years, maintaining one position**

This Indian holy man does penance by sitting in a circle of burning sods during the hottest part of the day

have been totally conquered. They engage in *tapas* – the way of 'active asceticism', the implacable mortification of the flesh, as opposed to mere contemplative, passive renunciation of the world. Their aim is to acquire both merit and spiritual or magical powers. Some remain immersed in water up to the waist for long periods; others wander about the vast country trying to bathe in as many sacred rivers as possible before they die. Some keep constantly on the move, others lie, sit or stand upon the same spot for years, until – it is said – creepers cover their limbs and birds nest in their hair. Some do indeed lie on beds of nails, others practise various forms of self-mutilation, including never unclenching their fists and allowing their finger nails to grow into the flesh. Many cover parts or all of their bodies with ashes, since ashes represent pure substances, the primal matter, present in all things, revealed by burning.

The sadhu may often also be recognized by characteristic possessions – his staff, for instance, frequently topped by representation of a skull, a trident or a phallus; his crutch, to support his chin or arm during meditation and his body at burial; his begging bowl (though some are forbidden to beg); his tongs, with which he tends his ritual fire and also uses as a clapper to accompany incantations. For many sadhus earn a living by magic and witchcraft maleficent and beneficent; others are fortune-tellers and interpreters of dreams, yet others makers and sellers of charms.

For many foreigners the Indian fakir has been the most obvious manifestation of the Hindu religion – and as many of them are undoubtedly rogues and their practices alien, if not abhorrent, to foreign sensibilities, Europeans and others have often gained a very perverted idea of Hindu beliefs and behaviour. But it is as well to reflect that when religion is a genuinely potent force, in a densely populated country still only superficially affected by modern technology, the religion of the market-place will, necessarily, be a very different thing from that of the palace or the cloister.

Falcon

To the ancient Egyptians a sacred bird, identified with the sky and the sun probably because it could fly so high: it was particularly associated with the god Horus who was depicted as a falcon or falcon-headed man and dead falcons were buried in expensive coffins.

See HORUS.

Michael Holford

Fall

The loss to man of divine grace as a result of disobedience: Adam and Eve were expelled from the Garden of Eden after disobeying God's command and eating the fruit of the Tree of Knowledge of Good and Evil; their punishment was death, the pains of childbirth, the subjection of woman to man, and hard work: an angel with a flaming sword was set to guard Eden to prevent Adam, Eve and their descendants from returning.

The petting of a small animal was often held to be proof that its owner was a witch. Many women were accused of giving suck to their 'familiars' in return for deeds performed by these supposedly supernatural companions

Previous page One of the 16th century Chelmsford witches with her imp or familiar ***Above*** Sketches by Breughel of witches capering and attempting to fly with broomsticks: they are attended by familiars including an owl and a cockerel ***Right*** At the sabbath demons were thought to assume the form of animals and the Devil himself often appeared as a goat and copulated with the witches

FAMILIARS

THE WITCH'S BLACK CAT has become firmly entrenched in popular imagination in Britain. Storybook witches all have cats as henchmen to help them with their spells and traditionally her cat is the one creature to which the witch is attached. Yet in the history of witchcraft the small animal kept as a crony appears fairly late, part of the final phase of witchcraft belief. Nor was the cat the only, or even the commonest, of the witches' pets: ferrets, rabbits, hedgehogs, mice or any small common animal, also figure in reports. Blackbirds and crows were fairly frequent, being traditional birds of augury. Toads and frogs were also regarded as suitable pets, being cold blooded, but fishes are never mentioned – perhaps because the fish is an ancient Christian symbol as well as an emblem of chastity. There were also more exotic 'familiars' like the one that was said to have appeared to Bridget Bishop of Salem during the outbreak of witch hysteria there in the late 17th century: 'A black Thing . . . the Body was like that of a Monkey, the Feet like a Cock's, but the Face most like a man's . . .'

Ideas of witchcraft at the Salem trials were a direct import from the England of a generation earlier. In the rest of Europe, the pattern and traditions were rather different. In the widespread Continental witchcraft persecutions of the 15th and 16th centuries, accusations concerning familiars seem to have played little part: the pet imp in the form of an animal was a typically, if not exclusively, British phenomenon. Accusations of familiar-keeping occur as corroborative evidence most frequently in the 17th century British witch-trials, possibly because witchcraft only became a capital offence under the second Witchcraft Act of 1604. This Act, which also provided harsher penalties for the 'wasting' of men's bodies or goods – an accusation easy to make and hard to disprove – was particularly unfortunate for the aged, the anti-social and the isolated who were most liable to become obsessively attached to small animals. Hence one of the modern stereotypes of the witch – the poor old crone, persecuted because she has only her cat for company.

Breast-Feeding the Familiar

While there is undoubtedly some truth in this image, the association between witches and the animal kingdom is far more complex and its roots go far back to the origins of sorcery. The use of animals' skins and masks in ancient witchcraft fertility rituals and the legends of werewolves are both reflections of the persistent idea that witches could, at will, turn themselves into animals. Tales of this kind crop up all over the world. In countries where the bear and the wolf (the oldest incarnations) died out during the Middle Ages, the cat, already associated with the witch for other reasons, was substituted in the myth.

There are many 15th and 16th century tales, chiefly from the Continent and from Scotland, of witches who became cats at night for their revels and turned themselves back again into their human form at daybreak. Often these witches were unmasked because wounds which had been inflicted on the cats would be evident the next day on the bodies of highly respected female members of the community.

Such tales, particularly those in which the practitioner assumed animal shape when she wanted to perform some evil deed unobserved, were confused by some authorities with the keeping of familiars, but there is a distinction: the true familiar spirit was an imp or minor devil kept by the witch and distinct from herself. It was also distinct from the Devil in person. It was sometimes given or sold to the witch *by* that gentleman, but here too confusions arose on account of the Devil's own habit of assuming a variety

of animal forms. Thus Dame Alice Kyteler, a celebrated 14th century witch of good social standing, was said to be frequented by a dark man called Robert Artisson who also appeared to her on occasions in the shape of a cat or dog. Clearly this was thought to be the Devil-God himself – the name 'Artis' suggesting a possible derivation from a pagan deity of Mediterranean origin. (See KYTELER.)

Three centuries later, however, when the ancient fertility rites were further decayed and forgotten, those who reported on the trial of Abre Grinsett in Suffolk were probably mistaken when they assumed that the witch considered it to be the actual Prince of Darkness 'who did appear in the form of a Pretty hansom Young Man first, and since Appeareth to her in the form of a blackish Gray Cat or Kitling, that it sucketh of a Tett which searchers since saw in the place she mentioned.' Suffolk was then a backward, rural area; elsewhere by that date (1665) informed opinion had begun to take the view that it was surely unlikely that the Devil in person 'would consent to be at the beck and call of poor, doting women.'

In other respects the description of Abre Grinsett's familiar is within the classic tradition of such cases. The suckling of the familiar by the witch is a typical detail which throws light both on the true nature of the relationship and on the evil interdependence which was popularly believed to characterize it. The modern reader, inclined to take the part of the 'harmless old women' may believe that this tale of suckling was a dirty-minded calumny spread by the witch-hunters, but it should be remembered that such events are set in an era when people lived closer to Nature, when infants were universally fed at the breast for want of any other alternative method, and thus many women went on being 'in milk' and casually nursing other babies besides their own for the greater part of their reproductive lives. It was apparently not uncommon for an old granny, left to mind a baby, to put it to her dry breast just to soothe it if it were fretful. It will be appreciated that in these circumstances to give the breast to a treasured animal would be seen as an exaggerated piece of petting but not necessarily as an unnatural or perverted action.

In Russia, as late as the 19th century, there are cases recorded of peasant women being ordered by their masters to nurse bear cubs that were being reared for sport. It therefore seems likely that much of the evidence about women suckling their pets was quite genuine, especially since they themselves frequently gave the animals nicknames such as 'Suckin' or 'Titty'. A 16th century Somerset witch, for instance, stated that 'her Familiar doth commonly suck her right Breast about seven at night, in the shape of a little cat of dunnish colour . . . and when she is suckt, she is in a kind of Trance.' It is probable that what alarmed our ancestors was not the intimacy of the relationship between mistress and familiar, but the supposition that the woman was thus rewarding her creature for malevolent services it performed for her.

Cats Burnt as Devils

Some familiars were thought to carry the witch through the air to sabbath revels – a version of the common tradition that witches themselves could fly – though the evidence is further confused by the coincidence that 'cat' is also an old dialect word for 'stick' (broomstick). More commonly, the spirit was supposed to act as a medium for ill-doing. Elizabeth Device, one of the Pendle, Lancashire, witches, had a brown dog called Ball through whom she was said to attempt to kill people who had offended her (see LANCASHIRE WITCHES). Another classic case was recorded in 1619, when a witch named Margaret Flower and her sister Philippa were hanged at Lincoln for using witchcraft to murder the eldest son of the Earl of Rutland. She said that among other rituals intended to kill the Earl's children and render the parents sterile, she had rubbed certain personal belongings of her victims, which she managed to steal, against the body of her cat. To ensure that no babies would be born, she had obtained feathers from the Countess's bed and had rubbed them on the cat's belly: this meant that the marriage would henceforth be barren. It seems probable that this witch, like many others, indeed regarded herself as a witch and actually performed the actions stated.

The cat employed – and doubtless cherished – by the Lincoln witch and her kind falls into a different category from the luckless animal that Agnes Sampson and her accomplices seized at random, christened and then cast into the sea, in an attempt to bring about the death by drowning of the future James I. The christening and ritual sacrifice of cats was a piece of magic that related back to fertility cults and the ceremonial sacrifice of the god; it survived as a rite in certain places, notably Aix-en-Provence, till the end of the 15th century. Elsewhere it was generally replaced during the Middle Ages by the burning of live cats as 'devils' on Good Friday or other significant days – a good example of a barbarous practice originating from pagan rites but later sanctioned by the Church, unchanged in essence, and adopted for a different purpose.

There are shades of the sacrificed cat in the latter-day witch's familiar – it was not uncommon for witches to make a small ceremony of naming their pets, often with a name suggested by the Devil their Master. It is also significant that cats seem to have been employed particularly, as in the Rutland case cited above, to bring about sterility: Bast, the cat-goddess of Egyptian origin, patron of fertility, became in the Christian world associated with sterility, that reversal of fertility that consists of 'taking' things for the Devil.

Most true familiars, far from meeting a sacrificial fate, seem to have been particularly long-lived. Jennet Dibble, one of a company of witches who plagued the Fairfax family at Fuiston, Yorkshire, in the early 17th century, had 'her spirit in the shape of a great black cat called Gibbe, which hath attended her now above forty years.' Others were handed down from one

Radio Times Hulton Picture Library

Many witches were accused of keeping familiars to perform malevolent services for them ***Top*** **A 17th century woodcut from** ***The Strange and Wonderful History of Old Mother Shipton*** **showing an old witch standing in a magic circle surrounded by imps and familiar spirits which she has invoked** ***Above*** **Three of the witches implicated in the Earl of Rutland 'hexing' case, with their familiars, a white dog, a mouse, an owl and a kitten called Pusse: one witch admitted that she had tried to kill the Earl's children by rubbing certain of her victim's personal belongings against the body of her cat**

witch to another, a circumstance which reflects the persistence of the sorcery tradition in one place or one family for generations. Elizabeth Francis, one of the Chelmsford witches arraigned in 1556, had a white-spotted cat called 'Sathan' who had been given to her by her grandmother and to whom she talked in a special 'hollow' voice. At the recitation of the Pater Noster in Latin it changed into a toad – shape-shifting was attributed to many familiars. She kept it 15 or 16 years and then, becoming weary of it, passed it on to another witch, Agnes Waterhouse. It was kept in a basket fed on bread and milk, and given a drop of blood every time it did something for her.

The belief that the familiar fed not only on milk but also on blood was a common one, which lent a more sinister twist to the character of the suckling familiar. Abre Grinsett's imp sucked 'at a Tett which Searchers since saw in the place she mentioned' that is, a special teat or 'witch's pap' which might be anywhere on her body but most probably 'in the secretest part'. There is ample evidence concerning these unnatural teats, which came into the wider category of 'witch-marks' and were, for a time, infallible proof of a witch.

Matthew Hopkins, the notorious Witchfinder General who carried on his trade briefly but profitably during the Protectorate, employed a special female searcher to hunt out these 'paps' (see EAST ANGLIAN AND ESSEX WITCHES). Presumably some of them were quite genuine supernumerary nipples, which are not uncommon in either sex. Others were probably warts, or seem from their position to have been piles, though the searcher usually declared that they were unlike any piles she had previously seen. There is a contemporary engraving of Hopkins standing in an admonitory way over two witches and their attendant imps, among them a kitten, a rabbit, a polecat and a 'long-legg'd grayhound with a head like an Ox' called Vinegar Tom. Other names given to these familiars were Pecke-in-the-Crown, Grissel Greedigut, and Pyewackit. The outlandishness of these pet-names was considered at the time, by the unimaginative persecutors, proof of their Satanic origin.

It is hard to avoid the conclusion that some of the defenceless old women arraigned with their pets must have been pathetic indeed, particularly when they were so confused in their wits as to implicate themselves readily. Delusion is not confined to paranoiac witch-hunters: it was found as often in the hunted, as a few of the more intelligent 17th century commentators pointed out. There is also the fact that, though torture was never officially sanctioned for witches in England, many an arrested woman was certainly bullied and harassed – put in a cramped gaol, walked up and down, nagged at for a confession, kept awake and watched continually to see if any small animal should creep in to visit her, in which case it would, of course, be a devil. As many of the country gaols of the period must have been squalid and tumbledown, infested with rats and cockroaches, it was all too likely that 'proof' should appear. This kind of circumstantial evidence on which a witch could be convicted (guilty unless proved innocent) is typified by the report of a trial at Bideford in 1682, a time when in better educated circles the whole reality of witchcraft was beginning to be called in question: 'This informant saith he saw a cat leap in at her window, when it was twilight: and this informant further saith, that he verily believeth the said cat to be the devil, and more saith not.'

Danger in Owning a Pet

But the keeping of pets was not confined to poor old women. At various times even eminent men fell under suspicion on this count including Oliver Cromwell who was said to have a familiar called Grimoald. Witchcraft seems to have been an issue, if a covert one, in the Civil War; each side suspected the other of practising it. It was whispered that the great storm that occurred on the night the Protector died was raised by the Fiend come to fetch him.

The distinguished German scholar Heinrich Cornelius Agrippa (1486–1535) came under suspicion on the same count. A strange mixture of occultist and sceptic, worldly lawyer and genuinely original thinker he made a thorough and intensive study of alchemy, astrology and the occult arts and developed an analytical faculty which eventually led him to speak out against the whole unscientific basis on which the witchcraft hunts were carried out. He denounced the Inquisition at Metz, his

home town, and was forced to leave. Only his previous eminence and prosperity saved his life, for the automatic assumption was, as always when a witch-hunt is in process, that those who defend witches must be in league with them. At this point his pet, a much loved black poodle called Monsieur, naturally fell under suspicion as a familiar (see AGRIPPA).

It is perhaps not out of place to end this brief survey of the place of the pet in witchcraft with a quotation from a memoir which has nothing to do with witchcraft but is by a man who, throughout his life (he died in 1967) was an outsider of a modern kind, a highly promiscuous homosexual. After several decades in which, by his own account, he expended a disproportionate amount of time and energy in seeking ephemeral sexual gratification, he unexpectedly found peace and fulfilment in a close (but non-sexual) relationship with an Alsatian bitch – 'I don't believe there was anything special about her, except that she was rather a beauty . . . She offered me what I never had found in my sexual life, constant, single-hearted, incorruptible, uncritical devotion, which it is in the nature of dogs to offer. She placed herself entirely under my control. From the moment she established herself in my heart and home, my obsession with sex fell wholly away from me. The pubs I had spent so much of my time in were never revisited, my single desire was to get back to her . . . the fifteen years she lived with me were the happiest of my life.'

The witch in the 17th century sense of the term may have disappeared, the animal-magic on which the ancient rites were based may be virtually extinct in our civilization, but the human need of relationships with the animal world is not extinguished. The plane of spontaneous instinct and sensation which the animal represents continues to exert a powerful attraction for us.

Kevin Hoddle

Fan
Used throughout the world in religious ceremonies and processions: in the Middle Ages a *flabellum*, a silver plate or disc on a long handle was held by church officials to brush away flies from the sacred vessels, and fans made of peacock feathers are still carried by the Pope's attendants on state occasions: in Japan the spreading fan is an emblem of life and prosperity, and decorative examples are used by dancers to represent the rising sun, falling leaves and cascading waterfalls.

FASTING

THE DISCIPLINED CONTROL of the body's natural appetites as a means of spiritual progress is a practice which is common to virtually all religions, ancient and modern. Belief in the value of fasting is apparent in ancient times, as for example in the cults of Mithras, in those of Isis and Osiris and in the Eleusinian Mysteries. In the Old Testament, the fast imposed on the Ninevites (Jonah 3.5–10) involved not only human beings but also animals. And primitives fasted to purify themselves before rituals (as for instance the American Plains Indians before the great Sun Dance).

The purpose behind this denial of the flesh may be to atone for past sins and so avert divine wrath; to placate the gods in times of national calamity; or to prepare the self for communion with God by heightening the mental faculties and increasing spiritual receptivity. Indeed, the value of fasting for this last purpose is recognized not only in religion but in magic; the purpose behind Christ's fasting for 40 days in the desert before beginning his ministry may be compared with that of the magician who abstains from food and sex before attempting to perform certain tasks.

Fasting was an essential part of the Jewish religion from earliest times and *Yom Kippur*, the Day of Atonement, is still

R. K. Singh

Indian holy man fasting during the festival of Singhastha last held in 1968

observed by practising Jews everywhere. Christ himself was careful to observe Jewish laws relating to fasting, although he spoke strongly against the ostentatious practices of the Pharisees. Chief among the Christian fasts is Lent, the 40 days before Easter. In the 6th century the Church introduced fasting as a penance for sinners. Many Christian mystics have seen in fasting the means to apprehend the vision of God: the practice was incorporated in monastic life as an aid to prayer, although excessive fasting, after the Reformation, was condemned along with other extreme forms of asceticism.

In the East, fasting has formed part of the practice of nearly all the great religions, including Hinduism, Buddhism and Islam; in an extreme form by the sadhus and fakirs of India and the Sufis of Islam. In modern times Mahatma Gandhi adopted the practice for the twin purposes of using it publicly as a political instrument and privately as a form of self-punishment and atonement. Among his many 'fasts unto death' that of 1931 proved a successful form of protest against separate electorates for the deprived classes, 'the untouchables'.

In the world of Islam, the fast of *Ramadan*, enjoined by the Prophet, is observed daily for a month, during which the partaking of food, sex and tobacco is forbidden between the hours of dawn and dusk. In modern society, even schoolchildren over the age of ten are expected to observe *Ramadan*. Traditionally the moment when fasting is to begin is when the light of the dawn enables the faithful to tell a black thread from a white, and ends at nightfall, when he can no longer distinguish between these colours. In the words of the writer Begum Aisha Bawany Wakf, the purpose of fasting in Islam is 'primarily a spiritual discipline and as a consequence it inculcates a moral discipline.'

Today in the increasingly secular society of the West, fasting is more likely to be practised for reasons of health or vanity than as a spiritual exercise. But there is also a vague hope that from this chastening experience one will emerge 'a new man' or woman – preserving one of the original ideas behind fasting, that of purification.

(See also FAKIR; SELF-DENIAL.)

Are we the pawns of our genes, the prisoners of predestination, or have we the power of choice? The role of fate in our daily lives concerns not only the philosopher and the priest but the ordinary man in the street

FATE

FROM THAT DISTANT TIME when man first became a thinking animal he must have been concerned, however dimly, with fate: his own fate and that of the world about him. It is doubtful if his attitude has changed much since then. He ponders on what fate has in store for him: if his luck will be good in the future; what his destiny will be and that of the whole human race. His attitude hovers between a feeling of total submission to what is bound to come, and a defiant striving to discover some method by which he can avert the bad and encourage the good, and therefore bend fate to his desires. From these attitudes have grown doctrines of predestination and free will, the division between the theory of determinism and that of choice.

The word fate derives from the Latin *fatum*, meaning a spoken decree presumed to come from the gods. It is that principle of determining cause or will, by which things in general are supposed to come to be as they are, and events to happen as they do, in a word, destiny. That which is destined or decreed is known as one's appointed lot, and collectively, man's ultimate lot. The conception of a foreordained pattern of individual or collective existence has been anthropomorphized into a deity or deities evolved from a primeval shadowy entity.

The Greeks called the goddess of fate Nemesis, the divine anger, daughter of Night, the instrument through which the gods punished those men who grew proud through riches or fame, of whom they were jealous or angry. As time went by, civilization called for a more kindly spirit of destiny and this goddess was transformed into Adrasteia, the Inevitable One, whom no man may escape. The executors of the decrees of Nemesis were the Erinyes, known to the Romans as the Furiae. These Furies hounded out and punished parricides and those who violated their sworn word. The Erinyes were born of the earth goddess Ge or Gaea; their association with Earth helps to explain a title of Demeter, 'Erinys', representing one aspect of this goddess which was concerned with powers of vengeance. In this context the triple goddesses of fate were given the names Tisiphone, Alecto and Megaera. Their faces were black, with living snakes for hair. They hunted the evil-doers with flaming torches and scourges in their claw-like hands, and in hell they tormented the guilty.

Another name by which these fate goddesses were known to the Greeks was the *Moirai* or *Aisai* (Latin, *Parcae*) mighty goddesses of birth and death who allotted joy and sorrow to mankind. Hesiod recorded their names as follows: Clotho, the spinner of man's destiny, Lachesis who weaves the web of chance or luck by which his life is sustained, and Atropos the inescapable one, who cuts the life thread with her scissors when death comes.

The whole of man's life was thus shadowed by these sisters; they presided at his birth, were invoked at his marriage, and as the Keres were present at his death. Zeus permitted them to sit in the assembly of the gods so that they could carry out his decrees, but some say that he himself was under their dominion. They also held the powers of prophecy and as Hecate are worshipped by witches to this day. They bore still other names: Tyche or Fortune who wore a crown and became guardian of cities; Ate the Malevolent who drives men on to irresponsible action, and Litai the Supplicator, who offers prayers for suffering humanity. Stern matrons in their positive roles, they took on the appearance of withered, wrinkled and lame old hags when thwarting the enterprises of man.

The Triple Goddess

In the Scandinavian and Germanic traditions the Fates were known as the Norns. They sat at the foot of the Tree of Life and of the Universe, the Ash Tree *Yggdrasill*, and watered its roots. As with the Greeks, the Nordic Fate was originally one spirit, but eventually took on a triple nature. The Norns were the mistresses of fate, wise women who were judges of right and wrong and dispensers of good or ill fortune. Weavers of destiny, arbiters of life and death, they were named Urd, the Past, who was incredibly old, Verdandi, the Present and Skuld, the Future. The Valkyries, female warrior spirits who rode abroad when war raged, to gather in the souls of slain heroes and carry them to rewarding feasts in the Nordic heaven Valhalla, were instruments of their decrees.

In children's fairy tales today, such as the Sleeping Beauty, we find the Fates demoted into fairy godmothers who bestow such gifts as beauty and wisdom on a child at its baptismal party. The Romans called a birth fairy *Fata Scribunda*, 'she who writes the decrees' for the newly-born. In Arthurian legends these Fates condense into the personality of the enchantress Morgan le Fay, King Arthur's sister who led to Merlin's undoing (see MORGAN).

The Fates, as triple goddesses, were also known as the *Graiae* or Grey Ones of Hellas, having kinship with the Muses. Similar to or the same as the Norns, they lived in the icy north. They were sisters of the Gorgons, greyhaired from birth, and had but one eye and one tooth between them, both of which they passed around as needed. Perseus stole their eye and forced them to tell him the way to the Gorgons. Under whatever name they went, the Fates were all triple aspects of the Great White Goddess, as Robert Graves's researches make clear. The Great Goddess of the Mysteries guarding fate survives in the Tarot cards, appearing in more than one form in the Major Arcana. The pack of 78 Tarot cards, indeed, is known as 'The Book of Fate of the Bohemians, the Book of the Recorder or Thoth the god of Fate and Fortune' (see TAROT).

As far back as ancient Egypt and the Chaldeans, the seeming contradiction between the doctrine of fate and that of free will or the power to choose was felt. If man was fated to carry out an evil act, what place was there for moral choice? Yet the sages taught him to choose the good and reject the evil and he felt intuitively within himself that he had the will to choose, yet at the same time he had the feeling of the inevitability of destiny throughout his life. If all was predestined why petition the gods with prayers, why offer them sacrifices, why strive for better things to come about? The answer to this ancient question, as urged by the priestly scribes, was silence: out of the silence, the magi said, the answer would be made clear: 'The gods love the silent man more than him who is loud of voice.' Man was exhorted not to search too deeply into the hidden ways of the gods, but to accept their decrees though they might seem unjust and yet walk in the way of righteousness.

For the common man, unconcerned with lofty concepts of fate and free will, the important question was, as it has always been, how can one avert the worst decrees of destiny and encourage good fortune? How can one protect oneself and those one loves from the cruel slings and arrows of the gods?

How can one placate the Fates and gain the kind services of the good goddess Fortuna or Luck? Why, even the high gods could cast the Evil Eye of dire fatality upon us! Belief in the Evil Eye by both evil wishers and by the unsuspecting possessors of this gift or curse was universal, and since good fortune and fertility were inextricably mingled in the mind of primitive man, protective measures against this baleful influence frequently took a phallic form. The horn, another symbol of fertility, is still used in this connection. (See EYE.)

Fate and Necessity

The thinking man, however, sought to find a more profound interpretation of fate and attempted in various ways to reconcile the seemingly irreconcilable. Greek mentality was capable of mingling an oriental strain of mysticism in which the magic and the irrational had a place with a rational belief in determinism. Indeed the thought of the more enlightened of the Greek philosophers was orientated towards rationalism. Respectful of the Mysteries before these fell into a decline under the Romans, they were swayed by reason where a study of natural laws and an attempt to discover a common sense politic for the State was concerned. It is as if the Greeks practised an almost perfect or harmonious way of life that allowed for the satisfaction of the irrational needs of the unconscious mind through the Mysteries and the rational needs of the conscious mind through philosophy. They were both religious in their dedication to their noble, if unethical, divinities, and moral in their search for a sober, dignified, truth-respecting way of thinking and behaving in the face of day-to-day happenings. They felt that each had his or its appropriate place, pattern and function in a universe which does not hang upon the whim of the All Father, who himself obeys cosmic law. This law of life was fated and one was compelled to realize its plan for one had no other choice. This is that necessity which applies not only to the ways of men but also to the heavenly bodies – indeed to the whole of life in manifestation.

In attempting to explain the variations which appear within this overall plan, a tendency to overstep justifiable boundaries was postulated. This factor leads to strife, or at least unpredictable change. It allows for our feeling that we have free will and so can exercise judgement upon our acts. The impersonal law which is that of fate, punishes *hubris* or pride – a setting up of oneself against the law of the gods, a sense of the 'I' in opposition to the whole, the rebellious side of man's nature. When punishment has fallen upon the man who has allowed unbalanced force to sway his actions, then the eternal order which the violator or aggressor sought to combat was restored. This explanation of the machinery of the universe led gradually to a conviction that an abiding natural and human law, the foundation of an individual ethic with a social ur political conscience, existed in man.

When Greek thought became permeated with the astrological notions from Chaldean Egypt and India, then an understanding of the decrees of fate and destiny was sought through the study of the planets and their effect upon the lives of men and nations. In that blending of civilizations we can see the mingling of the Eastern cult of the stars with the Greek or Western rationalistic belief in fate or destiny. Epicurus (c 342–271 BC) taught that the gods existed but they did not trouble themselves with the affairs of men, and that man although subject to the powers of Nature, which could be studied scientifically, yet had free will and was, within certain bounds, master of his fate.

Out of the dilemma in which all men have been caught grew the theory or doctrine called Determinism which teaches that acts of the will and social changes result always from determining causes. Human acts are not free but determined by motives regarded as external forces acting on the will. Total rejection of the freedom of the will gave rise to the doctrine known as Necessitarianism, the theory that results follow by invariable sequence from causes. So again and again, we see the goddesses of Fate and Necessity holding sway over our most learned savants. Such theories attempt to make the phenomena of manifesting and evolving life definite by setting limitations upon them, saying that all such phenomena are necessary results of previously existing conditions.

Free Will and Choice

The champions of free will are relatively few among the learned, if we except the theologians of the Catholic Church. Upholders of self-determinism see volition and action as sometimes being determined by the will of the individual and not only by some outside deterministic or materialistic fate; that is, they are capable of being independent of external influence or internal conditions. Here we have the theory known as Indeterminism which holds that it is possible for an individual to choose a course of action independent of the stimuli affecting him, or the motive prompting him at the time of his making his choice. An uprush of primitive emotion from the unconscious may drive a man to kill, but by an act of will he resists this urge and thus avoids committing a crime. He himself determines his course of action in the very teeth of a blind force that might have been called destiny. So self-determinism is the guidance of the individual by his own accord – although he undoubtedly is influenced by previously learnt moral commands – by his free will in this wide sense, that is, his moral purposefulness. Those who decry such a power of choice are called Materialists.

Whether philosophy influenced later religious thought or the reverse it is hard to say, but it would seem that the religious outlook came first, according to what we know of primitive peoples who reflected on the issues of fate and free will. The Roman Church upholds the doctrine of free will even though in the gospels Jesus was destined for the Cross by his Father, and Judas was fated to betray him that this might come about. The Stoic school of philosophers united their concept of fate with that of astrology, for which St Augustine pronounced them in error. For since angels and men have free will, he argued, their lives are not governed from without. It is true that God has foreknowledge of our sins, but we do not sin because of this foreknowledge. St Thomas Aquinas rejected astrology and in face of the question, is there such a thing as fate, said in effect: we may give the name 'fate' to that order impressed by providence, but it is wiser not to use the name 'fate' as it is a pagan word.

With the coming of the Reformation both Calvin, the propagator of the reform in France and Switzerland, and Luther, insisted upon the vital importance of original sin and predestination. God, those reformers taught – founding their dogmas as they believed upon the Bible – had destined from eternity some of mankind to salvation and eternal life in heaven, and others to damnation and life in an everlasting hell.

Kismet and Karma

The man who trusts only in 'luck' or 'good fortune' may easily be led into a slothful or negative attitude to life. In the East there is a temptation to interpret the 'will of Allah' as implying 'there is nothing that I can do about it.' Is the Moslem teaching concerning the will of God or *Kismet* to be considered a doctrine of blind fatalism, and similarly, the far older Hindu doctrine of *Karma*? Certainly not, in spite of popular misconceptions. Both the Hindu Scriptures and the Koran of the Islamic peoples indicate that the will of the Lords of Karma or the will of Allah or God is absolute. From this the uninstructed think that therefore negative submission is all that is required of them. But while Moslems say that God misleads whom he will, Hindus insist on man's own personal responsibility for his destiny. Simplifying it, one could say that the Moslem has to do his very best with that which God allots to him, while the Hindu himself has, through countless incarnations, woven his own destiny and is, in this sense, master of his fate.

In the doctrine of Karma we see an attempt to bring the two ideas of fate and free will together. Living in the illusive present a man may see that which happens to him in his daily life as his fate but in fact, from this point of view, he has woven what happens to him in past lives and is free to improve his character in preparation for future existences. He is therefore the chooser of his chances, good or bad, and as such has fashioned his own good or bad luck.

The Chinese call fate *Ming*, a word meaning destiny, decree or mandate; the first of a more or less anthropomorphized Heaven. Man, the sages taught, receives the decrees of Heaven and therefore is of a more lofty nature than the beasts. He who does not understand the decrees of Heaven cannot become a Superior Man, a Sage, according to Confucius. Besides human nature it was thought there existed an external factor known as fate or destiny. Nature (*Hsing*) and fate are distinct from one another for there are people whose characters or natures are good and who yet meet an

unlucky fate, whereas there are others whose natures are bad and yet who meet with a lucky fate. The doing of good or bad, being virtuous or evil, depends upon one's own character or nature. But calamity or good fortune depend upon fate. This, said Wang Ch'ung (1st century AD) is self-evident and refutes the popular belief that doers of good meet with good fortune while evil-doers meet with bad fortune, which through everyday experience we know not to be the case. That which happens without man's causing it to happen is from fate, said Mencius (c 371–288 BC). That which one meets by seeming chance is actually fate. So it is prudent to recognize and accept the inevitable and to quietly live at ease amidst events.

Stronger Than Instinct

Did fate relegate us to the shackles of mere heredity and environment? Did the Norns make us pawns of our genes? Of our physical, emotional and mental functions only? Our will to live is biological, that is, of the goddess Necessity. But our seeming will to choose may, under certain circumstances, be orientated otherwise than biologically, for we can choose to die as a sacrifice for others or by taking our own lives in despair or through a sense of honour.

The evolution of man's intelligence has permitted at least an appearance of some modicum of free will, of self-determination, and even if the range of this freedom is still extremely limited, there is no reason why it should not grow larger in the future.

Nothing in life is static, all moves, changes, has within it some urge to make something new, different, more complete. This rebel urge in the heart of the ordered workings of the law of life is what flowers in man as intelligence, the director of the will. It is the belief that anything is inexorable, solid, for ever fixed in a certain pattern that is illusion; that which flows into ever new channels is the real.

From a disreputable dabbler in the black arts to the apotheosis of mankind's dilemma: the transformation of Faust over the centuries is as strange as any of the miracles claimed by this 16th century magician

FAUST

THE STORY OF FAUST, or Dr Faustus, who sold his soul to the Devil in exchange for greater knowledge and power, has inspired countless plays and books over the centuries. Under Christian influence the revered magus of ancient days was transformed into a seedy charlatan who must suffer in life and face eternal damnation after death. Yet, this terrible fate emphasized rather than denigrated the powers of witch and magician, who were consequently feared by most people and secretly emulated by some.

The Reformation and the witch-hunters of the 16th century especially singled out the Faust tales, widely told among an uneducated populace, to serve as a dire warning against dabbling in the black arts to gain knowledge above that granted to ordinary men; Faust with his pact and mythical deeds, became the archetype of the legendary magician.

The historical Faust may be regarded as little more than a pebble round which has gathered the moss of later legend although

Aerofilms

undoubtedly, such a man existed some time in the early 16th century in Germany. It was formerly held that he was identical with a printer named Johann Fust (or Faust) who was born in 1400 and died in the plague in 1466, but this theory is now discredited. The facts about the 'real' Faust are still obscure and indeed the records relating to the name are so contradictory that it seems that they can only be accounted for by the hypothesis that either Faust possessed a dual personality – being at the same time a distinguished doctor of theology and a disreputable dabbler in the black arts – or that two men, Georgius and Johann, used the same surname. E. M. Butler has put forward an interesting theory that Georgius and Johann might have been twins.

A Faust who called himself Georgius Sabellicus Faustus Junior, and who claimed to be a necromancer, astrologer, alchemist, soothsayer and clairvoyant, was referred to contemptuously in a letter dated 1507 by the Abbé Tritheim of Spanheim in Germany, who called him a fool, an idle boaster and a charlatan. Several other contemporary writers had a similarly low opinion of this man, who it appears had to flee from his post at a school in Kreuznach when it was discovered that he had taken part in 'the most dastardly form of lewdness' with his pupils. In 1528 a Dr Georgius Faust 'of Helmstedt' was reported to be making wild astrological pronouncements and he was later to be banished from Ingolstadt for soothsaying. It is also recorded in 1532 that the city of Nuremberg refused a safe conduct to the 'great sodomite and necromancer', Dr Faust.

Over the same period it is recorded that in 1509 a Johann Faust obtained a theology degree at Heidelberg, where he distinguished himself brilliantly. Yet a few years later, in 1513, a man named Georgius Faust, described as 'the demigod of Heidelberg' (a title which would appear more appropriate to Johann) was overheard by the Canon of St Mary's, Gotha, boasting and spouting nonsense in an Erfurt inn. A number of other references to Faust between the years 1520–1540 are similarly confusing and fail to provide an answer to the question of the identity of the 'real' Faustus or to make it clear whether it was a case of dual personality or whether the records relate to two different people. It appears, however, that around 1540, his – or their – career came to an end, and prosaic records give place to fantastic rumour and legend.

Miracles or Juggler's Tricks?

Whoever he was it seems that the Faust who was the basis of the later legend frequented the lower haunts of society, and consorted with charlatans, quacks and jugglers in shady taverns, where he boasted of his magical prowess and performed incredible feats. Thus it was first among ordinary folk that he acquired his supernatural reputation, and soon everyone was giving some wild but irrefutable example of the magician's uncanny powers.

It is not surprising that Faust makes little or no appearance in serious works on magic, for the humanist and genuine student of the occult poured scorn on his deeds, and were infuriated by the braggart who was a great magician solely in his own opinion. According to Faust's boasts his own miracles far outdid Christ's, and if the works of Plato or Aristotle were ever lost, he claimed he could not only reproduce, but improve them.

The fairly reliable recorder and demonologist, Johannes Wier (1515–88), exposed Faust as a charlatan in *De Praestigiis Daemonum*, and stated that the pseudo-magician had started the rumour that he was in league with the Devil, whom he familiarly called his 'brother-in-law' or 'crony', to give himself the mysterious reputation which had belonged to powerful wizards of the past. He refers to Faust as a drunken vagabond who had studied magic at Cracow and had practised this art throughout Germany 'with unspeakable deceit, many lies and great effect.' Another contemporary, the classical scholar, Joachim Camerarius (1500–74), spoke of Faust's 'juggler's tricks', and in 1539 a physician from Worms named Begardi classes Faust among 'wicked, cheating, useless and unlearned Doctors.'

A story supporting the view that Faust's magic was no more than trickery liberally laced with malice and impudence also suggests that he might go down in history as one of the inventors of a depilatory cream: the

special arsenical salve he prescribed for a client, to save him shaving, not only removed his beard but also the flesh.

The legends might have lost their impact and become merely another thread in the tapestry of German folklore but for the rising tide of Protestantism, with its anti-humanistic leanings which strove to quench the growing thirst for knowledge, and its unquestioning belief in the unlimited powers of the Devil. It was Johann Gast, a Swiss Protestant pastor, who first attributed genuine supernatural powers to Faust. In a sermon preached in 1548, Gast described his experiences when he once dined with Faust in Basle. The fact that out-of-season game was served at the meal naturally counted as supernatural detail, and Gast declared that Faust's horse and dog – which often took the form of a servant – were really demons. Popular belief in Faust's dealings with the Devil was not only strengthened but encouraged by Luther, and his colleague, Melanchthon; the latter retold how Faust had swallowed whole a rival magician, and tried unsuccessfully to fly to Venice.

More 'evidence' was presented to an ever-credulous public, but who could doubt the truth of the earnest Lutherans' words? It was said that the Devil came in person to claim Faust at his death, and that the house shook and rattled terribly from the supernatural force. Some claimed that the body was torn apart, others that the corpse turned on its face five times despite the efforts of witnesses to lay it on its back.

Compared with famous contemporary magicians such as Paracelsus, Nostradamus and Agrippa, who were also suspected of having dealings with the Devil, Faust's own magical reputation was in some doubt, yet only this shady charlatan became the centre of an undying legend.

Face That Launched a Fleet

So little was known about Faust even in his own century that this allowed great latitude for myth making. Between 1570 and 1578 a manuscript collection of five more-or-less apocryphal Faustian tales appeared. However, Faust's widespread fame is due to his anonymous first biographer, whose *Faust-book* was published in Frankfurt by Johann Spies in 1587. Some of the anecdotes were taken directly from Hogel's *Erfurt Chronicle*, while others, which had been told about Virgil, Merlin, Pope Silvester II, Albertus Magnus, and Simon Magus, were re-attributed to Faust.

Although crudely written and spiced with heavy humour about Faust's dupes, the first *Faust-book* contained the inspiration for later really great works. The summoning of Helen of Troy from Hades, which ensured Faust's damnation, fired the imagination of the playwright Christopher Marlowe to write some of the most beautiful lines in English poetry:

> Was this the face that launched a thousand ships
> And burnt the topless towers of Ilium?
> Sweet Helen, make me immortal with a kiss!

The unknown author's obviously sincere belief in the truth of his tale, and his vivid evocation of hell and the anguished mind of the magician have an undeniable conviction and give tremendous dramatic impact to this cautionary story. Many of the original passages from the Spies *Faust-book* were incorporated by the modern German writer Thomas Mann in his powerful and moving book *Doktor Faustus* (1947).

A fearful reality was also conveyed by the creation of Faust's familiar spirit Mephostophiles, which became Mephistopheles in the 18th century. The identification of a demon by name imbued it with a convincing and terrifying personality that could not be ignored. The first *Faust-book* was an immediate success, and was quickly translated into low German, Danish, Dutch, English and French, and later into Polish and Czech. In Germany other versions soon appeared, one in rhyme.

In 1599 another *Faust-book*, by Rudolf Widmann, was published. It was a very mangled edition of the original, full of pious preaching, and blatantly anti-Catholic and anti-Semitic in its tone; this version was edited in 1674 by Johann Pfitzer. Lastly appeared around 1712 a version which became the most popular of all the *Faust-books*, under the anonymous authorship of 'A Christian Believer', it was entitled *The League with the Devil Established by the World-Famous Archnecromancer and Wizard Dr Johann Faust*. With the appearance of this well known chapbook the original *Faust-book* was almost forgotten, although its influence could be seen in much more

renowned and serious works. An English translation of 1592 inspired Christopher Marlowe's play *The Tragicall History of Dr Faustus* which appeared between 1592 and 1604. Marlowe's inclusion of a vein of comedy in the drama was instrumental in the degeneration of the original tragic tale into various farcical versions, such as William Mountfort's *Life and Death of Dr Faustus with the Humours of Harlequin and Scaramouche* produced in 1684, and John Thurmond's Drury Lane pantomime *Harlequin Dr Faustus* performed in 1724.

Marlowe's play was imported into Germany by companies of English strolling actors in the early 17th century, and as few people understood the English words, the comedy elements were stressed. Numerous German versions soon altered the text, and dispensed with much of the original in favour of the use of spectacular devices and a lot of coarse humour.

For 200 years Faust dramas of this flavour were widely presented on the European stage, with Marlowe's theme more-or-less retained in all of them. An English puppet production was staged in 1728, and such performances were very popular in fairground booths throughout Europe. These puppet plays, although giving tremendous licence to the antics of Caspar, the clown, never failed to show Faust's tragic death and final damnation.

19th century illustrations to Goethe's *Faust*: in Goethe's version the magician is saved from eternal damnation by the intercession of God *Left* Taken to a witch's kitchen by Mephistopheles. Faust is tempted by the illusory vision of a beautiful girl *Right* At the witches' sabbath on the Brocken, the tragic figure of the girl he has used appears to him and he suffers a pang of conscience

Debasement of Legend

Apart from the development of the Faustian theme in drama and literature, and later in ballet and opera, a very significant offshoot of the legend appeared in the form of magical books. They contained a jumble of ancient Chaldean words obtained from Greek and Roman papyri as well as elaborate Jewish rituals. Faust's name on the title pages, purporting to have written and successfully used the contents, as well as in the ceremonies and spells, widely publicized these manuals. The would-be magician of the 17th and 18th centuries believed, among other things, that the magic contained in these books could help in finding and raising buried treasure.

Compilers of these greedy and blasphemous works clung to the tradition that they could outwit the demons, yet in order to increase their sales utilized the name of the very magician whose own legend told only of damnation for dabbling in the forbidden arts. On the whole, the Faust of these magic manuals was a meagre, grasping fellow, who conjured up spirits to provide him with precious jewels or the Elixir of Life and threatened the demons into obedience. This is completely out of character with the Faust who vowed his body and soul to the demon Mephistopheles after 24 years in return for knowledge. The renunciation of God and an eternity spent in hell are very different matters from whistling up demons to do your bidding with the aid of an easily bought manual, and without incurring any risk to the magician.

The concept of magic in the Faust legend was dark and tragic, and the pact with the Devil the inevitable means of damnation. Yet, the Faustian rituals, no doubt partly in order not to scare off prospective buyers, ignored, denied, explained away, or even showed how to get around the diabolical contract.

Among the most famous of these manuals is *Magia Naturalis et Innaturalis* from the Grand Duke of Weimar's library. It gave the text of the soul-forfeiting agreement, but also showed how, while retaining the benefits, it could be renounced through the grace of God. It seems quite incredible that these mixtures of paganism, Devil worship and downright mumbo-jumbo should also have contained pious references to, and a confident belief in the intercession of the Christian God.

The Redemption of Faust

In the 18th century the German writers Lessing and Goethe, while obviously too enlightened to give any credence to the contents of these magic books, were well acquainted with them, and they introduced a totally new dimension into the Faust story: that of his eventual salvation through the intercession of God. Lessing was a

Scene from a National Theatre production of Marlowe's *Dr Faustus*; Faust is confronted by the Seven Deadly Sins, Pride, Covetousness, Wrath, Envy, Gluttony, Sloth and Lechery

Reg Wilson

rationalist for whom the very quest for knowledge was the ennobling factor in mankind's evolution. He wrote a Faust drama (of which only fragments survive) and in some scenes suggested the magician's ultimate reconciliation with his maker. The idea appealed to a number of writers, including Goethe, whose much rewritten and revised *Faust* appeared in two parts: part one in 1808, and part two in 1832 after Goethe's death. The prologue in part one contains the promise of salvation and the final act in part two depicts Faust's redemption.

This masterpiece is not merely the retelling of an old legend with a differently conceived ending, but a philosophical and psychological study of the meaning of human destiny. Faust serves as the personification of humanity seeking wisdom. No matter what sins might be committed during that search, God will grant him salvation because of that very quest for knowledge and truth. In Goethe's *Faust* appears the final form and highest expression of the legend.

Other celebrated writers, however, remained unaffected by Lessing and Goethe, and belong to the traditionalist school of thought, adhering closely to Marlowe's tragic portrayal of a doomed Faust for whom there is no possibility of redemption. None of them seem able to accept Goethe's hopeful ending, and Paul Valéry's *Mon Faust* published in 1946, particularly emphasizes the harm in gaining absolute knowledge with its corresponding power. Thomas Mann's complex and symbolic novel referred to earlier, goes further in examining the very meaning of history, and the paradoxes inherent in an artist's nature and life.

European literature in the 19th century took the Faust legend and interwove it with another traditional tragic myth, that of Don Juan, as in Christian Grabbe's famous work *Don Juan and Faust* which was published in 1829.

From the shadowy reality of a despised charlatan, whose posthumous career took him through great as well as tawdry works of art, emerges not only the character of the legendary black magician, but also the apotheosis of mankind's dilemma.

There are two choices of thought open to those who wish to delve into the tangled skein of Faustian legend: either that of the traditionalist who believes that man is inescapably doomed to destroy himself through his thirst for knowledge and power, or that of the salvationist, who must believe that no matter what transgressions mankind commits in his attempt to attain wisdom, God has vowed to redeem him.

FEATHER

THE PROVERBIAL LIGHTNESS of the feather – so sensitive that held to the lips of a dying man it betrays whether he is still breathing or not – is the aspect which the ancient Egyptians associated with the hairbreadth balance between truth and lying. In the old Egyptian picture-language, the hieroglyph for Maat, goddess of truth and therefore also of justice, was the ostrich feather, and in their ritual beliefs about death and the consequent journey to the underworld, the symbolic feather plays a vital role in the Judgement of the Dead. The deceased entered the Hall of Judgement, which was presided over by Osiris seated on his throne, clad in a tight-fitting robe of feathers, emblem of righteousness. Around the hall sat the 42 judges, each with the feather of truth on his head. The heart of the dead man was placed in one pan of the scales and in the other was placed Maat, or her symbolic representative the feather, to test the truthfulness of his testimony. Only if the two pans were perfectly balanced, did Osiris give favourable judgement: 'Let the deceased depart victorious.'
(See JUDGEMENT OF THE DEAD.)

Symbol of Peace

Of course many American Indian tribes also used feathers in this way, adding an extra feather to their headgear for every slain enemy. From this practice grew the superb traditional war bonnets of the Plains Indians – cascades of feathers (usually from the golden eagle) down warriors' backs.

The bonnets seem to have originated with the Siouan tribes; other Indians had their own sort, such as the Blackfoot war bonnet, a crown of feathers standing upright around a headband. But the usual inter-tribal borrowings led to the widespread adoption of the Sioux bonnets.

Feathers also functioned most centrally in American Indian religious practice – there reflecting a basic mythological idea, that birds are links and mediators between men and gods. Feathers had a mostly ornamental use for many north-west Pacific tribes, though such ornaments would indicate rank and status in highly status-conscious communities. (Similar considerations operated with the magnificent feather cloaks worn by Mexican and south-east American Indians; and the Creeks and others had turkey-feather fans to be carried during ceremonies as a sign of leadership.) But the north-west tribes also brought feathers into religion, in the form of down – which, as a symbol of peace, according to P. E. Goddard, was strewn over men's hair on all religious occasions.

More importantly, feathers were a major part of the ceremonial decorations on many of the objects used in Indian religious worship. Feathers decorated the calumet pipe that was smoked in so many rites of the Plains – and that was borrowed (from the Pawnee and others) by eastern tribes, Iroquois and Cherokee. The eastern Indians also borrowed an important rite called the Eagle Dance, in which feathers naturally functioned – mainly in the form of fans made from four eagle, turkey or wild goose feathers which were carried by the dancers.

C. M. Dixon

Feathers have, predictably, many magical and ritual roles in the complex religious activity of south-western Indians. But their greatest prominence is as the primary symbolic decoration on the 'prayer sticks' that are so important to such tribes as the Pueblo or Navaho. The feathers seem to be the specific 'carriers' of the prayer that is being offered up by means of the sticks. Sometimes, indeed, a cluster of feathers not on a stick can have the property of carrying a prayer.

And it seems that different feathers can have different associations. So (to oversimplify the symbolism) eagle feathers that are tinted red are linked with curing societies, but in natural colours they are associated with the dead, as are turkey feathers; hawk feathers are connected with war, and so on.

In Hungary during the 15th century struggles against the Ottoman Turks, only a man who had slain a Turk was permitted to sport a feather. The so-called Prince of Wales's feathers, the crest consisting of three ostrich feathers, has a similar provenance. It was taken by the Black Prince from John of Luxembourg, whom he left dying on the field at the Battle of Crécy in 1346 and it has remained the badge of the Heir Apparent to the English throne.

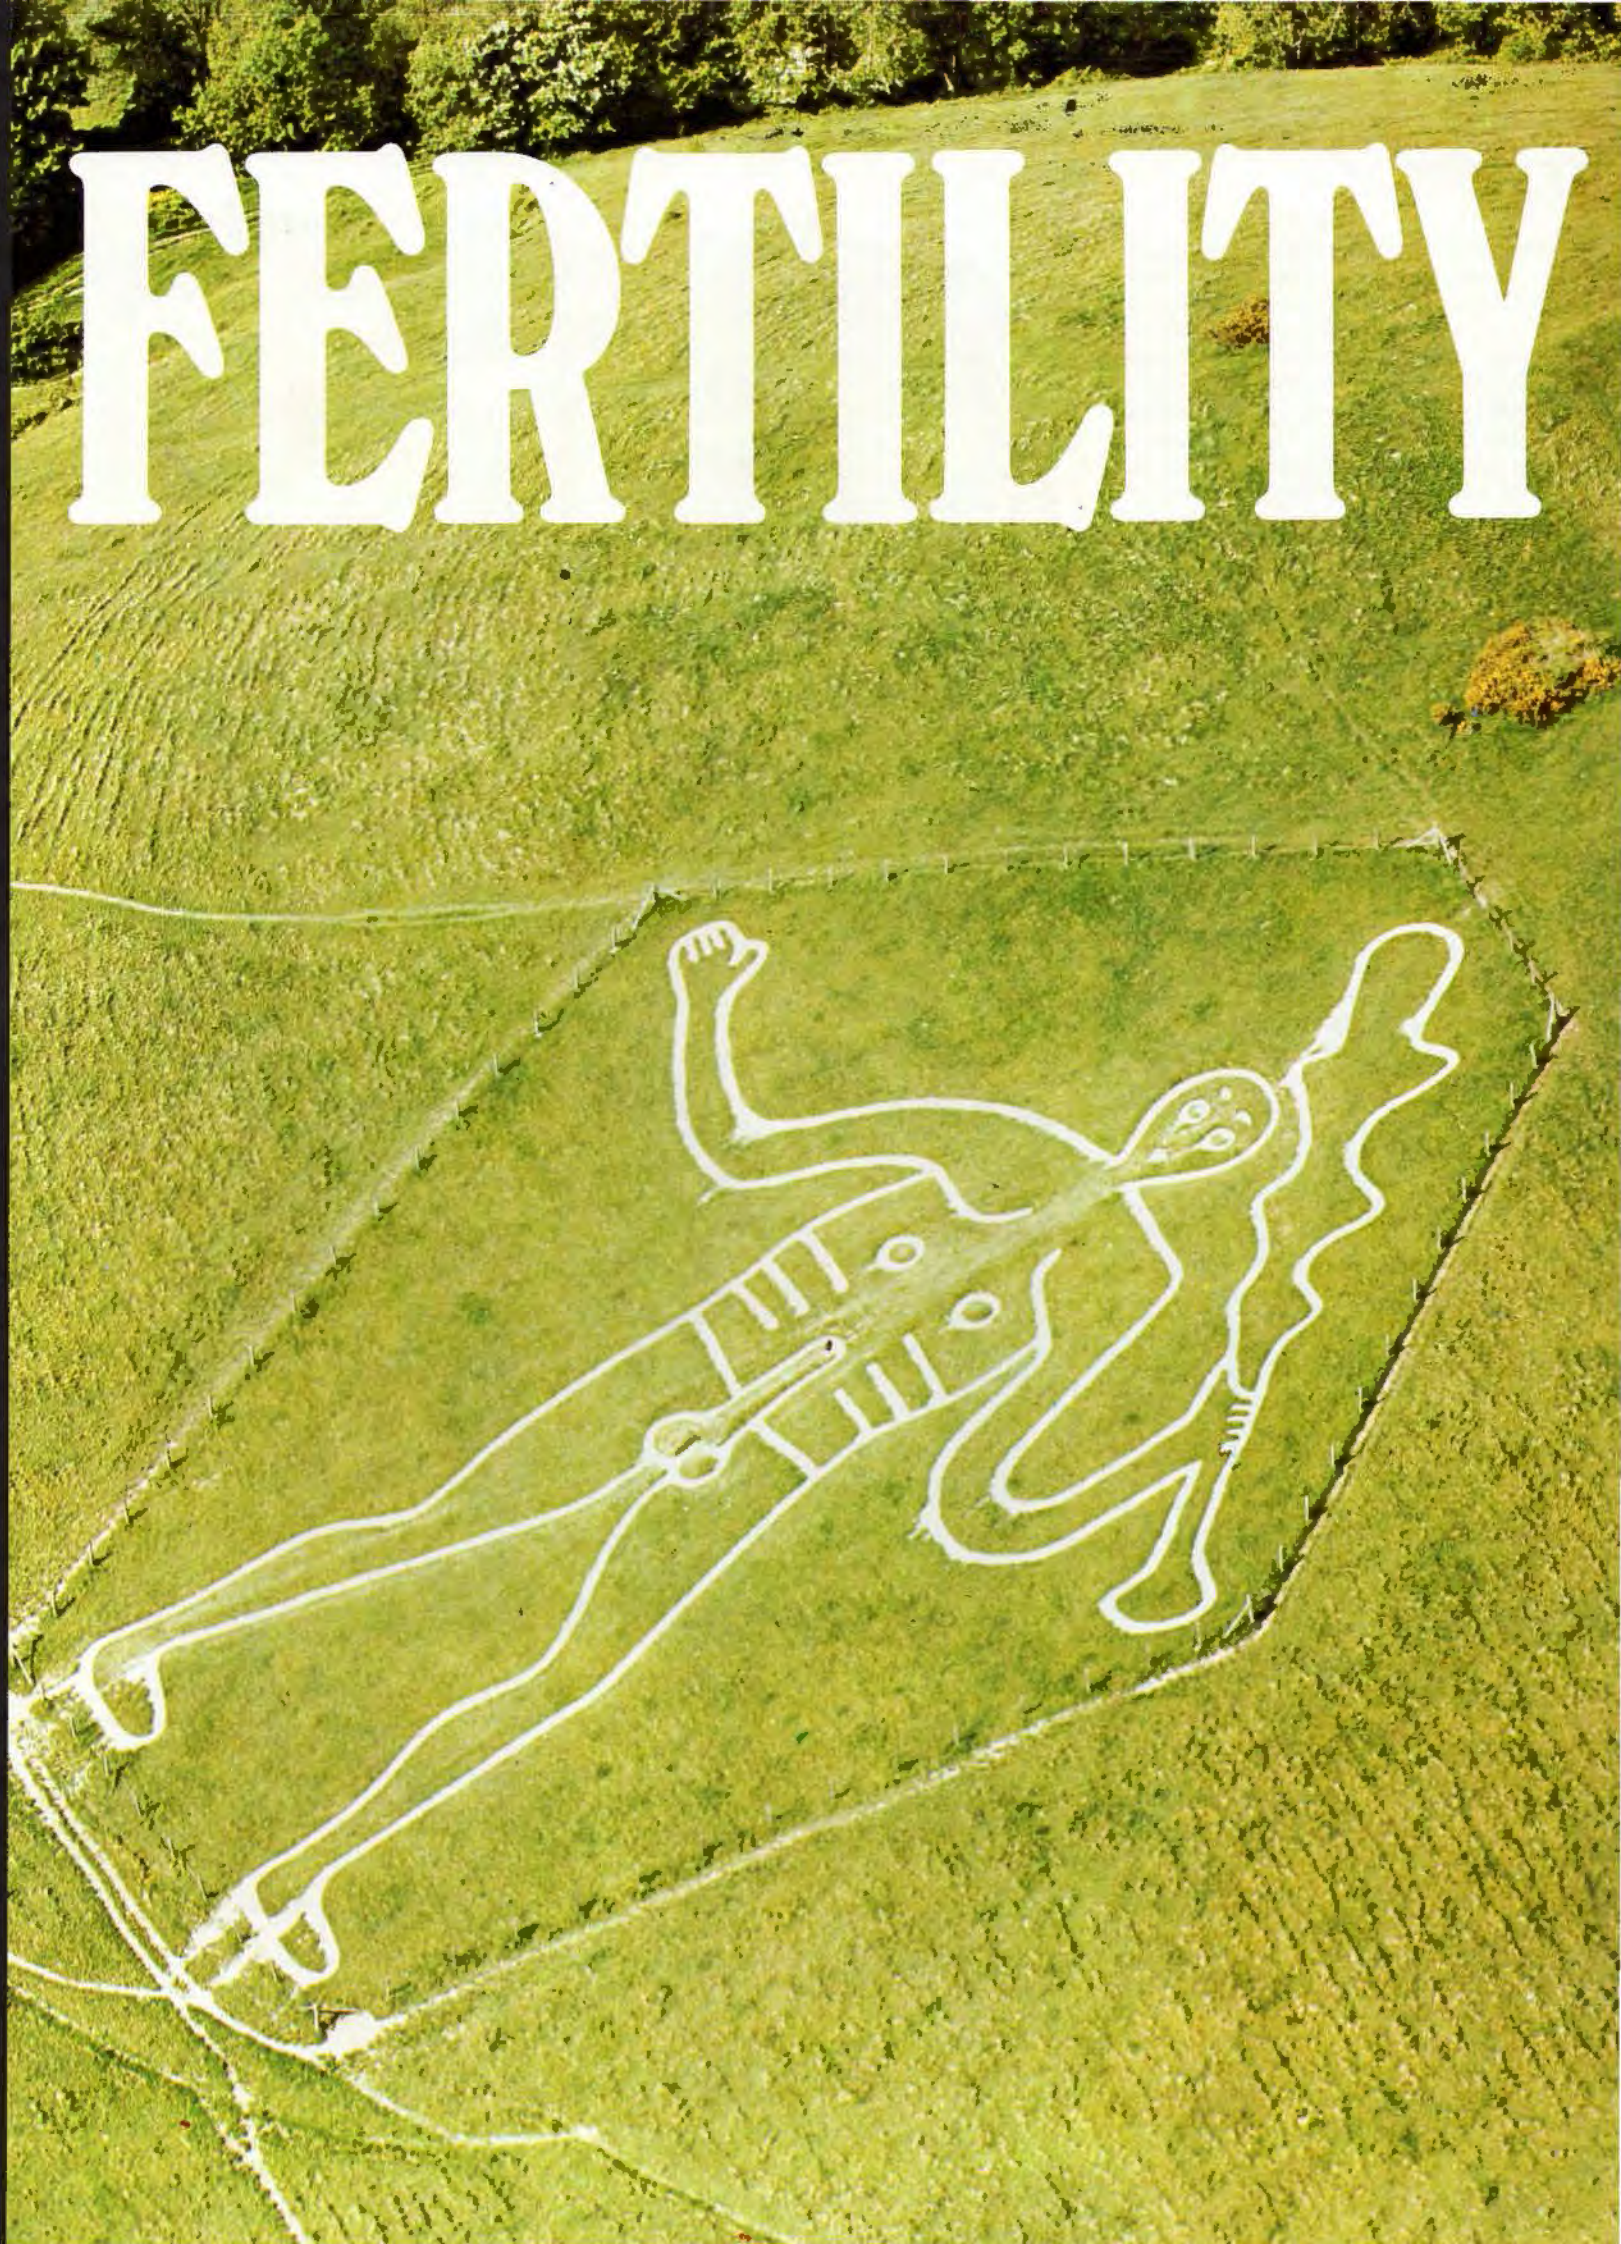
FERTILITY



Jorgen Bitsch

Primitive man often made images of beings with exaggerated sexual features, hoping by means of magic to appropriate some of the powers of fertility with which those figures were identified *Left* The Cerne Abbas Giant, cut into a Dorset hillside, is shown with an erect phallus: it is thought to have been a cult figure of Hercules dating from Romano-British times *Right* The crudely erotic figures on this African hut in Chad are designed to promote fertility

Primitive man believed that fertility, the principle at the root of all life, was entirely subject to the control of the spirit world

THE FASCINATING WORLD of magic and religion is often bewildering due to the vast variety of beliefs and practices which a century and a half of scholarship has accumulated. It is drawn from every age of mankind, and from every corner of the world. Much of it is extremely remote either in distance or time, and therefore very difficult to interpret. And yet because of the common bond of humanity which links us with bygone races, the attempt at understanding should be made.

'Fertility' is an exceedingly common word in religious history. By it we mean firstly, the principle of reproduction and growth, as it is manifested in man, in animals, and in the plant world; and secondly, by implication, the belief that reproduction and growth can be controlled and furthered by magical or religious means.

Man has always had a passionate concern with fertility: it has been a consistent feature of almost every type of human society, and particularly, agricultural society. Consequently, scholars have often seized upon the ideas of, and the rituals connected with fertility, as a key with which to attempt to decipher the mysteries of primitive religion and magic.

Ripeness Is All

The obsession itself is not difficult to account for. Man's knowledge of the biological and physiological processes controlling fertility is of very recent date, and human life-expectancy only a century or so ago was assured only on condition of frequent reproduction, for as long as the female of the human species remained capable of bearing children. Death was perhaps a calamity; but not so great a calamity as barrenness. Human life depended, too, upon the fertility of the fields which man tilled, the fruit which he gathered, the animals which he ate, milked, or hunted. It is only in the technological societies of the West that man has become to some extent liberated from a life-and-death struggle for existence, in which the need to reproduce his kind, and to see his crops growing and his animals bearing young, has been paramount. Elsewhere in the world, and at almost any other point in human history than the 20th century, failure of fertility, whether of man, animal, or field, has meant simply and starkly death. Small wonder, then, that the idea of fertility has loomed so large in his thinking and feeling.

Man's constant attempts to promote fertility are equally easy to explain, at least on one level. We know that in the past, the world has not as a rule been particularly amenable to man's efforts to control it. But despite this, the human animal has obstinately refused to give in. We must not fall into the trap of supposing that archaic man's attitude to the world in which he lived was one of dull resignation. Where archaic and primitive man differs from modern man is that whereas modern man strives to master certain fields of knowledge and influence, and acts accordingly, archaic man was convinced that ultimate power was never in his own hands. There were sources of power, but these lay without exception in the spirit world – the unseen, supernatural world of gods, spirits, demons and ghosts. What man had to do was to establish contact and rapport with the unseen world, with a view to channelling and applying its power. For power was a property of spirit; and thus the spirit world had to be approached, and if possible controlled, if man was to have a share in its blessings. Equally, since that power could (and frequently did) work in ways inimical to man, it had to be propitiated and kept friendly, lest it should simply sweep him, his children, his cattle and his crops away.

If a woman conceived, it was not because she had intercourse with her husband but because the spirits had put a child into her womb

Fertility was entirely subject to the power and control of the spirit world, whose greatest gift was the gift of life. When life came into being, it was because the spirits had made it so; when life ebbed and disappeared, or was withheld, this too was the work of spirits. In this most vital area of human experience, there was no effect without its spiritual cause. If a woman conceived, it was not because she had intercourse with her husband, but because the spirits had put a child into her womb. If the corn sprouted in due season, it was because the Sky Father had impregnated the Earth Mother and caused her to bring forth. If a child died, it was not through disease or malnutrition, but because an evil spirit had stolen away the child's soul.

To archaic man then, the world appeared to be governed by its own immutable laws: not the biological laws we think we know so well, but the laws of universal cause and effect, of giving and withholding, of correspondence and adjustment. And fertility – which is, after all, only a convenient Western abstraction – was completely subject to this pattern.

Rhythm of the Seasons

The first characteristic of the pattern of fertility, as man has experienced it for the greater part of history, is its cyclical character. In the temperate zones the rhythm of the seasons, on which so much depended, was utterly reliable and could without difficulty be regarded as a divine ordinance, as in the ancient Hebrew tradition: 'While the earth remains, seedtime and harvest, cold and heat, summer and winter, day and night, shall not cease' (Genesis 8. 22).

In parts of the world where the seasons were less well defined, other patterns took their place – patterns dominated by the alternation of wet and dry periods, by the phases of the moon, and the like. To the seasons corresponded the stages in the growth of the crops, and the mating habits of animals. Crops, animals and humans had their appropriate gestation periods. The menstrual cycle of women was seen to correspond with the phases of the moon. All this adds up to a conception of time, not as an ordinary linear progression from point A to point B, but as an infinitely repeated series of cycles, in which growth succeeds birth, maturity succeeds growth, and death succeeds maturity. But even death was not the end, for spring came to drive out winter, and the annual miracle of the rebirth of the crops served to remind man that life was always latent in death.

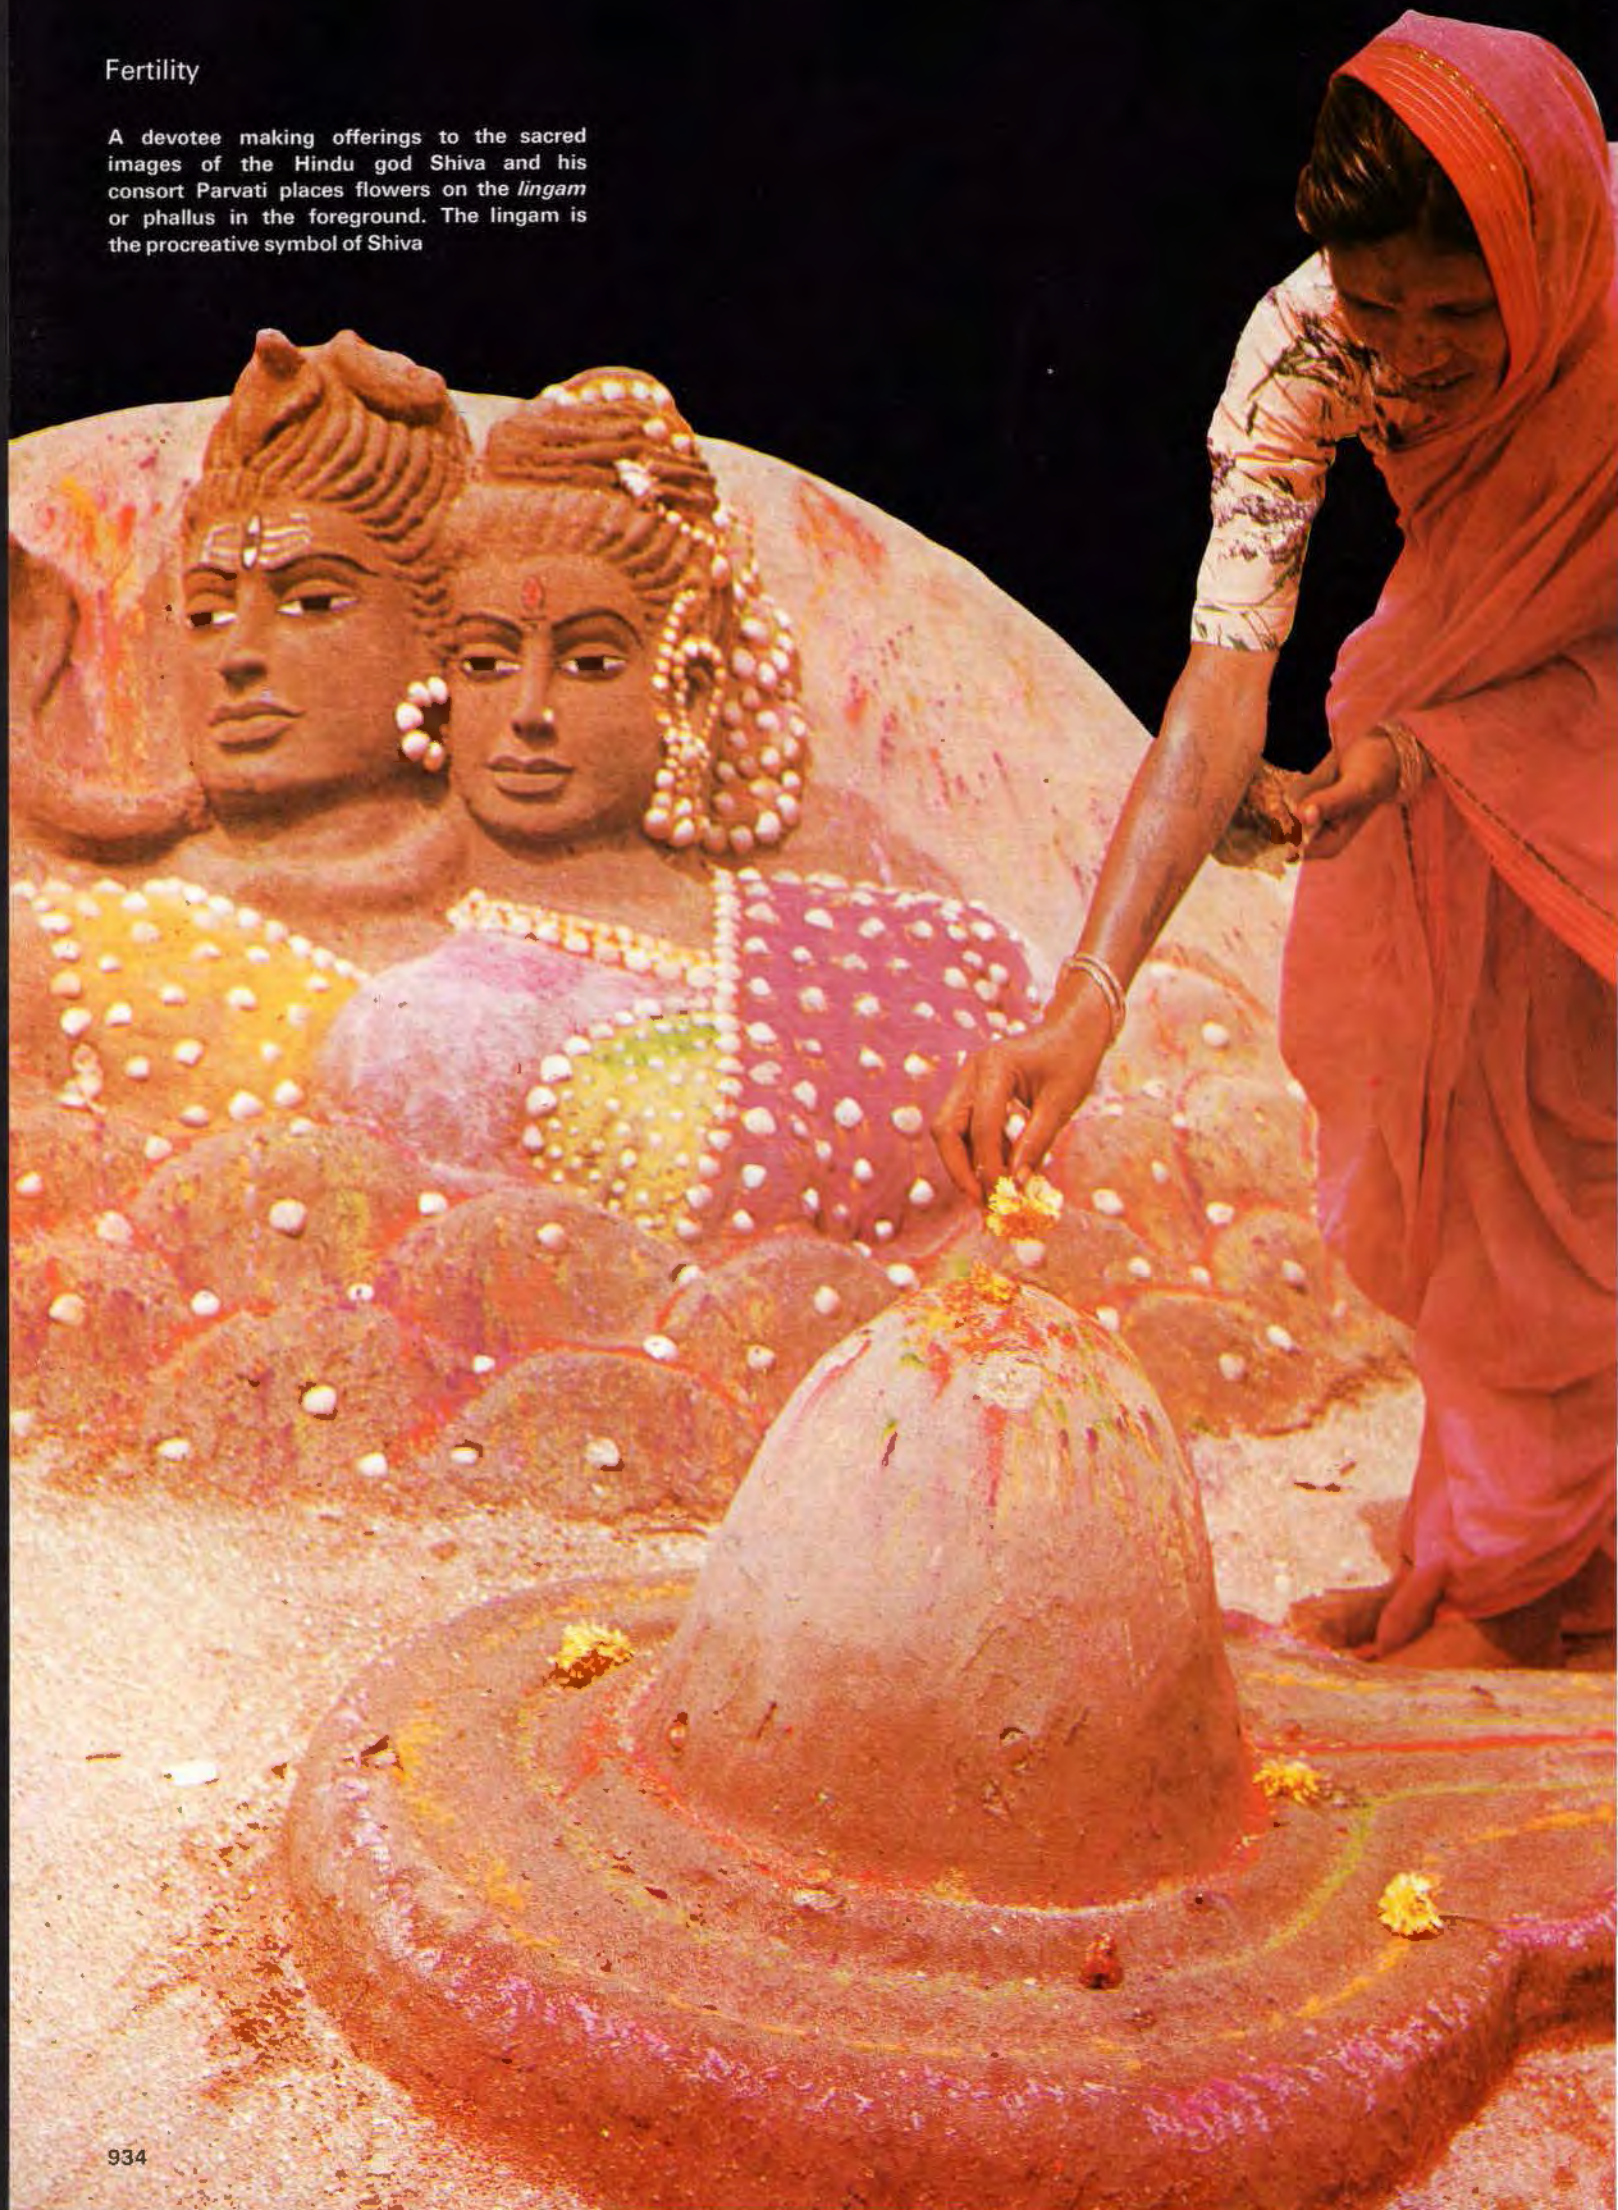
Left **Primitive 'Venuses', emphasizing the maternal aspects of woman, were probably used as fertility charms to induce pregnancy: 2nd century BC clay figurine from Yugoslavia** ***Above*** **Stetuette of the Canaanite fertility goddess Astarte, now in the British Museum** ***Right*** **Erotic Indian carvings from the temple at Khajurajo, testify to the importance of fertility in Hinduism**

It is easy thus to characterize the fertility cycle as a series of 'natural' phenomena; but archaic man did not think of it in that way. The power of life was not an impersonal entity, which merely needed to be left to its own devices. Accordingly we may say that its second characteristic was its personal, 'hierarchical' nature. Personal not necessarily because it was regarded altogether in human terms, but because it was able to be approached by humans, with whom it had some features in common, and could be, in some cases, communicated with. Hierarchical because it was thought of as a graded hierarchy of spiritual beings, from the mighty gods of the sky to minor, and in many cases malevolent, demons and ghosts.

Whether the various deities and spirits that went to make up the supernatural chain of beings were intrinsically benevolent or malevolent is an open question.

Fertility

A devotee making offerings to the sacred images of the Hindu god Shiva and his consort Parvati places flowers on the *lingam* or phallus in the foreground. The lingam is the procreative symbol of Shiva



The annual return of fertility was seen as a repetition of an original act of creation, in which order triumphed for the first time over chaos, fertility over barrenness

Many could be either or both, according to their moods and to the extent to which they had been acknowledged and propitiated. Perhaps it would be safe to say that any one of them *could* be dangerous, especially if slighted or ignored.

Art and Magic

The third characteristic of the fertility pattern, depended on the first two. The various cycles of fertility were thought to depend for their continuance upon the activity of the supernatural powers: the great cycles upon the great powers; the lesser cycles on lesser powers. In other words fertility, at whatever level, is always caused; it never just happens. Once the dependent nature of fertility in the thought of the greater part of mankind is recognized, it becomes clear firstly, that should the supernaturals choose for any reason to withhold the gift of life, this is a sufficient explanation for famine, failure in hunting, miscarriage and barrenness. And secondly, that the nucleus of primitive and archaic religion and magic alike concerns man's attempts to reconcile and appropriate the power, or life-force, that the supernaturals wield. Therefore man does what he can to ensure that the gods and spirits remain friendly. This may involve playing off one against another – a greater power against a lesser, or a benevolent spirit against a malevolent.

An example of this attempt to control Nature is the celebrated cave art of south-western France and the Pyrenees. It has been supposed by some authorities that their main purpose was magical: to ensure a supply of game animals, and success in hunting them. It has also been noted that the more dangerous the animal, the more often it occurs in the paintings, and the more seldom its bones appear in prehistoric kitchen refuse heaps. Scenes in which a bison, for example, is shown transfixed by spears or arrows, as well as recording an actual successful event may well have been intended to ensure repeated success. To this extent the purpose of the paintings appears entirely magical. But the underlying attitude, which saw the prey which a hunter hoped to catch as controlled by forces outside man's control, verges upon the religious; it presupposes the existence of a supernatural world, and the need for man to take that world into consideration.

Analogies from more recent pre-literate peoples may only be of limited value, but the various hunting tribes of the northern hemisphere (America, Europe and Asia) appear to exhibit a similar mixture of motives. North American Indian tribes, for instance, combine 'magical' rituals, designed to ensure the increase of the species, with a firm belief in the 'Owner of the Animals', who owns and rules the particular species in the same way as the Supreme Being rules over the universe and the world of men. The bear, which was always held in especial reverence, was hunted; but the killing was done with apologies and with as little blood as possible, and after death honour was paid to the skull. Doubtless the motive was in this case one of sharing in the great power of the bear; but in the case of the Ainu of Sakhalin Island in Japan, when a bear was killed, it was despatched with ceremony and sent home to its Owner, to tell of the good treatment it had received and to ask that more game be released. Should the Owner be offended, on the other hand, bear cubs would not be born and the bear could not be hunted (see BEAR).

Festivals to Ensure Fertility

In agriculture, the great fertility cycle is that of the seasons of the year, and in agricultural communities, two major events – the sowing of the seed and the harvest – were frequently the occasion for particular celebrations or festivals. Lesser festivals, though with virtually the same significance, took place at midsummer and midwinter. Traces of all these festivals survive to this day in the West, sometimes changed out of all recognition, sometimes – as in the case of the Scandinavian *Jul* (Yuletide or Christmas) – retaining enough of the original symbolism to demonstrate its origins. In the same way, the widespread 'first-fruits' and harvest rites practised by American Indians (in common with peoples all over the world) find a modern reflection in the American festival of Thanksgiving.

In all such cases, the objective was the continuation of the seasonal pattern, and the ensuring of a good and fertile year. The High Gods of the sky were the protectors of the cosmic order and the great givers of fertility, and so the festivals were centred, explicitly or implicitly, around the mighty deeds of these gods. A further feature which must be borne in mind is that the annual renewal of fertility was in very many cases seen as a repetition of an original act of creation, in which order triumphed for the first time over chaos, fertility over barrenness (see ETERNAL RETURN); accordingly, the festival itself was a magico-religious renewal of creation.

In the Babylonian *Akitu* (New Year) festival, the great epic of creation was recited, celebrating the victory of the god Marduk over the dragon of chaos. In addition there was a pattern of ritual, to which the myth served as a type of libretto. Centering on the figure of the king as the representative of the High God, this took the form of a symbolical dramatic confrontation between the god and the powers of chaos: chaos wins a temporary victory, law and order is forgotten for a time, the king is divested of his symbols of office; but then order is restored, rejoicing breaks out, the king is enthroned anew, and celebrates a 'sacred marriage' with a chosen priestess. New Year festivals of this type ensured the fertility of the land for another cycle. Since the power of fertility was in the hands of the High God, who stood at (or near) the head of the pantheon, only the king, as the head of the human hierarchy, could take it upon himself to approach the god and appropriate this power on behalf of his people.

The sacred marriage could be repeated on all levels of the hierarchy. Here, as elsewhere, we are confronted with an elaborate correspondence of man with the cosmos. The intercourse of the king and the priestess might be believed to further the fertility of the fields. References are scattered through the literature of popular religion and folklore to this practice. In the *Odyssey* there is mention of the occasion '. . . when fair-tressed Demeter, yielding to her passion, lay in love with Iasion in the thrice-ploughed fallow land . . .'. Intercourse on the field forms the climax of many recorded fertility rituals, and the 'May King' and 'May Queen' of European folklore may be supposed once to have symbolically fertilized the fields for another season.

This correspondence of function extends to the person of the woman and the 'person' of the earth. In mother goddess symbolism, the earth is regarded as a woman; conversely, the woman may be regarded as a ploughed field, and the male organ as the

Camera Press London

plough. Regard for the sacredness of the 'body' of the earth has, however, been known to give rise to a refusal to cultivate it. A North American chief is recorded as having said: 'You ask me to plough the ground! Shall I take a knife and tear my mother's bosom? Then when I die she will not take me to her bosom to rest. You ask me to dig for stone! Shall I dig under her skin for bones? Then when I die, I cannot enter her body to be borne again. You ask me to cut grass and make hay and sell it, and be rich like white men! But how dare I cut off my mother's hair?'

The Water of Life

Fertility as resulting from the interaction of male and female is a principle which animates virtually the whole of primitive and archaic religion. There is reason to suppose that many High Gods were at one time thought of as being androgynous, that is both male and female, but in historical times, one or other principle generally becomes dominant, usually, in the case of the gods of the sky, the male. The High God was the god of the sky and atmosphere, and as such controlled the phenomena of the weather, particularly the sun and the rain. Examples of this might be drawn from very many sources – the Greek Zeus, the Roman Jupiter, the Finnish Jumala and Ilmarinen, the Babylonian Marduk and the Israelite Yahweh. As it says in the Old Testament: 'He covers the heavens with clouds, he prepares rain for the earth, he makes grass grow upon the hills' (Psalms 147. 8).

The idea of the High God as sole dispenser of fertility accounts, however, for only a small part of early beliefs. Lesser gods, ghosts and demons have their own proper areas of influence, too. In a surprisingly large number of instances, the fertility of man is thought to rest with ghosts. One African tribe, the Nyakyusa, believe that the departed spirits control semen and seeds, and are always present at intercourse. Another tribe, the Lele, believe that human fertility is controlled by spirits residing in the deepest and dampest parts of the forest. Water has always been regarded as a major factor in fertility and amphibian or scaly animals are thought to be close to spirits and therefore especially 'powerful' in this regard. The connection between fertility and rivers, streams and wells is obvious.

In Derbyshire, the custom of 'well-dressing', is still carried out at more than a dozen villages, during which wells are decorated with flowers and various rites performed. The origins of this custom are no longer remembered, but its significance is evidently propitiatory: each well had its own guardian, who had to be honoured, lest he should cause the well to dry up. The custom is now Christianized, and takes place on Ascension Day, immediately following the three Rogation Days – days on which God's blessing is asked for the crops.

In India, there is a sacred grove, near Tiruttani, in Tamilnad, containing seven pools, or *yonis* (this is also the word for the female organ). Round the pools there are trees, in many of which votive offerings are hung by women wanting children. Offerings are similarly made in the precincts of many Hindu temples, usually under a pair of trees, male and female.

The Potent Gods

The symbolism and mythology of fertility in the cosmos corresponds to the interaction of male and female which is so large a part of human experience. In the cosmos, as in human experience, the generative power of the father is met and accepted by the receptive fecundity of the mother. A common overall pattern is therefore that of the Sky Father and the Earth Mother, repeated, with infinite variations, through the world of religions.

In the ancient Vedic religion of India there is the primordial pair Dyaus Pitar and Prithivi Matar, and in Hinduism Shiva and Shakti, Kali or Durga, Vishnu and Sarasvati, Krishna and Radha; in Egypt (where the pattern is to some extent reversed, the sky being regarded as the goddess Nut, sometimes symbolized as a cow) Osiris and Isis; in Mesopotamia Anu and Ishtar, Marduk and Sarpanitu; in Greece Zeus and Hera; in Scandinavia Frey and Freya. Not all these pairs can simply be identified with sky and earth, but rather with generation and fecundity as universal principles. Either may be dominant; the cult of the bull in the Semitic area and in the Minoan-Mycenean religion of Crete and Greece witnesses to the dominance of the male (see BULL; CRETE), while cow-worship in, for example, Hinduism points in the opposite direction (see COW). The 'mother goddess' figure in particular is capable of many varieties of expression, and may bear many names, as her attributes (the chief of which is that of the 'vessel') are taken over by local goddesses, belonging to the lower orders of the hierarchy.

Human male and female meet in the act of sexual intercourse; and the overall symbolism of fertility gods and goddesses is very frequently derived directly from that act. The great male gods were often represented with an erect phallus (ithyphallic), and mother goddesses either as pregnant, or with exaggerated breasts and labia. Ithyphallic figures are found in Paleolithic cave paintings and in the Bronze Age rock carvings of Scandinavia, as well as in the paintings and sculpture of many pre-literate peoples.

Evidence of phallic cults is found in the civilizations of antiquity: in Greece connected with Hermes, Demeter and Dionysus; in Rome, at the festival of Liberalia; in Egypt, Osiris was a phallic god, and the mysteries of Isis contained phallic elements. Farther north, in the greatest of the pre-Christian Scandinavian temples, that at Old Uppsala, in Sweden, it was recorded by the German writer Adam of Bremen that down to the 11th century the image of the fertility god Frey was ithyphallic. In early India, one of the best known of the seals discovered at the Indus Valley site of Mohenjo-Daro (c 2500 BC) represents a three-faced, horned deity, sitting in a yogic position and surrounded by animals; this figure, which has been identified with the later Shiva, is likewise ithyphallic. In later Hinduism, the phallus *(lingam)* is the symbol of Shiva, and although many Hindus would today contest the origin of the symbol, the evidence of erotic sculptures leaves the matter in little doubt.

Mother goddess symbolism is of many kinds, ranging from great crudity to great sophistication. Among the earliest attempts made by man to represent the symbol of maternity in plastic form are the so-called 'Venuses', rudimentary female figures shaped during the Upper Paleolithic period out of bone, ivory or stone. While their sexual characteristics are greatly exaggerated, their faces are seldom more than hinted at (see FACELESS GODDESSES). The use to which they were put must remain a matter of conjecture, but it seems at least likely that they were fertility charms, the possession of

Left The Wakamba fertility dance is frequently performed in many parts of Kenya. While the women stand in a circle and play on whistles, the men drum, dance and display their physical prowess by performing gymnastic feats, gradually working their way towards the women *Right* May Day celebrations begin with the gathering of flowers and branches and 'bringing home the May', or bringing the new life of spring, into the village. A maypole is erected and festooned, and young girls perform a dance around this phallic symbol

Barnaby's Picture Library

which was believed to bring about the condition they represent, that is, pregnancy.

A somewhat more sophisticated – at the same time more realistic – expression of the principle of fecundity is the figure of the mother and child. Images of this kind are found in Ancient Egypt, and an unbroken line may be drawn from these to modern figures of the Virgin and Child in Christian churches. Of course, the symbol has undergone many modifications in response to theological and other pressures, but its significance is still not far removed from that which it originally possessed – the divine principle of fecundity and motherhood nourishing the 'son of man' from her own body.

Cycle of Birth and Death

In the past it has frequently been believed that children are indeed born from the divine earth, from caves and ravines, springs and wells; and as man is born of the sacred soil, so he must one day return to that same soil from which he once emerged, perhaps to be reborn – the image on which the Greek mysteries depended – perhaps not.

The fact that the divine earth gives birth to man, beast and plant, and also receives the lifeless corpse in burial and decomposition – in other words, that the idea of fertility has as its corollary the idea of destruction – has been responsible for many grim images. Today we are apt to fall back upon abstract notions of the passage of time, such as 'Time, like an ever-rolling stream bears all its sons away,' but the myth-maker was once less easily satisfied. Particularly in those religions in which the female principle was dominant, in which the body was buried – returned to the womb of the earth – rather than being cremated, the same images which represented fertility also represented death and destruction. So it is that mythology tells how the great mother goddesses descend into the realm of departed spirits – the Mesopotamian Ishtar into the shadowy realm of dust and death, Kore (Persephone) into the House of Hades – symbolizing the annual death of vegetation and the fate awaiting all men. They emerge, however; and in the Greek mysteries, of which the rite of Eleusis may be taken as typical, the initiate may assure himself of immortality by assimilation to the cosmic fertility pattern they represent. Demeter, goddess of Eleusis, presides over birth and death alike, and offers to her devotees the gift of life – eternal life (see DEMETER).

Elsewhere there is hope of reincarnation. The most striking of these ambivalent images is perhaps that of the Hindu goddess Kali, who is undoubtedly a mother goddess but equally a goddess who devours even her consort, Shiva the destroyer. Her tongue protruding, her body wound round with snakes or with ropes of human skulls, her fangs dripping blood, she dances in triumph on the prostrate body of Shiva.

An ancient Hindu marriage ritual contains the words, spoken by the bridegroom, 'I am the sky, you are the earth.' To comprehend the place of fertility in the world of religion and magic one must understand the vast correspondence between the microcosm which is man and the macrocosm which is the universe in which man lives. Both depend for their life and their continuation on the power of the spirit world, and what is done in one reflects in unimaginable ways on the other.

(See also DYING GOD; EARTH; MOTHER GODDESS; PHALLIC SYMBOLISM.)

FETISH

A MAGIC CHARM or amulet, worshipped because of its significance to the individual rather than for its physical attributes or for any symbolic value, is called a fetish. It protects the possessor from harm by virtue of its inherent talismanic properties warding off evil. In many parts of Africa the use of these guardian objects has become an important sub-stratum of the established religion, and has earned its own name – fetishism. This cult employs fetishes in two distinct ways. For domestic use, common natural objects with supposed supernatural powers are preserved, rather as the horseshoe or four-leaf clover are valued in parts of the West. Sometimes they are impregnated by the medicine-man with a concoction, the composition of which depends on the intended purpose of the fetish. These objects therefore, not only safeguard, but cure, and they can be anything from teeth to snakes' heads, or may take the form of images of men or animals. Many of the fetishes on the West Coast of Africa are embellished with reflecting glass, an addition dating from the introduction of mirrors by Europeans and the resultant association with 'white man's magic'.

In the second, more social, aspect of the cult, the fetishes are considered to be divine ministers, harbouring the protective powers of the spirit-world. The important fetishes are guarded by fetish-doctors who act as the spirits' representatives. It is the responsibility of each fetish-doctor to carry out the rites and ceremonies appropriate to a particular spirit. In exchange he is protected by his spirit and can make use of some of its power for the benefit of the community at large. Each spirit has its own prescribed function and the fetish-doctors tend therefore to be specialized and cover a narrow field of activity: they may ensure a successful pregnancy, attract or deter alligators, cause or prevent a whirlwind, and so forth. When a native intends to go hunting, he applies first to the fetish-doctor of hunting who supplies him with the necessary charm. Some tribes possess a 'man-panther' fetish-doctor who is consulted to detect criminals and wrong-doers.

As Puckett makes clear in *Folk Beliefs of the Southern Negro*, the fetish concept was brought to America by the slaves, and for years formed an important sub-stratum of Southern folklore. Fetishes have gone by many names in America – conjures, hoodoos, jacks, goofers – while those who dispense them are perhaps most widely called 'root doctors' or 'conjure doctors'. Though the names are new, the pattern is the same: any object or combination of objects may make up the charm, mainly at the whim of the individual conjure doctor. (See CONJURE MAGIC; TALISMANS.)

Primitive man uses virtually any object as a fetish, as long as he believes it to be endowed with magical properties *Left* Nail fetish from the Bakongo of Portuguese Angola. *Above right* Steel articles for sale as fetishes in Cotonou market, Dahomey

Peter Larson

Ficino Marsilio

A Florentine philosopher and doctor who, in 1489, published a medical book, *Libri de Vita*, in which he suggested that a planet's favourable influences could be attracted by concentrating on images or mental pictures, characteristic of that planet's nature, and that these influences could be of great therapeutic value: by meditating, therefore, on a picture of a young girl holding flowers and apples, an image of Venus, the return of health and happiness would be assured.

Fifteen

The number closely associated with sex; sacred to Ishtar, the Babylonian goddess of sexual love: reached by multiplying 5, the number of sexual pleasure, with 3, the symbol of genitals: in the Tarot pack, 15 is the card of the Devil, who often appears as a goat, in which form he is identified with lust.

See NUMEROLOGY.

Sacred to Bacchus, the fig symbolizes procreation, fecundity and wisdom and has been venerated in many parts of the world

FIG

THE FIRST PLANT mentioned in the Bible, where it occurs 57 times, is the fig, *Ficus carica*: 'Then the eyes of both of them were opened and they knew that they were naked; and sewed fig leaves together, and made themselves aprons.' Many Biblical references testify to the importance of the fig (as much a symbol of security as a producer of food) such as 'a land of wheat, and barley, and vines and fig trees' and 'every man under his vine and under his fig tree.' Its attractions as a fruit were praised by Mohammed, 'If I should wish a fruit brought to Paradise it would certainly be the fig.'

Besides being man's first garment – an attribute sometimes adopted by sculptors to conceal the private parts of their nude figures – there are legends which suggest that the fig – which belongs to the same family as the mulberry, hop, breadfruit and Indian hemp – was in fact the Forbidden Fruit rather than the apple which is traditionally associated with Eve (see APPLE). This would be in keeping with the mysterious and slightly suggestive appearance of the pear-shaped receptacle commonly referred to as the fruit, inside which are numerous tiny flowers, the only access for pollinating insects being a small opening at the end. As D. H. Lawrence wrote:

> The Italians vulgarly say, it stands for the female part; the fig fruit:
> The fissure, the yoni,
> The wonderful moist conductivity towards the centre.

One suggestion is that the incident of the Forbidden Fruit, with Adam and Eve and the aprons they subsequently made, is based on an ancient custom associated with the pollination of fig trees, during which those involved wore the tree's leaves. It has also been suggested that those carrying out the pollination were afterwards sacrificed as scapegoats, a theme which has a parallel in ancient Greece, where according to

Frazer: 'the Athenians regularly maintained a number of degraded and useless beings at the public expense; and when any calamity such as plague, drought or famine befell the city, they sacrificed two of these outcasts as scapegoats. One of the victims was sacrificed for the men and the other for the women. The former wore round his neck a string of black and the latter of white figs.' In Asia Minor the scapegoat, once again sacrificed if calamity struck, was first made to eat bread, cheese and dried figs; he was then beaten on the genitals with squills and fig branches and was finally burned on a pyre.

Legends of the Fig

Another fig tree with Biblical associations was one, for centuries pointed out to visitors, under which the Holy Family was supposed to have rested on their flight into Egypt. This gave rise to a legend of a fig opening its trunk as a refuge to Mary and the infant Jesus when pursued by Herod's soldiers. The fig is also one of the many trees on which Judas is supposed to have hung himself and hence in some places, notably Sicily, a plant of ill omen.

Roman mythology brings in the fig several times, although in widely differing contexts. In one legend the Titan Lyceus, pursued by Jupiter, was transformed into a fig tree by Rhea, mother of the gods. Rhea's husband Saturn is elsewhere associated with the fig's creation, and for this reason the inhabitants of Cyrene crowned Saturn's statue with fig-wreaths. Bacchus is credited with creating the fig, which was therefore sacred to him; and certainly, during Bacchanalian festivities, the fig shared the honours with the vine, and Bacchus's virility was credited to it. Female votaries on these occasions wore necklets made from dried figs, while men carried statues of the phallic god Priapus carved from fig wood.

The Romans believed a fig tree to be responsible for the siting of Rome, as the cradle in which Romulus and Remus arrived became lodged in the roots of a fig on the banks of the Tiber. The resulting veneration for the fig can be traced over four centuries. This sacred tree became known as *Ficus ruminalis*. Ruminus was the surname of Jupiter, provider of mankind's food, while Rumina was goddess of the female breast. This strengthened the Bacchic connection in making the fig symbolic of fecundity and procreation, and it was sacred to Juno as goddess presiding over marriages.

There are hundreds of species of fig and it is interesting that many of these are revered as Trees of Life and of Knowledge or, as in Central Africa, haunts of ancestor spirits. To Buddhists the most sacred tree was the Bo-tree, *Ficus religiosa*, because under it Buddha found wisdom. To his followers it combined the attributes of creation, wisdom and preparation for the afterlife. Mythologically it became a tree of creation, the *Asvattha*, sheltering the world – resembling the Nordic Ash *Yggdrasill*. The Asvattha's flower held ambrosia, bringer of intelligence to the eater. There are sacred Bo-trees all over India and, in the past at least, in China, some undoubtedly of enormous age. The famous specimen at Anurâdhapura, Ceylon, is reputed to have grown from a branch taken from Buddha's original Bo-tree, and planted in 288 BC.

Buddha is also reputed by the Chinese to have meditated under the Banyan, *Ficus bengalensis*, the tree under which Vishnu was born. One of its Sanskrit names is Bahupâda, the Tree of Many Feet, which drops vertical roots from spreading branches so that, over the centuries, a single specimen makes a whole grove of trunks. Like the Bo-tree, the Banyan seems imperishable, and on the Narbada river, near Surat in central India, is one reputed to be over 3000 years old, which is said to have been visited by Nearchus, an officer of Alexander the Great.

In the Victorian 'language of flowers' the fig meant 'to be prolific' – shades of Bacchus – while dried figs were an unlucky gift to a woman. To dream of figs should mean happiness, riches, long life and wishes fulfilled. A belief from the American South seems to deny the tree's positive value, saying that if you fall out of a fig tree, any injuries received will never heal. But American folk medicine reaffirms the fig's value: boiled in milk it will cure quinsy, the juice will cure warts, and it is claimed that figs will cure cancer.

Sacred fig or Bo-tree at Buddh Gaya in India: it was under a Bo-tree that the Buddha first received enlightenment

Christopher Lee as Dracula

The best supernatural films reflect an outward world that we all know; but they do so in ways that throw us psychologically off balance

To convey a genuinely supernatural atmosphere in a film is far more difficult than one might think; seeing is not the same as believing. Those which have succeeded best have drawn on certain mythical themes which evoke a universal response among filmgoers

OF ALL THE ARTS the cinema is, theoretically, the one that is best suited to suggesting the presence of the supernatural. Watching a film is rather like being at a seance. There is the same semi-darkness, the same atmosphere of sympathetic concentration and expectancy, the same opportunity for the individual's judgement to be swayed by mass emotions so that ready credibility is given to a materialization, the image on the screen, that is visible yet intangible.

Unfortunately, it is only very rarely that filmgoers gain any acute sensation of the supernatural from what happens on the screen. In fact, in the case of the supernatural and the cinema, seeing is *not* believing. There is a paradox here: the more markedly bizarre and mysterious the methods a film-maker uses to create a supernatural event, the less easily disposed are filmgoers to fall under the spell.

The very beginnings of film-making show this. The French director Georges Méliès, in the 1890s, made some short fantasy films with stop-action photography in which people seemed to vanish, and double exposures that turned the actors into transparent phantoms. Although audiences were delighted by the novelty, they looked for the technical explanation of the magic phenomena. Yet at about the same time two other Frenchmen, the Lumière brothers, were filming reality with documentary-like precision showing workers streaming out of their factories, trains steaming into a station, and so on. And audiences reacted violently. They cringed back in their seats as the trains bore down on them, they got out of the path of the advancing workers. As with primitive tribes who even today become actively disturbed when watching a film in which one character apparently vanishes off the side of the screen, the sheer realism of the events in the Lumière films induced uncertainty, unease or alarm in the early cinema audiences.

With far more sophisticated means, this is how the best supernatural films get their effects. They reflect the outward world we all know and can recognize, but they do so in ways that throw us psychologically off balance. In other words, to get to the dark at the top of the stairs, we first have to ascend the staircase; and the journey into the unknown is made even more frightening by keeping a firm grip on the banister. Sometimes a film-maker can 'jam' the rational censor in us that scoffs at the 'otherness' of things by using techniques that are not easily identifiable by lay audiences. For instance, infra-red film was used to shoot the night scenes of the haunted house in director Robert Wise's film *The Haunting* (1963). The tonal values of the eerie mansion appeared like those of daylight; but it was a daylight transfigured on the screen by the suggestion of a 'presence' not altogether normal.

The length of time in seconds or minutes for which a camera lingers on scenes, even on a chair, a bed, a corridor, can be another effective way of creating the supernatural. For it can endow inanimate objects with a sense of some 'thing' about to become apparent. It is almost always the instant before the apparition appears on the screen that is frightening – seldom the actual appearance. We project our apprehension far more powerfully on to an empty, but foreboding, scene than on to one filled by a spectre that all too often is the creation of a purely mechanical cinema projector.

But even with sophisticated techniques allied with the psychological exploitation of people's fears, the cinema still lacks the resources to explore some areas of the supernatural as effectively as literature. For example, there have been hardly any faithful film versions of stories by those two master writers of terror and the uncanny, Edgar Allan Poe and M. R. James. The reason is that both writers communicate an almost tangible feeling of the supernatural – and films, as yet, have no possibility of duplicating this effect. Poe's tales are for the most part fantasies about suffocation; they take their terrors, and their very tone of isolation, from the nightmare fear of some great weight that stifles, crushes or immures the victim. In *The Tell-Tale Heart* the victim is beneath the floorboards, he is behind the plaster in *The Cask of Amontillado*, literally walled up in *The Black Cat*, buried alive in *Berenice* – even *A Descent into the Maelstrom* deals with air being exhausted as a man drowns. But a film camera is unsympathetic to the idea of such horrifying claustrophobia: it tends to disperse the sensation when it tries to film it.

M. R. James's stories are equally hard to film, for they depend for their chilling effect on conveying the sensation of human flesh coming into ghoulish contact with something equally solid yet supernatural; a wallpaper pattern turning into human hair and creeping over the narrator in *The Diary of Mr Poynter*, a giant spider dropping on to a face in *The Tractate Middoth*, and, most unsettling of all, the bed sheet 'with an intensely horrible face of crumpled linen' that tries to smother the sleeper in *Oh Whistle, and I'll Come to You, My Lad*. Jonathan Miller made an interesting television film out of this story but, significantly, he substituted the *sound* of the animate bed sheet for the sight of it – the *feel* of it was, of course, beyond his powers. The cinema made one sad little attempt to convey fear of this kind with a picture called *The Tingler* (1959) which tried to frighten selected members of the audience by wiring the seats for mild electric vibrations. But it proved too costly and risky; besides being artistically unsuccessful.

The Body Without a Soul

Films have excelled in portraying supernatural themes wherever directors and actors with gifted, almost obsessional, sensibilities have combined their talents to make films based on some of the myths, sexual, psychological, religious and even racial, that are deeply-rooted in human nature and which are shared, consciously or unconsciously, by the majority of filmgoers. Six main themes are the 'man-made monster', the 'devil in the flesh', the 'human fiend', the 'vampire', the 'old dark house' and the 'things from another world'. A Jewish theme lies both at the start and at the end of such a study.

It is important to realize that the early American film-makers were themselves European immigrants, largely from central and eastern Europe and that they tended to turn to the supernatural myths of Europe for films mainly because the tradition of magic and the supernatural is not indigenous to American culture. In the United States, myths, as befits a young

civilization, are more concerned with worldly things like land conquest, frontier life and folk heroes of flesh and blood, than with the phantoms of European imagination.

The 'man-made monster' owes its film genesis to the religious and folk traditions of the Jews of central Europe. In 1913 one of the earliest film versions of the Faust story, *The Student of Prague*, was made by the Danish director Stellan Rye. It told of a student who signs away his mirrored reflection in return for love, riches and honours, and eventually kills himself when he kills his double. (By killing the evil in himself, man destroys an essential part of himself: so ran the argument, as it does in the Jekyll and Hyde theme.) The star of the film, Paul Wegener, heard of the Jewish legend of the Golem, the 'body without a soul' which the 16th century Rabbi Loew made out of clay to defend the Hebrew community against the pagans. The story inspired Wegener to star in and co-direct, with Henrik Galeen, a film called *The Golem* (1914) in which the monster is brought to life, given lowly work to do, falls in love with its creator's daughter, runs amuck and is finally killed when it falls from a high tower.

Although the plot is essentially the same as the one used for *Frankenstein*, the famous Hollywood film starring Boris Karloff in 1931, there are striking differences. For instance, in *The Golem* a little child removes the Star of David from its chest and it becomes a lifeless statue. But in *Frankenstein* it is the non-sectarian monster that destroys the little child. The man-made monster of the American film is not presented as the supernatural weapon of Jewry against the invader, as it was in the original legend, but as the incarnation of man's irreligious challenge to a Christian God.

A Sense of Sin

The film was produced by a south German immigrant, Carl Laemmle, a Jew who was the head of Universal Studios where many of Hollywood's German-Jewish talents flourished from the early 1920s on. Significantly, the Frankenstein film has more in common with the Golem legend than with Mary Shelley's novel on which it is nominally based. But its original Jewish flavour was expunged in the Hollywood version.

Frankenstein introduced the element of explicable logic – the idea that every eerie event should have a rational basis – into Hollywood's portrayal of the supernatural. Boris Karloff's make-up as the monster illustrates this perfectly: the creature had a square skull since this, the box-shaped hinge of a primitive lobotomy, is the most basic cut used by grave-robbers on cadavers. The protruberances on the monster's neck were electric plugs and not bolts as is commonly misrepresented, since it was the Promethean fire from lightning that was meant to animate him.

National Film Archive

The 'fiend in human form', one of the main themes in early horror films, is an embodiment of a myth that is deeply-rooted in human nature: scene from *The Phantom of the Opera* showing Lon Chaney as the hideously deformed creature, his face a living skull, who lived in the depths of the Paris Opera House and kidnapped a singer for his bride

Although in this case it worked brilliantly, and despite all the ghoulish accoutrements Karloff's performance is vividly personal, such concern for logic was to have a banal effect on the growth of the supernatural film. The belief that audiences would not accept magic, ghosts or other supernatural agents unless they had an explanation that belonged to the natural world became ingrained in the minds of studio heads. Even today, for this very reason, a ghost film is one of the hardest of all types for which to find financial backing.

On the plus side, the early *Frankenstein* film was able to incorporate an element

The early cinema was a moralizing force: to avoid denunciation films had to show a clear separation of good and evil

A 'human' monster, or one that is semi-human in appearance, is more frightening than a creature that has obviously been created in the special effects department of a studio *Facing page, above* Scene from *The Creature from the Black Lagoon.* In *The Cat and the Canary* (1927) the director Paul Leni established the ingredients that are still used to create an atmosphere in which the appearance of a ghoulish figure *(far left)* seems a natural development in a film's story *Left* Bela Lugosi, the screen's first Dracula, played the part of the count with such conviction that he has been identified with the role ever since *Above* Fredric March in *Dr Jekyll and Mr Hyde:* in his playing of Mr Hyde there was a 'lurking sense of primitive man in pagan enjoyment of his powers'

largely lacking in more recent supernatural films. This is the sense of sin, of a divinity that is being sinned against. Today's films, including the Hammer Films remake of *Frankenstein* in 1956 and the many Roger Corman versions of Poe, are given much more to dealing with horror or sadism, perhaps as a result of the public's abandonment of more conventional religious values.

But the greatest contribution to the original *Frankenstein* came from the association of two Englishmen: the director, James Whale, and William Henry Pratt, better known as Boris Karloff, whose performance as the monster suggested the pathos of a being who had not asked for the life breathed into his miscellaneous parts. Between them they not only created one of the archetypal figures of the supernatural cinema, but they also raised the film well above any later type in the genre; even above its own sequel, *The Bride of Frankenstein* (1935). Again directed by Whale, this film combined the sense of sin with the new ingredient of sex though it allowed Elsa Lanchester, as the man-made bride, one unforgettable moment when she first sets eyes on the mate for whom she is destined – and registers utter revulsion. It is the high point in the distaff side of the monster-making tradition.

Despite this, and despite Karloff's playing which turns the monster into a Christ-like martyr figure, the film showed evidence, especially in Ernest Thesiger's performance as a rival monster-maker, that the Frankenstein theme was being guyed. Supernatural

The Monster Awakes

Frankenstein realizes with horror that he has created a monster:

It was already one in the morning; the rain pattered dismally against the panes, and my candle was nearly burnt out, when, by the glimmer of the half-extinguished light, I saw the dull yellow eye of the creature open; it breathed hard, and a convulsive motion agitated its limbs.

How can I describe my emotions at this catastrophe, or how delineate the wretch whom with such infinite pains and care I had endeavoured to form? His limbs were in proportion and I had selected his features as beautiful. Beautiful! – Great God! His yellow skin scarcely covered the work of muscles and arteries beneath; his hair was of a lustrous black, and flowing; his teeth of a pearly whiteness; but these luxuriances only formed a more horrid contrast with his watery eyes, that seemed almost of the same colour as the dun white sockets in which they were set, his shrivelled complexion and straight black lips . . .

I had worked hard for nearly two years, for the sole purpose of infusing life into an inanimate body. For this I had deprived myself of rest and health. I had desired it with an ardour that far exceeded moderation; but now that I had finished, the beauty of the dream vanished and breathless horror and disgust filled my heart . . .

Mary Shelley, *Frankenstein*

themes very quickly degenerate in the hands of sequel-minded Hollywood into the horror-comic. Frankenstein ends up meeting not his Maker, but Abbott and Costello (Even the original *Golem* was followed by a film called *The Golem and the Dancing Girl*.)

Frankenstein, however, taught one lesson Hollywood could not ignore. It cost $750,000 to make and proved a tremendous commercial hit. It has since grossed over $13 million. It proved to Hollywood that the supernatural was commercial, and opened the way to the other great films of the 1930s.

The Jekyll and Hyde theme, the 'devil in the flesh', is probably the most often filmed story of the supernatural. Even before Fredric March starred in director Rouben Mamoulian's classic version in 1932, it had been made at least six times since 1908. One good reason was that the early cinema was a moralizing force: if films were to avoid denunciation from local pulpits, they had to show a clear separation of good and evil. The Jekyll and Hyde theme provided the perfect exemplary subject. John Barrymore, in 1920, had played the dual role and introduced a sexual element absent from Stevenson's story: he played Jekyll as a virginal Victorian gentleman misled by his cronies at a stag party into visiting a brothel, where his sexual instinct is awakened and becomes embodied in the bestial Hyde.

This interpretation is also true of March's virtuoso performance which, since it pre-dated the Hollywood censorship code of 1934, clearly implies Hyde's relations with the prostitute. But the bravura element of the latter film is the weird perfection of the transformation scene done without any help from a photographic laboratory, but with the camera looking Jekyll full in the face as he changes into Hyde. Even today, Mamoulian declines to reveal the secret, though possibly the then newish infra-red film was used, along with subtle changes in lighting, and special make-up visible in some lights and not in others. The film's sound effects, including the use of heart-beats, aided the creation of the supernatural. And Fredric March's conception of Hyde, catching a lurking sense of primitive man in pagan enjoyment of his powers and contrasting it with the sophisticated Jekyll's prayers for forgiveness, is a landmark in the supernatural cinema that quite eclipses Spencer Tracy's far less dynamic interpretation of the part in the 1940 version.

It is also significant that March's Hyde is linked with the natural elements – he greedily drinks the pouring rain – in a way that makes him part of the natural order. One recalls Karloff's monster in *Frankenstein* blinking in the first sunbeam he sees. In one case the effect is malignant, in the other benign: in both, oddly powerful. This elemental quality is also something of a lost dimension in recent films that harp on the horrors of the flesh, not of the soul.

The theme of the 'fiend in human form' is Hollywood's peculiar contribution to Gothic supernatural. Just as the 'old dark house' is the architectural embodiment of Gothicism, so a stunted, tortured, twisted, disfigured and hideous human form is the living embodiment of the same collective myth. Lon Chaney was the actor to whom the myth became a way of life and an artistic obsession. It seems that to fulfil himself as an actor, Chaney had to alter himself in some fearful way in each part by make-up of almost masochistic painfulness. He made the *Phantom of the Opera* (1925) because he needed a vehicle in which he could be physically repulsive; and found it in this story of a hideously deformed creature whose face when unmasked is a living skull and who inhabits the bowels of the Paris Opera House, kidnaps a singer for his bride, but is killed by the pursuing mob. This human fiend demands only to be loved in return, to be rendered more human and less fiendish: the kind of ending Hollywood would find commercially congenial.

'I am – Dracula!'

The idea of love as a mystic spell is also the motivating force in one of the most beautiful supernatural films yet made. Jean Cocteau's *La Belle et La Bête* (1946). *Orphée* (1950), his love affair between life and death, is the most poetic reworking of the fiend in human form, represented in that philosophical fantasy by the haunting Maria Casarès as the messenger of Death. In the American manifestation of the theme, gruesomeness wins out over poetry. And Chaney's taste for the fiendish, the deformed and the mutilated was fully reciprocated by a director with whom he often worked, Tod Browning. It was Browning who made the third great seminal film of the supernatural – *Dracula* (1931).

Except for Browning, the talents contributing to *Dracula* were distinctly European in origin. It was made for the same studio as *Frankenstein*, selected for filming (from Bram Stoker's novel) by Universal's German story editor, photographed by the brilliant German cameraman Karl Freund, and, of course, starred the Hungarian-born Bela Lugosi who, like Karloff, identified himself forever with the supernatural role. The film's triumph lies in the absoluteness of the conviction with which Lugosi as the vampire count announces, 'I am – Dracula!'.

The 'vampire' theme probably owes its origins to the primitive belief in the regenerative power of human viscera, of the sacrificial victim whose blood refreshes the tribe. *Dracula* established that the supernatural had box-office appeal provided it was sufficiently fleshy and bloody, though the film had redeeming touches of jocular Gothic wit – as when the Count at dinner spots a tempting pinprick of blood on a guest's hand and refuses other refreshment murmuring 'I never drink . . . wine'.

Before very long, however, the purity of the Dracula theme became polluted; and supernatural films about vampires put an almost sadistic emphasis on the blood lust. The inevitable introduction of a female vampire soon came to imply a lesbian relationship between the female who was already a vampire and the innocent girl whom she made into one. The vampire films from Hammer's studios seem especially fond of such implications – and of course public opinion now permits the theme to be stated more openly if far less artistically.

The Danish director Carl Dreyer made his film *Vampyr* from a Sheridan Le Fanu story at about the same time as the Hollywood *Dracula*. This was a far more poetical and consciously aesthetic work than the American film, but lacked the latter's

The early Frankenstein films incorporated a sense of sin, of a divinity that was being sinned against; as the monster, Boris Karloff suggested the dilemma of a being who had never been asked to be brought to life. In *The Bride of Frankenstein* he turned the monster into a Christ-like martyr figure, as shown *(right)* in a scene from the film

Warner-Pathe

Warner-Pathe

The Vampire Count

Jonathan Harker describes his first impression of Count Dracula:

His face was a strong – very strong – aquiline, with a high bridge on the thin nose and peculiarly arched nostrils; with lofty domed forehead, and hair growing scantily around the temples, but profusely elsewhere. His eyebrows were very massive, almost meeting over the nose, and with bushy hair that seemed to curl in its own profusion. The mouth, so far as I could see it under the heavy moustache, was fixed and rather cruel-looking, with peculiarly sharp white teeth; these protruded over the lips, whose remarkable ruddiness showed astonishing vitality in a man of his years. For the rest, his ears were pale and at the tops extremely pointed; the chin was broad and strong, and the cheeks firm though thin. The general effect was one of extraordinary pallor.

Later, Jonathan Harker comes upon the Count lying in his coffin:

There lay the Count, but looking as if his youth had been half-renewed, for the white hair and moustache were changed to dark iron-grey; the cheeks were fuller, and the white skin seemed ruby-red underneath; the mouth was redder than ever, for on the lips were gouts of fresh blood, which trickled from the corners of the mouth and ran over the chin and neck. Even the deep, burning eyes seemed set amongst swollen flesh, for the lids and pouches underneath were bloated. It seemed as if the whole awful creature were simply gorged with blood; he lay like a filthy leech, exhausted with his repletion.

Bram Stoker, *Dracula*

crude archetypal energy. Dreyer defined very precisely one of the atmospheric conditions for success in the supernatural genre. Instructing his cameraman in the effect he desired, he said:

> Imagine we are sitting in an ordinary room. Suddenly we are told that there is a corpse behind the door. In an instant the room we are sitting in is completely altered: everything in it has taken on another level: the light, the atmosphere have changed, though they are physically the same. This is because *we* have changed, and the objects *are* as we conceive them. This is the effect I want to get.

Technically he achieved it, simply but effectively, by placing a very fine gauze filter several feet in front of the lens, which gave a weird indistinct glow to objects and bathed the actors in an ominous perpetual twilight. In another vampire film, Murnau's *Nosferatau*, made in Germany in 1922, deep-focus photography was used for the similar purpose of filming that psychological space which is the gap between daily happenings and supernatural events.

The relevance of this can be seen in supernatural films of the 'old dark house' theme, where the architecture becomes an extension of weird characters or manifestations. The house itself becomes alive. Paul Leni who directed *The Cat and the Canary* (1927) established the atmospheric ingredients that are still used even in infinitely more sophisticated ghost films like Jack Clayton's *The Innocents* (1961): the spooky journey down corridors by a tip-toeing camera, the guttering candles, the wind-stirred curtains, the suddenly banging shutter and the apprehensively creaking floorboards.

Old dark house films are popular subjects not only because, having largely one set, they fit well into the economics of film-making, but because they adhere to the convention of the explicable supernatural: in other words, Hollywood's old formula of a happy ending. Filmgoers can be given their thrills, but are allowed to keep their self-respect when there turns out to be a rational, if far-fetched explanation. James Whale's *Old Dark House* (1932) gathers under one roof a hideous collection of benighted travellers, with Karloff as a horribly scarred and dumb butler. But there is nothing really supernatural about the film, which is merely a grotesque parody of freakishness. Indeed as the 1930s wore on, some of the old dark house films became battles with science rather than with the supernatural, testifying both to the exhaustion of the original classic stories of the supernatural and to society's growing unease over science's contribution to the insecurity of a period that was to end in the Second World War. Karloff and Lugosi, for example, co-starred in a film called *The Black Cat* (1934), only the title of which recalls Poe. The plot shows how the scientist had invaded the realm of the supernatural, for it is set in an ultra-modern castle in Transylvania whose host (Karloff) is no vampire but a scientist who has built his home on the site of a wartime massacre that was caused by his own treachery.

The Devil's Child

Old dark house films featuring the traditional English ghost are much rarer than one would think. This is partly because the English ghost, like the English accent, did not travel well in America, but also because, apart from such comedies as *Blithe Spirit* (1945) and *The Ghost Goes West* (1935), the true ghost story resists the easy explanation in the last reel beloved by film producers. But at least four serious and, in varying degrees, successful films of this kind have been made in Britain and America. One is *The Uninvited* (1944), directed by Lewis Allen and set in a haunted house in Cornwall where Ray Milland and Ruth Hussey feel, hear, and finally see the ghostly presence. Their sight of the ecto-plasmic apparition is, in fact, the film's weakest point: otherwise it suggests 'things' a great deal more effectively by showing a rose withering or the bristling of a dog's hair.

More recently, *The Innocents*, adapted from Henry James's *The Turn of the Screw*, the story of a governess and two haunted children, was a film of sharp intelligence, with some eerie passages when evil seemed to clot the English summer air; but overall it was ambiguous in its attitude to whether the ghosts were 'real' or simply projections of Deborah Kerr's sex-repressed fantasies. If they were the former, then it was a mistake to allow one of them to leave the ghost of a tear so solidly on one of the children's schoolbooks. In *The Haunting*, which has already been referred to, a psychic investigator was burdened with two female assistants, one of whom was a neurotic virgin and the other a latent lesbian. In spite of some horrifying moments produced by sound effects, the glib psychological explanation that the phenomena were the result of the disturbed relationship between the two women weakened the whole eerie fabric.

Undoubtedly the best example of the supernatural in a contemporary setting is director Roman Polanski's famous American film, *Rosemary's Baby* (1968), in which a young newly-wed wife living in a luxury block of New York apartments gives birth to the Devil's child. Polanski's ability to take the supernatural at an acute angle, rather than head on, is what makes *Rosemary's Baby* so successful. In the early 1970s audiences flocked to view *The Exorcist* which handled the theme of demonic possession with great power. Unfortunately, the effect was over-heightened by the use of mechanical aids such as a levitating mannikin exuding vomit and abuse in equal measure.

The 1980s witnessed yet another best-seller from the novel *The Shining*. Jack Nicholson played the hero in spine-chilling fashion.

Nuclear Age Movies

The supernatural film got a new lease of life in America in the late 1940s and 1950s. Ranging from *The War of The Worlds* (1953) to *Star Wars* and *Close Encounters of the Third Kind* in the 1970s and 1980s the genre mutated into the science-fiction film, a post war school that gives potent expression to contemporary phobias and obsessions. Several elements link the science-fiction film with the supernatural one. It owes its basic origin to the public interest

Facing page **Vampires, undead beings who feed on human blood, have been a recurring theme in horror films ever since *Dracula*, the story of the vampire count of Transylvania and one of the great seminal films of the supernatural, was made in 1931. The fascination that the subject holds for film-goers probably reflects a subconscious belief in the regenerative power of blood: scenes from *Taste the Blood of Dracula***

National Film Archive

Films that have successfully conveyed the supernatural have generally dealt with universal myths, and themes that throw the audience psychologically off balance: scene from *The Cabinet of Dr Caligari*, a 'haunted' film, preoccupied with violence and death, in which the director and designer created a nightmare world of legend and fantasy

shown in the United States space programme, which can be interpreted as postulating, at least implicitly, the possible existence of other, worlds where natural laws would not operate but would be replaced by a kind of magic.

Secondly the bombing of Nagasaki, Hiroshima, and the post-war threat posed by nuclear energy, predisposed people to accept the idea of mutants, or dehumanized figures, the radioactive age's equivalent of the zombies or living dead of pre-war supernatural films. Thirdly, the spells and omnipotent powers associated with earthly superstitions are embodied in the science-fiction film's monsters, or events of extra-terrestrial import or menace. For these reasons science-fiction can legitimately be seen as being a contemporary extension of the supernatural.

Demonic Computer

In *The War of the Worlds* (1953), the 'things from another world' took the form of armoured intelligences which could be halted in their destructive tracks only by such an earthly item of 'explicable magic' as a common cold germ. *The Thing* (1951) featured an extra-terrestrial monster that drank the blood of earthlings: like Dracula, it needed constant replenishment to survive. Other films were based on the idea of an advanced expeditionary force of supernatural beings landing on earth to form a kind of coven among the inhabitants, or to take over the latter's personal identities and human shapes, as in director Don Siegel's *The Invasion of the Body Snatchers* (1956). What is this but the extra-terrestrial projection of the magic spell of earlier times, the demonic possession of human beings? The monsters in such films are post-atomic metaphors for the evil that scientific man has unleashed on the world and on himself, much as Frankenstein's man-made monster was the creation of the sin of his maker. It is interesting that these films, for all their modernity, share one of the weaknesses of the conventional supernatural film where there is no Karloff or Lugosi to incarnate the evil: the actual sight of the monster is less impressive than the suggestion of its presence.

Demonic possession of human beings in science-fiction films like director Wolf Rilla's *The Village of the Damned* (1960), based on John Wyndham's *The Midwich Cuckoos*, in which village women bear children with strange powers, can be traced back at least to the dybbuk, or unholy spirit, of Hebrew religion, a return to the Jewish tradition that inspired the early 'man-made monster' films. But it also has its Christian evocation in witchcraft, as in director John Krish's *The Unearthly Stranger* (1963), where the tears of the otherworldly visitant leave corrosive streaks on her cheeks in keeping with the belief that damned spirits may never show the human weakness of repentance.

But there is an even wider link between films of this genre and the Jewish emphasis present in much American culture. The literary critic Leslie A. Fiedler in his book of essays, *Waiting for the End*, expressed it in these words:

> The long dominance of the Western and the detective story is challenged by that largely Jewish product, science-fiction . . . The basic myths of science-fiction reflect the outlook, the social consciousness, the Utopian concern of the modern, secularised Jew . . .

The relevance of Dr Fiedler's view to this study becomes clear if one considers the most imaginative science-fiction film to date, Stanley Kubrick's *2001: A Space Odyssey* (1968). Actually fiction is a misnomer here, for this story of a deep probe into outer space, lasting many, many months, is documentarily accurate to the last real or predictable detail. It seems to be light years away

from the supernatural world of the old films. But one incident, a major one, is significant. The entire working and sleeping life of the astronauts aboard their space ship is masterminded by a computer of extraordinary but, as it turns out, demonic intelligence. Instead of merely looking after the welfare, and doing the bidding, of the space crew, this machine develops its own rebellion and sets out to annihilate its masters. What is this but the man-made monster of the supernatural films?

It is *The Golem* or *Frankenstein* creature projected into the future and rendered many, many times more sophisticated; but also more dangerous because it can now outthink and outwit its creators. Instead of the Star of David or the Mark of Cain, it wears on its body the non-denominational badge of some international computer organization; but it possesses all the capacity for developing human emotions ranging from anger to pathos with which Karloff and his brethren endowed their creations. In Kubrick's film the computer suffers audibly when an astronaut fights its rebellion by unplugging its brain cells, much as the monsters of earlier films were immobilized and destroyed by human agents.

In a recently published account of the Weizmann Institute of Science in Israel, *A Walk Through the Garden* by Joseph Wechsberg, the author includes a detail which may serve as an ironic footnote to this article. The computers there are serviced by Yemeni technicians who have given to the machines they tend some names of interesting inspiration. One of the main computers is called The Golem, after the mysterious automaton created in Prague. Thus has a racial myth passed into a cinema tradition and been carried by imaginative mutation until it passes out as a scientific reality.

FINDING OF WITCHES

AN IMPORTANT DIFFERENCE between witchcraft and sorcery in tribal societies (possibly also in pre-Christian Europe), and witchcraft in the Christian era is reflected in methods of finding witches and sorcerers. The relation between two facts, first that men in tribal societies tried through beliefs in witchcraft to explain the otherwise inexplicable occurrence of their particular misfortunes and second, that they held their personal enemies responsible for these has has been interpreted by E. E. Evans-Pritchard in his study *Witchcraft, Oracles and Magic among the Azande* (1937).

Tribal beliefs in witchcraft attempted to explain why it was that at a particular moment and in a particular place, a particular person suffered a particular misfortune – such as disease, the death of kin or animal stock, accident, the blighting of crops, and so on – when he had previously not been thus unfortunate and his fellows were still enjoying good fortune. His ill-fortune was ascribed to the malevolence of a personal enemy, operating by occult or supernatural powers. But witchcraft was not the only possible hidden occult cause of such events: gods and other spirits, or ancestral spirits, or breach of taboo, might be the mysterious cause of ill-fortune. Whichever of these causes were involved, it expressed a moral judgement. Witches and sorcerers harmed those against whom they felt envy and jealousy, spite, malice, hatred or anger. The ancestral gods usually also sent misfortune to either a wrongdoer who had broken a rule of morality which came under their surveillance, or one who had failed to render to them appropriate offerings or sacrifices.

Different tribal societies ascribed misfortunes to various occult causes in varying degrees: among the Azande of the Sudan it was primarily witchcraft which was blamed; among the Tallensi of Ghana it was primarily

ancestral spirits or the earth goddess; among the Bantu of South Africa it was equally witchcraft or the ancestral spirits – though in all these societies there was some element of all these, and yet other, beliefs. Sometimes the occult cause of a misfortune was indicated by its very nature, but mostly it had to be sought by some form of divination or oracle, the latter of which might sometimes involve an ordeal.

There were many forms of divination, means of bringing the occult into the open. Some were mechanical devices, while others involved direct searching by specialist magicians (usually called witch-doctors, but better named, following J. A. Barnes, witch-detectives). These magicians were often believed to be helped or possessed by spirits, often ancestral, who spoke through them, in their search for occult causes. The most famous of such oracles were the Greek oracles of Apollo at Delphi and of Zeus at Dodona. Tribal diviners of this time, commonly called shamans after a Siberian model, were of this type.

Evans-Pritchard's illuminating study of these systems of belief among the Azande also analysed for us the hierarchy of divinatory and oracular mechanisms. When a Zande suffered a misfortune, he was likely first to consult a rubbing-board oracle: he rubbed together two grooved pieces of wood, while he pronounced the names of persons whom he considered to be inimical to him. It was believed that the boards stuck at the name of any man who might be the witch causing that particular misfortune. Or he might put two different kinds of twigs into a termite's nest, with the name of a suspected witch, and depending on which twig was the more eaten, he received confirmation of his suspicion or not.

The most important Zande oracle consisted in giving chickens a certain substance – a form of strychnine – which had been collected with many hardships in enemy territory, while observing many taboos. Questions, including the names of persons suspected of being the witches possibly responsible for the consultant's present misfortune, were put to the oracle-substance in the chickens; and the answer was 'no' or 'yes' depending on whether the form of the question called for the chicken to vomit the substance or to

Smelling Out A Witch

In the kingdom of the Kukuanas during their search for the legendary mines of King Solomon, Alan Quatermain and his companions are forced to watch a witch-finding ceremony:

Quicker and quicker she danced, till she lashed herself into such a frenzy of excitement that the foam flew in flecks from her gnashing jaws, till her eyes seemed to start from her head, and her flesh to quiver visibly. Suddenly she stopped dead and stiffened all over, like a pointer dog when he scents game, and then with outstretched wand she began to creep stealthily towards the soldiers before her. It seemed to us that as she came their stoicism gave way, and that they shrank from her. As for ourselves, we followed her movements with a horrible fascination. Presently, still creeping and crouching like a dog, the *Isanusi* was before them. Then she halted and pointed, and again crept on a pace or two.

Suddenly the end came. With a shriek she sprang in and touched a tall warrior with her forked wand. Instantly two of his comrades, those standing immediately next to him, seized the doomed man, each by one arm, and advanced with him towards the king.

He did not resist, but we saw that he dragged his limbs as though they were paralysed, and that his fingers, from which the spear had fallen, were limp like those of a man newly dead.

As he came, two of the villainous executioners stepped forward to meet him. Presently they met, and the executioners turned round, looking towards the king as though for orders.

'*Kill!*' said the king.

'*Kill!*' squeaked Gagool.

'*Kill!*' re-echoed Scragga, with a hollow chuckle.

Almost before the words were uttered the horrible deed was done. One man had driven his spear into the victim's heart, and to make assurance doubly sure, the other had dashed out his brains with a great club.

H. Rider Haggard, *King Solomon's Mines*

die. If the misfortune were a continuing one, the consultant could then, through a neutral intermediary, send the wing of a chicken to a man thus accused of being the witch responsible. The accused had to blow water over the wing and state that if it was his witchcraft which was at work, he was not aware of this, and by blowing cold water he 'cooled' his witchcraft. (Witchcraft in this context was a substance in the intestines, whose power could go out and harm others when it was animated by malevolent feelings, even if the alleged witch did not intend it to; immoral feelings set witchcraft power to work.) Should a man thus accused refuse to blow water, and merely assert that he was innocent, it would be taken as proof of his obdurate guilt.

The death of a kinsman on the father's side demanded that his fellows take vengeance. Before colonial rule was established the verdict of their oracle had to be confirmed by the chief's oracle; and the person held by the chief's oracle to be responsible for a death, had to pay compensation. After the Anglo-Egyptian government stopped such payments, the social demand for vengeance persisted; the kin of the dead person made vengeance magic against the unknown witch responsible for the death. This magic sought for the witch; and as other persons died in the neighbourhood, the kin asked if each was killed by their vengeance magic. If their oracle said 'yes', they had to get confirmation from their chief's oracles before they could stop mourning, their vengeance completed. Chiefs thus had sufficient information to see that each death both started, and possibly ended, a chain of vengeance magic; but in the plasticity of the system of beliefs, they could hold that a witch was killed both by the others' vengeance magic, and by the witchcraft of an enemy.

Azande also sometimes organized seances at which one or more witch-detectives would dance to work up the power of their magical substances, and detect particular witches at work, or clear away a general threat of witchcraft from around the organizer of the seance. He might give the witch-detective in advance the names of those he suspected.

Azande also consulted oracles before undertaking any important activity, such as betrothing a daughter, selecting a site on which to build a homestead, going hunting on a particular day in a particular direction, going on a journey, and so on. What they were doing was testing the alignment of threats from witchcraft against success, at that particular moment; if the answer were that witchcraft was threatening, they could, if eager to pursue the planned course of action, consult the oracles later to see if the alignment of occult forces had changed. Witchcraft from the future is in the present, and its threats may shift. Or they could use protective magic to control the witchcraft.

Certain important facts become clear in discussing the finding of witches and the threat of witchcraft, within a single society. First, we see that in most Azande techniques, the sufferer controls the names of the persons put to the oracle, so that he is likely to point out some person who has a grudge against him, or against whom he has a grudge, as the cause of his misfortune. For this reason many early observers of these systems of belief and action considered them to be fraudulent. But we must remember that for people who believed in the system in which they had been reared, it seemed very reasonable that personal enemies should be responsible for one's misfortunes; and since one was deeply concerned to avoid the misfortune, one had a greater interest than anyone else in detecting the responsible witch accurately. Nevertheless some persons in these societies did become sceptical of the whole process, particularly chiefs or those connected with chiefs, who were getting most information.

Azande witch-doctor or witch-detective: specialist magicians with the ability to search out witchcraft are highly prized in a society which believes that most illnesses are caused by malicious witches or sorcerers who must be identified if a complete cure is to be effected

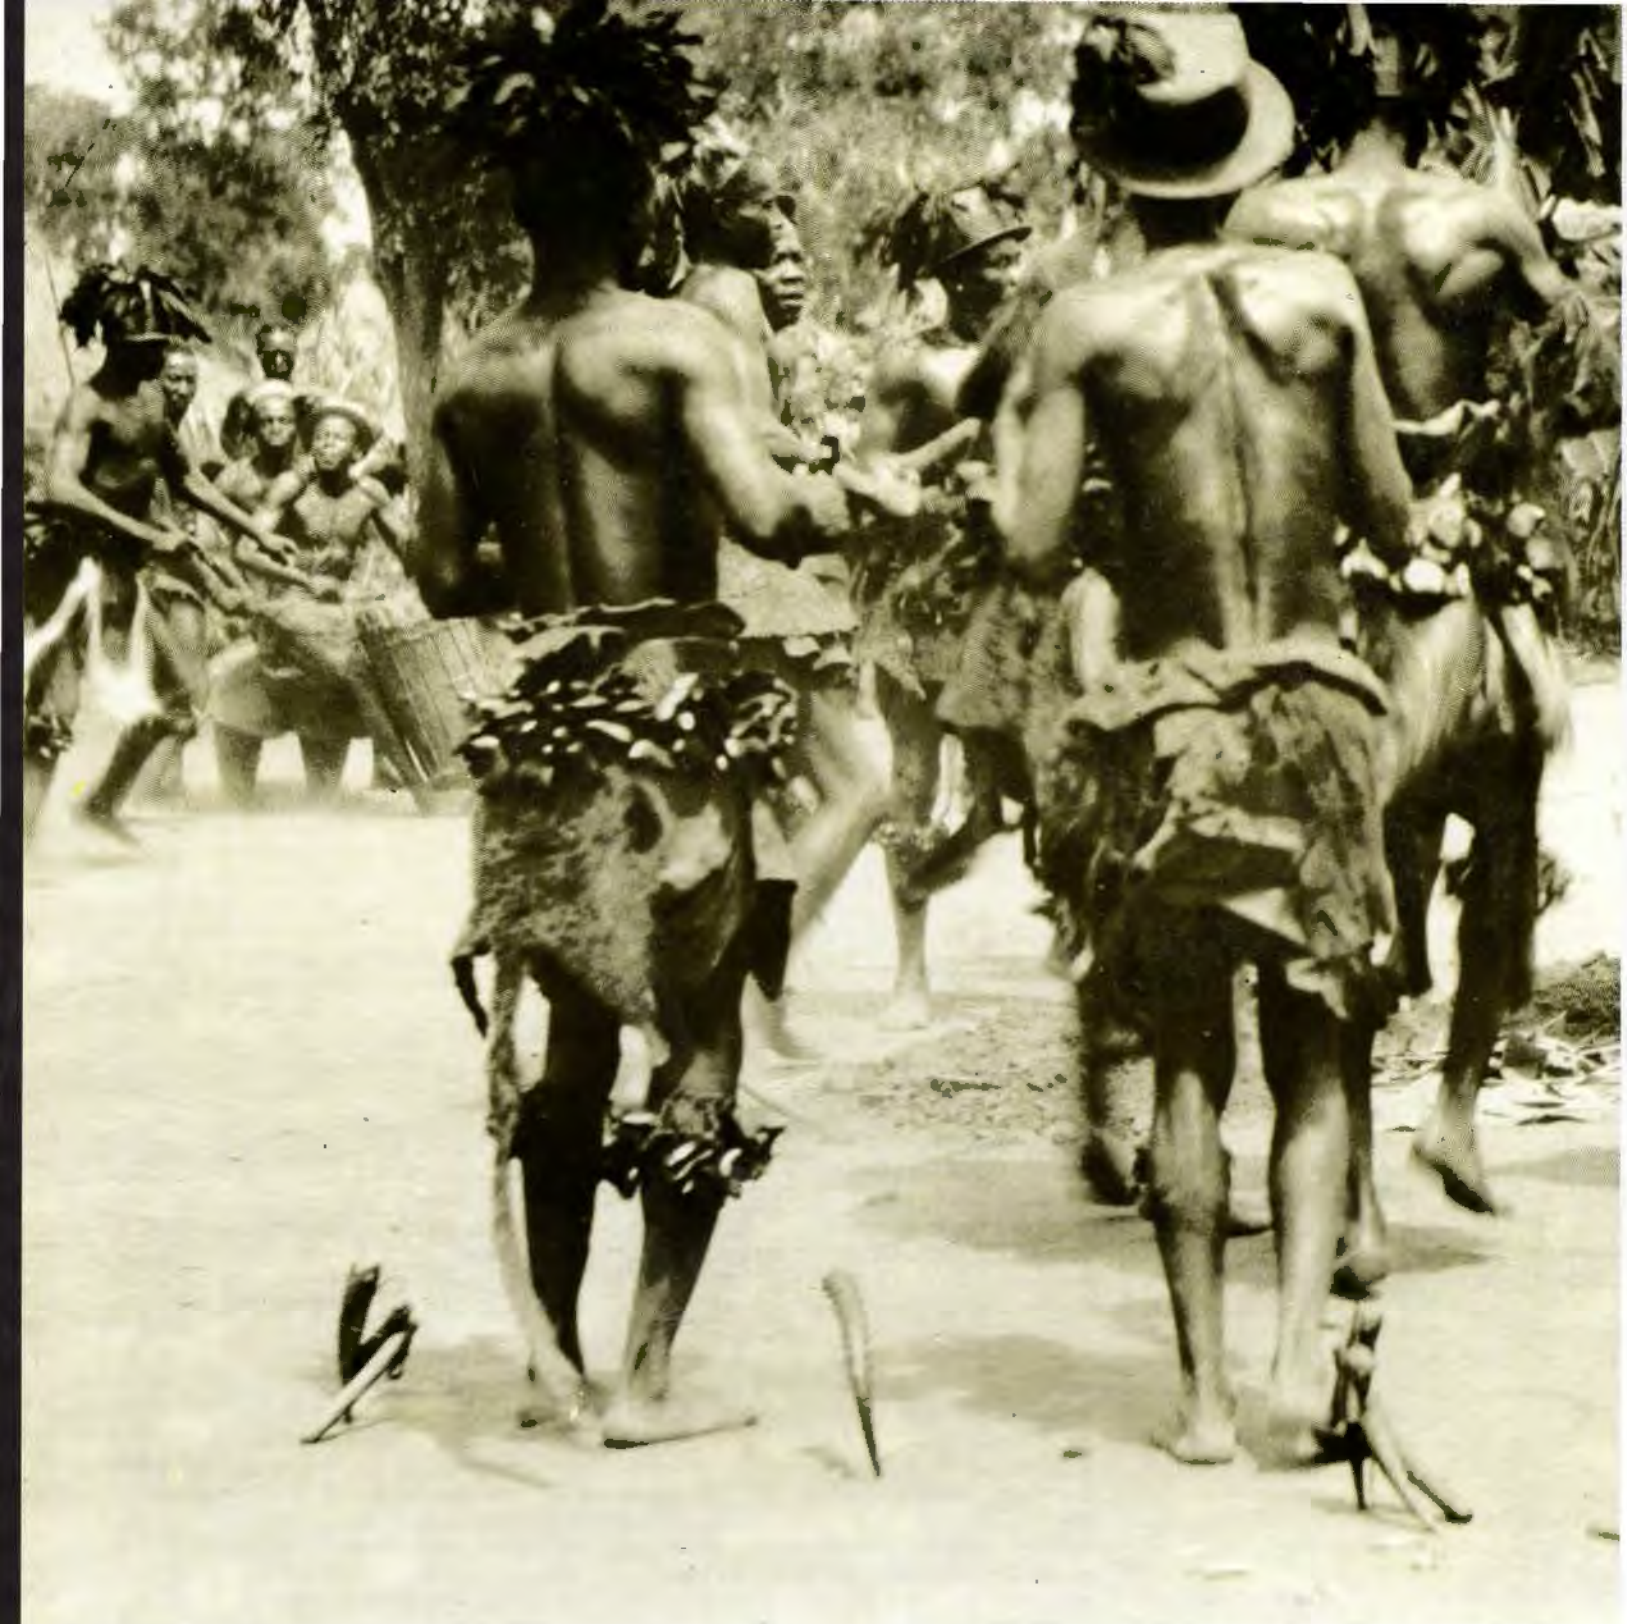
E. E. Evans-Pritchard

When a diviner or oracle spoke directly, in a trance, or through a possessing spirit, the clients were obviously much less in control of the course of divination. Such diviners, like the oracle-substance of the Zande which could not be in human control (as the rubbing-board oracle might be) were more trusted than others. It is usually assumed by anthropologists that these diviners acted on the basis of local knowledge; but since they did not specify a witch by name, but only indicated who he or she might be by the description of social characteristics, they often did not need detailed information about their clients. The range of kinship relationships was extended to bring more distant relatives under the term of near kinsfolk, so that everyone was likely to have some relatives, who could be described in general social terms.

Private and Public Witch-Hunts

In most of the tribal societies described, witches were considered most likely to be relatives of the actual victim, or of the person who was guardian of the victim. More recent researches have brought out that each divination might have to be understood in terms of a long process of development of social relationships, as sections of a village or large group of kinsfolk, or individuals, competed for positions of authority over the whole. Hence one section might reject a divination acceptable to another, and go to its own diviner; or a divination acceptable at one time might be rejected some time later, and quite a different occult cause postulated for the misfortune.

The search for witches in tribal societies was quite different from the great witch-hunts in Europe in the 16th and 17th centuries, or the outbreak of accusations at Salem, Massachusetts, in 1692. In tribal societies accusations of witchcraft were specific to particular social relationships; these might be set in the development of relationships within a group of relatives, bound together with strong sentiments of love and co-operation but also involved in competition for positions of authority and



limited resources. A witch was usually a witch with reference to the particular misfortunes of a particular person; and other persons might not be interested in the question. But in the European hunts for witches the whole community, and more particularly the Church, would be deeply involved. For witchcraft was closely identified with heresy, and with Jewry, and in some areas with Islam; and it was the task of the Church to root out heretics and witches.

After being denounced by some accuser, witches were then subjected to torture, under which they both confessed and implicated others as partners with them in the witches' sabbath. Alleged spectral visions of others and admissions against themselves extracted under torture were the principal evidence; and those judges who showed any leniency, or thinkers who might question the sense of the outburst, became suspect themselves. The only ordeals akin to those in tribal societies were those which required the thrusting of the arm into hot water and then judgement on its effects; or throwing the suspect into a pond: if she floated it was the Devil who bore her up, if she sank she was innocent, and lucky if she were rescued before being drowned.

It is true that the kinds of fantasies produced by persons subjected to torture and making confessions in European witch-trials, or the standardized beliefs and allegations by their accusers, bear similarities to the beliefs in tribal societies about the activities of the witches: riding in the air on familiars or objects, going naked, committing incest and indulging in sexual promiscuity, and so on. But the sociological setting of these forms of witchcraft were quite diverse, and so therefore were the methods of detecting witchcraft and witches. Some of those who observed the witch-hunts in Europe or in Salem commented that they reflected village hatreds and malice; and we have seen that malevolent motives in tribal personal relationships were believed to inspire witches to do harm. But this similarity of motives is too trivial to help us make sense of the quite different social and cultural systems of belief and action which share them; while the similitude of fantasies can be understood better by examining the limited number of emotional and moral

E. E. Evans-Pritchard

Azande witch-doctors: seances were sometimes organized at which one or more witch-doctors would work up their magical substances by dancing, and in this way detect individual witches or dispel the witchcraft which threatened the organizer of the seance

themes open to human beings in society. Hence the witchcraft and the witch-detecting of tribal societies and of the Christian world need to be understood in very different contexts, despite superficial similarities.

The outbreaks of witch-finding cults which periodically have swept through parts of Africa seem to be at least a first stage in the spiritual reaction of small-scale societies to their absorption in the economy and organization of the expanding Western world: hence they are in some ways akin to the situations of European witch-hunts, or the Salem trials. But they were not carried out in the name of a Christian orthodoxy, nor did they hunt directly for witches. They demanded that their adherents purify their hearts and get rid of their charms of witchcraft and magic; and lacking the support of an organized Church, and being opposed by the government, they were far less searching or punitive. They did induce many confessions. They appear to have been succeeded by millenary cults, which echoed Judaeo-Christian ideologies, but which included generally the idea of cleansing one's heart of vicious feelings against one's neighbours; and in societies which had indigenous beliefs in witchcraft, this entailed cleansing one's heart of witchcraft. Hence we can describe them as a community method of finding out witches – and at the same time curing these of their evil.

Fingers have been credited with spiritual powers in many societies: late Roman model, in bronze, of a hand in the attitude of benediction. Its effectiveness was thought to be increased by the pine cone on the thumb, the snake-like ring and the charms that embellish the palm and wrists

Each of your fingers was supposed to have a special significance in popular lore, and the exact position of a white spot on a certain nail foretold an event in the future

FINGERS

THE FINGERS OF THE HAND, which was man's first weapon and tool, have long symbolized in myth and religion both physical and spiritual power, with the added significance that the number five, sum of the fingers and thumb, is the symbol of humanity, health and love. From ancient times the fingers have played their part in the mysteries of religion and magic. Christ speaks of casting out devils with 'the finger of God' (Luke 11.20). In the world's religions it is an accepted principle that power may be communicated through the sensitive finger-tips, a belief that underlies Christian ordination and confirmation, and finds further expression in the legends of saints whose fingers gave forth fire and radiance, while certain clairvoyants lay claim to the power of seeing by means of the finger-tips. Pagan purification rites were often performed with the middle finger; while Moses dipped a finger in the blood of a bullock at a sacrificial ceremony. In early Christian times protection against demons and other hostile psychic influences was sought by inscribing an imaginary cross upon the forehead with the forefinger.

In English country lore each finger was given its individual name: Towcher for the index finger, Long-man for the middle finger, Lech-man or ring finger or gold-finger for the fourth, and Little-man for the small finger; the thumb was called Thuma.

The healing power of the fingers provides one of the most ancient of psychic endowments, the best known examples being the treatment of the King's Evil, and the cures of the famous 17th century mystic, Valentine Greatrakes, who achieved his remarkable successes by stroking the sick with his fingers, which he claimed enabled him to 'restore temperament of the debilitate parts and reinvigorate the blood' (see FAITH HEALING). In folk tradition the third finger of the left hand, or ring finger, has the power to cure a wound by the act of stroking. This finger is supposed to have a direct link with the heart.

There is a widespread belief that the index finger, known as the poison finger, must not be used to touch any wound as it will then never heal. According to an Oxfordshire tradition the index finger is also known as the 'witch' or 'cursing' finger; among the Negroes of the American South it is called the 'conjure' finger. There is a superstition in Turkey to the effect that one must eat with three fingers only because 'the Devil ate with the other two'. Crossing the first

and second fingers remains a popular rite for keeping the Devil at bay even today.

To point with the finger is not only rude but psychically dangerous, and if the object pointed at happens to be a ship at sea it will suffer misfortune or even shipwreck. American Negroes refuse to point for fear that the finger used will rot off, while to point at a fruit tree causes the fruit to decay. The Latin writer Ovid mentions an ancient rite in which the spirits of the unburied dead are held away by pointing the joined finger and thumb in their direction. To point at those celestial orbs, the sun, the moon and stars, brings misfortune upon the one who points.

In ancient times when mystical signs and portents were the rule in the 'science' of prediction, the finger was sometimes regarded as the symbol of fate itself. Thus Fitzgerald's *Omar Khayyam*:

> The Moving Finger writes and having writ
> Moves on, nor all thy Piety nor Wit
> Shall lure it back to cancel half a Line . . .

In rustic fatalism the fingers were believed to indicate by their individual shapes the fates of their owners. Thus in England long fingers were a sign of improvidence, but in Scotland were the characteristics of the potential thief; hence the slang phrase 'fingers' meaning pickpocket. A 17th century writer, Gaule, ridicules the whole dogma of finger lore which was then current; citing the superstitions that short fat fingers indicate intemperance and foolishness, long lean fingers wit, and that those whose fingers crook upwards are 'brutish, ravenous and unchaste'. There is a superstition that those born with an extra finger are destined to be lucky in life, which is countered by the fate of Anne Boleyn who possessed six fingers on her left hand, a fact which was held to support the view that she was a witch.

Signs in the Nails

The practice of decorating the fingers has been carried out for both medical and magical purposes in the past. The Arabs tattooed their fingers as a protection against sprains at the joints; while finger rings of cabalistic design were worn for protection against the assaults of devils and witches. Some finger rings were said to endow the wearer with magical powers, including the art of achieving invisibility. Finger mutilation was performed in primitive rites for a variety of reasons: religious, sacrificial, magical, as a luck-bringer, for the propitiation of the gods, and often as a symbol of mourning. Imprints of hands on cave walls dating back many thousands of years suggest that this is an extremely ancient practice. The Hottentots and Bushmen had the custom of sacrificing the joints of the little finger of a newly-born child as a rite that, it was hoped, would prolong its life; while among the West African Benga tribe the first joints of the fingers of dead ancestors were handed down as precious relics from generation to generation. It is on record that as many as 100 fingers were amputated as part of the mourning ceremonies of a Fijian chief.

The lore of finger-nails is, broadly speaking, analogous to that of the fingers, consisting of a treasury of signs and portents of the future, and as an indication of personal character which in the past was commonly regarded as authentic. Sceptics such as Gaule, however, referred contemptuously to the belief that there was any esoteric significance in variations in growth and shape or the specks on finger-nails. In pre-Christian times, and later, the art of divination by means of the finger-nails was known as onychomancy and this has survived in popular superstition to this day. If you see white spots on the thumbnail, this means that you will receive a gift; if on the index finger-nail, you have as many friends as there are spots; the number of spots on your middle finger indicates the number of your enemies; those on your ring finger-nail are a sign that a letter or a lover will soon arrive; and spots on the nail of your little finger mean that a journey is promised.

A vast system of ancient taboos continues to be associated with cutting the nails, with an infinity of variations. It is lucky to cut them on a Monday or Tuesday, and moderately so on Wednesday; nail-cutting on Thursday portends an illness or a pair of shoes and on Friday is ill-omened. If you do this on Saturday it invites either a loss or the visit of a lover, while cutting the nails on Sunday makes it a certainty that 'the Devil will have you all week'. It is still believed by many that a child's finger-nails must not be cut until it is one year old, except over a Bible; otherwise it will become a thief. They may be bitten off by the mother, however, with perfect safety. According to popular lore, the child who bites his finger-nails is a potential criminal.

In many communities it is considered essential to prevent finger-nail parings from falling into the hands of sorcerers who might use them for evil spells directed against their owner. A Northamptonshire rite by means of which one could acquire the powers of a witch was to sit on the hob cleaning the finger-nails and muttering 'I wish I was as far from God as my nails are from dirt'. In the days when witches were generally feared, it was widely believed that scratching the forehead of a witch with the finger-nails until the blood flowed would break her spell.

Decoration of the finger-nails as a device to ward off evil spirits was practised by the ancient Egyptians. It was one of the minor idolatries banned in Cromwell's England. Chinese mandarins gilded their finger-nails as a sign of rank, and men and women of mixed blood in Spain and America used to colour them to conceal their ancestry which would otherwise be betrayed by their nails.

In affairs of the heart, the lore of finger-nails played a bizarre part. Nail parings discreetly inserted into the loved one's wine provided an irresistible aphrodisiac; while the Indian lover was reputed to use his nails to inscribe symbols upon the body of his mistress during the rites of love.

FINLAND

The Struggle of Light and Darkness

'For the people of the North, magic was the goal of all knowledge' and the epic poem of Finland, the Kalevala, *is 'shot through and through with magic'. The first article deals with the religion of this great circumpolar region, and the second examines the folklore enshrined in the epic*

FOR MOST PEOPLE, the music of Sibelius is the only window into the world of Finno-Ugrian religion (a linguistic term meaning a family of languages spoken from Lapland and the Baltic in the west to the Urals in the east). In Sibelius's tone-poems, such as 'Pohjola's Daughter', 'The Return of Lemminkäinen' and above all 'The Swan of Tuonela', a romantic picture is evoked of dark forests, long nights and mystery. Knowing that the composer drew his inspiration from the Finnish national epic the *Kalevala*, we might suppose that if we knew this work we should have the key to the Finnish religious mind. In fact, the picture is much more complicated.

The peoples who speak the Finno-Ugrian languages belong today to Sweden (most of the Lapps), Finland, Hungary and Russia; they are widely scattered, and have been subject to many different religious influences. In some areas traditional religious beliefs survive only as half-remembered folklore; elsewhere, and particularly farther east, they retain their relevance, perhaps beneath a veneer of Christianity, Islam or Communism. But they have for the most part been superseded.

The earliest written sources date from the coming of Christianity. In 1551, Michael Agricola, the great reformer of the Finnish Church, included a list of the old gods in the preface to his translation of the Psalter. Needless tu say, his purpose was to be theologically controversial rather than scholarly, and these sources have to be used with care, and backed up wherever possible by folklore and anthropology. The same applies to the *Kalevala*, which in its present form is a 19th century compilation by Elias Lönnrot, the Finnish scholar, on the basis of popular traditional material.

The setting of the *Kalevala* is the struggle between life and death, light and darkness, represented by the kingdoms of Kalevala and Pohjola. Its heroes, especially Väinämöinen (a figure who has some affinities with Orpheus) and Lemminkäinen, meet death, but emerge victorious. Their quest is a quest for power; and the *Kalevala* is shot through and through with magic, in the sense of power over both the material world and the world of the spirits. For the people of the North, magic was the goal of all knowledge and all wisdom, and both Väinämöinen and Lemminkäinen, like the Scandinavian Odin himself, were great magicians.

In this respect the *Kalevala* is a microcosm of circumpolar religion, from Lapland to Labrador, and the object of all its religious practices was to secure man's place in a dangerous world by means of magical techniques. Of trusting dependence on the great supernatural powers there is little or nothing; of fear, wisdom and cunning a great deal. Its typical figure is not the priest or prophet, but the shaman, with his power over the spirits and the capacity to project his own spirit through the air to the dwelling-place of the dead, as Väinämöinen does. In this, the Finno-Ugrians were at one with all the Northern hunters.

But for more than 3000 years most Finno-Ugrians have been agriculturalists, and like all agricultural peoples, their religious beliefs and practices must be seen in the context of the need for fertility – of man, animal and plant – and within the framework of heaven and earth, wood and stream, life and death.

At the head of the Finno-Ugrian pantheon stand the figures of the Sky Father and the Earth Mother, the primeval pair who are the joint sources and guarantors of fertility, to whom sacrifices are made in order that the fields may be fruitful. The Sky Father (either the sky personified or a personal living god in the sky) was called by various names: Jumala, Ilmarinen and Ukko ('grandfather') being the most common among the Baltic Finns. Jumala means 'sky', and Ilmarinen contains the word *ilma*, 'air, sky'. Similar words are found among the Cheremis of the Volga basin and the Votyaks in the Urals region. Jumala seems originally to have been a god of the sky; Ilmarinen a god of the atmosphere, wind, and weather (in the *Kalevala* he is a blacksmith, perhaps indicating an original connection with lightning); Ukko was a god of thunder, similar to the Scandinavian Thor, and, like him, was worshipped with spring sacrifices, libations, the consumption of intoxicants and sexual indulgence. After the coming of Christianity all three came to be identified in various ways with God, Jesus and saints such as St George, St Nicholas, and many more.

The Earth Mother, as the consort of the Sky Father, was known in Finland as Maan-Emoinen or Rauni (a word derived from the Swedish name of the sacred tree, *rönn*, or mountain ash), in Estonia as Maa-ema and among the Votyaks as Muzjem-mumi.

Monarch of the Forest

The omnipresent forest was sacred to the Earth Mother, but was also thought of as possessing a life, will and power of its own; as such, it might well be personified as a spirit (*haltija*) or spirits in human form. By and large, the forest spirit (*metsänhaltija*) was benevolent if treated with respect. He or she would provide game for the hunters, and guide the lost traveller; and to this end small symbolical offerings were made, perhaps on a tree stump. Michael Agricola recorded the forest spirit's name as Tapio, and his kingdom as Tapiola; but the spirit might be female, or even a family of spirits.

Of the animals of the forest, the bear was the incomparable monarch. The first drops of blood from any game animal had to be poured on the ground in order to propitiate the spirits, but the skulls of bears were accorded special reverence and were mounted on a sacred tree, looking in the direction of the rising sun: a rite that was probably nearly as old as the forest itself. Both bear and wolf might be identified with the spirit of the forest, and animals generally were known as 'Tapio's flock'. Each species was also believed to have its 'owner', or guardian spirit, the bear mother, fox mother, and so on. It is interesting that in Christian times, saints such as St Anne and St George have taken over from the haltija of the forest some of their functions as protectors of hunters. There were many lesser vegetation deities outside the forest, whose functions were also taken over by Christian saints.

The country east of Finland is a region not only of forests and fields, but also of lakes and rivers, and water spirits played an important role in popular belief. Just as the forest spirit owns the animals, so the water spirit, often pictured as a woman with long hair, is the owner of the fishes, and has to be

The Sacred Tree

Among the tribes of the Finnish-Ugrian stock in Europe the heathen worship was performed for the most part in sacred groves, which were always enclosed with a fence. Such a grove often consisted merely of a glade or clearing with a few trees dotted about, upon which in former times the skins of the sacrificial victims were hung. The central point of the grove, at least among the tribes of the Volga, was the sacred tree, beside which everything else sank into insignificance. Before it the worshippers assembled and the priest offered his prayers, at its roots the victim was sacrificed, and its boughs sometimes served as a pulpit. No wood might be hewn and no branch broken in the grove, and women were generally forbidden to enter it.

But it is necessary to examine in some detail the notions on which the worship of trees and plants is based. To the savage the world in general is animate, and trees and plants are no exception to the rule. He thinks that they have souls like his own, and he treats them accordingly. 'They say,' writes the ancient vegetarian Porphyry, 'that primitive men led an unhappy life, for their superstition did not stop at animals but extended even to plants. For why should the slaughter of an ox or a sheep be a greater wrong than the felling of a fir or an oak, seeing that a soul is implanted in these trees also?'

J. G. Frazer, *The Golden Bough*

Ateneum, Helsinki

Lemminkäinen, one of the main characters in the *Kalevala*, the great epic poem of Finland, was torn to pieces by the son of Tuoni, Lord of the Dead, when he attempted to kill the swan that swam on the dark river surrounding the underworld. He was magically restored to life by his mother: this and subsequent paintings depicting episodes in the *Kalevala* are by A. Gallen-Kallela

propitiated when a good catch is desired.

In their houses, too, the Finno-Ugrians lived close to the world of the spirits. Each home had its own proper guardian spirit, who looked after the house and its inhabitants in return for small regular offerings of food and drink.

Finno-Ugrian beliefs and practices concerning the nature and destiny of man show remarkable similarities with those of Siberia and the northern parts of the North American continent. Common to all is the belief that man has more than one soul: he has a life-soul which is identified with the breath, and which animates the body, disappearing on death; and a free-soul, thought of as a man's 'double' (Doppelgänger), and which continues to enjoy independent existence after death, either in some land of the departed, or as a wandering and often mischievous ghost. It was believed that the dead themselves did not walk, and it was their haltijas, or spirits, that appeared as ghosts. In addition, there are vestiges of belief in the name-soul, in so far as a name was thought to carry with it qualities and attributes that could be passed on to a child.

In transactions involving the soul and the shaman, it is always the free-soul which is meant: sickness is believed to be caused by 'loss of soul', and a cure can only be effected if the lost soul can be caught and brought back by the shaman. Alternatively, cases of 'demon' possession would be treated by some form of exorcism. It was thought that death could occur when the soul of an afflicted person had passed entirely into the sphere of influence of some malevolent power. Death was never by 'natural causes'; always by supernatural.

The land of the dead, Tuonela or Manala, as pictured in the *Kalevala*, is beneath the earth, approached by a long and difficult path, and surrounded by a dark river, on

which a swan swims (the 'Swan of Tuonela', in Sibelius's tone-poem). The Lord of the Dead is Tuoni, and his consort is Tuonetar; their daughters are evil spirits, bringers of disease. The dead live more or less the kind of life they have lived on earth, even marrying and having children, but there are traces in folklore of the belief that the land of the dead was a 'mirror-land' in which the sun rose in the west and set in the east, in which everything was upside-down, and in which the dead gradually regained their youth. Some Finno-Ugrians also believed in a celestial 'heaven', peopled by heroes killed in battle or by lightning. Otherwise there is little indication of any kind of moral distinction being drawn between people after death.

ERIC SHARPE

Epic Poem of Finland

Finnish folklore is generally associated with the *Kalevala*, the great epic poem compiled by Elias Lönnrot (1802–84) from oral traditions he collected while practising medicine in North Karelia, now part of Soviet Russia. '*Kalevala*' means 'land of Kalevala', the great national hero of Finnish and Estonian folk poetry, and is generally thought to signify the 'fatherland of heroes'. The final version of the *Kalevala* was published in 1849, and consisted of 50 cantos containing 22,795 verses.

Elias Lönnrot's motive in collecting oral literature stemmed from nationalist sentiment: he wanted to show that the Finns had a cultural heritage comparable to that of other peoples. The desire to create an artistic whole explains why he arranged his material in a sequence unknown to the unlettered singers of folksong, why he often united several characters into one and why he even made up passages. Nonetheless the *Kalevala* clearly reflects the main themes of Finnish folklore. Although the basic plot is heroic, Lönnrot wove into his work every type of Finnish oral tradition ranging from legends, tales and epic poetry to lyric 'bird' poems, riddles and magic charms.

The action of the *Kalevala* centres on seven distinct episodes. It begins with the creation of the world from an egg and the birth of Väinämöinen, an ancient hero sage, whose mother was the Virgin of the Air, but who was born in the water. Väinämöinen uses his magic powers to prepare the primeval wilderness as a home

Ateneum, Helsinki

Ateneum, Helsinki

Facing page **In the *Kullervo*-cycle, part of the *Kalevala*, Kullervo revenges himself upon the wicked wife of Ilmarinen by turning her cows into bears and wolves which then devour her: *The Curse of Kullervo*. Väinämöinen, an ancient sage and the chief hero of the epic poem, was frustrated in his desire to marry Aino, who flung herself into the sea to escape marriage with him *Above*** **Painting of the episode showing (*left*) Väinämöinen's meeting with Aino; the maiden preparing to enter the water (*right*) and (*centre*) the hero attempting to seize Aino, who has become a water divinity**

for the people of Kalevala. This is followed by Väinämöinen's wooing of Aino who prefers death by drowning rather than marriage to the old man. Then follows a description of the relations between the people of Kalevala and their northern neighbours in Pohjola, identified by most scholars as Lapland. Väinämöinen, Lemminkäinen the wild adventurer, and the hero-smith Ilmarinen all in turn undertake the hazardous journey to woo the daughter of Louhi, the Mistress of Pohjola. It is Ilmarinen who finally wins her, but only after accomplishing various tasks including the forging of the *sampo*, a magic mill that provided unlimited amounts of grain, salt and money.

Five cantos known as the *Kullervo*-cycle follow. Kullervo is a hapless youth separated from his family by a feud between his father, Kalervo, and his uncle, Untamo. While he is still a boy his uncle makes several unsuccessful attempts to murder him. Kullervo is finally sold as a slave to Ilmarinen, whose wife torments him beyond endurance; he takes his revenge by causing her to be torn to pieces by a pack of bears and wolves. Kullervo flees and by chance is reunited with his family. Fate still pursues him, however, and returning home one day he meets and seduces a girl only to discover that she is his long-lost sister. The girl commits suicide and in despair Kullervo sets out to slay his uncle Untamo. The cycle concludes with Kullervo taking his own life.

The death of Ilmarinen's wife provides the link back to the main narrative. Ilmarinen decides to return to Pohjola and woo his sister-in-law. Unsuccessful in winning her affection and angered by the ease of life that the sampo, the magic mill, has provided for the inhabitants of Pohjola, he persuades Väinämöinen and Lemminkäinen to accompany him on an expedition to seize it. There follows a series of struggles during which the sampo is smashed and most of it lost in the sea; Louhi the Protectress of Pohjola sends diseases to Kalevala, and hides the sun and moon, but is finally forced to leave the people of Kalevala in peace.

Finally, Marjatta, a virgin, conceives by swallowing a whortleberry, and gives birth to a son. Väinämöinen wants to have the baby killed; but when the two-week-old boy reproaches him, he is forced to acknowledge a greater power. The boy is christened King of Karelia and Väinämöinen departs to a place between heaven and earth to await a day when his people will need him again.

Folk Tales and Legends

Finnish folklore, typified by the *Kalevala*, embraces elements from many ages and sources. For the purposes of a general analysis there are four major strata. The oldest stratum of Finnish folklore is represented by the pervading atmosphere of magic which owes much to the shamanistic cults of northern Eurasia. The same stratum also includes legends concerning the creation of the universe, struggles between men and animals, the worship of animals, and laments. Scholars are not entirely agreed on the date of this stratum, but it probably goes back to several centuries BC, before the ancestors of the Finns had emerged from Russia, when they were still in contact with other Finno-Ugrian peoples.

The second stratum dates from just before the birth of Christ, when the ancient Finns began to reach the east Baltic area and came into close contact with the ancient Balts and Germans. This period saw the distinctive *Kalevala*-type metre, and the 'origin' poems or spells. This is a form of magic which is rarely found beyond the Finnic area. By describing the origin of an object, displaying one's knowledge of its nature, the object could be created, in the case of fire or iron; overcome, in the case of the bear or other enemies; or warded off, in the case of illness. It is interesting that the actions of these spells were brought about by the power of knowledge, without appeal to a supernatural force. It is also thought that the poems about Väinämöinen, Joukahainen, who is also featured in the *Kalevala*, and Ilmarinen began to evolve during this era.

The third stratum dates from the early Middle Ages when contacts with Scandinavian peoples became more frequent. Evidence of these contacts is found in the borrowing of the Scandinavian ballad form and thematic concepts. The sampo-episode is reminiscent of a Viking raid and comparison with the Icelandic sagas shows that there can be no doubt of the sampo-cycle's Scandinavian origin.

The fourth stratum coincides with the introduction of Christianity in the 12th century, and the subsequent spread of medieval tales and legends, which often

Kurt & Margot Lubinski

The practice of magic was a central feature of Finnish life, and there was a magical formula to accompany almost every aspect of living

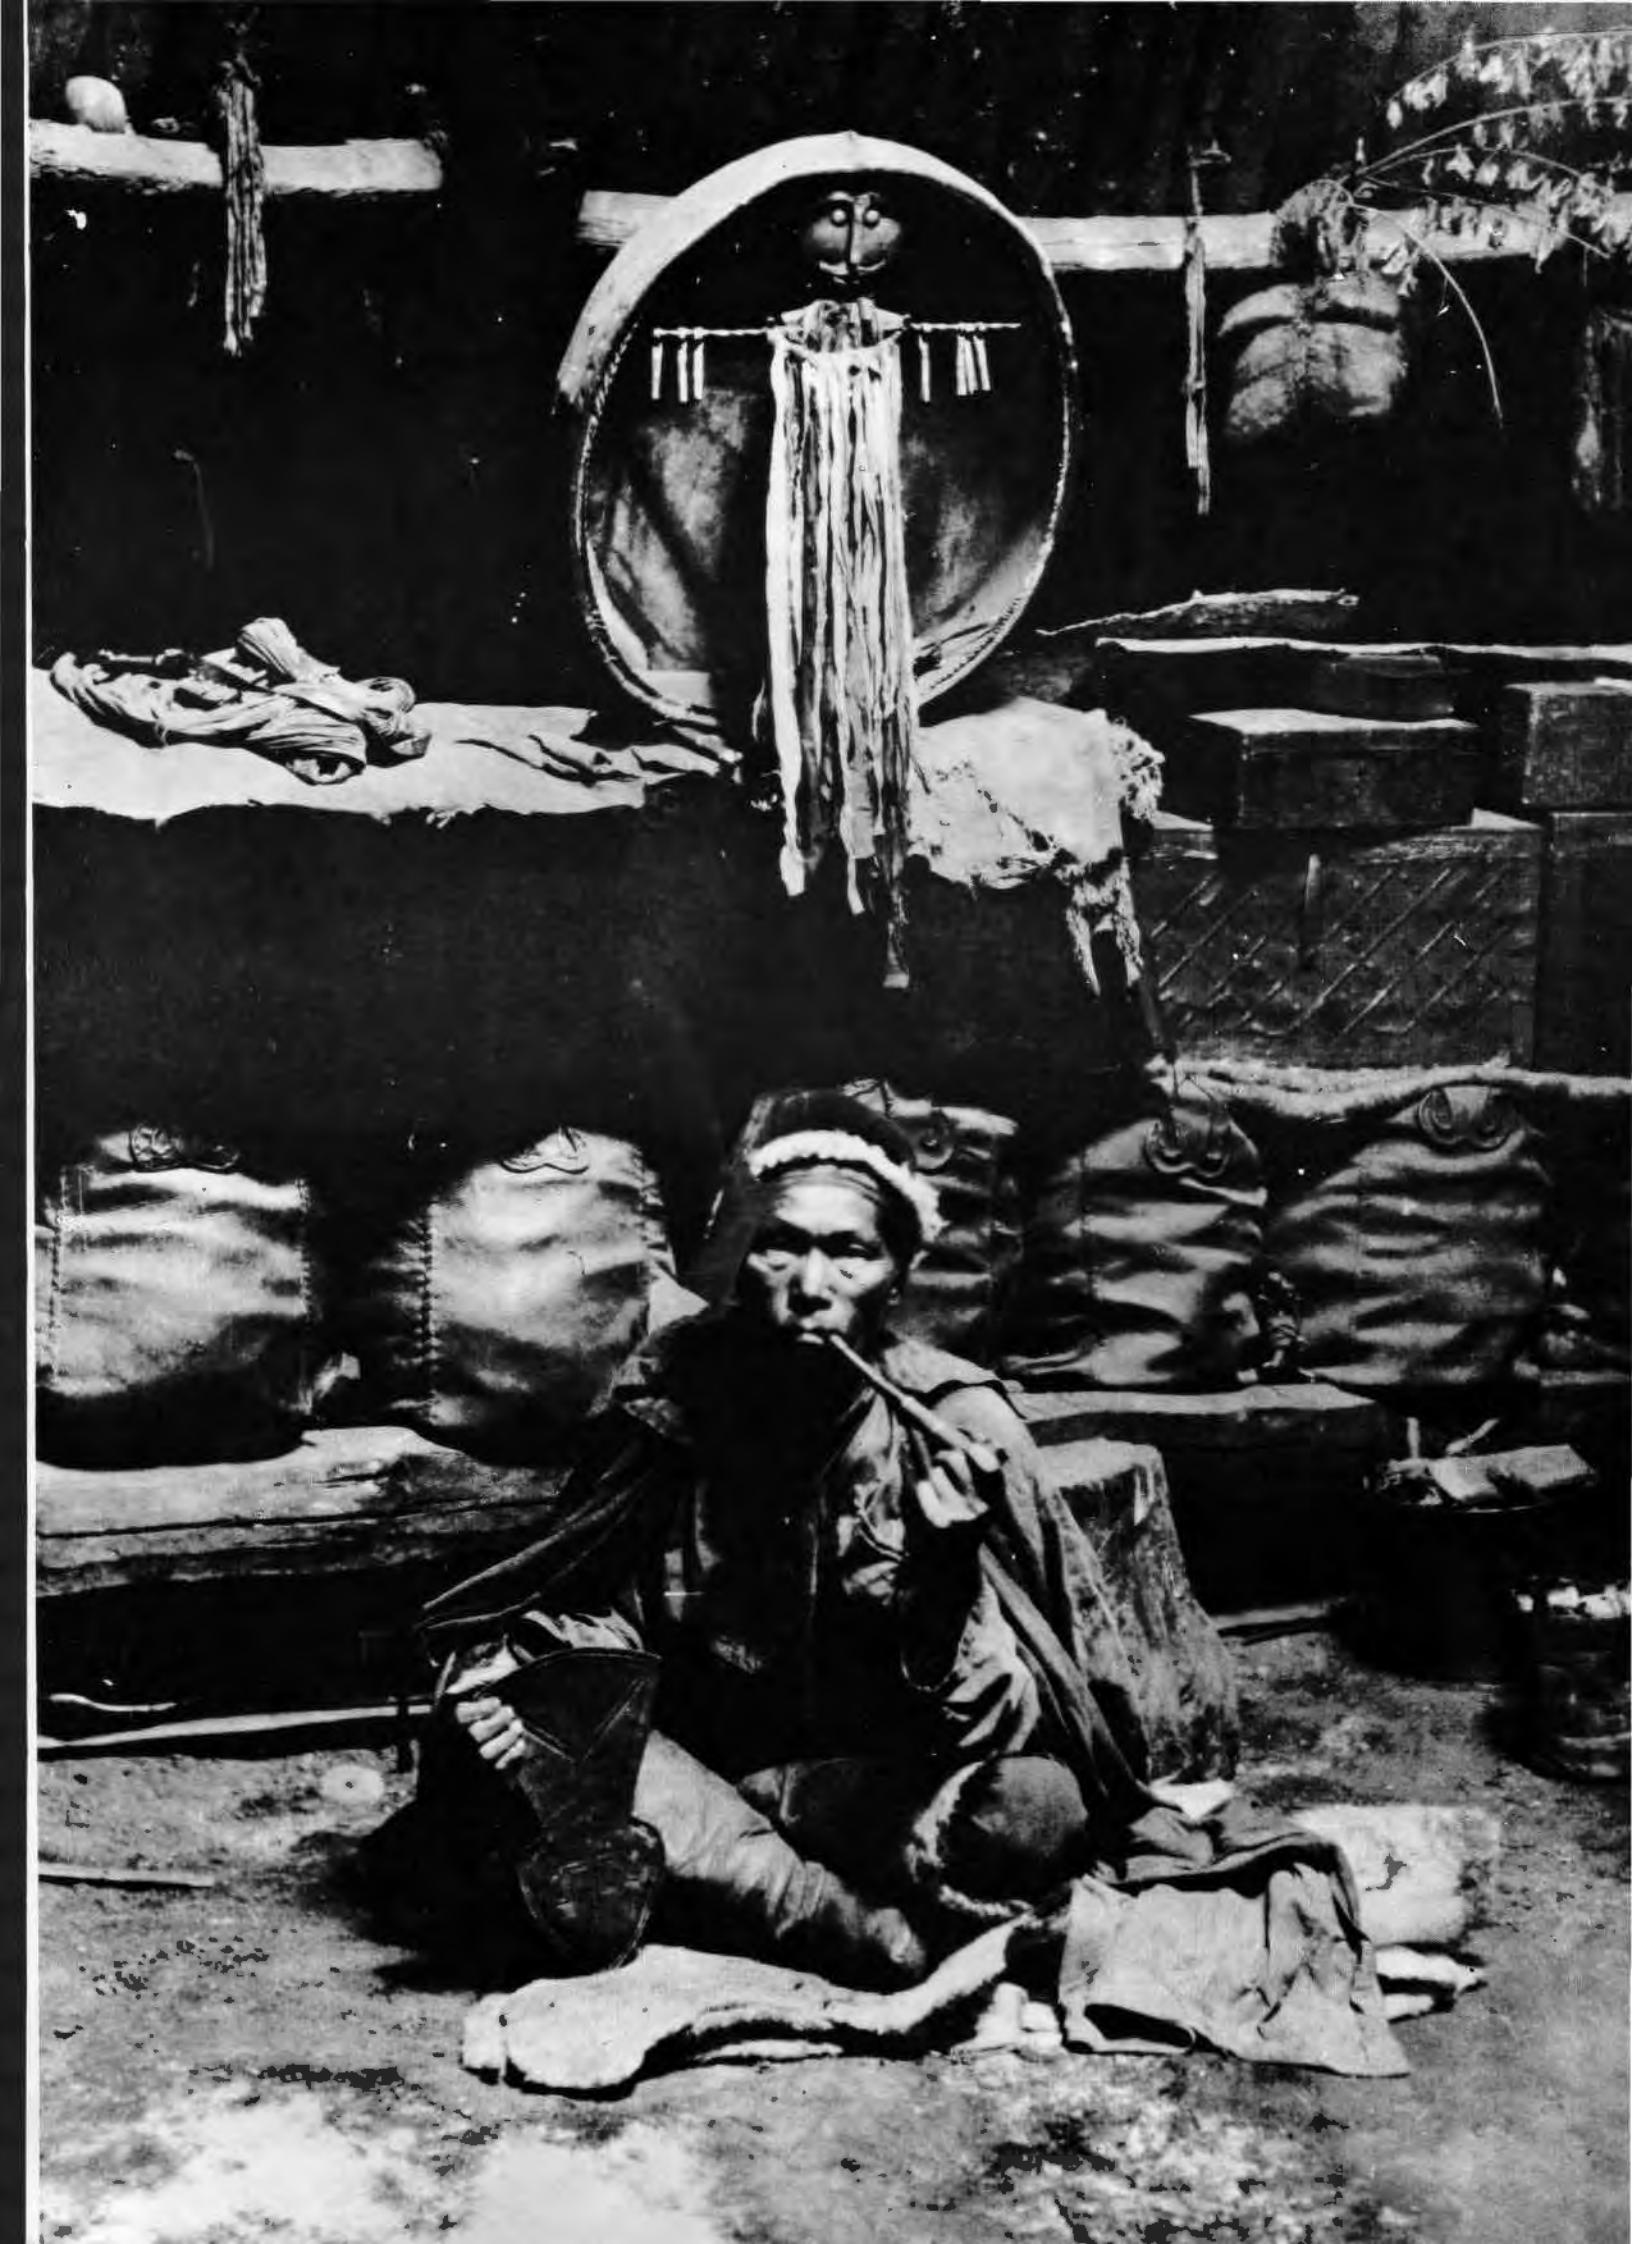
underwent considerable local modification both before and after reaching Finland. Among the themes dating from this period are the *Kullervo*-cycle, related by some scholars to the medieval *Amleth* or Hamlet tale; and Vainamoinen's playing of the zither-like *kantele*, which recalls the medieval versions of the Orpheus legend. The impact of Christianity on Finland's pagan culture is pleasingly symbolized by the episode in which Vainamoinen relinquishes his power to the child born of the virgin Marjatta. The same period is also characterized by a marked increase in folk literature forms with especial proliferation of spells, ballads, proverbs and riddles.

For centuries Finns have been reputed to possess demonic powers, but the practice of devil-worship within Finland itself does not seem to have been widespread. It is clear that the ecclesiastical authorities never had cause to fear witchcraft as it was feared in England and on the Continent, for in the whole of Finland's history less than 60 people were sentenced to death for this crime. The practice of magic, however was a central feature of Finnish life (and still is, in a few remote areas); it is also an essential feature of Finnish folklore and the *Kalevala* contains some 4,200 verses of spell poetry. Magic was used to ensure success, and sometimes protection, in hunting, fishing, farming and raising livestock; and spells were used to cure or ward off illness, to protect against evil and to foretell the future. In fact there was a magic formula to accompany almost every aspect of life.

There were various ways in which magic could be worked: the supplicant could make offerings to spirits of the forest, field and so on; he himself could recite spells; or he could have them recited by a recognized worker of magic, who generally performed the spell alone or only in the presence of the

The shaman, with his power over the spirit world and his ability to project his own spirit to the land of the dead, is the priest of Finno-Ugrian religion *Above* Shaman uttering incantations to the sound of a magic drum, his back decorated with feathers that will help him fly to the spirits, and with bells to announce his arrival *Right* Shaman in his tent; the magic drum is behind him

Kurt & Margot Lubinski



supplicant. He rarely performed before groups of people for fear of weakening the magic. The spell was often in verse, and the wizard would move his body to the rhythm of the chant. Sometimes this induced a state of trance which may be seen as a survival of ancient shamanistic practice. This state was much sought after, for it was believed to give greater effect to the spell.

Finnish magic has much in common with that practised throughout Europe and Asia, where much of it originated. The influence of the ancient spells of India and Egypt reached the Finns through the ancient Germans and easily took root in minds that regarded shamanistic magic as the driving force of life. The majority of surviving Finnish spells, however, spring from the Christian beliefs and legends that spread to Finland during the late Middle Ages.

The *sampo*, a mill that provided unlimited amounts of salt, grain and money, was magically forged by the smith Ilmarinen; but in one of the climactic episodes in the *Kalevala* it is destroyed, and Väinämöinen is able to rescue only its scattered fragments: *The Forging of the Sampo*

Warrior-magician and poet, conqueror of giants and monsters, Finn is the central figure in a cycle of Irish heroic tales; his exploits are commemorated even today in the songs and legends of Gaelic-speaking Ireland and Scotland

FINN

THE TWO MOST RENOWNED heroes of early Irish tradition are Finn and Cu Chulainn. The latter is alleged to have lived about the turn of the Christian era, while Finn was reputed to have died in the second half of the 3rd century AD, aged 230 years – a sure indication of his superhuman nature. Each of these two warriors has attracted the interest of the Irish story-tellers, and each in his own way has stimulated their imagination and inspired their talent.

Similar though they were in many ways and, in the earliest tales, both operating in a heroic milieu, there are marked differences between their individual characters and their roles in their own society. Cu Chulainn never gained the hold on popular tradition that Finn and his followers obtained; and it seems that in the case of Finn there was a strong oral tradition concerning him amongst the common people at the time of the earliest manuscript records, and that this tradition was to persist. Cu Chulainn was the central figure in the so-called *Ulster Cycle* of tales (see CU CHULAINN), while Finn was the main character in the *Fenian Cycle*, the second group of heroic tales, which was named after the *fiana*, 'bands of warriors', whose deeds it commemorates. The leading personalities in this cycle of stories are Finn mac Cumaill, his son Ossian (Oisin), Diarmait mac Duinn and Goll mac Morna. Finn belonged to the Clann Baoiscne, which formed one faction of the company; Goll was a member of the Clann Morna and had been responsible for killing Finn's father Cumall.

According to tradition, Finn and Cu Chulainn are both warriors and both possess magical powers; both have direct and profound dealings with the gods and goddesses of the pagan otherworld. They differ in so far as they each portray different aspects of early Celtic society. Cu Chulainn figures as the hero within the tribal system, the protector of his people, the nephew of the king himself. Finn, on the other hand, stands for the hero outside the tribe, living off the land, fighting, hunting, plundering, living a life that was in essence nomadic. He was not subject to the tribal laws; he had renounced his kin, and his kin had given up all claim to him. They would not avenge his wrongs, nor would he protect them in their distress. He was *ecland*, 'clanless'. But Finn and the fiana, his bands of followers, although landless, did have the right to obtain justice.

The fiana had a recognized and respected place of their own in society; they could only become members of a *fian* or war-band by being chosen, and acceptance depended upon their proving themselves through a series of rigorous initiation ordeals. The following examples will give some idea of the nature of these rites: a hole, deep enough for a man to be buried in up to his waist was dug, and the candidate entered it armed with his shield and a hazel stick of prescribed length. Nine warriors then launched their javelins at him, and if any one of these touched him he was rejected. He had to braid his hair and run off through the woods with the Fenians after him; if caught he could not be accepted; if a branch cracked under his feet, or a twig caught his hair, or if his weapons trembled in his hands, he failed the test and was refused admittance to a fian. Various other ordeals that must be undergone by those who wished to break with tribal society and join one of these war-bands are described in the Irish tales.

The Magic Hood

A *feinid*, a member of a fian, must have been educated to an advanced standard (the Celtic peoples have always held learning in the highest esteem) and he must be familiar with the 12 traditional forms of poetry. In the summer months the Fenians lived a life of wandering, seeking for game and for military glory. In winter they lived off the country – but they cannot in any sense be considered to have been a mercenary army, such as the *Gaesatae* of Gaul. They had one extraordinary privilege which gave rise to much ill-feeling within the tribes: the right to have the first choice of any of the women of the tribe. No girl could in fact be married

until she had first been offered to the Fenians. Unlike Cu Chulainn, who had only one wife, Finn was polygamous.

Finn was the son of Cumall. The form *Cumall* is in fact an error which crept into the later Finn tales, and gave rise to the identification with the god Camulos, invoked at Colchester (Camulodunum) and elsewhere. Finn's father most probably was divine, but he could have had no connection with Camulos. The oldest recorded form of his name is in fact *Umall*; the form *macc Umaill*, 'Son of Umall', gave rise to the later *mac Cumaill*, the second 'c' of *macc* being transferred to the father's name. But Umall himself was in all likelihood of divine origin. It has been argued that Finn had as his father a Celtic ancestor-deity known as Nuadu, who, in accordance with universal Celtic custom, may have had other names, among them Umall. The Celtic deities were often known by several different names and descriptive epithets.

The supposition that Finn had a divine father is somewhat strengthened by the fact that Cu Chulainn had as father the great god Lugh himself; just as Umall and Nuadu may well have been the same person originally, so (it has been argued) may Finn and Lugh once have been identical. Be that as it may, there are certainly strong reasons for believing Finn to have been a pagan Irish deity who was given a historical basis by the story-tellers and turned into a warrior-magician with singular powers. According to one tradition, in fact, he was reborn in the form of King Mongan, a historical personage who lived in the late 6th or early 7th century AD, although 'Mongan would not let it be known' that he was a rebirth of Finn. In this form Finn could allegedly assume any animal shape. Again, another indication of his original divinity is the fact that there are hints in the early Irish genealogies of a triad (group of three) of Finns, much in

Finn may have been a pagan Irish deity who was later given a historical basis; there are hints in early genealogies of a group of three Finns, in keeping with the Celtic predilection for gods in triple form, and the meaning of the Gaelic name for Tara, early Ireland's main royal centre, is 'Tara of the three Fionns': interior of one of the mounds on the hill of Tara

C. M. Dixon

keeping with the Celtic predilection for the number three, and their liking for deities in triple form. The Gaelic name for Tara, County Meath, the main royal centre of early Ireland, means 'Tara of the three Fionns'; and there are also references to the 'Three Finns of Emania'. The god Lugh likewise appears in triadic form.

A triad of deities are Finn's enemies in an 8th century story: these were the Fothads, known as *Aendia*, 'Single God', *Trendia*, 'Strong God' and *Caendia*, 'Fair God'. Another divine opponent of Finn in another story of the same period, 'Finn and the Man in the Tree', is Derce Corra mac hui Daighre. A passage in this extraordinary tale, quoted in my *Pagan Celtic Britain*, gives a most convincing impression of genuine mythology, comparable to that suggested by certain reliefs from Roman Gaul:

> One day as Finn was in the wood seeking him he saw a man in the top of a tree, a black bird on his right shoulder and in his left hand a white vessel of bronze, filled with water in which was a skittish trout and a stag at the foot of the tree. And this was the practice of the man, cracking nuts; and he would give half the kernel of the nut to the black bird that was on his right shoulder while he himself would eat the other half; and he would take an apple out of the bronze vessel that was in his left hand, divide it in two, throw one half to the stag that was at the foot of the tree, and then eat the other half himself. And on it he would drink a sip of the bronze vessel that was in his hand, so that he and the trout and the stag and the black bird drank together. And then his followers asked Finn who he in the tree was, for they did not recognize him on account of the hood of disguise which he wore.

Finn himself had a magic hood which enabled him to be a different animal according to the way he wore it. A further hint of Finn's divinity may perhaps come from the fact that his equivalent in Welsh tradition is the shadowy figure, Gwyn ap Nudd. Like Finn, Gwyn is a hunter-warrior-magician; there is very little about him in early Welsh literature, but he is of the first importance in one of the *Four Branches* of the *Mabinogion*, namely the *mabinogi* of *Culhwch and Olwen* (see MABINOGION). Here he is associated with the hunting of the great mythical boar Twrch Trwyth, a transformed prince, who appears in Irish tradition as Orc Treith.

Prophetic Powers

It seems that a deity having a name similar to that of Finn, or containing the same element, was worshipped in Gaul (*Vind*, from *vindos*, 'white'). Such names as that of the god Vindonnus as well as evidence from certain place-names containing this element suggest that, like Lugh, Finn – or a closely related deity – was known in Gaul, and therefore was popular throughout the Celtic world. Like many other Irish and Welsh heroes, the divine Finn was replaced by the hero Finn under the influence of Christianity. Other indications of Finn's non-human nature are not difficult to find.

Finn possessed the gift of magic prophetic powers. The way in which these powers were allegedly bestowed upon him differs according to the various traditions; but it is interesting that the entire lore about Finn, ancient and modern, is in agreement in making him consistently a warrior-hero-magician who, when he chews his thumb, becomes possessed of second sight. One of the best-known versions of the story which tells how he obtained this magic gift is, in outline, as follows: Goll mac Morna killed Umall (Cumall), Finn's father, in a fight. His mother was pregnant at the time, and shortly afterwards gave birth to a son, Finn. His original name was Demne (just as Cu Chulainn was known as Setanta before he earned his real name) and he later became Finn. When he grew up he went to a certain poet in order to learn the poetic arts. This poet, Finn Eces, had been waiting for seven years to catch the legendary salmon of Linn Feic, which would bestow knowledge of all things upon him who ate it. When he had caught it he asked Finn to cook it for him, but said he must on no account eat any of it. Finn, however, burnt his thumb, and when he put it in his mouth he realized he had become possessed of the knowledge of all things, including, according to some later versions of the tale, the realization that his tutor was his enemy. He proceeded to kill him. Thereafter, Finn evoked his magical knowledge by chewing his thumb.

Tooth of Wisdom

This ritual is reminiscent of the rite performed by the pagan priests of Ireland, known as *imbas forosnai*: to evoke knowledge the priest chewed a piece of raw flesh from a cat, dog or red pig, which had been sacrificed in honour of the deity in question. Finn chewed his own thumb in order to obtain the same result. In the words of one folktale version of the episode (in T. F. O'Rahilly's *Early Irish History and Mythology*) Finn chewed his thumb from the skin to the flesh, from the flesh to the bone, from the bone to the marrow, from the marrow to the juice – and then he knew. Finn was also alleged to have possessed a special 'tooth of wisdom' and he is described as putting 'his thumb under his tooth of wisdom'.

Finn and his followers also manifest a semi-animal nature. Finn was the father of Ossian or Oisin, 'little deer', from whom the *Ossianic Cycle* was named. The Fenians lived very much on the outskirts of society, close to Nature, and were deeply involved with the supernatural world. One of Finn's wives, the mother of Ossian, was a doe called Saar. When her offspring was about to be born she was told that if she could refrain from licking it, it would be human; but that otherwise it would be a deer. When the creature was born she managed to deny her instinct to lick it, as she had been bidden, except that she could not refrain from touching its brow with her tongue. As a result Ossian had a tuft of fur on his forehead. Finn's two faithful dogs, Bran and Sgeolan, his companions on every venture, were his own nephews, sons of his sister Tuirenn; she had been turned into a bitch by a jealous rival. Finn himself could become a man, dog, or deer according to which way he wore his magic hood.

The evidence therefore all points strongly towards Finn's divine origin with counterparts in Wales and Gaul, and probably throughout the Celtic world, just as had Lugh (Lugus, Lleu) himself. But although he is likely to have originated as a god, he had no divine connotation for the later storytellers and the tradition-bearers of the surviving Celtic world. The growth of the legend of Finn as national hero of Ireland took place during the 10th, 11th and 12th centuries, when he was associated with the supernatural, with fighting and hunting, and with amorous adventures of all kinds. By the time of the famous narrative work, *Acallam na Senorach*, 'The Colloquy of the Old Men' in about 1200 AD, Finn had been fitted into a close historical context, and is represented as being in charge of troops at about the end of the 3rd century AD. He is still portrayed as a warrior and a hunter, possessed of outstanding poetic gifts and supernatural wisdom, but much Christianization has now taken place.

In length the *Acallam na Senorach* is second only to the epic *Tain Bo Cualnge* (the main story in the *Ulster Cycle*, of which Cu Chulainn is the central character). It is basically concerned with St Patrick's meeting with the survivors of the Fenians, namely Ossian, son of Finn, Cailte, and one or two others. They are wandering about in Ireland, lamenting the old days and their beloved companions in the chase and the fight. Ossian eventually joins his mother in a *sidh* (otherworld dwelling), and Cailte goes on by himself and meets Patrick. They travel throughout Ireland together, and Cailte tells Patrick all the heroic deeds performed by Finn and his followers in the past. He describes their encounters with the supernatural and with the pagan gods and goddesses, and Patrick questions him closely and listens with sympathy and enjoyment. Cailte explains why particular places have certain names, and tells the story of how these came to be bestowed. As a reward for the pleasure given to Patrick and to the kings who sometimes formed part of the audience, Patrick promises forgiveness and release from hell for Finn and other noteworthy members of the company.

Vital Tradition

The most famous prose tale of the *Fenian Cycle* is the 'Pursuit of Diarmaid and Grainne', a version of which goes back to the 10th century. Finn is married to Grainne, a danghter of Cormac the king. She prefers his son Ossian, but he refuses her for the sake of his father. She then falls in love with Diarmaid, and forces him to elope with her. The story is concerned with their adventures in escaping from the vengeance of Finn and his men, and Finn's ultimate revenge when Diarmaid is slain some years later hunting the great supernatural boar of Ben Gulban. Finn has many adventures with the inhabitants of the pagan otherworld, and a number of the modern folktales and ballads are concerned with these. Unlike the *Ulster Cycle*, and the stories of the great hero Cu Chulainn, the *Fenian Cycle* took a great hold on the popular imagination. In modern Irish and Scottish

Gaelic folktales elements have remained which in many instances seem to form a more direct link with the Finn of the earliest Irish written traditions than with later literary compositions.

As the collector of Scottish-Gaelic folktales, J. F. Campbell, wrote in *Popular Tales of the West Highlands*, published in 1862: 'Short passages, stanzas and lines of poetry, ascribed to Ossian, are even still recited through a great many parts of the Highlands, and tales about the Feinn, interspersed with verse, are yet to be heard in many districts from old men. There are very few Highlanders that cannot even now say something about Fionn and his heroes; how they fought and died . . . Rocks, hills and streams are called after the Feinne. Surnames are derived from them . . . and generally the Feinne and their exploits pervade all Celtic Scotland and all Gaelic tradition.' This is an impressive testimony to the longevity and vitality of a tradition which began in the distant Celtic past and persisted with no decrease in popularity down to the present day. For it is still possible, in the remaining Gaelic-speaking areas of Ireland and Scotland, to hear tales and to listen to songs commemorating Finn mac Cumaill, his son Ossian, and all the other colourful members of the fiana, tales and songs in which Finn is still the warrior, the poet possessed of supernatural knowledge, the conqueror of giants and monsters, the mighty hunter; preserving in his legend ideals and beliefs that belong to a remote, barbaric past, a pagan rather than a Christian world.

Usually a symbol of fertility and constancy, the fir or pine was also associated with ancient funeral customs; in northern Europe and Russia it was the tree of the shaman or medicine-man

FIR

IN MYTHOLOGY references to the fir include not only the true firs but any kind of cone-bearing tree or conifer, and many of these are undoubtedly kinds of pine. The word 'fir' is used in the same way in the Bible. As one of the first timbers to be used for boat-building, the pine was sacred to the sea god in classical times.

In Phrygia the pine was sacred to Cybele, 'Mother of the Gods' and the goddess of fertility. Legend tells of her love for Attis, a young shepherd, whom she charged with looking after her temple, making him vow to remain celibate. In one version he fell in love with a nymph and, mad with remorse for neglecting his vow, castrated himself and bled to death beneath a pine. In a Roman version the goddess – now Rhea – prevented his death by turning him into a pine and was only consoled when Jupiter assured her the tree would remain evergreen.

The spring festival of Cybele involved cutting down a pine and carrying it, shrouded corpse-like and decorated with the violets believed to have sprung from Attis's blood, into the sanctuary. The third day was known as the Day of Blood when the eunuch priests wounded themselves, and some of those attending the ceremony became possessed and castrated themselves. Attis is therefore one of the tree spirits, but like Adonis, his history also represents the 'killing' of the corn by the reaper, its burial in the granary, and its rebirth on being sown. He has a further parallel in the Egyptian Osiris whose image, in his tree spirit manifestation, was buried in a hollowed-out pine log which was burned a year later. This ritual is illustrated in Osiris's hall at Denderah in Egypt, and was recorded by Firmicus Maternus in the 4th century AD.

The pine appears again as a rebirth

Because of its longevity, and because it is evergreen, the Japanese regard the pine as a symbol of constancy and long life; this concept is reflected in the aged couple, Jo and Uba, the spirits of the pine tree, who are depicted in this Japanese print: Victoria and Albert Museum

symbol in the Greek *Thesmophoria*, a ritual in which food and pine branches were cast into caves or vaults sacred to Demeter, and were brought forth a year later and placed on the altar. Those present seized the decaying morsels and sowed them together with the seed corn to ensure a fruitful crop. The immortality symbolism of the evergreen pine rendered it useful at funerals to signify man's belief in the immortality of the soul, a custom that was recorded in classical times and, more recently, in Norway and Russia, where pine or fir boughs were placed on coffins before they were interred. In Norway fir boughs were fixed to a house where a death had occurred to keep away evil spirits.

Pine Cones for Virginity

Immortality and perpetuation go together, and pine and fir were also used as fertility symbols. Virgil described the pine as *pronuba*, because of the pinewood torches used at weddings. In a Shrove-tide custom recorded in Hanover, the men begged gifts from the women, beating them with fir branches at the same time, which was supposed to encourage their child-bearing. Fir trees were placed before houses in central Germany when a wedding was taking place, and in northern Germany newly married couples went through a ceremony in which they held fir branches carrying candles. In the same area, when the cattle were driven to their first spring pastures, the drovers often fixed fir branches on the last cow, hoping to ensure productivity for the herd.

The Japanese regard the pine, an evergreen tree, as a symbol of constancy, and of married faithfulness. Because of the longevity of dwarfed or *bonsai* trees, the pine also represents long life in Japan. The Chinese likewise made the pine one of their emblems of constancy, because it was evergreen and withstood the adversity of winter without any alteration.

The Romans believed that unopened pine cones represented virginity, and virgins would wear pine garlands at ceremonies, as described by the poet Callimachus in his hymn to Diana, in the 3rd century BC.

The pine was also connected with Dionysus, whose followers would sometimes wear pine foliage; a cone tipped the god's thyrsos, a ceremonial staff twined with ivy or vine leaves.

It seems probable that the fir, often the only tree apart from the birch in northern Europe and Russia, was the tree of the shaman or medicine-man in those countries. At any rate, fir saplings, either nine or in multiples of nine, were set before or around the shaman's house; he had to climb the first sapling, leap from one tree to the next, and come down the ninth, to prove that man belonged to both earth and sky. The shaman became possessed and prophesied in front of fir saplings; and when he died his body or his coffin would be hoisted up into a fir.

The mysteriously hardening resin of conifers was believed to have magical properties and was used in incense when the Eastern materials were not available. Resin was also an ingredient of primitive fireworks, and as such connects the fir and pine with the Green Man. Basically, like Attis, a tree spirit or king of the woods, this figure is thought to have originated in a cult of priest-magicians who were custodians of fire and developed the art of making fireworks in order to impress their devotees. In the early 17th century the Green Man and his savage ally the Wodehouse, who dressed only in breeches and headpiece of leaves, were popular characters in plays and pageants. His symbol was a staff tipped with a pine cone.

As the Christmas tree, the fir plays an important part in modern Christmas celebrations, although the reasons why a fir is used are speculative. In an ancient German ritual girls danced round a fir, and having imprisoned the imp of the tree in this way, made him give them whatever they wished for. This pagan imp was later associated with the Christian St Nicholas, or Santa Claus. Since the tree was apparently decorated with eggs, among other objects, it seems likely that this was originally a fertility ritual, yet another example of the use of the evergreen conifer as a symbol of productivity.

These peasant rites, probably celebrated in many parts of Scandinavia, Europe and Russia, gradually spread. The popularity of the Christmas tree in Britain dates from its appearance at a famous children's party held by Prince Albert at Windsor in 1841: abetted by Charles Dickens, the royal family soon made the Christmas tree as universally popular in this country as it was in Germany (see CHRISTMAS).

The Jews used evergreens in holy rituals: 'The glory of Lebanon shall come to you, the cypress, the plane and the pine, to beautify the place of my sanctuary' (Isiah 60.13).

Although to dream of a fir means suffering, it was thought possible to prevent nightmares by laying a branch at the foot of one's bed. A branch that had been partly burned was believed to be protection against lightning, and a bough on the barn door prevented the theft of grain by witches or human thieves. In the language of flowers, fir represents time, and pine is 'hope in adversity'.

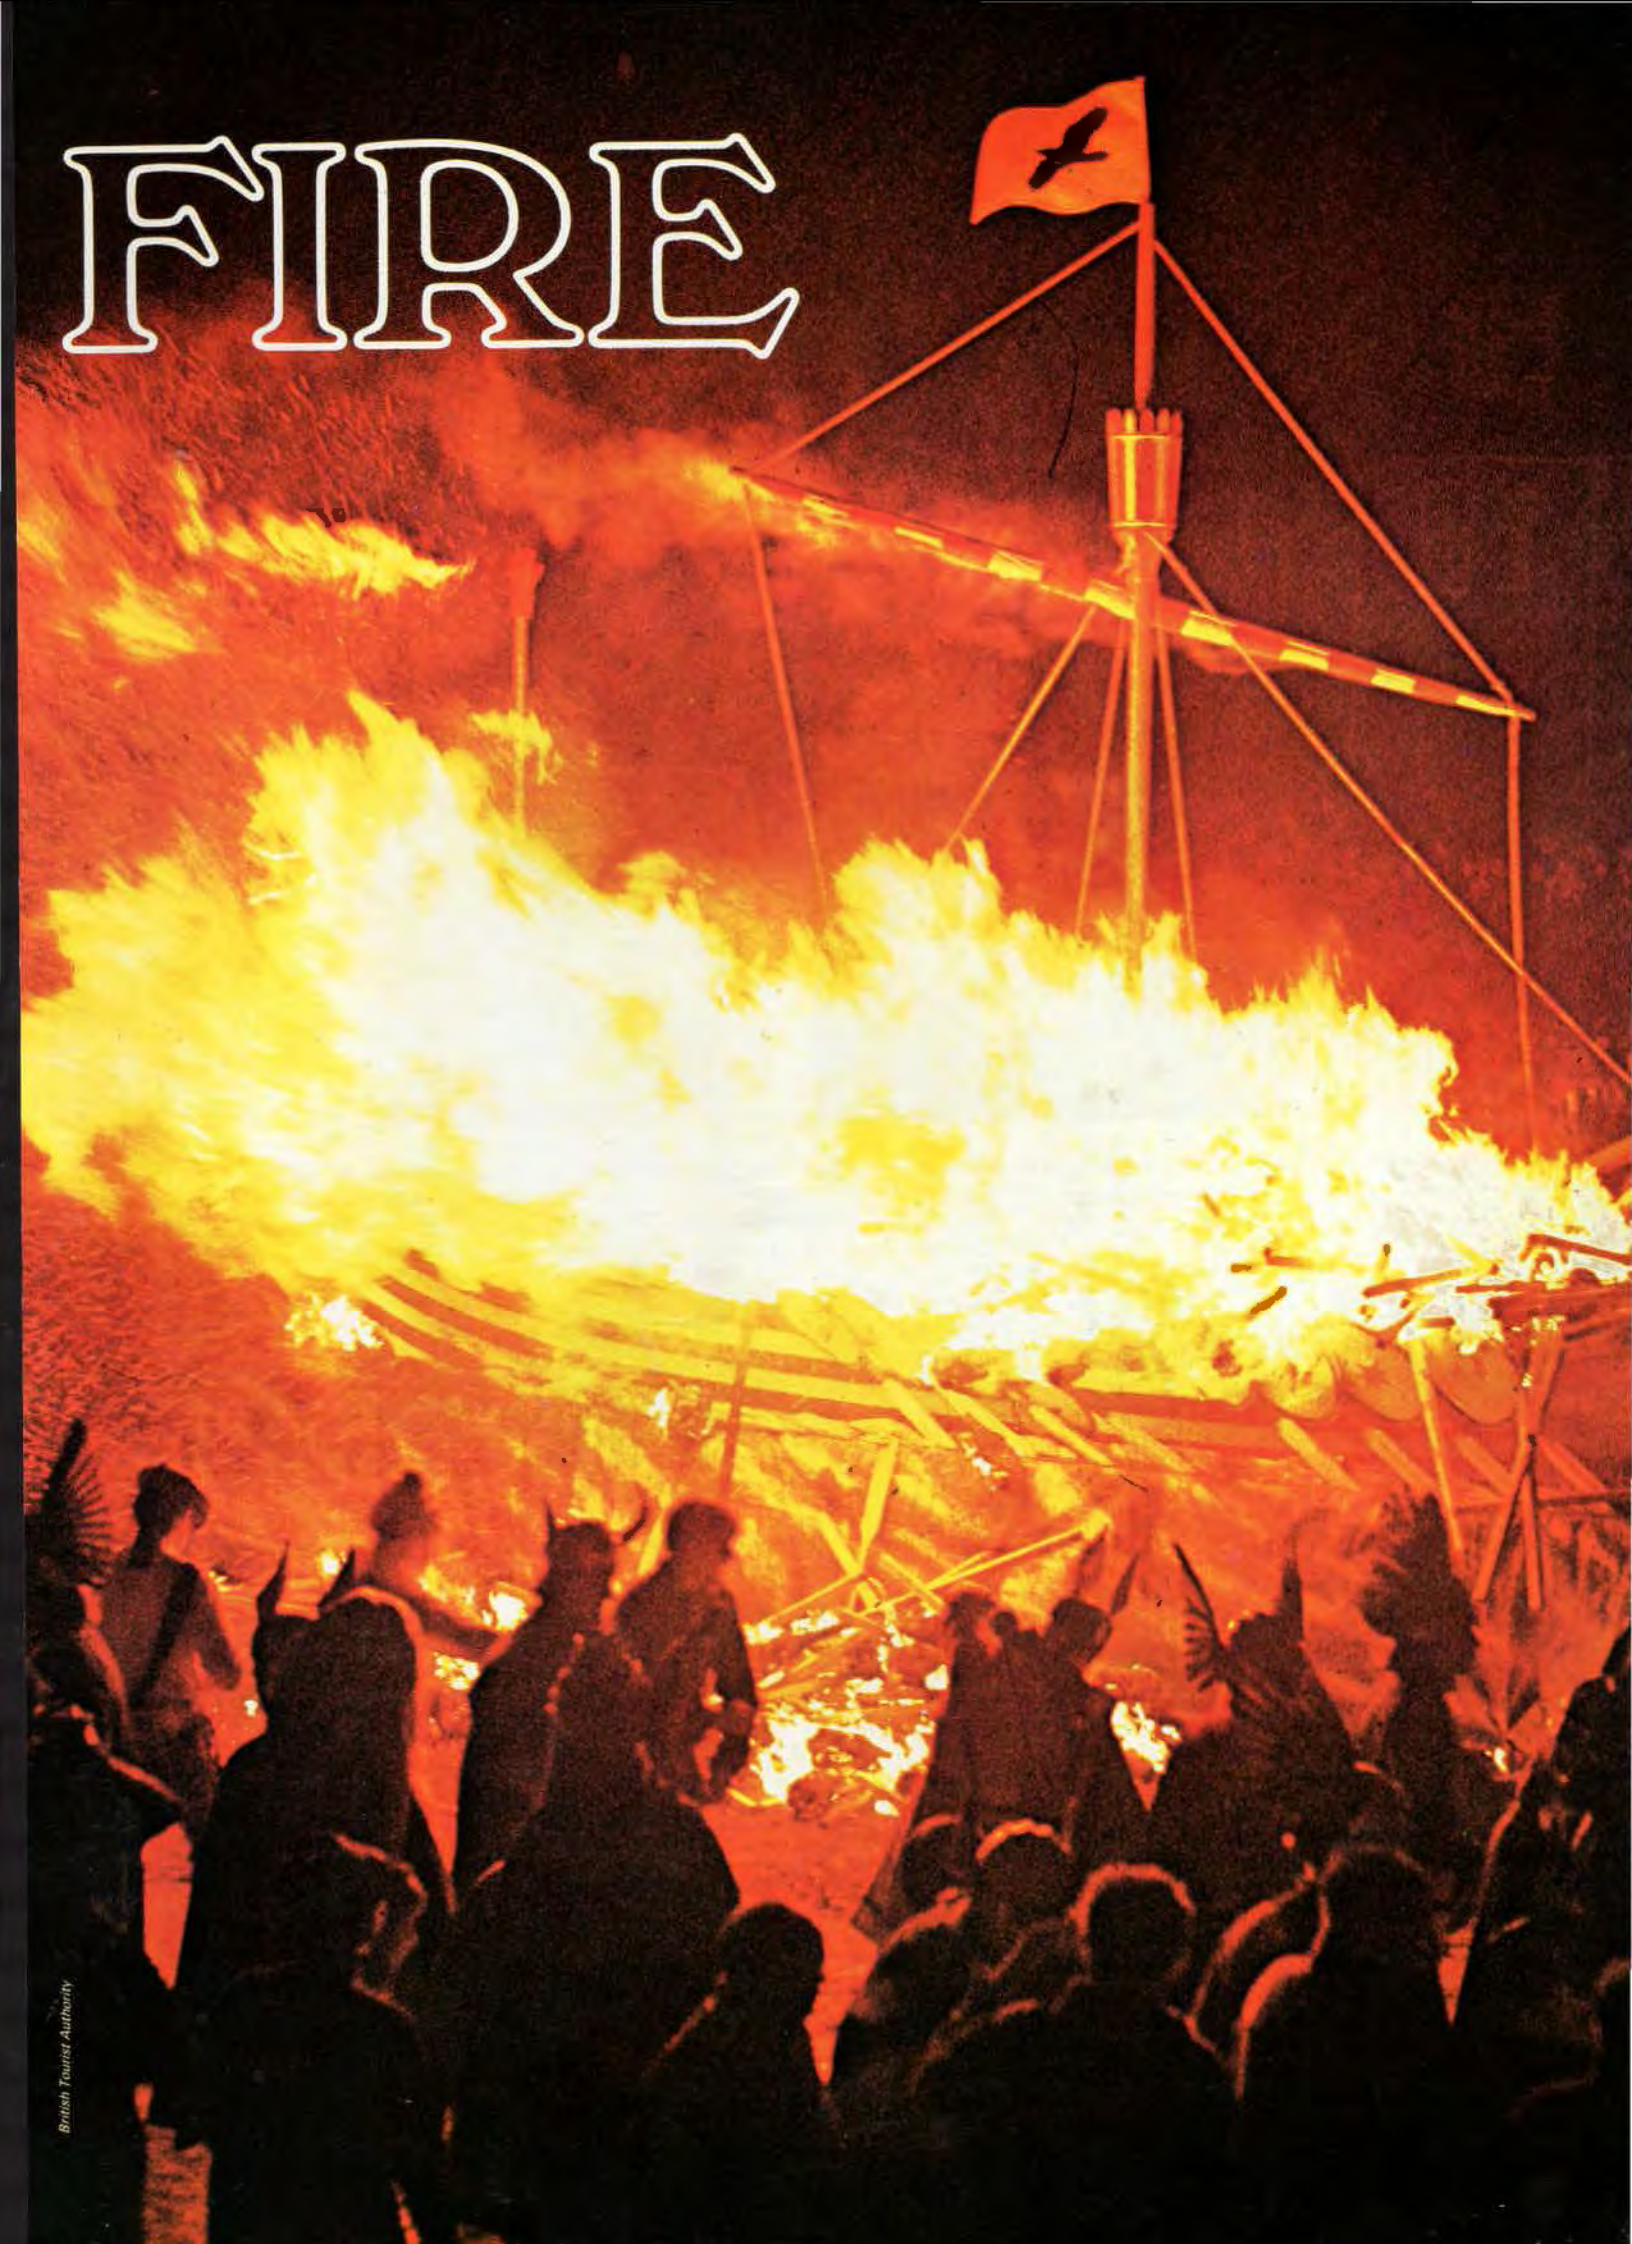
FIRE



British Tourist Authority

Constantine Reyes-Valerio

The everlasting flames of hell have been used to terrify sinners for generations. But fires are also associated with festivals, as any child who celebrates Guy Fawkes' Day knows
